## TABLE OF CONTENTS.

No of Ap- pendix.	Subject.	Page.	No. of Ap- pendix.	Subject.	Page.
SECTION I.			SECTION VI-B (1)— <i>continued.</i>		
1	Statement showing the area and population affected in 1896-97, 1899-1900, 1900-01 and 1901-02 ... ..	3	23	List of famine relief works in the affected districts carried out during the period 1900—1902 with the dates of their commencement and closure ... ..	57
2	Map showing the affected area in 1899-1900 . . . . .	4			
3	Statement showing the rainfall of the seasons of 1899 and 1896 and the average ... ..	5	24	Government Resolution prescribing standard tables of task-work and piece-work rates ... ..	62
4	Statement showing the rainfall of the season of 1900 as compared with the normal... ..	9	25	Review of the effect of the penal wage on relief workers... ..	65
5	Statement showing the rainfall of 1901 as compared with the normal ... ..	10	26	Instructions regarding selection of the most suitable works for employment of famine labourers after the commencement of the rainy season ... ..	66
6	Extracts from the reports of Divisional Commissioners and Deputy Commissioner, Thar and Parkar, about the failure of the harvests in 1899-1900 ... ..	11	27	Regulations for village works in the Broach District.	68
7	Statement showing the variation in the area of crop sown and matured in 1899-1900 as compared with 1898-99... ..	14	28	Statement showing the daily average numbers of men, women and children among relief workers in the last week of each month from September 1899 to October 1902 ... ..	70
8	Statement showing the area cultivated with food and non-food crops in 1898-99 and 1899-1900 ... ..	16	28A	Statement showing the incidence of wages and fines per working unit relieved during 1899—1902 ... ..	78
9	Statement showing the outturn of crops in 1894-95 to 1899-1900 (except 1897-98) ... ..	15	29	Statement of works classified according to their utility ... ..	79
10	Statement showing the number of persons relieved in each of the affected districts in 1899-1900 and 1896-97... ..	16	30	Statement showing the famine expenditure and values at normal rates, with the percentages of the latter on the former, on different classes of works from the commencement of the famine in 1899 to end of October 1902 ... ..	90
11	Do. do. in 1900-01 and 1901-02 ... ..	22	31	Notes by the Chief Engineer and Secretary to Government in the Public Works Department on the utility of the works carried out by famine labour ... ..	94
12	Statement showing the daily average and maximum numbers relieved in 1896-97 and 1899-1900, 1900-01 and 1901-02 ... ..	27	32	Report by Mr. W. Santo Crimp, M Inst. C. E., on the possibility of finding an artesian supply of water ... ..	96
13	Statement showing the proportion of different classes of people on relief works in 1899-1900 and 1897 ... ..	28	SECTION VI-B (2a).		
14	Statement showing cultivated area and estimated outturn in 1900-01 compared with those of a normal year ... ..	34	33	Circulars concerning relief measures in the Northern Division... ..	97
15	Statement showing percentages of area and outturn of kharif and rabi harvests of 1901-02 to average kharif and rabi harvests ... ..	35	34	Statement showing the daily average numbers of men, women and children receiving village relief in the last week of each month from September 1899 to October 1902 ... ..	102
16	Extracts from the reports of Collectors describing the extent of damage caused to crops by rats, locusts and other insects in 1901 ... ..	36	35	Statement showing the daily average numbers of men, women and children among dependants of relief workers in the last week of each month and their proportion to workers, and also the proportion fed in kitchens from September 1899 to October 1902 ... ..	110
SECTION II.			36	Statement showing the daily average numbers of men, women and children relieved in poor-houses in the last week of each month from September 1899 to October 1902 ... ..	120
17	Statement showing the imports and exports of food-grains from August 1899 to August 1900 ... ..	38	37	Statement showing the percentage proportion to affected population of (1) workers and (2) gratuitously relieved in each month from September 1899 to October 1902 ... ..	128
SECTION IV.			38	Statement showing the incidence of cost per unit of work relief and gratuitous relief ... ..	134
18	Extract from the report of the Collector of Kaira regarding the extent of scarcity of fodder ... ..	38	39	Statement showing the details of special relief to weavers in their own craft during the famine of 1899—1902 ... ..	135
19	Statement showing the average price of Kadbi (Jowari straw) in the affected districts from December 1899 to October 1901 as compared with the normal ... ..	39	SECTION VI-B (3).		
SECTION V.			40	40	Statement showing takávi advances made under the Land Improvement Loans Act XIX of 1883 and the Agriculturists' Loans Act XII of 1884 ... ..
20	Extracts from the correspondence on the subject of immigration into British Districts from Native States ... ..	40	41	Statement showing the areas of land irrigated from wells built from takávi advances and from other wells ... ..	138
SECTION VI-A.			SECTION VI-B (1).		
21	Statement showing the total of extra establishments entertained in connection with the famine of 1899—1902 ... ..	52	22	District maps showing the situation of relief works and the dates of their commencement and termination in the year 1899-1900 ... ..	56 (a)

No. of Appendix.	Subject.	Page.	No. of Appendix.	Subject.	Page.
SECTION VI-B (5).			SECTION VII (2)—continued.		
42	The general policy and the procedure followed in the matter of collection of land revenue during 1896-97 (Government Circular No. 9704, dated 2nd December 1896) ... ..	138	61	Statement showing the increase in mortality in 1899-1900, 1900-01 and 1901-02 ... ..	194
43	Orders elucidating the land revenue policy in 1896-97 (Extract from Government Resolutions No. 1965, dated 7th April 1900, and No. 2671, dated 30th June 1900) ... ..	139	62	Statement showing the death-rate (per mille) during the year 1900 from all causes, exclusive of plague, and from cholera, small-pox, fever, dysentery and diarrhoea and plague ... ..	196
44	Instructions for the collection of the land revenue of 1899-1900 in the year 1900-01 (Government Resolution No. 3265, dated 5th September 1900) ... ..	140	63	Sanitary Commissioner's review of the mortality from September 1899 to October 1900, opinion of the Surgeon-General and précis of a report by the Deputy Sanitary Commissioner, Gujara't ... ..	202
45	Statement showing the state of land revenue collections and remissions on 1st August 1902 ... ..	142	64	Statement showing the proportion of population on relief and death-rates (exclusive of plague) in the affected districts in 1900 ... ..	206
46	Comparative statement showing the amount of pressure used to recover land revenue during the years 1898-99, 1899-1900, 1900-01 and 1901-02 ... ..	144	65	Statement showing the mortality on relief works and in poor-houses during the famine of 1899-1902.	207
47	General orders on the subject of coercive process (Government Resolution, Revenue Department, No. 8932, dated 23rd December 1901) ... ..	145	66	Statement showing the number of deaths from starvation ... ..	212
SECTION VI-B (6).			SECTION VII (3).		
48	Summary of a report by Mr. R. C. Wroughton, Conservator of Forests, on famine fodder operations undertaken in 1899-1900 ... ..	145	67	Statement of crime ... ..	213
49	Rules for the management of Depôts in Gujara't (Government Resolution No. 8361, dated 22nd November 1899) ... ..	153	SECTION VII (4).		
50	Description of the nutritive value of fodder by Mr. J. Mollison, M.R.A.C. ... ..	158	68	Statement showing the variations in the number of cattle in the affected districts during the period between June 1899 to June 1902 as compared with total cattle in 1896-97 ... ..	214
51	Statement showing the imports and exports of fodder in the various districts of the Presidency ... ..	160	69	Note by the Director of Land Records and Agriculture regarding the traffic in hides, skins, bones and horns ... ..	217
52	General rules for cattle camps ... ..	161	SECTION VIII.		
53	Extract from the Annual Administration Report of the Civil Veterinary Department for 1899-1900 and the review by the Commissioner, Northern Division, regarding the cattle camp scheme, etc., etc....	163	70	Statement showing the rainfall at principal stations in the affected Native States in 1899 and 1900 as compared with the average of eleven years ending 1897 ... ..	218
54	Report by Mr. G. Montearth, I. C. S., describing the distant grazing operations in the Thána District ... ..	169	71	Statement showing the affected area and population of the affected Native States in 1899-1900, 1900-01 and 1901-02 ... ..	219
55	Preparation of prickly pear fodder and results of the experiments regarding its use ... ..	170	72	Statement showing the prices of food-grains in the last week of each month in the affected Native States during 1899-1900, 1900-01 and 1901-02 ... ..	220
56	Notes by Mr. J. Mollison, M.R.A.C., on manual power tillage implements ... ..	173	73	Statement showing the loans borrowed for famine purposes by the Native States from the beginning of famine in 1899 up to the 15th November 1901 ... ..	222
SECTION VII (1).			74	Statement showing the numbers of persons receiving relief in the Native States during 1899-1900 1900-01 and 1901-02 ... ..	223
57	Statement showing the total number and value of sales and mortgages of land registered under the Indian Registration Act III of 1877 during the years 1899-1900—1901-02 as compared with the average of the preceding nine years ... ..	176	75	Statement showing the expenditure reported to have been incurred in Native States on famine relief operations during 1899-1900 ... ..	235
58	Statement showing the number and value of sales and mortgages of land between agriculturists and non-agriculturists registered under the Indian Registration Act III of 1877 during the years 1899-1900—1901-02 as compared with the average of the preceding nine years ... ..	177	SECTION IX.		
59	Statement showing the number of sales and mortgages of land registered under the Deccan Agriculturists' Relief Act XVII of 1879 during the years 1899-1900—1901-02 as compared with the average of the preceding nine years ... ..	178	76	Statement showing the total direct expenditure, on famine relief, and amounts of advances and remissions ... ..	236
SECTION VII (2).			77	Statement showing the indirect expenditure incurred in connexion with the famine of 1899—1902 under the different service heads ... ..	240
60	Statement showing the number of deaths in the affected districts from September 1899 to August 1902 as compared with the normal ... ..	179	78	Statement showing the indirect expenditure of different classes incurred from the commencement of the famine, in 1899 to 31st October 1902 ... ..	241
			79	List of non-official gentlemen who rendered useful service during the famine of 1899—1902 ... ..	242

## APPENDIX '6.

(Referred to in Paragraph 4 of the Report)

*Extracts from reports of Divisional Commissioners and Deputy Commissioner,  
Thar and Parkar, concerning the failure of the harvests in 1899-1900.*

*Northern Division.*

In the British districts of the Northern Division, the famine of 1899-1900 lay heaviest on Ahmedabad, Kaira, Panch Mahals and Broach. With the exception of 1897-98, previous seasons for eight years had not been good. Cotton and sugarcane, the two chief crops grown for sale, had also fallen in price. Altogether in the early part of 1899 the agricultural interest was depressed. In the ensuing monsoon season it may be said generally that no useful rain fell after the month of June. This meant that after a first scanty outcrop of young grass there was no fodder on the land, and it also meant the failure of the kharif harvest. Very little was saved by wells even where they existed, for the people had never known the rain to hold off till the end, and could not bring their minds to believe it possible. Hence, they delayed to irrigate the withering crops, for it was believed that rain falling after artificial watering would rot them. An estimate of the kharif outturn is supplied by the Director of Agriculture. The Commissioner from general observation would not put it at more than one anna in the rupee. Much land was put under rabi cultivation by means of wells, but the result was poor. The hot weather crops of fodder were good, but in quantity sown of not much account.

The ordinary agricultural capital of these districts consists of (1) the matured crops of the year, (2) the hoards of the money-lenders, and (3) the savings of the cultivators which took the shape of land, cattle (young stock, milch and draught), ornaments and metal utensils. The first never existed in 1899-1900. The second were largely locked up in land, or if liquid were withheld from use by the money-lenders, who as a body refused to make advances. The third class of assets was devoted to the maintenance of family and cattle, the demand on account of the latter being the more exhausting of the two. Hence, from an early date the wage-fund began to fail. Most of the rural labouring classes became destitute, except those who lived by eating roots and other jungle produce, or by selling sticks, or the materials of their houses or make-shifts for fodder, such as leaves and chopped twigs. More and more of these latter had to give up the struggle and become dependants of Government in a more or less emaciated state as the year wore on, and the ranks were also swelled by the lower classes of cultivators as one after another they had to abandon the desperate effort to keep alive their cattle. Towards June and July this steady breakdown had reached a higher though not the highest stratum. Many took relief who till then had kept themselves independent.

Another incident of the year was the destruction of mango and other trees, an important element of wealth in Ahmedabad and Kaira and, to some extent, in the Panch Mahals district. No exact statistics are available, but the number lost to the country is enormous, partly withered by drought, and partly destroyed by the people for the sake of fodder and fuel.

Famine in the Surat district was but slight in comparison. Rice, the staple of large areas, failed and other crops were poor, but there was no lack of fodder and the deficiency all round was largely made up by high prices, both of grain and straw. The real distress was limited to the Kálpuraj (black-complexioned) who owing to their low intelligence and improvident habits always live a hard life for half the year.

In the Thána district there was some pressure on account of high prices, but the only classes seriously affected were the hill tribes. Mr. Orr notes in this district, too, a wholesale destruction of trees owing to the reckless sale by occupants for the sake of a little ready money.

*Central Division.*

In Sátára, the scarcity of 1896-97, though it told far less upon the people than that of 1876-77, was appreciable. The chief distress in 1896-97 was in the hills, where the kharif crops had been lost owing to excessive rain. There was very little rabi crop anywhere in the district and the harvest of the year on the whole did not exceed 40 per cent. of the average. Thus the people entered on the year 1899-1900 with resources more or less exhausted. The rainfall of 1899 was far below the average. East of the Krishna River, *i.e.*, in the Man, Khatáo, Khanapur and Tasgaon talukas, the drought was specially marked. The kharif crops in the district varied from *nil* to six annas. The September rains were generally good, but as practically no showers followed, the rabi crops very generally failed. In 1899 things to the west and in the hills were a little better than in 1896, and distress was consequently first felt in the east. The labouring classes resorted at once to relief works. The distress continued till October 1900, though it still lingers in the eastern talukas and in the Khándala Petha and the Pátan taluka in the west.

Poona in 1896-97 suffered more than the Sátára district, inasmuch as the whole district was affected. The Ghát or the westerly portion suffered as in Sátára from the excessive rain of the earlier period of the monsoon, and here, too, the plague in Bombay prevented the population in as great numbers as usual seeking work in Bombay. In 1899 the practical cessation of the rain, from the middle of September onward, removed all hope of a satisfactory kharif

harvest and resulted in widespread failure of the rabi crops. The Dhond Petha suffered most, as there the failure of both dry crop harvests was complete. Next came the rabi-dependent talukas of Indapur, Bhimthadi and Sirur and the eastern portions of the Purandhar, Haveli, Khed and Junnar talukas. In the Mulshi and Ambegaon Pethas the distress was also severe. In the rest of the district the crops averaged nearly 8 annas and the villages on the Nira and Mutha Canals were only lightly affected. The yield on the dry uplands, even of irrigated villages, fared, however, no better, and this general failure coupled with high prices told on the labouring classes.

Sholapur lies on the high plateau of the Deccan, and there is hardly ever a year in which both the early and the later rains are copious. During the last 25 years there have been four ruinous famines, the first two being those of 1876-77 and 1896-97; the third is under report and the fourth is in progress. In 1896-97 the kharif crops withered and the outturn was estimated at from 1 to 2 annas. A heavy fall of rain in November gave a fair rabi crop in parts of two talukas and in scattered spots elsewhere, while the bulk of the rabi lands only produced a small supply of inferior fodder. The harvest of 1898-99 had been exceptionally good in the Sholapur district, which was a material help to the people called upon to pass through what proved to be two consecutive years of drought. The early rains of 1899 failed and the kharif came to naught, but a copious fall in September permitted a general sowing of rabi which came up well. The sudden cessation of the rain, however, almost entirely destroyed the crop, and by the middle of November famine was certain.

The famine of 1899-1900 was immensely more severe in Ahmednagar than that of 1896-97. The outturn of the harvests in the latter year is recorded as 29.2 or 39.8 per cent. In 1899 the narrative of failure is similar to that told by the Collector of Sholapur. The rains opened well; the long drought of July and August ruined the kharif crop, the outturn of which was estimated at only one anna. September rain enabled rabi sowings to be made and the October and November drought brought these to naught. The rabi outturn was consequently *nil*. The shortness of water in wells restricted the irrigated crops. The year 1900 yielded a slightly better kharif, which was 5 to 6 annas for the whole district, but very unequally distributed. The rabi ranged from *nil* to 4 annas. Consequently the famine continues.

In 1876-77 the distressed area in the Nasik district was limited to some 2,000 square miles and in that area the distress did not assume famine proportions. In 1896-97 the distress was mainly due to high prices of food and did not reach the acute stage. The years 1897 and 1898, though not quite normal, yet gave the district good kharif and fair rabi harvests. But before the district had time to recover from the depletion of stocks and resources occasioned by the strain of the year 1896-97, the people had to face the almost total failure of the rains of 1899. How complete this failure was the following figures will indicate. At headquarters, the total rainfall was 12 inches and 40 cents compared with the average of a trifle over 30 inches. In the talukas the fall varied from less than 4 inches in Niphad (average 25 inches 31 cents) to 64 inches 23 cents (average 143 inches 83 cents) in Igatpuri. And these figures include some unseasonable and useless showers in April and May 1899. Sowings were confined to about 62 per cent. of the normal area and the yield on unirrigated lands varied from *nil* in Yeola in the east to some 10 annas in parts of Igatpuri and Peint in the west. The Collector estimates the total outturn to be about 19 per cent. of that of an ordinary year. The entire district was thus affected though not all in equal degree.

Khándesh had always been classed as 'protected from famine' until the calamity of 1899-1900 came to dispel this illusion and plunged the whole district along with Gujarát, which had similarly been considered as immune, into the woes of one of the worst famines known during the century. In Khándesh there was severe scarcity in 1876, and in 1896 the population suffered from a general rise in the prices of food. The early rains in 1896 were excellent and the kharif did not fail. The hill tribes did not suffer at all and West Khándesh was free from the pinch of the high prices. But in 1899 a terrible scourge swept over all parts of the district and the distress lasted for 14 months and has not yet wholly ceased in the hilly tracts. The monsoon of 1899 began fairly but quickly weakened. The rainfall is described as follows:—

June ...	...	... Slightly below normal.
July ...	...	... Only over one inch.
August ...	...	... 1½ inches.
September ...	...	... 1¼ inches.
October ...	...	... <i>Nil</i> .

The total rainfall was 9 inches compared with 28 inches, the average of five preceding years, during which the rainfall was defective. The kharif crop was a total failure and the rabi area was not sown, except in irrigated lands, there being no late rains. This was a disaster of the first magnitude.

#### *Southern Division.*

In nearly the whole of the Southern Division, including parts described in the Famine Atlas as not liable to famine, there was more or less scarcity resulting from deficiency of rainfall, short crops and high prices. Indeed two test works were opened in Dhárwár, one in Kolába and three in Ratnágiri, but they failed to attract an appreciable number of labourers. Real famine was confined to the Indí, Sindgi and Bádámi talukas of Bijápur: and intense scarcity to the other

tálukas of that district and the Athni, Gokák, Parasgad and Chikodi (part only) tálukas of Belgaum. In the Bijápúr district the villages of the Don and lands in favoured situations and the Bágalkot táluka produced fair crops : while in the rest of the district the crops stunted and sickened and either failed entirely or produced from one to two annas.

*Sind (Thar and Párkar).*

The rains of 1898 almost entirely failed in the four Desert tálukas, *viz.*, Nagar, Mithi, Gháchro and Diplo, and in the Desert portions of the Umarkot and Khipro tálukas, and the year 1898-99 was therefore one of great scarcity in this tract, the area of which is approximately 10,000 square miles, and which is the westernmost portion of what is known as the 'Great Indian Desert'. Hardly any cultivation was undertaken, and the small area sown yielded absolutely nothing. The cattle perished by tens of thousands, and by the end of June 1899 not 30 per cent. of the original stock was left. But as the Desert people live more by the profits of cattle-breeding and the sale of *ghi* than by agriculture, and as the preceding year had been one of the best ever known, and had left them with large profits in hand, they managed to tide over this first year of scarcity without having recourse to the State for relief, and what would have been a year of severe famine in any other part of the Bombay Presidency passed by without an official declaration of famine.

Still, the year 1898-99 was for all this the worst year experienced in the Desert since the great famine of 1868-69, known as the 'Pachisa,' and so the people had reached the very end of their resources when the monsoon of 1899 again failed, and they were of course utterly unable to withstand the gigantic calamity which this failure implied, and relief measures at the expense of the State were therefore commenced at the end of September 1899. It should here be explained that the Nára Valley portion of the Thar and Párkar district enjoys a perennial supply of irrigation water, and is thereby rendered absolutely safe from famine. It was the immediate proximity of this rich and prosperous tract which helped more than anything else to mitigate the losses and distress of the Desert people.

In the Desert of the Thar and Párkar district, more than nine-tenths of the population depend for their living directly and entirely either upon agriculture or upon cattle or upon both—in most cases, upon both. The remaining one-tenth of the population is composed of petty traders, whose trade is almost wholly confined to grain, cattle and ghi, and nearly all of whom own cattle themselves. It is therefore obvious that a famine, so prolonged and intense as the recent one has been, pressed heavily upon the entire population. Field labour there is none in the Desert. Every one cultivates his own small holding, and it is incorrect to speak of the labouring classes, for the reason that the Bhils, Kolis and Menghwars—the low castes, who, in adjoining parts of India, subsist mainly by labour—have in the Desert nearly all got their own small holdings and a cow or a donkey or two. All were therefore reduced to great poverty by the famine. The population is naturally largely nomadic, as the water supply is precarious, and the graziers in particular are accustomed to wander over the Desert with their cattle. Sind and the Nára Valley have always afforded a grand field for labour and agricultural employment, and after the failure of the monsoon of 1898 quite a quarter of the entire Desert population had emigrated and found employment there. When, therefore, in August 1899, the monsoon had for a second time entirely failed, the Desert people again began to emigrate in thousands, and in October it is certain that more than half the entire population had already left their homes and come into Sind. By the end of November, when the rice harvest had begun, only about one-third remained, and this state of things continued until May 1900, when people began coming back so as to be in good time to start cultivation when the first rain should fall. The population of the Desert in 1891, including the Desert portion of the Umarkot táluka, was about 156,000. The most careful inquiries and estimates made every week in each táluka from the very commencement of the famine showed that by the end of November quite 100,000 persons had emigrated. Of these about two-thirds settled down comfortably in the Nára Valley, and the other one-third in the Lar of the Hyderabad district. Thousands found occupation as cultivators and field labourers, in the clearance of zamindari water courses and on the numerous Government irrigation works (principally connected with the Jamrao Canal) that were in progress. Thousands made a living by harvesting and cotton picking, as private and menial servants, and by the performance of miscellaneous jobs for the lazy and well-to-do Sindhis. Thousands settled at the larger villages, and there carried on their professions as potters, weavers, dyers and artisans. It was never found necessary to provide any State relief for these Desert emigrants, and the solitary relief work that was opened in the Nára Valley in April 1900 was for the comparatively few immigrants, from Native States, who had failed to obtain private employment. The remaining third of the Desert population which stayed at home was composed of the Bantias, who, of course, were well off; the Rajputs, who were unaccustomed to migrating and who stayed at home either from family reasons or from pride; the well-to-do cattle-breeders and large landowners who had the means to tide over the famine; and the residue of Bhils, Kolis, Menghwars and the poorer Muhamadans, who feared the long journey across the Desert sands, and clung to some forlorn hope of withstanding the famine, were prevented by family ties from leaving their homes, or—and these last were the aged, infirm and indolent—made up their minds from the first to throw themselves upon the State.

## APPENDIX 7.

(Referred to in Paragraph 5 of the Report.)

Statement showing the variation in the area of crops sown and matured in 1899-1900 as compared with 1898-99.

## APPENDIX 16.

(Referred to in Paragraph 14 of the Report.)

*Extracts from the reports of Collectors describing the extent of damage caused to crops by rats, locusts and other insects in 1901.*

**Ahmedabad.**

Cotton pods are torn to pieces by rats as soon as they ripen; and the 'til' crops in the Bhál, which might have produced some outturn even after the locust invasion, are being reaped wholesale by the rats, which gnaw the thick stalk through at the base and eat the green pods when the plant has fallen. They are also injuring the young wheat and will probably cause very heavy damage as soon as the ears begin to form and ripen. Nevertheless the people refuse to protect themselves by attempting to destroy the rats; and it is only in Modása that good progress has been made in this direction. The Bhils and wild Kolis of that Mahál are not restrained by religious scruples from earning the Government reward.

In the Daskroi charge the main damage was done in the Daskroi taluka, where about 22 villages round about Ahmedabad and in the tract of country to the north were completely stripped of their standing crops, the damage varying from 12 to 16 annas in the rupee: many other villages were damaged, but their losses were not so heavy, varying from 3 to 8 annas.

The bájri crop in Sánand taluka fared better than in Daskroi and the damage to the standing crops nowhere exceeded 8 annas and averaged about 5. On the other hand, the jowári and banti crops were completely destroyed and castor oil suffered heavily, the damage being estimated at 10 annas. The pulses had already withered from want of rain. The damage done to cotton was estimated at 8 annas, but though fresh leaves sprouted after the departure of the locusts, it is feared that there will not be any appreciable outturn.

The principal kharif cereals grown in the Viramgám taluka are bájri and jowári: they had suffered severely from drought and grasshoppers before the locusts came, and it may be estimated roughly that perhaps 20 per cent. of such of these crops as had come to maturity were saved.

Cotton was also attacked: plants which were completely stripped of their leaves put out fresh leaves in a few weeks and bear no apparent marks of damage. But the effect has been to stunt and retard the plants, and it is doubtful if they will come to maturity. The outturn in any case will be but small.

Even in the Bhál many fields of young wheat were devoured and very heavy damage was done to the standing kharif crops of bájri, tal, bávto, banti and fodder jowári. The damage was probably greater owing to the concentration of the locust swarms on a comparatively small area of standing crops. In the village of Sinaj, out of a total cropped area of 250 acres of bájri the unripe stalks and ears are still standing in no less than 100 acres; the locusts have removed all that was worth removing.

The same is true of the Western Nalkántha tract; the only matured crop of which the people have been able to save a little perhaps 2 to 4 annas has been bájri.

**Kaira.**

Locusts arrived in the district on the 8th October 1901 and have devastated huge tracts wherever they settled.

The locusts first appeared in the Mehmabad taluka from the Ahmedabad side, staying in the villages where they settled for the whole night, and devouring the promising bájri and bávto crops, which had not been reaped. The estimated yield of several of the crops was therefore lowered and towards this result rats contributed in a much greater degree than locusts. In fact, but for rats Thásra would have had fair crops, and there would have been no talk even of relief measures in Borsad, Anand and Nadiád. The early sown bájri crop varied between three annas in Mátar and nine annas in Anand and Borsad, while bávto, kodra and rice, through the withholding of the later rains, proved total failures, thus making the situation in the Daskosi villages most serious and pressing. Bávto, kodra and even rice would not have suffered much in certain tracts where the early rains were sufficient but for the ravages of rats. Rewards were offered for their destruction (one rupee for 100 tails) and about Rs. 500 were spent in Thásra and there the matter ended. The Thásra people gave it up after a time as hopeless and in most places owing to the teaching of the Swámi Náráyan sect, the people could not be induced even to make a start. The prospects of the rabi crops are also very poor generally. The water in the wells is insufficient to irrigate anything like the normal area, and the rats come in again to increase the woe by grubbing up and devouring any seed sown and young seedlings, and so deterring people from trying. The rats have been so numerous that they have driven the quail away and about Mehmabad, Kapadvanj and Thásra they disturbed one's rest at night. About Kaira, Katakpur and Aklácha (all in Mehmabad) they were very bad in December. Chipdi way (Kapadvanj) they were not nearly so numerous. About Antroli (Kapadvanj) they were bad, but not nearly so bad as at Aklácha. About Chikhlod (Kapadvanj) they were constantly falling into and being drowned in a good drinking water well. The people did not seem to mind, and left them to be devoured by frogs or to be macerated, I had to insist before they would fish out 3 highly putrified ones; at Thásra they were said to be fewer than they were in November; at Sui (Thásra) Mr. Hughes killed 22 one evening without stirring with a stick,

## Panch Maha'ls.

The early maize and jowári crops had promised to be bumper ones throughout the district, and another fall of rain would have made them so. The later kharif crops suffered severely from drought, while rice and rabi crops were both valueless. The damage done by the short rainfall was enormously increased by the plague of rats. Great efforts were made to get rid of these, and many thousands were killed. For a time it seemed as if these efforts were being successful, but the apparent decrease was probably due to the rats leaving the crops temporarily for the wild rice. With the destruction of the latter, of which there was little this year, they returned to the crops, and in many cases ensued scarcity where want would not have otherwise been felt. Every crop, including cotton and oilseed, seems to come alike to them, and it was not possible for the cultivators to cope with their constantly increasing numbers. It is to be hoped that these numbers will lead to their dying from starvation in the hot weather. Locusts scarcely visited the district, but a species of grasshopper did considerable damage.

## Khandesh.

In the talukas of Taloda, Nandurbár, including Navápur Petha, and Pimpalner and in the western portions of Sháháda and Dhulia talukas insufficient and untimely rainfall produced very little or no crop while locusts and rats damaged what little was produced.

## Ahmednagar.

The insects, supposed to be grasshoppers, which have been damaging the bájri crops in Nevása, Shevgaon and Ráhuri, have been difficult to identify. Specimens were sent to the Divisional Forest Officer who pronounced them to be grasshoppers. The Professor of Botany at the Poona College of Science thought that the insects, which I sent to him, were locusts, but recommended me to make a reference to the Government Entomologist, India Museum, Calcutta. This I did. Of the five specimens sent to the Government Entomologist three are pronounced to be grasshoppers (one a new variety), and two to be locusts, viz., *acridium aeruginosum* and *acridium peregrinum*. These specimens were from Nevása. But it is probable that the damage in Shevgaon and Ráhuri is being caused by the same insects. I have now sent specimens from Shevgaon to the Government Entomologist and I will also forward specimens from Ráhuri. The curious thing about these locusts is that they do not behave like locusts. They are only attacking the ears of bájri eating perhaps half the grain in the ear. They do not seem to fly or to settle in swarms or to devour green leaves. And the cultivators have not identified them as locusts. In Nevása the insects have not as yet touched the growing rabi crops. The probability is that the number of locusts is small compared with the number of grasshoppers, but it is also probable that the damage is mostly caused by the locusts. The Mámlatdár of Ráhuri estimates the damage done by these insects at 4 annas in the rupee in fields which the insects are attacking in force. This may be taken as the maximum damage done. It is found that the insects chiefly live in fields abounding in grass and weeds, whilst clean black soil fields are nearly free. I understand that the fields in which serious damage is done are comparatively scattered.

## APPENDIX 18.

(Referred to in Paragraph 20 of the Report.)

Extract from the report of the Collector of Kaira regarding the extent of scarcity of fodder.

The failure of the early fodder throughout the district was complete. There was no grass and there was only an insignificant crop of bájri and jowári stalks. The large number of wells in the district enabled very fair crops of jowári to be raised from December to May and the fortunate owners of the wells were thus enabled to keep their own plough cattle alive. For the great bulk of the people however there was no fodder in the district. The existing stocks had been exhausted before October if not earlier and from that time onward until their cattle died or until they purchased some of the grass imported by Government they had to feed them on the leaves of trees and on such weeds and creepers as could be found in the hedges. The trees of the district have received injuries from which they will not recover for years. Not only were the leaves plucked from them but branches of all sizes were cut off them and hacked off them to facilitate the collection of the foliage. The talukas which suffered most from the want of fodder were Mátar, Mehmádad, Thásra and Kapadvanj.

## APPENDIX 20.

(Referred to in Paragraph 21 of the Report.)

EXTRACTS FROM THE CORRESPONDENCE ON THE SUBJECT OF IMMIGRATION  
INTO BRITISH DISTRICTS FROM NATIVE STATES.*Telegram from the Government of Bombay dated 19th September 1899.*

Commissioner, N.D., reports relief measures in Ahmedabad greatly complicated by influx from adjoining Native States, notably from Jodhpur, Márwár, Baroda, Rádhanpur, Pálanpur, Káthiawár. They beset streets, overwhelm relief works, create serious danger of pestilence. Eight thousand on one relief work from Jodhpur, five thousand from Márwár, with more arriving daily. Commissioner has addressed States concerned. Pálanpur and Káthiawár have arranged to take charge of their subjects. Replies from Baroda, Márwár and Jodhpur not yet received. As matter is serious, this Government will be obliged if India will address Baroda, Márwár, Jodhpur and any other States under India's control urging them to prevent further efflux by taking immediate measures for relief of their subjects.

*Telegram from the Government of India dated 28th September 1899.*

Your telegram 19th. Agent, Governor General, Rájputána, and Resident, Baroda, instructed to communicate directly with Commissioner, Northern Division, informing him what relief works are open in Márwár and Baroda to which emigrants could be advised to go and take whatever steps are possible to direct and control emigration. Please instruct your local officers to make enquiries as suggested in last paragraph, (Famine) Commission's Report, regarding cause of movement; to communicate facts ascertained directly to Political officers concerned, to ascertain directly from the Political officers concerned what relief works existed in the Native States from which emigrants came, and to advise them to go back to these works. Where this is impossible emigrants must be placed on relief in British territory pending further arrangements.

*Extract from a letter dated 24th October 1899 from the Agent to the Governor General, Rájputána, to the Government of India.*

The difficulty is intensified by the absence of water in Márwár, Bikáner and Jesalmir, from which most of the emigrants flow. As the Government of India are aware, it has hitherto been the practice in these States for a large number of persons to migrate with their cattle even in normal years. In unfavourable years the Darbárs, so far from checking emigration, have encouraged it, being thoroughly aware of their inability, arising from slender resources, inadequate machinery and scanty supplies of grain, fodder and water, to support the entire mass of the distressed population. Probably for the first time on record, the emigration expedient has this year altogether failed. Applications have been received from all the districts adjoining Rájputána, to which emigrants from this province usually resort, asking that aliens may be recalled. The several Darbárs in Rájputána have been addressed accordingly, and are engaged in organizing measures to enable them to meet this embarrassing demand. They are arranging for loans, increasing their establishments, and starting relief works where water can be found in sufficient quantity to supply large numbers. In some instances agents have already been sent with money to recall emigrants and to find them employment within the State. Within the next month earthwork will be commenced on railways traversing many of the most affected tracts.

But arrangements of this kind and on an unprecedented scale take time to mature; and it would, in my opinion, be extremely imprudent to insist on the immediate return to their own country of the many thousands of persons who have sought maintenance abroad. Their enforced transfer in large numbers before measures were complete for their reception would be attended by grave danger, and not improbably with serious disturbance and plundering of grain stores both by the way and wherever they found themselves eventually deposited. I am informed that many persons have already been sent back from the Bombay Presidency prematurely.

*Extract from a letter from the Government of India dated 30th October 1899.*

The Government of India agree generally in the views expressed by Mr. Martindale, and I am to express a hope that the Bombay Government will issue instructions accordingly. It is of course very inconvenient to a Local Government to have its relief works and poor-houses crowded by foreign refugees, and this is a very proper ground for complaint and remonstrance; but the Governor in Council will no doubt concur in the principle that emigrants from Native States should not be sent back to their States, until the State authorities are in a position to take over and provide for them. The only thing to be done in such cases is therefore to endeavour to collect the refugees of each State on separate works and to arrange with the Political officers concerned for the removal of the refugees to relief works in their own States.

*Extract from a report of the Commissioner, Northern Division, dated 11th May 1901.*

Immigrants were of two classes: (1) gangs generally of some size who wandered aimlessly about from place to place, living on what they could get by begging and with no intention of working; many of these filled our poor-houses: (2) persons who came to our relief works presumably because there were none or none so convenient in their own territory. The influx of both classes began early in the famine. In September 1899 the city of Ahmedabad was flooded with refugees from Jodhpur, Baroda, Pálanpur and Káthiawár. On the 15th September, an average day, 1,214 arrivals were registered at a single *chauki*. Some went to work, some infested the streets and died in the fields outside. In Virámgám, another wealthy centre, 'are crowds of lusty beggars attracted by private charity,' writes Mr. Mead in February, 'and though evidence is wanting there is no doubt that many came from the neighbouring States of Káthiawár and Pálanpur Agency.' The northern táluks of the same district, being interlaced with villages of the Mahi Kántha, was overrun with wandering immigrants. 'They are simply swarming in Modása,' writes Mr. Reuther in July, who in seven mornings personally collected and took to the poor-house an average of 155 per day. Of 157 in the Modása Hospital nine-tenths were wanderers, and he was 'morally certain that they all belonged to the I'dar State.' In the first week of September 194 out of 300 in the Kapadvanj poor-house (Kara district) were Native State subjects. Similarly at Mátar. In the Panch Maháls, Mr. Ryan wrote that every morning two or three hundred new-comers from Lúnáváda State appeared for dole in the small town of Shera. At last it was found necessary to order all who came back to their territory, for about 2,000 were in and about the town seeking relief. The Collector of Broach reported in September 1899 that large numbers were flocking into his district from Káthiawár as also from Ahmedabad. They showed no inclination to stop or to work, and were in a pitiable condition. The Collector of Surat in the same month reported that over 1,000 refugees from Káthiawár and Márwár 'sleep outside the city at night and come inside to beg by day.' Over 1,000 were reported in the same district to have come into the Válod Mahál from the Vyára Mahál of Baroda territory. Parties were also landing on the Bassein coast in the Thána district, having come by sea from Káthiawár. In June 1900 there were 305 Baroda subjects in the Ahmedabad poor-house, 102 from Rewa Kántha in Broach poor-house, and large numbers were reported from others. On works immigrants were still more in evidence. On the Chandola Tank, one of the first works started near the City of Ahmedabad, 5,000 out of a total of 8,000 were from Jodhpur. In Kaira district at the same period a census on the Bobha Tank disclosed 2,500 Baroda subjects and on the Anklaó Tank 2,300 out of a total of 10,251 workers. Later in the year (July 1900) there were said to be two works in the Petlád Táluks of Baroda Division employing 778 persons and a third on which the number is not stated. In the adjoining British táluks of Borsad the numbers were at that time 55,000. In October the Amod-Pálej Road was taken in hand in Broach district, not because it was a desirable work, but because the need was emergent and there was nothing else ready. It was quickly swamped by people from across the Baroda border, who numbered 4,000 (from 37 villages) out of a total of 9,000, when no more could be taken on and further arrivals of our own people had to be sent elsewhere. 500 sickly people from Rájputla State swelled the mortality on the Sukaltirth work in July. Colonel Ferns, Political Agent of the Mahi Kántha, wrote in December: 'At Ahmednagar (in I'dar State) I was told there were no starving poor. I found the town swarming with emaciated men, women and children. At Hathmati Canal Works (British) I found 879 I'dar subjects.' Such are a few of the facts that came to the Commissioner's personal notice. The course followed with reference to these people was that indicated in paragraph 596 of the Famine Commission Report, 1898. The various Residents and Political Agents were communicated with and also report was made to the Local Government, who in their turn brought the facts to the notice of the Government of India. The Jodhpur immigrants who came in at the beginning of the year were cleared off, and this Division has no reason to complain of Rájputána, Káthiawár or the Pálanpur Agency. Baroda, the I'dar State and some of the Rewa Kántha States have throughout the year imposed an undue share of their burden upon us. It must be remembered that our own subjects, too, wander. People from Ahmedabad were picked up in Thána district; people from Khándesh, &c., in Central India.

*Extract from a letter to the Government of India, No. 3585, dated 26th October 1900.*

When in the month of March 1900 the scale of wages was reduced on the relief works to the north of the Narbada in the Broach district and the labourers on those works were given the option of going to relief works to the south of that river where the Code scale of wages was in force, 2,118 persons, who were all subjects of His Highness the Gáikwár, preferred to be sent back to works in Baroda territory, and were accordingly drafted to Miagam and Valan. In the month of April 1900 the Collector of Khándesh reported that he had had to start a poor-house at Navápur mainly on account of the influx of destitute persons from the neighbouring territory of His Highness the Gáikwár, and stated that apparently no relief was being given in that territory up to the middle of March last. This was pointed out to the Resident at Baroda, who was at the same time requested to ask His Highness the Gáikwár to give adequate relief in that part of his State, and in particular to establish a poor-house in Songad. In reply this Government were informed that the Baroda Darbár had instructed their Subha in the Navsári Division to open immediately a poor-house at Songad, and that steps had also been taken to open relief works in that part of the district.

*Letter from the Collector of Ahmednagar to the Commissioner, C. D., No. 571S,  
dated 30th March 1900.*

I have the honour to submit a report on immigration from the territory of His Highness the Nizám into this district and of the steps taken in respect of it, as promised in paragraph 2 of my No. 3348, dated 2nd instant, and called for in Government memorandum No. 1636, Famine Department, dated 19th idem.

2. On receipt of Government Resolution No. 8165, Revenue Department (Famine), dated 15th November 1899, orders were issued for showing in Forms 15 and 16 the number and cost of persons from foreign territory relieved on work or in kitchen. These orders were to some extent complied with, but not fully.

3. Meanwhile, a circular, dated 8th November 1899, had been issued by the Nizám's Famine Commissioner, forbidding migration across the frontier; a copy of this reached me with your No. R.—5683, dated 13th December 1899. Consequent on this circular, I addressed Sub-divisional Officers in my No. 11768, dated 27th idem, in which I directed that applicants for relief from the Mogláí should be sent (or if too weak to travel, relieved until fit and then sent) to the nearest work in that country; and if the nearest work in that country were not known, then to the nearest village in that country. The intention was to relieve the pressure on our famine relief works, which was very severe; and it probably served the purpose to some extent and for a time. But it could not do so wholly, or for long, the weak points being that no works were known of in the Mogláí and that there was nothing to prevent people sent back to their villages drifting back on to our works.

4. The actual result was that immigrants from the Hyderabad country concealed the names of their villages and represented themselves as British subjects. Owing to this cause, and to the pressure of dealing daily with hundreds of applicants for work, the orders mentioned in paragraph 2 fell almost wholly into neglect, and though I repeated them, both myself and through the Executive Engineer, early in February, I fear they are still not acted up to with any regularity except on a very few works.

5. Meanwhile there was no doubt that very large migration was still going on; and you addressed the Resident, Hyderabad, in your Nos. r.—122 and 474, dated 5th and 27th January 1900. At the same time His Highness' Famine Commissioner (Mr. Dunlop) addressed me direct with an enquiry whether I had still any complaints to make, informing me that he had opened 'a relief work' on the Aurangabad-Toke Road, some two months before, which had attracted no large number of persons; saying he was prepared to take measures to bring back any of his people that I might have on any of my works, and adding that he would be glad if I refused all new-comers from his side. On 8th February 1900 I replied informing him of the orders and their results which have been mentioned in the preceding paragraphs; stating that I had had a rough count kept at Karhe Takli opposite Paithan of immigrants at that point, and found them 120 all emaciated in six days; estimating that, therefore, the famine-stricken were crossing the border at the rate of at least 50 a day\*; and begging for more works to be opened on his side of the border.

\*An exceedingly low estimate.

6. I collected various facts bearing on the point in addition to the rough count on the frontier mentioned in my last paragraph:—

- (1) Shevgaon Mámílatdár—17th February 1900—questioned poor-house inmates who gave Khárvandi (a British village on the frontier) as their home, and found that 50 of them were Nizám's subjects.
- (2) 15th February 1900—Mr. Hudson, Personal Assistant, checked 24 admissions to Nagar poor-house and found 7 of them were Nizám's subjects.
- (3) Shevgaon Mámílatdár reports, in diary of 17th February 1900, having visited two Mogláí villages\* near the frontier; population 1,007 and 571; 700 and 200, respectively, left village and gone to works in Shevgaon táluka; deaths for 3 months, 0, 1, 6 and 0, 1, 5; no blind or cripples to be found; 4 or 5 emaciated; no dole; nor any other relief.
- (4) The Jámkhed Mámílatdár at my direction made a tour in British villages which are enisled in Nizám's country and noted the state of things in the latter's villages. He reported that there was the same distress as in the adjoining British villages and that there was no dole and no other relief. His tour was from February 8th to 22nd.
- (5) Shevgaon Mámílatdár's diary, 24th February 1900—At Gogalgaon met 11 men coming from Mogláí to Shevgaon famine relief work. Village officers of Khárvandi and Kámbi (British villages on the frontier) having been ordered to register immigrants for one week recorded 288 and 270, respectively.
- (6) Same Mámílatdár at Tákli (frontier village—British) found boy of 18 in last stage of emaciation in *chárdí*, who said he came from táluka Jálna and was

going to Shevgaon poor-house. Jálna to Shevgaon is about 80 miles. He also found eight Nizám's subjects on dole in one or two of our frontier villages.

(7) Máládevi Tank in the extreme west of the district reported a few Mogláí immigrants on the work. Sangamner táluka also has a few.

7. These numerous indications decided me to have a regular enquiry on a few selected famine relief works. Accordingly I directed the Nagar Relief Mámílatdár, Ráo Sáheb Palshikar, to hold such an enquiry at Bhátodi Tank, which is right on the frontier and had been placidly returning no Mogláí workers at all on it. Mr. Palshikar made his investigation with much tact and acumen and found that out of 7,000 people on the work 2,400 were immigrants from the Mogláí. (I give round numbers; the detailed lists are with the Mámílatdár.) The Shevgaon táluka Mámílatdár and Relief Mámílatdár at the same time made enquiries on the Shevgaon and Samangaon and other camps. They were not in my judgment so successful as Mr. Palshikar in getting through the deception of immigrants who had no desire to leave; but still 1,658 were found on the Shevgaon famine relief work and 1,550 on Samangaon and two other camps. Táluka Mámílatdárs and Mr. Palshikar have now been told to make similar investigations on all famine relief works in frontier tálukas. No regular enquiry at the Shevgaon poor-house has been reported to me, but in a report of 5th March the District Deputy Collector mentions about 150 Mogláí people having been found there in the preceding week and sent (after relief) to their own country.

8. While this was going on I was in communication with Mr. Dunlop. On 26th February 1900, he sent me copy of an order directing a famine relief work with tools for 5,000 workers to be opened at Ashti, District Bid. Again on 3rd March 1900 he informed me of two works having been opened additional to the two already intimated to me (Aurangabad-Toka Road and Ashti-Jámkhed Road), viz., Gangapur-Lassura Road (somewhere up north opposite Kopargaon táluka) and Paithan Road near Paithan. I addressed the Tálukdár of Bid direct and learnt from him (dated 12th March 1900) that besides the Ashti-Jámkhed Road famine relief works are open on Ravatvadi Ghát Road (between Patoda and Bid) and on the Savtara-Patoda Road (this is north-east of Jámkhed). Lastly, I have been informed that poor-houses are open at Paithan, Ashti and Patoda and have been verbally informed by the Tahsildár of Ashti that famine relief work is also started at Bid and in the Gaorái Táluka of the Bid District on the Bid-Jálna Road.

9. On 25th March 1900 I visited Ashti and found that the work on the Nagar-Jámkhed Road near Ashti had been opened on the 22nd idem. There were some 5,000 people and the officer in charge expected that there would, in a very short time, be 10,000. The arrangements were in a very callow condition. The officer in charge said he was paying the workers cash for the grain equivalents of 20 chataks men, and 15 chataks women; cash allowances for children; no kitchen. If he goes on at these rates and does not exact tasks or enforce discipline, his works will soon attract workers from our works. This is not really to be anticipated however; the lack of supervision and of 'bandobast' will not draw people from our side of the border. The 2,400 mentioned in paragraph 7 had been drafted from Bhátodi and 800 had arrived. I also saw the so-called poor-house at Ashti. The village officers throughout the Tahsil (125 villages) are ordered to send to Ashti all the people that we should put on dole under Section 57; these people are allowed to squat on a site indicated to them for the purpose; they have to attend the kacheri daily to receive the dole in grain; I saw it distributed (by measure) to a good many; and was told that from 27th it would be distributed in the shape of cooked food. The numbers on the register reached 714; but as each of many serial numbers covered several individuals, it was not possible to ascertain the actual numbers being relieved. Plainly this is no poor-house; it is merely collecting all the dole recipients at head-quarters (that is, all who can come; those who cannot must do without) and giving them grain dole, or (hereafter) cooked food, with no provision for hutting or sanitation (somewhat necessary for such large numbers of decrepit and weakly persons). There are no medical arrangements on the famine relief work or in the 'poor-house.' On the 28th I passed by the famine relief work in progress on the section of the Nagar-Jámkhed between Kada and the Nagar border. An overseer in charge; he said he had opened a week ago and had 2,500 on the work; was paying 3 annas men, and in proportion women and children (Hyderabad State currency = 2 annas 3 pies British); there was no bazar, no organization and no tasking or discipline.

10. Regarding the absence of dole in villages, Mr. Dunlop has kindly explained to me that he does not find it possible with the means at his disposal; and that it is in accordance with his orders that people are sent up to táluka head-quarters for gratuitous relief.

11. The distress around Ashti (Mogláí) and Kada (British) is markedly less severe than elsewhere, while in the Godávári Valley, on both sides of the river, British and Mogláí, it is very much more acute than in any other part of this district. I have not seen or received any reports of what the actual state of relief measures is in the Gaorái Táluka of the Bid District or in the Aurangabad District, where the famine is at its worst.

12. From the foregoing concise statement of facts, I have the honour to submit that it is clear that—

(1) from the very beginning of the distress there has been a large and constant migration of famine-stricken people from the Hyderabad country into this district, reaching from as far as 80 miles off on that side to the remotest western limit on this;

- (2) up to the end of February nothing whatever had been done on that side to meet the distress, except the opening of one work which was so managed as to attract no considerable number of persons needing relief ;
- (3) during this period, and up to now, the recording of the exact number of immigrants on our works has not been possible owing partly to the extreme pressure on the works, and partly (and more largely) to the concealment by the immigrants of the fact that they were immigrants ;
- (4) consequently it is not possible to state accurately the number of immigrants relieved or the cost of relieving them ;
- (5) the absence of relief measures on that side caused the majority of the immigrants to be in all stages of emaciation ;
- (6) at present the relief offered in the adjoining districts of His Highness' dominions (so far as information is available here) consists of eight famine relief works and three poor-houses. No gratuitous relief being given in villages ; as contrasted with 36 famine relief works sending separate returns (which include some subsidiary camps), two poor-houses and gratuitous relief in every village on this side ;
- (7) the organization of famine relief on that side, while the best that the Famine Commissioner finds feasible with the means at his disposal is on a very different grade of efficiency from ours ;
- (8) consequently the migration still continues, and is likely to continue, while the same causes will continue to render correct record of numbers and cost unattainable.

13. At present as immigrants are discovered by the enquiries mentioned in paragraph 7 they are drafted under escort to the nearest famine relief work across the frontier. But there is no guarantee against people drifting back from Moglái relief works or poor-houses, or of their being discovered except by perpetually renewed inquiries under paragraph 7 above.

14. It is a question whether our famine relief works should not be opened to immigrants without restriction, *i. e.*, with no intention of drafting them off to Moglái works as soon as it was discovered that they are immigrants. If this were done, the immigrants would have no cause for concealing their real domiciles, and we should be able to record correctly the numbers and cost of relieving subjects of foreign states. The labour and trouble of keeping such record would however not be worth incurring unless it were intended to recover the cost from the State concerned. Such intention there has not been so far, either in the last famine or in this, any indication of Government entertaining, and in the absence of it the record would merely serve statistical purposes. The facts reported above show that for such purposes the record is already irretrievably vitiated ; and therefore it is not worth attempting now ; it adds not a little to the already heavy clerical work of the relief camp. On the whole, now that there are works opened and more being opened in the Moglái, which, it may be hoped, will attract the people in need of relief on that side and check the flow to this, no special steps seem to be necessary. It will suffice to admit foreigners to our works as they come ; to take no special steps about drafting them ; but when in ordinary course drafts are made from a work, foreigners should be drafted to a work in foreign territory and not to one in British territory.

*Letter to the Government of India No. 1440, dated 13th March 1900.*

I am directed to request that you will be so good as to lay the following facts before the Government of India for their consideration and for such action as may be deemed expedient.

2. In the táluka of Bársi in the district of Sholápur, the number of people on relief works some days ago amounted to about 36 per cent. of the population, and the number of new applicants is sometimes more than 2,000 in a day. Within a few days there was an increase of nearly 10,000. The population of the town of Bársi does not appear to be seriously affected by famine and it forms about one-seventh of the population of the táluka. Inquiry at villages did not indicate that an unusually large number of local inhabitants had gone to the works. There can be little doubt that the enormous demand for relief in that táluka is due to an influx of distressed people from the territory of His Highness the Nizám by which it is entirely surrounded. In accordance with the orders contained in the communications from the Government of India noted in the margin, considerable numbers have been sent back, but it is alleged that they have not been kept or do not remain for many days on works in His Highness' territory, and that they on their return as well as others who have become aware of the result of admitting that they belong to that territory falsely state that they come from British villages. Crowds of people are met coming from the direction of Láfár, but they all, though often in a hesitating manner and after correction, claim to be British subjects. It is of course impossible in the circumstances to obtain evidence one way or other, but it is incredible that so many of the inhabitants of the Bársi táluka as are represented by the number of persons employed on relief works can be in need of relief.

Telegram No. 1963, dated 23th September 1899  
(Department of Revenue and Agriculture).  
Letter No. 3194-I.A., dated 30th October 1899  
(Foreign Department).

3. It is believed that works in other parts of the Sholápur district as well as of the Ahmednagar district which adjoin Hyderabad territory are similarly, although not to the same extent, made use of by His Highness' subjects. The number of people relieved on all works in the Sholápur district amounts to about 21 per cent. of the population.

4. The situation is one of extreme gravity. It is quite impossible to have ready an establishment sufficient to cope with such enormous influxes or even tools for their immediate employment and the grant of relief without a condition of work adds to the attraction besides demoralizing the whole body of workers.

5. The only remedy is the provision of sufficient relief by His Highness the Nizám for his own subjects. There is frequently difference of opinion as to the measure of relief which is sufficient, but I am to suggest that the Resident may be instructed to obtain some definite statistics of the number of works open within say 20 miles of the whole frontier, of the number of people employed on them, and of the rates of wages paid. It is impossible in the circumstances described to be satisfied with a general statement that relief is provided, and unless some effective measures are taken to secure the provision of adequate relief for His Highness' subjects in His Highness' territory, it is difficult to over-estimate the seriousness of the result in the Sholápur district, where work suitable for famine labour is becoming rapidly exhausted.

6. In view of the urgency of the case, I am to request that the Resident at Hyderabad may be asked to obtain early information of the nature above indicated and to press on His Highness the need of establishing sufficient relief works in Hyderabad territories.

*Letter from the Collector of Sholápur, No. D.—3031, dated 28th May 1900.*

In compliance with the instructions conveyed in Government memorandum No. 1638, Famine Department, of the 19th March 1900, I have the honor to submit a report on the influx into this district of distressed people from the territory of His Highness the Nizám.

2. The probability of a large immigration of famine-stricken people from Hyderabad was one of the principal subjects which engaged my attention at the beginning of the famine. The situation last October was this. Practically the whole of the north and north-east frontier of Sholápur is conterminous with His Highness' territory, while one táluka, Bársi, is an island in the midst of it. Distress was at least as severe there as here, while the administrative machinery of the State, far less efficient than ours, held out little prospect of prompt and thorough organization of relief. With numerous famine works in progress on one side of the frontier, and very few (if any) open on the other (and those probably mismanaged) it would be natural, at any rate during the first-half of the famine, that distressed people should cross the boundary in large numbers in search of that relief which they could not obtain in their own neighbourhood. My apprehensions were soon realised: the stream of immigration set in as soon as our works were opened and continued in growing volume.

3. The first test work we opened in the frontier tálukas was the Sholápur-Tuljápúr Road. It was started on the 10th October 1899 and it filled in a few days. Report was made to me that a number of people employed on it were undoubtedly from Hyderabad, though it was difficult to discover them, since they usually gave the names of British villages to avoid being turned off. Hotgi tank was opened soon afterwards, also in Sholápur táluka, and the same thing happened there. It will be seen that, from the very commencement, these foreigners realised they were unwelcome guests, and took measures accordingly to conceal their origin. I immediately put myself into communication with Mr. Dunlop, His Highness' Famine Commissioner. His ready and cordial co-operation from that day onwards I wish most gratefully to acknowledge. He immediately sent two officers to remove all Hyderabad subjects from our works and they took away 350 people. In the meantime Mangi tank in Karmála had been opened on the 27th November 1899: it filled with great rapidity, until, within a month, 18,000 people were employed on it—practically its full complement. Of these it was reported to me that about 4,000 were from Hyderabad, though as before it was difficult to identify them as they represented themselves to be British subjects. I visited the work on the 15th December and found it full, with 1,200 fresh applicants waiting for admission. On this I again wrote to Mr. Dunlop and he again caused officers to be sent to remove all Hyderabad subjects that could be discovered. They took away 2,100 people. At the same time Mr. Dunlop informed me that some works had been opened in His Highness' territory near the frontier and requested me to send back to them all subjects of His Highness that might resort to our works in future. But this it was impossible to do with people coming on, as so many did, in an emaciated condition requiring immediate relief.

4. The situation of Bársi táluka showed me from the first that the main stream of immigration would direct itself to that part of the district, and so, when it became necessary to open works there, I took special precautions to prevent them from being immediately swamped. The Páthri Tank was opened on 21st October 1899, and when it reached its full complement of 2,500 which it did in a few days, further admission was refused to all but the emaciated. The Bársi-Tadval Railway extension was opened on 21st December 1899, and here I gave orders

that no able-bodied applicant was to be admitted who could not produce a certificate from his village officers, or the Mámálatdár of the táluka, showing him to be a British subject. This system checked the usual rush from Hyderabad at the commencement of the work, and I believe would have continued to do so to a great extent, but it lasted only a fortnight, being stopped in consequence of the orders contained in Government Resolution No. 11 in the Famine Department, dated 2nd January 1900. The work was then thrown open to all comers. In a few days, when this became generally known, an influx of distressed people from Hyderabad set in and continued for the next two months. The Railway work was soon full, and, no more could be taken on. I had, therefore, to open the Kuslambe-Yermála Road work, and, while that was being got ready, to pay minimum wage for two days to 1,100 applicants for work whose condition was very bad. The number of workers (exclusive of dependants and children), which on 1st January was 14,188, rose by the 15th idem to 20,094. 9,000 were then drafted to works in the south of the district. On the 30th January the number was 13,376; on 15th February it was 17,325; on the 28th February it was 25,040; and on the 10th March it was 26,081. The corresponding figures during the last famine, when there was little distress in Hyderabad, were—January 4,080, February 5,724, March 8,879. On the 28th February, at the height of the rush, the Honourable Mr. Monteath visited Bársi, and I had the advantage of accompanying him. He saw distressed people travelling in an almost continuous stream towards Bársi along the roads leading from the Hyderabad frontier; he questioned a number and found that they invariably represented themselves as British subjects, though in many cases they could only give the names of British villages with hesitation and often under correction. He learnt that during the last 13 days hard on 8,000 workers had been admitted, forming with dependants and children a company of nearly 12,000 people, and that on some days the number of new applicants had been more than 2,000, while many others were wandering about Bársi town, begging. It was impossible in the circumstances to obtain conclusive evidence, but there was small doubt that a large proportion of these people were from Hyderabad.

5. To stop this serious evil Mr. Monteath desired that admission to all local works should be closed, save to emaciated persons in urgent need of immediate relief, and that all able-bodied applicants should be directed to works further south. This was immediately done. Mr. Monteath then took the further steps described in the accompaniments to Government Resolution No. 2278 of the 14th May 1900. As a result the local officials of His Highness the Nizám's Government have removed 1,429 of their people whom they discovered in Bársi town and on our works, have made more strenuous efforts to provide relief on their side of the frontier, and are guarding the roads to prevent immigration into British territory.

6. These measures have proved on the whole successful. I do not believe that more than a small proportion of the Hyderabad people employed on our works or wandering round Bársi town have been discovered and removed. The difficulty of identification is too great. The vast majority prefer to remain where they are, rather than return to their own country. Nor has immigration been entirely stopped: a steady trickle is still coming in across country from the villages, avoiding the high roads. But the main stream has undoubtedly been checked. I have just been over the two principal roads leading from the frontier to Bársi. Save for the usual strings of loaded carts, they are practically deserted—a most striking contrast to the scene they presented in February, when they were everywhere dotted, as far as the eye could reach, with batches of famine-stricken people, bearing their few scanty chattels on their heads and hastening towards Bársi in search of relief. But were our works again thrown open to all comers, those scenes would be repeated even now, and the numbers on the works would go up 20,000 in a fortnight.

7. I beg now to report the result of the special inquiries which I have had made on selected works as directed by Government in their memorandum No. M.—258 of the 22nd April 1900. The works I chose for this purpose were in Karmála the Mángi tank, in Bársi the Railway work and the Páthri tank, in Sholápur the Hotgi tank and Hiraj Ballast-breaking work. I also had enquiry made at the Sholápur and Bársi poor-houses. The Mámálatdárs of the three tálukas have paid several visits to the works and poor-houses and tried their best to find out the truth. They all report great difficulty in identifying Hyderabad people, since the majority will not own to their real villages for fear of being drafted back. So far as can be ascertained, however, the facts are these: at Mángi there are now 454 subjects of the Nizám on the work and in the kitchen, while 2,100 more have been drafted back over the frontier. Since the work was commenced 19,000 people of all sorts have been drafted to other works in the district, and of these 4,000 are estimated to have come from Hyderabad. On the two Bársi works the Mámálatdár was unable to discover any Hyderabad people, and he says that the 975 handed over to the Nizám's officials from these works represent all whom it was possible to detect. As previously stated, besides these, 454 others had been handed over from Bársi town, but there are now 300 more Hyderabad people on dole there, and 200 in the poor-house, while others are coming in every day. On the Hotgi tank the Sholápur Mámálatdár has discovered 528, 350 others having been previously drafted back; on the Hiraj work there are 24, while he is sure that the real number on both works is far greater. In the Sholápur poor-house 104 Hyderabad people have been discovered, and there are probably many more who have escaped detection. To the Ashti Tank work, where I am now encamped, 900 people have recently been drafted from this poor-house; of these 126 belong to the Hyderabad State.

8. I doubt whether it is worth while to keep on deporting these people across the frontier. They merely drift back in the guise of British subjects, having no confidence of

getting relief in their own territory, where the arrangements are similar to those described by Mr. Lamb as existing on the Hyderabad-Ahmednagar frontier. Dole is given at the head-quarter stations only, and both this and the works in progress are said to be very badly managed. The helpless poor who are too feeble to walk simply die, I suppose, where they are, and of those who can move many prefer to apply to our works or wander into our towns and villages in order to get the dole.

9. The condition of things in Bārsi still continues to cause some anxiety. In other tálukas the works are now open to all comers, so that with the approach of the rains the people may be employed as near their homes as possible. This cannot be done in Bārsi, because of the rush which would inevitably follow from the encircling Hyderabad territory. Consequently all new applicants for employment have been hitherto directed to the work at Bārsi Road, 21 miles to the south. Most of them have utterly refused to go and have preferred to hang on, begging round the town. They all say they are British subjects, but, in view of the numbers already on our works in the táluka, many of them must be from Hyderabad. Again, the somewhat indiscriminate and ill-considered charity of the merchants of Bārsi (which it is impossible to stop) has collected a large number of distressed people from all the country round, who do not want work, but clamour for alms only. These people equally represent themselves as British subjects, but in view of our carefully supervised system of dole in every village the greater part of them must be from Hyderabad. On my recent visit to Bārsi, I found five or six thousand destitute people wandering about the town subsisting on charity. Of these 1,200 of the worst cases were on the dole, the rest had been directed to the Bārsi Road work, but had refused to go; besides these there were 1,400 in the poor-house, where the accommodation was really only sufficient for 600. To remedy this evil I adopted the following plan which is now being carried out under the personal supervision of Major Hardy, I.S.C. The poor-house is being rapidly enlarged and as fresh sheds are built the Police arrest a proportionate number of destitute wanderers and take them there. They are then sorted out, and the able-bodied are marched under Police escort to Yedshi, the head-quarters of the Railway extension, 27 miles off, where they are entered on the work. The emaciated are compelled to stay in the poor-house where they are employed on such light work as can be given them. Already over 900 have, in this manner, been drafted to Yedshi and an equal number prevented from wandering about. In a fortnight more I hope that I shall have thus remedied the whole evil to the great benefit of the wanderers themselves and the intense relief of the townspeople, to whom the influx of this horde of beggars was a most intolerable nuisance. By the same device I have almost entirely suppressed mendicancy at Sholápur itself.

10. The foregoing narrative shows that what has happened in Ahmednagar has happened here also. Thus the general statements in Mr. Lamb's paragraph 12 apply textually to this district as well. But I cannot agree with him in the opinion he expresses in his paragraph 14 that all foreigners should be admitted to our works without restriction. I feel certain that the result of that step would be an influx so enormous that we should be quite unable to cope with it. This is what things were coming to in Bārsi last March and I consider that the right way of meeting the difficulty was the course that we actually adopted.

*Statement showing the number of immigrants detected on certain relief works and in some poor-houses in Gujarát.*

*Extracts from Famine Progress Reports of Collectors.***Ahmedabad.***3rd May 1900.*

The number of starving immigrants into Ahmedabad increases; many of these persons are persons who object to go to work or even to remain in poor-houses. Beggars may be seen lying on the road near a poor-house preferring freedom and occasional dole of dry grain from the charitable, to decent food and quarters with confinement. Ambulances are working to pick up persons unable to walk.

*4th July 1900.*

The wandering round Ahmedabad, I regret to say, is not decreasing and the poor-house is fuller than ever. We expected to have to keep only 1,200 for the rains, but considerable difficulty is experienced in getting rid of people. The Baroda authorities sent to take away some of their subjects but after being railed to Dehgám and Talod many of them reappeared again in Ahmedabad, having apparently walked back. The Superintendent says they stated no provision had been made for them in their own territory.

*19th July 1900.*

The number of wanderers in and near Ahmedabad tends to increase and the poor-house at Dhuliákot (Ahmedabad), when I last visited it, contained 3,600 inmates. At your suggestion I have taken steps to open a separate poor-house for deserted children and another poor-house for all classes. This will be started as soon as buildings can be erected. A Náik and eight sepoy of the Erinpura Field Force arrived last Sunday and are employed in supervising the ambulance parties in Ahmedabad. These are now to be managed and paid for by the Municipality; *ekkas* are employed for the removal of the sick to the poor-house. Eight sepoy of the 2nd Grenadiers have been sent to Virangám, Dholka and Dholera on similar work. Whatever is done, till good rains come wanderers will increase and numbers will die. These wanderers come, many of them, from Native States and a large proportion of them (all of those who are inhabitants of this district) are persons who are averse to regular work and wander about begging and getting gradually weaker and weaker. It must be remembered that large numbers of the Kolis and other poorer classes never do hard regular work for long together but make a living by odd jobs, watching crops, mango trees, &c., and pilfering.

*10th September 1900.*

I do not think any cultivators are now left on the works; there are a great many from the city and also from a long distance off (a good many I think from Native States) on Chandola, the Daskroi work, and I am told three-fourths of the numbers on Modása works are Native States subjects.

**Kaira.***31st July 1900.*

Looking to the fact that in the Borsad táluka alone there are over 50,000 people on works it seems most likely that Gáikwádi and perhaps Cambay subjects are coming to our works. I am having inquiry made into this and will in all probability have to ask you to move Government to bring pressure to bear on the Government of His Highness the Gáikwár with a view to some relief works being opened in Baroda territory near Petlád and Sojitra. In this connection it may not be out of place for me to state that a considerable number of people from a large Baroda village near Nadiád presented petitions to me the other day asking for relief of various kinds, none according to their account being afforded them by their own Government.

*22nd September 1900.*

The poor-house population has again slightly increased, but it appears that our numbers are swelled by the admission of a very large proportion of Native State subjects. At the Kapadvanj poor-house I found 194 Native State people out of a total of 300 and at Mátar also there is a considerable number. I have just sent to their homes over 50 residents of Baroda and Káthiáwár, despatching them by rail at the expense of private charity from the Kaira poor-house and on the receipt of complete returns from the other poor-houses, I hope to be able to bring down the population of these institutions very considerably.

**Panch Maháls.***9th May 1900.*

The (Eastern) Maháls are bounded on the east by the States under the Central India Agency and though I believe works have been started there, there is no doubt that a considerable number of people has taken advantage of our works and poor-houses and contributed their quota to the large mortality recorded in this district.

*9th August 1900.*

When at Dohad last week I met the Reverend Mr. Mulligan of Irish Presbyterian Mission, who lives at Jhálod and knows the country about there thoroughly. He told me that he was quite surprised at the number of people who were turning up in their villages after being believed dead and he said he was convinced that a very large proportion of the deaths in Jhálod (and the same will apply to Dohad) has been due to immigrants from the neighbouring Native States. Owing to the fact that so many of the people give false names and addresses, and particularly that people from Native States do so lest they should be sent back, it is impossible to verify this statement at present but I think the coming census will prove Mr. Mulligan to be correct.

### **Broach.**

*31st May 1900.*

Many people of the adjoining districts and States resorted to our relief works, not because the works were popular, but because there were no works in the other districts and States.

*22nd July 1900.*

On some of the works in the district there are a number of foreigners from the Native States. The Baroda Darbár had sent an official of its own to carry the residents of Baroda territory to their villages at my request. The Baroda authorities have asked me to arrange for taking back the Broach residents that are now fed in the Kathor poor-house of the State. I have requested the Resident at Baroda to send them back to Broach. I have written to the authorities of the different Native States to make early arrangement to take back their people. To facilitate the work of handing over the foreigners to the officials sent by the respective States' authorities, I have directed that all foreign subjects employed on our works be sent to the Broach reservoir work.

*8th August 1900.*

But I must here point to the fact that the people of the neighbouring Native States resort greatly to our poor-houses and works. I have frequently called upon the authorities of the States to send State-officers to carry back these people; but up till now the results do not appear to have been satisfactory. The presence and the frequent invasion of these people increase our death-rate. It is not possible to drive these people away from our works and poor-houses. They are sure to wander in the district and get more emaciated. Indeed the rains raise hopes that they may return to their villages.

### **Surat.**

*9th June 1900.*

Mr. Kadri complains of the migration into the Bádoli and Mándvi talukas of famine-stricken persons from Ságbára Wádi, Bánsda and Gáikwári territory. The Bánsda Darbár and the Political Agent concerned are being addressed. There are still many refugees from Káthiawár and Northern Gujarát begging in Surat city, for whose deportation I am making arrangements.

*10th August 1900.*

The Mahálkari (of Válod) complains of the trouble caused at Buhári by famine-stricken wanderers from the adjoining Gáikwári territory who, as often as they are sent back to their villages, return.

### **Kha'ndesh.**

*23rd May 1900.*

A few immigrants are coming in from His Highness the Nizám's territory in the south. When I visited the Mhasáwad-Neri camp I found new-comers being admitted from Moglái villages, and a few rather emaciated cases from there in the kitchen. Such immigrants have also been attracted by the private charity given at Chálisgaon, Jámner and Páchora and will go to swell the population of the poor-houses there.

*8th June 1900.*

In the poor-houses at Jámner, Páchora and Chálisgaon there are about 300 destitute immigrants from Hyderabad territory. The Famine Commissioner, Aurangabad, has been asked whether he can take them over.

*12th July 1900.*

At the Raipur tank and the Mhasawad-Neri Road some 700 to 800 workers from His Highness the Nizám's territories have come on. The Famine Commissioner, Aurangabad, has been asked whether he can take them over on the Ajanta Road.

I visited the Cháligaoon and Páchora poor-houses. At both places some extremely emaciated cases had recently come in from Hyderabad territory. The Famine Commissioner, Aurangabad, informed me that the inmates from Hyderabad would be taken over at three poor-houses over the border. Those who are able to be moved have been and are being sent there. From Jámner over one hundred were sent.

*25th July 1900.*

Some extremely emaciated new-comers have arrived from Hyderabad territory at the camps on the Párola-Erandol Road.

*10th September 1900.*

The Mámlatdár of Ráver reports that there has been an influx of destitutes from Burhánpur probably owing to a contraction of the relief given there. They are being put on the dole as the Támaswádi camp is now closed. The Mámlatdár has been told to maintain the kitchen if it is required for these wanderers. Before this the Deputy Commissioner, Khandwa, was sending by rail to Ráver drafts of Khándeshis to be taken on at Támaswádi. Very few of them stayed. Some belonged to the Berárs and numbers made their way back to Burhánpur again. The Deputy Commissioner has been asked to send only persons belonging to this district.

*25th September 1900.*

There has been a slight increase (in the number of workers) at the Yeoti Camp in Bhusával. The new-comers are not in very good condition, but the large majority are from Hyderabad territory. They are allowed to remain on our works till they get into better condition. I have heard, though not officially, that of the draft of 900 Hyderabadis made from the Ráipur Tank none arrived at Ajanta.

*26th October 1900.*

At Yeoti and at Máheji the condition of some of the applicants for relief has been bad, but it has generally been found that such people have come from the Ghát villages in Hyderabad territory.

#### **Na'sik.**

*12th July 1900.*

A good number of emaciated persons are found in the kitchens (in Peint táluka), but this is due to the influx of wanderers from Dharampur State. I am about to address the Agent to His Excellency the Governor at Surat on the subject.

*27th July 1900.*

In Peint kitchen there are some cases of extreme emaciation said to have come from the Dharampur State.

*13th September 1900.*

The number of inmates in the poor-house (Nándgaon) is increasing owing to wanderers from the Nizám's territory and Khándesh. Wanderers from Dharampur are somewhat on the increase (in Peint táluka).

#### **Ahmednagar.**

*11th January 1900.*

At Shevgaon and Nevása immigration of famine-stricken folk from His Highness the Nizám's territory is reported as continuing and causing trouble.

*2nd March 1900.*

The difference between east and west continues to be very marked; the amount of emaciation being small and death-rate normal in the west and large and abnormal in the east. This is, I am convinced, due to no defect in the district administration, but to the absence of any adequate relief operations across the frontier.

*11th April 1900.*

There are now 40 separate sites of work sending in daily returns under the heading large relief works; and there are two small relief works under civil agency. The average daily numbers have varied somewhat largely :—

Week ending	Workers and Kitchen population.
17th March ... ..	... 223,478
24th " ... ..	... 202,469
31st " ... ..	... 224,263

The heavy fall in the intermediate week is due, I think, to three causes :—

- (1) Holiday-making at the Shimga ;
  - (2) Drafting of immigrants back to Mogláí ;
  - (3) Drafting within the district.
- (1) calls for no comment ; it is only illustrative of the well-known fact that not all famine relief workers are devoid of all resources, and some can manage to do without work for a bit when they feel so disposed.
- (2) did not become possible until we knew what Mogláí immigrants we had on our works and what works in Mogláí to send them to. As separately reported I found out these things. The exact number drafted out I have not at hand, but it is not less than 6,000.

*7th June 1900.*

We have the usual crowd of Mogláí people on the Bodhegaon-Sakli Road which is close to the frontier. And there is no keeping them out of the poor-house. Though carted away to Ashti under escort, not a few turn up again at Nagar before very long.

*24th June 1900.*

The proximity of certain works to the Nizám's border is causing them to be very much crowded with very emaciated and nearly naked people, undoubtedly immigrants. There is no help for these things apparently. Certainly it is not possible to remove the works in question further away from the frontier, for they are roads under construction and must of course be continued until completed.

*19th July 1900.*

Many cases of nearly naked women and quite naked children continue to be noticed on famine relief works, especially near the Nizám's border. There is so little relief given there (and no charitable relief I believe) that when clothes are given they are sold and the recipient goes as nude as before. It is difficult to devise a system for preventing the sale of charitable gifts.

#### **Shola'pur.**

*26th May 1900.*

The physical condition of the people on works and in villages was as a rule good. Their appearance was generally normal. The only place where much emaciation was observed was in Bársi Town, where the charity of the merchants attracted a number of immigrants from Hyderabad territory, many of them in a very bad condition and some almost at their last gasp. These would not go on to works, but preferred to linger about the town begging and getting worse day by day. Measures have been taken to enlarge the poor-house, arrest all beggars and convey them there retain emaciated persons and draft those fit to labour under police escort to works at some distance from the town.

#### **Sa'ta'ra.**

*28th June 1900.*

I have recently arranged with the Political Agent, Southern Marátha Country, for relieving some of the works in this district of the presence of people from the Southern Marátha States.

## APPENDIX 24.

(Referred to in Paragraph 61 of the Report.)

*Standard Tables of task work and piece-work rates for Famine Labour :—Orders directing adoption of—*

PUBLIC WORKS DEPARTMENT.

No. F.—538 OF 1900.

*Bombay Castle, 5th March 1900.*

RESOLUTION.—The disadvantages arising from the want of a satisfactory standard task table for famine labour have lately been brought to the notice of Government. In order, therefore, to secure uniformity of system in the tasking of labour on famine works, the following orders, framed after consulting the Superintending Engineers concerned, are issued for the information and guidance of all officers in charge of relief works.

2. The task work tables given in Appendix III of the present Famine Code should be cancelled, and the accompanying tables substituted for them for general adoption.

3. These should be considered as standard tables of task work and of piece-work rates. It is not intended that Executive Engineers should rigidly adhere to the figures given in all cases but any important deviation from them should have the approval of the Superintending Engineer of the Division (see Famine Code, paragraph 80). Such deviations should generally take the form of a percentage addition to, or deduction from, the figures.

4. The modifications referred to in paragraph 3 may be made for various reasons, such as the following :— expertness or otherwise of the labourers, their physical condition, the state of the weather, &c. The modifications may be made applicable to the whole body of labourers, to selected gangs, or to sub-gangs.

5. The tables are prepared on certain defined principles, and the proportions therefore between the tasks for classes and for various leads and lifts should be maintained. Any proposed modification involving a departure from the standard proportions will require the sanction of Government in the Public Works Department.

6. The special attention of the Superintending and Executive Engineers is drawn to the notes at foot of Table IV, and they should make arrangements for the supply to the metal breakers of small rubble as specified.

## STANDARD TABLES OF TASKS AND PIECE-WORK RATES FOR FAMINE LABOUR.

*General Notes.*

1. The daily tasks are given to the nearest cubic foot, and the rates per 100 cubic feet for piece-work to the nearest pice.

2. The tasks and rates are applicable to reduced leads half way above and below the figures given. Thus, the figures opposite 150 feet apply to all values of the reduced lead between 125 and 175 feet, and those opposite 800 feet for all values between 750 and 850 feet.

3. The proportion of the tasks is taken at the maximum limit laid down in paragraph 76, Famine Code, *viz.*, I Class, II Class, III Class as 3 : 2 : 1 for all work, except metal breaking, where the proportion is as 2½ : 2 : 1.

TABLE I.  
Table of Tasks and Rates for Digging.

Materials.	Task per day in cubic feet.	Piece-work rates per 100 cubic feet, corresponding to the following grain rates expressed in lbs. per rupee.								
		Class I.	12	14	16	18	20	22	24	26
Ordinary Earth ...	120	a. p.	a. p.	a. p.	a. p.	a. p.	a. p.	a. p.	a. p.	a. p.
Soft Muram ...	90	3 0	2 6	2 3	1 9	1 9	1 6	1 6	1 6	1 6
Average Muram ..	60	4 0	3 6	3 0	2 6	2 6	2 3	1 9	1 9	1 9
Hard Muram ...	40	6 0	5 0	4 6	3 9	3 9	3 3	2 9	2 9	2 9
Motal and Gravel (filling) ...	240	9 0	7 6	7 0	5 6	5 6	4 9	4 3	4 3	4 3
		1 6	1 3	1 3	1 0	1 0	0 9	0 9	0 9	0 9

- Notes.—1. The digger's task includes filling into baskets.  
 2. Where pickaxes are not required the operation is practically that of filling only.  
 3. The tasks should be modified according to the material dealt with. The above classes of materials are those most commonly met with; but intermediate classification will often be necessary, and the corresponding task values and rates can be readily interpolated.  
 4. The equation used in calculating the rates for piece-work is—  

$$R = D w_1,$$
 where R = rate in annas per 100 cubic feet.  

$$D = \text{number of diggers for 100 cubic feet} = \frac{100}{\text{task}}$$
  

$$w_1 = \text{daily wage} + \frac{1}{4} \text{ rest day wage, in annas, for I Class labourers.}$$

TABLE II.  
Table of Tasks and Rates for carrying materials of all kinds.

Reduced Leads in feet.	Tasks per day in cubic feet			Piece-work rates per 100 cubic feet, corresponding to the following grain rates expressed in lbs. per rupee.								
	Class I.	Class II.	Class III.	12	14	16	18	20	22	24	26	
50	174	116	58	a. p.	a. p.	a. p.	a. p.	a. p.	a. p.	a. p.	a. p.	
100	110	74	37	2 6	2 3	2 0	1 9	1 6	1 6	1 3	1 3	
150	81	54	27	4 0	3 6	3 0	2 9	2 6	2 0	2 0	2 0	
200	64	42	21	5 6	4 9	4 3	3 9	3 3	3 0	2 9	2 9	
300	45	30	15	7 0	6 0	5 3	4 9	4 3	3 9	3 6	3 6	
400	34	23	11	9 9	8 6	7 6	6 6	6 0	5 6	5 0	5 0	
500	28	19	9	12 9	11 0	9 9	8 6	7 9	7 0	6 9	6 6	
600	24	16	8	15 6	13 3	11 9	10 6	9 3	8 6	7 9	7 9	
700	20	14	7	18 6	16 0	14 0	12 3	11 0	10 3	9 3	9 3	
800	18	12	6	21 0	18 3	15 0	14 3	12 9	11 6	10 9	10 6	
900	16	11	5	24 6	21 3	18 6	16 6	14 9	13 6	12 6	12 3	
1,000	14	10	5	26 9	23 3	20 3	18 0	16 0	14 9	13 6	13 3	
				29 0	25 0	22 0	19 0	17 0	16 0	14 0	14 0	

- Notes.—1. Higham's formula has been used in calculating the tasks, viz,  $T = D(36 + H + 12V)$   
 where D = task per day in cubic feet.  
 " H = horizontal lead in feet  
 " V = vertical lift in feet  
 $T = 15,000$  for I Class, 10,000 for II Class, and 5,000 for III Class.  
 2. The "Reduced Lead" =  $H + 12V$ , when V is 3 feet or over  
 =  $H + 36$ , when V is 3 feet or under.  
 3. The equation used in calculating the rates for piece-work is  

$$R = C(\frac{1}{4}w_2 + \frac{3}{4}w_3)$$
 where R = rate in annas per 100 cubic feet  
 " C = number of carriers of the II Class required for 100 cubic feet  
 $w_2, w_3$  = daily wage +  $\frac{1}{4}$  rest day wage of II and III Class labourers, respectively, in annas.

TABLE III.  
Table of Tasks for Digging and Carrying, combined.

900	13	9	4	13	8	4	12	8	4	11	7	4
1,000	13	9	4	13	8	4	12	8	4	11	7	4

- Notes.—1. The above tasks are calculated by adding together the number of units (III Class) required to excavate (from Table I) and carry (from Table II) 100 cubic feet of material, and dividing the figure thus obtained into 100.
2. The piece-work rates per 100 cubic feet for combined digging and carrying can be found by adding the rates of Table I to those of Table II.
3. To find the tasks for the various classes of labourers in any gang, and the requisite numbers of diggers and carriers: calculate the full quantity of work to be done by the gang from Table III; divide the result by the task shown in Table I; the quotient will give the number of diggers required. The remainder of the gang will be employed in carrying, the tasks for which are given in Table II.

TABLE IV.  
Table of Tasks and Rates for Breaking Metal.

Tasks in cubic feet.			Piece-work rates per 100 cubic feet, corresponding to the following grain rates expressed in lbs. per rupee.							
Class I.	Class II.	Class III.	12	14	16	18	20	22	24	26
			a. p.	a. p.	a. p.	a. p.	a. p.	a. p.	a. p.	a. p.
8	6	3	48 0	41 3	36 0	32 3	29 9	26 3	24 0	22 0

Note.—The tasks and rates given are for metal to be broken from "average trap" stone, prepared as rubble of a convenient size for reduction by the light hammers in use. They should be modified, therefore, for work done with material differing from that above specified.

TABLE V.  
Table of Tasks for Filling, Carrying and Stacking Metal, combined.

Reduced Leads in feet.	Tasks per day in cubic feet.		
	Class I.	Class II.	Class III.
50	101	67	34
100	76	51	25
150	61	40	20

800	17	11	6
900	14	9	5
1,000	14	9	5

Note.—This is a combination of the tasks given in Table I (filling) and Table II (carrying). See notes at foot of Table III.

## APPENDIX 25.

(Referred to in Paragraph 63 of the Report.)

## EFFECT OF THE PENAL WAGE ON RELIEF WORKERS.

*Government Resolution, Famine Department, No. 2180, dated 5th May 1900.*

These reports do not afford sufficient grounds for a definite conclusion as to the effect of the reduction of the minimum wage in excluding from the works persons not really in need of relief, the ascertainment of which was the main object Government had in view. It can scarcely be doubted that the measure has had some result in this direction, but in Sholapur only have the local officers formed a decided opinion on the point, and the figures as given in a tabular statement do not seem to support it. If the estimate of the District Medical Officer in Khândesh, which however is not accepted by the Collector, is at all approximate to the truth, there is an enormous number of people on the works in that district who prefer the penal wage without substantial work to a higher wage on condition of honest work. Two reasons are indicated—first, that some have some other resources, second, that beef is at present so cheap that such as eat it find the penal wage sufficient for their absolute wants. The figures given for Sholapur indicate that after the introduction of the penal wage fining has been almost universal, but it is not shown how many have been fined to the full extent. On the Sangogi Tank in Bijapur apparently few able-bodied persons earned more than the reduced minimum, but the organization of the work is scarcely complete yet. The introduction of even that minimum in the Sâtara district is said to have attracted so many that it was abandoned and the system of entire payment by results resumed. These facts indicate that in these districts as in Khândesh there are circumstances which to some extent frustrate the effect of the penal wage which was intended. On the other hand the proportion of workers in Ahmednagar who are fined to the full extent is very moderate; and in Ahmedabad there is said to have been no occasion to apply the penalty at all. For other districts no definite information on this point is given.

2. All the officers who have reported regarding works on which the penal wage has been given are agreed that there has been no deterioration in physical condition, although a different opinion seems to have been expressed by some subordinate officers. There can be no question therefore as to the expediency of continuing it. Even if through causes such as are above mentioned with regard to Khândesh it has not the effect of eliminating all who could do without aid from the State, it at any rate tends to economy, which is very desirable so long as it is not attended with evil results. But the greatest care must be taken that such as work honestly are not subjected to the penalty. The remarks of the Collector and District Medical Officer of Khândesh that the increase of the task will result in an increase of those getting only the penal wage raise a doubt whether proper attention is paid to the repeated instructions on this point. The metal breaking task referred to seems to be an exceedingly moderate one, and it is remarkable that in Ahmednagar, where it is understood to be the same, metal breaking is preferred to earth-work, and the condition of the people on metal breaking works in Sholapur is said to be better than that of those employed on earth-work. But much depends on the nature of the stone and on the manner in which it is broken up before being supplied to those employed with small hammers as well as on the capacity and experience of the workers, and all these circumstances should be taken into account before it is held that workers are contumaciously idle.

3. The Governor in Council concurs in the view of most of the officers who have expressed an opinion on the point that it is not desirable to carry the reduction further. Such a measure might be applied without injurious effects to such as have other resources or eat flesh, and might have the result of inducing some of them who are not in absolute want of assistance to leave the works and of stimulating others to work, but for other classes the present penal wage is probably as low as is safe. It is to be remembered that individuals who persist in contumacious idleness may be fined down to the value of the work done by them. The Collector of Sâtara should be informed that his instructions to dispense altogether with a minimum are approved only on the condition that he satisfies himself that the establishment, European and Native, is competent to detect promptly either on the works or in the villages any persons who are suffering from insufficiency of relief. There is a strong presumption that those who remained on the works without earning a living wage were not contumaciously idle.

4. Further reports should be submitted as to the effect of the reduction by the end of the current month. It is especially necessary to show the proportion of the workers to whom the penal wage is paid and if possible to contrast it with the proportion of those to whom the minimum was paid before the reduction. There should be no difficulty in obtaining this information, but it may be given for selected works which can be regarded as fair specimens of those in various tracts. \* \* \* \*

Government Resolution, Famine Department, No. 3321, dated 14th September 1900.

The delay which has occurred in obtaining these reports has to a large extent frustrated the object of calling for them. It is to be hoped that the time when most relief works can be closed is now not far distant, and if there had been reason to believe that the application of the penal wage had evil effects incompensurate with any advantages gained, it should have been discontinued as soon as possible.

2. Fortunately it is clear that there has been in very few cases any physical deterioration as a result of the reduction of the minimum, and that in these cases the result has been due to the improper application of the penal wage, while the defects have been remedied before any serious effect was produced. In all cases in which it has appeared that excessive fining was not entirely due to the idleness of the workers, and that the establishment could not be relied on to apply the penal wage properly, fining below the Code minimum has, it is understood, been discontinued.

3. The opinions as to the general effect of the penal wage are very various, and on the whole the reports do not afford grounds for more definite conclusions than are recorded in Government Resolution No. 2180, dated 5th May 1900. There are cases in which people who were not in need of relief have been induced to leave the works, but there continue to be large numbers of people who remain in good condition without attempting to earn more than the penal wage, and who must be presumed to have other resources. There is, however, abundant evidence that the reduction of the minimum has had a very material effect in checking idleness and thus preventing extensive demoralization.

---

#### APPENDIX 26.

(Referred to in Paragraph 65 of the Report.)

*Instructions regarding selection of the most suitable works for employment of famine labourers after the commencement of the rainy season.*

Government Resolution, Famine Department, No. 2128, dated 30th April 1900.

The Commissioners of Divisions should be requested to take into very early consideration in consultation with the Superintending Engineers the question of selecting the most suitable works for employment of famine labourers after the rains commence. Their attention is invited to Government Resolution No. 1179-FAM.,\* dated 14th May 1897, the general instructions contained in which were, in the opinion of His Excellency the Governor in Council, on the whole shown by experience to be appropriate. There are, however, some conditions peculiar to this famine of which account must be taken.

2. In the districts which are severely affected the number of people in need of relief is so large that practically all the works available are being used to their fullest capacity. It is improbable that there will be before the sufficiency of the early rains is beyond doubt such a reduction in the number that it will be possible to close many works. Further while the number of cultivators employed in the last famine was not, it is believed, on the whole very large, the great bulk of the workers in most of the districts must now belong to that class.

3. It has always been recognized that it is not desirable to keep cultivators at a great distance from their homes on the approach of the monsoon. It would however be altogether impracticable to provide on small or village works for such large numbers of people as are now employed or even as were in the last famine employed in some districts. All that is possible is to permit cultivators to be employed on the works nearest their homes and this course should be followed as far as it conveniently can be from the beginning of June. The works in almost all the districts are now so numerous that under this arrangement cultivators should experience no difficulty in taking all necessary steps for the resumption of agricultural operations before they finally leave the works, while in the other districts it is probable that comparatively few of the workers are cultivators. At that time also the condition of compulsory residence should cease to be applied, and it is hoped that the hutting available will suffice for those who are not within easy reach of their homes or unable to obtain accommodation in villages near the works.

4. It may be expected that if the early rains are favourable almost all cultivators and most agricultural labourers will leave the works by the middle of July in Gujarát and Khándesh, and many will probably leave the works in the Deccan which are within kharif tracts

---

\* Printed as an accompaniment to this Appendix.

about the same time. It is feared that in the Eastern Deccan there will be no great reduction in numbers until the sowing of rabi crops has begun. In anticipation of the decrease the works most suitable for employment of people during the rains should be selected and those who remain in need of relief should be concentrated on them.

5. As regards the class of works most suitable for this purpose the views expressed in Government Resolution No. 1179-FAM., dated 14th May 1897, were found to be generally correct. Work on the large irrigation tanks was carried on without difficulty throughout the rainy season, the camps being established on high dry ground, with shelter from the prevailing wind where possible, in the vicinity. Such works are not however available in Gujara't and Kha'ndesh and there is no alternative to the selection of the largest of the works which are in progress in these places. Where however embankments have been thrown up for roads, famine labour should as far as possible be employed in the rains for the consolidation of the surface, without which the roads instead of being improved will have been rendered impassable for a considerable time.

6. When the number of works is largely reduced, there will probably remain ample material for huts on the works kept open. Although most of the huts used in the rains of 1897 were found fairly water-tight, it is feared that considerable sickness resulted from damp and exposure. Efforts should be made to have as water-tight material as possible used. Instructions on this point are being issued in the Public Works Department.

7. When there is reason to believe that the people left on any works are of the class of professional labourers and there is no considerable proportion of them in a weak state, a system of pure payment by results with a limit of earnings sufficient only for the subsistence of the workers and their dependants should be introduced, the weak only being dealt with under the Code rules. As soon as the number on any work is so small that all can conveniently be employed on another work which it is necessary to keep in progress, the former should be closed and the people drafted to the latter. In the course of this process of concentration works which there is a prospect of completing should be kept open longest.

8. While these measures are being taken, village inspection should be carried on with, if possible, more vigilance than ever, and there should be such an expansion of village relief as the circumstances require. When cultivators, including agricultural labourers, find employment in the fields, they may nevertheless be unable to support their dependants, and these will in that case be fit recipients of the village dole unless they are within easy reach of a kitchen and can be induced to go to it. It is also very necessary to see that those engaged in cultivation are by advances for subsistence or otherwise, if they need assistance, prevented from falling into bad physical condition.

9. The foregoing instructions apply only to relief in the open country. Small works have been opened where they seemed to be needed to provide relief to members of aboriginal tribes who would not go far from home. From the nature of the case hutting is not needed at them. These small works should be carried on as long as they can be while the need for aid lasts, but it will not be possible to keep open those amongst the hills in heavy rain. It will then be necessary to rely on the other measures recommended by the Famine Commissioners for the relief of aboriginal tribes or such of them as are found practicable.

10. The Commissioners should be requested to bring to notice any difficulty experienced in carrying out these orders and to report in due course the precise arrangements made by them.

Government Resolution, Revenue Department (Famine), No. 1179-FAM.,  
dated 14th May 1897.

The Commissioner, C. D., and Commissioner, S. D., are requested to consider in consultation with the Superintending Engineers which of the works in the several districts affected by famine will be most suitable for relief after the rainy season has commenced. It is understood that some kinds of earth-work can be carried on most advantageously after a moderate fall of rain, but they are not available in sufficient quantities. As selection should be made of the works which it is desirable to keep open for the longest periods, and it will probably be necessary to provide at them more substantial shelter than has sufficed in the fair season both for the workers and the establishments. On this account the metal breaking works and road repairs which involve the moving of the workers from place to place at comparatively short intervals will not be very suitable, but it is feared that in some places no others are available.

2. It may be expected that in the kharif tracts the great majority of cultivators and agricultural labourers will leave as soon as the rainy season commences. In the rabi tracts they may not leave so soon, but in them also the preparation of the land for sowing will require a large amount of labour. As the numbers become reduced, works should be closed and the remaining workers should be drafted to the most suitable works. This process will be particularly necessary after the rabi sowing season commences, for then all reason for keeping the workers in the vicinity of their homes will have ceased. No works should be kept open after the number has been reduced to a point when establishment cannot be fully employed.

3. It is probable that a proportion of the people will need relief until at any rate the kharif harvest is assured and prices have greatly fallen. As already directed it should be considered whether it is desirable to introduce the modified piece-work system when the people remaining in need of relief are the landless classes accustomed to labour on public works. If, however, that system is introduced, great care should be taken to fix such a scale of payment as will provide merely for subsistence and will not compete with the wages obtainable in private employment.

#### APPENDIX 27.

(Referred to in Paragraph 70 of the Report.)

##### *Regulations for village works in Broach district.*

One sub-overseer for two groups representing 20 villages and 4 works.

To select work, prepare sketch and estimate of each work, calculate the tasks, mark out the work (enough for at least a week) setting out separate tasks for gangs. Visit each work once a week and check, measure up the work done giving result of the measurements to the "Panch" and copy to Mámlatdár, reporting cases where he finds anything wrong or the tasks not being properly done. Should make his check measurements in presence of the "Panch" or a certain number of its members and point out and explain any mistakes he finds and their remedy.

The "Panch" (a village council) to generally superintend and be responsible for the people doing a fair day's work, also to see that "gangs," either large or small as may best suit, be formed with certain reliable heads who will be entered in the rolls as representing the gang and who under the Panch will see that the tasks are fairly divided amongst the gang and the amounts earned in like manner fairly divided. The Panch will receive from the sub-overseer the sketch and estimate of work to be done with the tasks to be allotted and the amount to be paid for each task and will with the sub-overseer see check measurements taken and take such steps as may be necessary to stop abuse or swindling under his advice.

The Panch will have under its control one or two kárkúns, as the case may be, whose duty it will be to enter in the form which will be supplied to him the name of heads of gangs with their number, and daily muster these gangs and measure up the amount of work executed of the task set and enter such measurements in the proper column of the form supplied for the purpose and calculate the amounts earned by the different gangs for each day, making a total at the end of the week, showing the amount due to each gang with its proportion for men, women and children, based on the rates supplied to him by the sub-overseer and Panch. The Panch or a certain member of it will sign these rolls at the end of the week, and on such rolls the cashier will make payment.

The cashier will work directly under the orders of the Mámlatdár and will visit each work in his group once a week on fixed days and make payments on the rolls the Panch produce, taking these rolls with him as vouchers and at once submitting them with his accounts to the Mámlatdár. The cashier should also show the sub-overseer the rolls he is paying or has paid, so that the sub-overseer can point out to him anything radically wrong in them or on the other hand certify to their general correctness.

Tasks set will be lenient and will enable a fair sustenance wage to be earned by completing  $\frac{3}{4}$  of the full task, but on the other hand there will be no minimum payment, and when under  $\frac{1}{2}$  the task is done no payment will be made for that day though the amount of work done may be counted into next day's measurement, in other words where under 33 per cent. of task is done no entry will be made in the rolls for that gang on the day in question. A fixed rate of payment will be fixed for each group and this will not be subject to alteration, except under the written order of the Mámlatdár who will advise the Executive Engineer when there be any large alteration in price of grain justifying an alteration in rates of payment, and on which a new scale will be supplied to the sub-overseer and Mámlatdár for use in the group affected. The basis of the proposed scheme of relief is more or less "Local Self Government", the village Panch with the assistance of Government advisers and responsible cashiers being entrusted with the task of seeing that the money given by Government for relief be expended in the best manner possible in providing relief to those requiring it, who on the other hand should be made to do an easy day's work in effecting local village improvements in return for the money given them.

The scheme further is intended only for application to distressed and run down people who cannot go to any great distance from their homes without overtaxing their strength or neglecting such home work as they still may have. People in good condition and able to leave their villages, who simply are in want of employment and are prepared to do a normal task of work for fair payment, will have to go to the larger works which may be opened as necessity arises, but no one should be refused work except by order of the Mámlatdár or superior officer.

Note.—The figures in ordinary type show the expenditure from the commencement of famine in 1899 to end of November 1900; those in italics show the expenditure from the commencement of famine in 1900 to end of November 1901; those in bold type show the expenditure from the commencement of famine in 1901 to end of November 1902. The figures of famine expenditure given in this statement are inclusive of liabilities and no account is taken of the amount of the famine fund.

## APPENDIX 31.

(Referred to in Paragraph 79 of the Report.)

*Notes by the Chief Engineer and Secretary to Government in the Public Works Department on the utility of the works carried out by famine labour in the Bombay Presidency.*

1899-1900.

I find it very difficult to say anything definite on the subject as so much depends on the meaning given to the word 'useful.' In the statement (Appendix 30) the expenditure in each district has been classified under three heads "Works of permanent utility," "Works of temporary utility" and "Works of doubtful utility." For the whole Presidency the total expenditure in the Public Works Department, exclusive of Establishment and Tools and Plant and Gratuitous Relief, was Rs. 2,55,38,274, which has been classified as follows:—

	Famine expenditure. Rs.	Value at normal rates. Rs.
Works of permanent utility ...	1,11,50,613	47,62,696
Works of temporary utility ...	1,36,90,893	51,27,165
Works of doubtful utility ...	6,96,768	4,10,168
Total ...	<u>2,55,38,274</u>	<u>1,03,00,029</u>

2. Attached to the statement are detailed lists of all the works (Appendix 29) included under the three heads.

3. It is all of course a matter of opinion and I will simply state the principles on which the statements have been prepared.

4. As works of permanent utility we have included with a few exceptions all irrigation tanks. I think it is admitted that though such tanks in the Bombay Presidency do not return a revenue nearly equivalent to the interest on the capital sunk in their construction they are of undoubted benefit to the lands under their command. It goes without saying that until these tanks are completed there will be no return either in revenue or indirect benefit from the expenditure incurred, but still the figures of normal cost represent so much solid work done towards attaining the object aimed at. With the projects which have been submitted for most of these tanks we have received figures which show that when completed they will at the least pay their working expenses; many of them will yield considerably in excess of this and possibly further investigation will show that the calculations were too sanguine in some cases. At present I have no data to enable me to differentiate between them. A special officer is now engaged on the inquiry. We have also included under this head such works as railway embankments, drainage channels and improving certain irrigation tanks in Gujara't. Also the making of new and improvement of old roads where such improvement did not consist mainly in providing a supply of metal. The railway embankments will all eventually be taken over at normal cost by the Company concerned, the drainage channels included are of undoubted permanent utility; the enlarging of the irrigation tanks will not result in any great increase in revenue but the existing cultivation will be rendered more certain; as regards the roads it must be admitted that the utility of the expenditure will depend, in a great measure, on whether it will be possible to maintain them in the future, but as I have said in regard to the large tanks there is so much solid work done.

5. Under works of temporary utility we have included all metal collection works. There again it is a question of definition. The metal when spread will wear away and will have to be renewed hereafter. From this point of view the expenditure must be looked upon as of purely temporary utility but it might be, indeed has been, held by some that having so large stocks of metal available will result in a reduction in road maintenance charges for many years; and so should be looked upon as of permanent utility. I cannot see that this view is correct and class all metal collecting works under the second head. In some cases it is possible that money will not be available for spreading and consolidation for many years and in such the expenditure should be considered as of doubtful utility. At present, however, I have no information nor has any one, which would enable us to further classify the works. Under this head has been included, also, most of the expenditure incurred in Gujara't on deepening and improving village tanks. A large number of tanks has been enlarged and deepened and these works will for many years be of advantage to the villages concerned. But I do not see where the funds for keeping them in repairs are to come from, and in course of time they will silt up. I therefore class the works as of temporary utility only. In the Deccan districts certain works called 'Improvements to roads' have been classed as of temporary utility. In these cases the work done was mainly collecting metal and no real improvement to the roads was effected. There may have been some mistakes made in that classification but the general result will not be altered by them.

6. The greater part of the expenditure which has been classified as of 'doubtful utility' was in the Surat and Broach District, the Broach Reservoir being responsible for Rs. 4,55,269.

This work was started at a time when people were clamouring for relief and no other work was available for them. I am afraid that instead of being classed as 'doubtful' it should be considered 'useless.' Certain road improvement works in Broach are classed under this head because it has been reported that there is very little chance of their ever being completed. The expenditure on the Ráipur Tank has been classed as of doubtful utility, because it was largely incurred on hutting and such incidental matters in preparation for the large number of people who would have had to be provided for had the rains failed in Khándesh, which happily they did not.

7. It will be possible, from the detailed statements attached (Appendices 29 and 30), to modify the figures giving the general results as was done in regard to the expenditure during the Famine of 1896-97 in paragraph 397 of the Famine Commission report, if such a course seems desirable, but as I have said above, it is all a matter of opinion and having given the figures and the general principles on which the statements have been prepared I leave it to others to criticise them.

### 1900--1902.

I need add scarcely anything to my note on the expenditure up to November 1900.

2. In some few cases, nine in all, the classification differs from that given to the same works in the former statements (Appendices 29 and 30). On two tanks, the Dedki and Oad in the Ahmedabad District, the work done previous to November 1900 was considered to have been of the nature of improvement and was, therefore, classed as of permanent utility.

The work done afterwards, however, was simple deepening which has been classed, for the reasons given in paragraph 5 of my former note, as of temporary utility.

3. The classification of two road works in the Kaira and Panch Maháls District, one in the Broach District and four in Ahmednagar has been changed from temporary to permanent utility. It has been decided to complete some of these roads from ordinary funds and it is probable the others will be taken up before very long.

4. The whole expenditure in the Public Works Department from December 1900 to end of October 1902, exclusive of Establishment and Tools and Plant and Gratuitous Relief, was Rs. 84,68,053, which has been classified as follows :—

	Famine expenditure.	Value at normal rates.
	Rs.	Rs.
Works of permanent utility ... ..	58,84,184	31,39,419
Works of temporary utility ... ..	25,11,925	19,81,619
Works of doubtful utility ... ..	71,944	82,489
Total ... ..	84,68,053	52,03,527

5. For the whole famine, that is from its commencement in 1899 to end of October 1902, the expenditure in the Public Works Department, excluding Establishment and Tools and Plant and Gratuitous Relief, was Rs. 3,40,06,327, which I classify as follows after making some corrections referred to in paragraph 3 *ante* :—

	Famine expenditure.	Value at normal rates.
	Rs.	Rs.
Works of permanent utility ... ..	1,78,50,117	80,99,517
Works of temporary utility ... ..	1,53,87,498	69,11,382
Works of doubtful utility ... ..	7,68,712	4,92,657
Total ... ..	3,40,06,327	1,55,03,556

These figures will, of course, require some modification when the final accounts are made up.

6. One feature which a comparison of the statements for the two periods of the famine brings prominently to notice is the much more favourable results obtained in the Northern and Central Divisions in the second as regards the normal value of the work done. In the Southern Division the percentage, which was a high one in the first period, remained practically the same. I attribute the more favourable result in the other two Divisions to three causes: One, which mainly had effect in the Central Division, was the greatly reduced proportion which metal breaking bore to the whole work done. Another was, doubtless, improved management as every one concerned gained experience. While a third must have been that the people in the second period had got accustomed to unusual forms of work and also realised that it was better to endeavour to do a proper task and receive full wages than to sit idle and be content with the minimum.

## APPENDIX 32.

(Referred to in Paragraph 90 of the Report.)

*Report by Mr. W. Santo Crimp, M.Inst.C.E., dated January 1900.*

I have the honour to report that upon the receipt of your letter of the 19th December 1899, I at once began to study the geology of the Presidency of Bombay for the purposes of this report.

2. The general map of India has been of great assistance, as the principal geological formations are shown thereon with sufficient accuracy for my purpose, whilst the 'Articles on the geology of portions of the Bombay Presidency' have been of use also.

3. I may preface my remarks by stating the general conditions necessary for the establishment of artesian wells. In the first place there must be a large catchment area of porous rocks such as chalk or oolite or some of the sandstones which will permit of a portion of the rain falling upon them being absorbed in its pores.

4. In the second place the porous formation must extend underneath a plain, some part of which must be of clay, so that the water is confined in the porous strata.

5. When these conditions exist water may be obtained by boring through the impervious clays to the water bearing formations below, the water thus liberated overflowing the surface if the hydrostatic pressure is sufficient; if not the water will rise in the boring to the balance level.

6. An example of the conditions mentioned may be found in the Thames Valley. The chalk hills of Surrey are connected with those of Hertfordshire to the north of London, the plain occupied by a great part of the metropolis being filled in with tertiary beds, the London clay portion of which prevents the water in the chalk from escaping until wells are sunk.

7. As my firm have made a large number of wells in this and other formations, we are familiar with the subject, and can say that so far as London is concerned, the water level is gradually being lowered, and wells that formerly overflowed continuously no longer do so; I mention this, because even in the case of the great chalk formation, which is nearly 700 feet in thickness, the volume of water available is by no means unlimited.

8. With regard to the Bombay Presidency, I may at once say that the great area south of the Nerbada river is devoid of all the essentials of an artesian supply. The area is mainly composed of the trap rocks of the Deccan, rocks which do not absorb water. It is hopeless to expect to find water by boring anywhere in this large area.

9. The geology of the area lying between the Nerbada and the Indus is more diversified in character, consisting of great tracts of loess, or blown sand and loam, underlaid by old beds of alluvium deposited by great rivers in remote times.

10. The plains are bounded on the east by the Salambar range of hills and mountains which are of primary rocks, such as granite, sienite, hornblend, gneiss and mica slate; none of these are porous or water bearing. There is a fringe along the edge of the volcanic rocks, known as the Bagh group, but this fringe, even if porous, is much too small in extent to afford much water. There is, moreover, no evidence to show that it extends westwards to any distance under the alluvial plains.

11. To the westward, in the peninsula of Káthiawár, there is a mountain range of granites, gneiss, &c., as in the case of Salambar range, but these are not water bearing formations. If they were and both ranges extended in an unbroken sheet under the alluvial plains, we should have one of the essentials for artesian wells.

12. I regret to say that nowhere in the Presidency have I been able to discover any formations that afford a remote hope that artesian wells would be successful.

13. I made particular inquiries at Surat and at Baroda with respect to water-supplies, and I found that at Surat the wells are in the bed of the river Tápti, from which the water is pumped. There is nothing of an artesian character about this supply.

14. I was informed at Baroda that there was an artesian well in the bed of the river Máhi and I inspected it. This well is a tube well, sunk in the bed of the river, and it overflows constantly, but it is artesian only because it is in the river bed. The general experience in this district is that when wells are sunk to a depth of about 70 feet, the water bearing stratum is reached, when the water rises to within 20 to 30 feet from the surface. Pumping or other means for obtaining the water must therefore be resorted to.

15. As artesian wells in this part of India are not likely to be successful, it would be unwise in the extreme to raise hopes at a time of dire distress like the present, unless there was at least a probability of their being realised. Attention would be diverted from the more immediately pressing work of deepening the existing wells and of sinking fresh ones. I was informed at Baroda that unlined wells were being sunk at a cost of only one rupee per foot of depth, and although comparatively small amounts of water are obtainable, some good is done in growing fodder crops for the purpose of keeping alive breeding cattle.

16. In conclusion, I think surveys of the great rivers discharging into the sea around Káthiawár should be made in order to ascertain whether it would not be practicable to form great reserves of water for meeting emergencies like the present one. It is possible that as in the case of the Nile, the Nerbada or the Máhi or some of the rivers flowing from the granite mountains of Gujarát would afford water for irrigation purposes in times of drought, thus preventing some at least of the miseries now experienced, but obviously such undertakings cannot meet the existing wants, which indeed appear to be beyond mitigation by human means.

## APPENDIX 33.

(Referred to in Paragraph 106 of the Report.)

*Government Resolution No. 2680, dated the 30th June 1900.*

Memorandum from the Commissioner, N. D., No. 7206, dated 25th June 1900 :—

“The Commissioner, N. D., presents compliments, and with reference to paragraph 1 of Government Resolution No. 2587 of 19th instant, has the honour to submit for the approval of Government copies of the following Circular orders issued by him :—

\* \* \* \*

No. 7125, dated 23rd instant, regarding the expansion and regulation of the village dole.

No. 7192, dated 25th instant, containing detailed instructions regarding the relief of people until and after the rains come down heavily and for encouraging and affording facilities for cultivation.”

Memorandum from the Commissioner, N. D., No. 7260, dated 26th June 1900—Submitting in continuation of his memorandum No. 7206, dated 25th idem, copies of two more Circulars Nos. 7190 and 7191, dated 25th idem.

RESOLUTION.—The instructions issued by the Commissioner are approved, but he should be asked to make it clearer that kitchens are not intended solely for people in the villages in which they are established. In Circular No. 7192, dated 25th June, paragraph 10, it is stated that a kitchen for a circle of three or four villages may be possible in the Panch Mahals, and the same is likely to be the case in other tracts, although not perhaps in black-soil country owing to the difficulty of travelling in it in the rains. It is said in paragraph 2 of that Circular that it is agreed that persons from other villages should not be compelled to come to a kitchen, but in the Central Provinces it has been ordered that children within two miles of a kitchen should rarely be put on the dole lists and the same course may be followed in tracts of Gujarát other than the black-soil country and extended to people entitled to gratuitous relief who are able to walk. The correct principle is stated in paragraph 2 of Circular No. 7191 not to include in a kitchen list any one living inconveniently far off.

*Accompaniments to the above.*

## CIRCULAR.

No. 7125, dated 23rd June 1900.

His Excellency the Viceroy has wired his wish that the present emergency should be “boldly and generously handled.”

2. In the spirit of this message the following instructions are issued.
3. It is presumed that since the dispersion of the people by cholera all persons found in danger of starvation, whether able-bodied or not, have been put on the dole list.
4. All who are too weak to work and all others who have some good excuse for remaining in the village, such as to take care of cattle or to begin cultivating the land, should be kept on the dole list. Destitute cultivators will in due time receive a separate allowance for subsistence, but meanwhile may be kept on dole if they are doing any *bonâ fide* work.
5. If a person is strong and able-bodied and remains idling in the village without doing any work, the first-inspecting officer who comes (from Circle Inspector upwards) should warn him that he cannot be kept on the dole list for ever. He should make the note “warned” on his name in the dole list. If he is still not gone to work at the next visit of an inspecting officer, he should be taken off the list and pressed to go to work. At subsequent visits all persons so taken off should be specially enquired after and replaced for a few days more on the list if in danger of starvation. In short every dole list should be scrutinized by all inspecting officers with reference to (1) those who ought to be on it and who are not, (2) those who are on it but ought not to be, and (3) those who were on it and have been removed.
6. Inspecting officers should be on their special guard against men who, being deprived of dole, continue in the village and eke out a living from the allowance made to their dependants.
7. The above also applies to kitchen lists in places where there are village kitchens.

## CIRCULAR.

No. 7192, dated 25th June 1900.

In the Central Provinces cooked food is given in kitchens in every village to all comers whether able-bodied or not, and this is to be continued during the rains. The scheme has been accepted by the Government of India on the assumption that in the circumstances of the Central Provinces it is the one sure way of preventing much mortality.

2. The Commissioner thinks all the Collectors will agree with him that kitchens on such a very extensive scale are out of the question in Gujarát; but the above fact shows the spirit with which the Government of India expects the crisis to be met. Eliminating people with means of their own, the majority of the population will have to be fed—

## I. Until the rains come down heavily—

- (1) By employment on the regular works and on "small" works more of which should even now be opened wherever possible and likely to be useful.
- (2) By dole for all those remaining in the villages, *vide* this office Circular No. 7125 of 23rd instant.
- (3) By poor-houses. Can any more poor-houses be started with advantage? They may be used as kitchens afterwards. The rule for admission into these places must not be too strict. Persons *beginning* to run down may be admitted and treated as directed in the Circular above noted for dole. There is too much of a feeling among subordinates that an overfull poor-house means bad management.

## II. When the rain comes down heavily—

- (1) By monthly allowance from the Charitable Fund for three months. On reconsideration the Commissioner thinks this should be made a little more attractive than the dole, say Rs. 5 per month for two adults. It will be dependent on the recipients cultivating *bond fide* land either of their own as holder or tenant or on the share system. If the *táluka* has been divided into circles it will not be difficult for the officer in charge to ascertain from the headmen of each village by the end of the first month if the condition has been fulfilled. It is presumed that the amount of rupees (*vide* margin) already allotted from the Charitable Fund to (*vide* margin) is being all or nearly all applied to the provision of subsistence and also of seed. The

	Rs.
Ahmedabad ... ..	2,65,000
Kaira ... ..	2,28,000
Panch Maháls ... ..	1,24,000
Broach ... ..	1,29,500
Surat ... ..	20,000
Thána ... ..	5,250

Collector will kindly furnish information as to this.

- (2) By *takávi* for subsistence. May be lent on the same condition to such cultivators (presumably of a better class) as have not received free gift from the Fund. It is hoped also that larger land-holders may be induced to extend their cultivation by the loan of *takávi* to be spent as wages.
- (3) By employment on such works as can be kept open.
- (4) All the rest will have to be kept (1) on dole or (2) fed in village kitchens. The Commissioner will be obliged if the Collector will consider at an early date in what villages kitchens can be started. There are difficulties in the way, but the Government of India evidently approves of kitchens and there need be little delay in changing the dole machinery into kitchen machinery. One of their advantages is that they make it possible to put pressure on the loafer. A good Superintendent or a sensible "Panch" will see that each woman and child eats her or its own ration and does not carry it away to be gobbled up by a sturdy man of the family lying at home. Efforts should be made to start a kitchen wherever possible and the Commissioner requests the favour of a brief report of what has been and can be done. It is not clear why there should not be one at every village of size, but it is agreed that persons from *other* villages should not be compelled to come to it. Where there is no kitchen there should be dole in full force and where there is no dole there should be a kitchen. Care must be taken to prevent them from becoming call-houses for vagrants. If started in only a few centres people will flock to them from far and near. To prevent this no one should be entered in the list but residents within a specified area. The lists should be scrutinized in the same way as dole lists.

3. It should be impressed on all responsible for village inspection that every one except those who have means of their own must be included in one or other of the above classes.

4. Special note should be taken of the dependants of persons who are in receipt of a free grant of cash from the Fund or of *takávi* for subsistence. It is not intended that these grants should be enough to keep the non-working members of a family as well. They are to get dole at the sanctioned rates or rations from the kitchen.

5. Too often it will happen that the *rayat* having got money (either free gift or *takávi*) for seed and for subsistence will say "How am I to cultivate without bullocks?" It will be impossible to supply all with bullocks not so much for want of money as for want of bullocks.

But it is hoped the Collector will suggest and adopt any expedient for increasing the number that occurs to him. If Mr. Molison's hand-implements are rejected, it will still be possible to work with the ordinary kodáli and pávra. This should be urged on the people. They should be told that help has been given them on condition that they do *something*. If all officers keep pressing them it is likely they will comply and that the question of resuming or stopping the grants will not practically arise. It is undesirable that it should.

6. Cultivators should be clearly informed that any crops which they may grow by hand-implements or by kodáli will not be attached for assessment. They will be allowed to remove it on condition that it is for their own eating, not to sell.

7. It is a question how and where payments of free gifts and takávi for subsistence and seed should be made. The Commissioner has already expressed his personal opinion that they should be made in each Circle by the best man the Collector can command in the presence of the village patel and taláti, and that they should be made in two instalments at least. In black-soil tracts it may be necessary to give the whole in one sum. There will be great danger, in handling so many small sums of money, of speculation. Any easy check that can be devised against this will be desirable. It is suggested that each recipient should be given at the time of payment a chit clearly stating under each head the amount he has received. A percentage of these chits should be afterwards tested by questioning the recipient and comparing them with the books.

8. The class of persons who will not through pride go to work nor receive dole requires special looking to. The better sort will get takávi, but of the poorest a separate list should be kept (if there are any in a village) and cash dole should be offered to them on nominal *loan*. This may soothe their pride.

9. In some villages there are small things to be done such as levelling ground, removing prickly-pear, mending roads, &c. The Circle Inspectors should report these and get them done through the patel in the rains, if employment is needed.

10. In the Panch Maháls are many villages where there are no Baniás' shops. The best plan is believed to be to pay dole in cash and leave people to get their own grain. For the country is no more inaccessible than it is on the coast and the roads are clear even in the rains. The Collector is requested to be good enough to once more carefully reconsider this matter and say if anything more can be done to ensure provision of food to all the villagers. A kitchen for a circle of three or four villages may be possible in places and, if so, should certainly be tried.

---

#### CIRCULAR.

No. 7190, dated 25th June 1900.

It has been stated to the Commissioner by a high placed officer that there is some confusion still existing in the minds of some district officers as to the respective limits of village dole, Charitable Fund and takávi for subsistence. It is difficult to understand how this can be, but, as it is most desirable that there should be uniformity in the main lines of action in the Division, the Collectors are requested to be good enough to see that the principles followed are as stated below.

2. All but a fraction of the grants from the Central Relief Fund should be spent in grants for seed and maintenance to the poorest class of cultivators. These should be selected by the takávi officer mainly by the test already laid down (*viz.*, having resorted to relief works) and should be awarded seed and one month's allowance to begin with on the condition that they cultivate as much land as they can by whatever means they can.

3. Probably the grants up to date will not be enough to cover all on this list, but more money comes in from time to time and is distributed at once among the Collectors.

4. It must be distinctly understood by officers and people that the Central Fund grants are not sufficient and are not intended to provide for dependants. They are for the maintenance of the adult working members of the family. *Dependants are to be put on the village dole or kitchen list.*

5. Next must be taken up those poor cultivators who may receive takávi for seed, subsistence and bullocks. This too is to be given on condition of the recipient cultivating as much land as he can by what means he can. This too does not provide for dependants who are to be put on the dole or kitchen list: In order to spread the help as wide as possible, advances should not be made for the purchase of more than one bullock per cultivator.

6. Lastly will come takávi to the better class of cultivators.

7. A practical difficulty may arise through the want of finality in the Central Relief Fund grants. Two lákhs came in to-day and it may be hoped more will come. Each awarding officer will perhaps keep a margin in his list of poorest cultivators which can be filled up from subsequent grants. If, when the Charitable Fund failed, he gave takávi to all the rest, it may still be possible to change the takávi into free gift for the most deserving. Great care will have, however, to be taken in such cases to prevent confusion of accounts and fraud. The Commissioner can only promise to send on any further grants at once when received.

---

## CIRCULAR.

No. 7191, dated 25th June 1900.

The objections to village kitchens are mainly against making people from other villages go to them or else are such as apply equally to village dole on a liberal scale.

2. It is not proposed to include in a kitchen list any one living inconveniently far off.

3. The immediate management should be in the hands of the most reliable local persons, generally by preference a Panch of not too many members, including the patel and one or two leading men. The Mámlatdár and other officers can do a good deal to interest such men in the work by explaining to them all that Government is doing and how it is their duty to help. "If Government gives the food, won't you look after your own villagers?" is an appeal which will meet with a response, if urged in the right way.

4. The taláti should keep the accounts and in short the machinery should be that already in work for the daily dole.

5. When cooking pots cannot be otherwise obtained, the Panch should be persuaded to lend or get others in village to lend them, at any rate to begin with. A couple of large pots are all that are required. Here again a little tact and vigour on the part of talúka officers will do wonders.

6. The same rules to apply to the kitchen list as to the dole list. Wanderers from other villages to be fed for the day and sent back to their own villages. If their numbers increase or if foreigners come, special report to be made.

7. Steps should be taken to let the people know how much ration they are entitled to. If they once know, they will protect themselves. The Circle Inspector or other officer should take an early opportunity of getting the ration weighed and cooked in his own presence so that the people may know by eye how much to expect.

*Government Resolution No. 2745, dated 6th July 1900.*

Circular letter from the Commissioner, N. D., to the Collectors of his Division, No. 7333, dated 27th June 1900:—

"With reference to my Circular No. 7125 of 23rd instant and other recent Circulars, I have the honour to remark that of the large number of destitute people whom we shall have to support in some way when the rains fall it is far better that most should be employed on the land rather than on comparatively useless and troublesome relief works. That in short is the object of recent orders to make sure against wandering and starvation when the rain comes and to get the people back on the land.

"2. It has been suggested that a large cultivator may employ labourers to till his land and get them paid at the expense of Government by putting them on the dole. That will not however be possible if the inspecting officers understand the orders. A man who works for another certainly has 'means of subsistence' in the shape of a claim on his employer to whom he should be referred.

"3. It has also been suggested that the list of persons who will not receive help from feelings of pride and who are allowed to take it on nominal loan should be strictly limited. I quite agree as to this. Even Pátidárs who give themselves such airs should not I think be humoured. The people contemplated were Girássia Bhayats, Mussalmáns of good family and the like.

"4. As to the general situation I need not remind you that it is quite novel in Gujarát and no one can say beforehand how it will develop. It is probable—indeed it is to be hoped—that the first heavy fall of rain will cause a general dispersal from the works of persons who have no means of living. In the villages there is already a large population of men, women and children already worn down by a year of famine and ill-fitted to stand the strain of a change of season and of hard field work. I feel confident that the first step as indicated in my Circulars is in accord both with the policy of Government and with ordinary prudence, viz., to make sure against a further deterioration in the condition of the people and further mortality. At the same time I am very strongly of opinion that an uncertain situation like the present is not to be governed by hard and fast rule. We must keep our hands upon the facts as they develop and feel our way changing the course of the ship as the weather may indicate. To make this possible the Collectors must have well organised inspection throughout their villages. *Vide* this office No. 7261 of 26th instant. This is the foundation stone of success.

"5. I cannot but hope that in most parts the people will respond themselves to the call to cultivate. If it be insistently pressed on them that Government will only give continued help to the able-bodied who do some work to increase the coming

crop they will admit the reasonableness of it. The patels and other village leaders will also bring influence to bear in the same direction if the inspecting officer will only take the trouble to enlist their aid. But if this is found to be over-sanguine, if the instructions of Circular No. 7125 result in excessive abuse (*some* abuse there must be) and in an unmanageable number of idle paupers, the formality of 'warning' may be dispensed with and the idle at once removed, though a careful eye should be kept upon them as desired in the Circular.

"6. In conclusion I need scarcely ask you to favour me at short intervals with information as to how things are going and suggestions."

Memorandum from the Commissioner, N. D., No. 7334, dated 27th June 1900 :—

"Submitted to Government for approval."

RESOLUTION.—The instructions issued by the Commissioner, N. D., are approved.

## APPENDIX 42.

(Referred to in Paragraph 140 of the Report.)

Government Circular No. 9704, dated 2nd December 1896.

I am directed to request that you will now submit with the least possible delay a statement of the extent to which in your opinion it will be necessary, if at all, to suspend the collection of the land revenue in each táluka of your district. You have already in Government Circular No. 9292, dated 21st November 1896, been asked to furnish a report as to the areas sown and the estimated outturn. The information collected on this matter will give a general indication of the suspensions which will probably be needed. I am however to point out that if occupants have the means of paying the assessment it is not to their own interest that the levy of it should be postponed. It is to be remembered that if they have been able to sell any produce even of previous years, they have probably received a very high price for it and may be in a better position even than in ordinary years to pay what is due in money. In districts in which there has been only a partial failure of crops many are likely to have some surplus even of this year's produce, which will fetch a high price, and in some cases fodder which is available for sale will probably realize more than enough to pay the assessment. But the principle\* that as far as possible nobody should be forced to borrow in order to pay the assessment should be carefully borne in mind, and estimates of the suspensions needed should be framed on that basis. In any case in which for special reasons the levy of assessment due from a land-owner who does not cultivate himself is postponed, it should only be on the condition that the levy of rent due to him from tenants is also postponed and the condition should be strictly enforced.

\*Laid down by the Famine Commission.

2. In connection with this question it will be desirable to ascertain how far, if at all, small occupants and tenants are already in such distress that they resort to the relief works and how far substantial land-holders have ceased to employ the labourers who ordinarily work for them. Careful inquiries should be made on this point from the labourers employed on the works or otherwise.

3. As soon as the information on the points above noted is ready for any táluka, it should be forwarded without waiting for that for other tálukas. The estimates should be corrected and observations on them made by the Assistant Collector or Deputy Collector, Collector and Commissioner, with the aid of such independent information as they may be in possession of. The effect of the recent rain will, of course, be carefully taken into account.

By Government Resolution No. 98-Famine, dated 9th January 1897, the following instructions issued by the Collector of Poona were approved and it was directed that the course proposed for Poona should be adopted in all the affected districts and also in Thána, Kolába and Ratnágiri :—

“ Notices of demand should issue only to—

- (a) all non-agriculturist occupants,
- (b) all non-agriculturists directly interested as mortgagees or otherwise in land,
- (c) all agriculturists whom the Mámlatdár knows to be either well-to-do (irrespective of outturn of the crop) or occupants, who are not well-to-do, of fields which have yielded a crop of four annas or over, and
- (d) all agriculturist mortgagees and others interested directly in lands in the occupancy of class (c).

“ Notices should not issue to agriculturist occupants or agriculturists interested in land who are not well-to-do and have had less than a four-anna crop.”

#### APPENDIX 43.

(Referred to in Paragraph 140 of the Report.)

*Extract from Government Resolution No. 1965, dated 7th April 1900.*

To prevent possibility of mistake His Excellency the Governor in Council repeats, and he wishes it to be clearly understood, that no coercion should be used to recover from an occupant assessment which he cannot pay out of resources other than those needed for the efficient resumption of agricultural operations. The benefit of any reasonable doubt should be given to the occupant, more especially in the Deccan, where the recurrence of severe famine after an interval of but two not very favourable seasons must have exhausted the savings of many cultivating occupants. At the same time Government see no reason to modify the instruction contained in paragraph 1 of Government Resolution No. 236, dated 16th January 1900, that if a man who sublets land or lends money asks for a postponement of levy ample proof will be required of the absence of other resources than the means of gaining a livelihood by cultivation before it is held that he is entitled to have payment suspended. Even in such cases postponement is not prohibited if such proof is forthcoming, and the condition on which the levy of assessment due from a land-owner who does not cultivate himself may be suspended has been stated in Government Resolution No. 9704, dated 2nd December 1896. But if a person has hitherto been receiving rents and interest on loans, there is a strong presumption that he can without difficulty pay his assessment and the burden of proving the contrary lies on him. The orders which have been issued relate only to the suspension of the levy of assessment. In 1896-97 Government followed the course recommended by the Famine Commission of 1878 that as a rule in the first instance postponement should be allowed where needed and the question of remission decided subsequently according to the nature of future seasons and other circumstances and the same course will be followed now. But the same principle will be applied in deciding the question of remission as that of suspension. And if in any case it is clear that there is no chance of an occupant being able for several years to come to pay what is due without borrowing, a remission may be granted at once. In existing circumstances it may be expedient to adopt that course somewhat freely in the Deccan where it will save thrifty cultivators from being completely disheartened by an accumulation of misfortunes. It is presumed that in all cases in which the issue of notices is followed by a decision that the levy of the assessment should be suspended the notice fees are remitted. If orders to that effect have not already been issued by the Collectors they should now be given.

*Extract from Government Resolution No. 2671, dated 30th June 1900.*

In accordance with Government Resolution No. 236, dated 16th January 1900, notices should be issued only to those who are *prima facie* able to pay, and others should at once be regarded as unable to pay their assessment within the year and may of course be so informed. If there is reason to suppose that the Mámlatdárs have issued notices to people who are not *prima facie* able to pay without being thereby forced to borrow, there is no objection to the revision of the lists by the Collectors under the orders of the Commissioner. It has been directed that the benefit of any reasonable doubt should be given to the occupant. But if any one is presumed to have means to pay other than what are needed for efficient cultivation and maintenance, it must of course rest with him to show that he has not, if he wishes collection to be suspended. If the Commissioner is satisfied that an occupant will not for several years to come have such means, he is authorized by paragraph 5 of Government Resolution No. 1965, dated 7th April 1900, to grant a remission at once.

## APPENDIX 44.

(Referred to in Paragraph 140 of the Report.)

*Government Resolution No. 3265, dated 5th September 1900.*

As the revenue year 1899-1900 has now closed His Excellency the Governor in Council considers it desirable to issue the following further instructions with regard to the collection of land revenue pertaining to that or previous years and at the same time to call attention to certain provisions of the law which there may be some risk of being misconstrued.

2. If, as is hoped, the harvests of the current year are good, it will be legitimate and no doubt in many cases expedient to adopt the precautionary measures authorized in Sections 140 and 141 of the Land Revenue Code. The revenue of the current year is properly a first charge on the crop, and the lien should be enforced where the crop is good and leaves after discharge of the Government dues a balance sufficient for the maintenance until another harvest of the cultivator and those dependent on him. But it is important to bear in mind that this lien is only to the extent of the current year's revenue and the utmost care must be taken to avoid any action likely to lead to the mortgage of the crops on account of arrears of revenue of past years. When the crops are reaped, it will be a question for consideration whether the outturn is or is not such as will enable the occupant without borrowing to pay also part or the whole of what is due for the previous year.

3. In any case in which land has not been cultivated owing to the occupant's want of means the responsibility for the assessment in consequence of notice of relinquishment not having been given before the date prescribed in Section 74 of the Land Revenue Code should not be enforced. In almost all such cases it will be in accordance with the principles which have been laid down to remit the arrears of previous years. But care should be taken to confine the benefit of these concessions to persons who being in actual occupation directly under Government have not the means of cultivation. Superior holders, whether registered as occupants or not, who are not impoverished but who for reasons other than inability to provide the cost of cultivation have allowed land to remain fallow are not entitled to it.

4. In the recovery of arrears the orders already issued should be very strictly carried out. There should be no further delay in rigorously enforcing the provisions of the law against defaulters about whose possession of means to pay there is no doubt. For the present others should be in no way pressed. The instruction that no order of distraint, which of course should be held applicable to forfeiture of land, shall be issued by an officer below the grade of Assistant or Deputy Collector must be adhered to pending further orders without any modification whatever, and Government will notice with severe displeasure any departure from it which comes to their knowledge. The Collectors should make all subordinate officers clearly understand that the adoption by them of any measures which are not authorized by the law or orders will meet with punishment.

5. When however the condition of the crops is definitely known, it should be considered whether the outturn is such as to admit of the payment of a part or whole of the arrears as well as of the current year's revenue without unduly curtailing the cultivators' means of subsistence. Such occupants as get good crops on a considerable area of land may be able to discharge all their dues without difficulty. In other cases in which the occupants are not clearly well-to-do it may be desirable to recover a part only of the arrears and leave the balance for levy in future years. In cases in which owing to the small size of the holding or the poverty of the crop the outturn is not such as will leave any balance after discharging the year's assessment and supplying the means of subsistence until another harvest, the arrears may be at once remitted.

6. His Excellency the Governor in Council recognizes that considerable trouble will be involved in carrying out these orders, but it is impossible otherwise to combine the recovery of such revenue as in the interests of the State ought to be levied with such relief as may be fairly accorded to impoverished cultivators, and he confidently relies on the officers of Government to spare no pains to secure that object. Timely steps should be taken to obtain such detailed information as is necessary for the purpose, the Circle Inspectors being required to complete their inspections and write up their books without any avoidable delay. As regards the kharif crops Village Form No. 3, Part I, should be filled up by village officers before the end of September. The Circle Inspectors should conduct their inspections and checks of the forms not merely after the completion of the form by the village officers but during its compilation in order that its progress and the genuineness of the field inspections by the village officers may be assured. A second inspection of the rabi-sown areas should be made by the village officers in November, and should be subjected to similar check by the Circle Inspectors. The check should be principally directed to the correct registration of the areas left unsown. Returns of such areas should be compiled number by number for each village and submitted to the Collector under the certificate of the Circle Inspector that he has personally inspected the village and believes the return to be correct. The work of the Circle Inspectors must be diligently supervised and checked by the Mámlatdárs and Assistant and Deputy Collectors as well as by the District Inspector and Superintendent of Land Records and Agriculture. As soon as possible after the prospects of the rabi harvest are known there should be submitted to Government estimates of the amounts likely to be collected on account of the revenue of the year and on account of arrears, also of the amount of arrears which should be held over for recovery in future years and of the amount which should be remitted at once.

## APPENDIX 47.

(Referred to in Paragraph 144 of the Report.)

*Government Resolution, Revenue Department, No. 8932, dated 23rd December 1901.*

The following general orders are issued for the guidance of Collectors and other officers concerned.

2. It should be clearly intimated to taluka authorities as well as to all village officers that in each and every case before making any distraint an express order must be obtained from the Mamlatdar, Mahalkari or other officer, duly empowered under Section 154 of the Land Revenue Code, and that any violation of this rule by the village officers will meet with severe punishment. When asking for orders in such cases the village officers should state the amount of arrears due, the approximate outturn of the defaulter's crop, the extent of his general means and the reasons for supposing him to be contumacious. In proposing the attachment of cattle the area of the holding and the number of cattle that will remain should be noted.

3. It is of extreme importance that the record of coercive process of every kind should be complete and trustworthy, and the Governor in Council is pleased therefore to direct that a separate register should be kept in every village of all distraints made by the village officers with a note of the orders authorizing the same. An abstract of the entries in this register should be forwarded annually to the taluka to form the basis of Jamabandi Form No. 9. The village register of coercive processes and the taluka returns should be most carefully examined by Assistant and Deputy Collectors and compared with the files of the various cases with the object of securing that all cases of distraint are brought on record and no distraints are made without full legal authority. The Commissioner, N. D., should be requested to prepare, in consultation with the other Commissioners, and submit to Government a form of the register to be kept under these orders.

4. The Governor in Council is also pleased to direct that the attachment of such articles as cots, children's cradles, household utensils, grinding-stones and the like should not be permitted in future except with the sanction of the Sub-divisional Officer, which should be given only when a special reason, such as the removal of more valuable property, is shown.

## APPENDIX 48.

(Referred to in Paragraph 148 of the Report.)

*Summary of a report by Mr. R. C. Wroughton, Conservator of Forests, on Famine Fodder Operations undertaken during 1899-1900.*

Famine Fodder Operations were initiated under Government Resolution No. 6372, dated 9th September 1899, in the Revenue Department, which also sanctioned my proposals for collection, baling and the supply of grass to famine-stricken areas. Under the same Government Resolution I was deputed as Special Officer to undertake and control the Famine Grass Operations in the Bombay Presidency.

The work was divided into five Famine Grass Divisions, one Divisional Officer being placed in charge of each division. Besides this the undermentioned staff was deputed to assist.

	Extra Assistant.	Range Forest Officer.
G. I. P. R., South Section ...	...	2
Do. North Section ...	2	2
B. B. & C. I. Railway ...	2	3
Navapur ...	2	2
Southern Circle...	1	3

For the efficient working of Famine Fodder Operations, only such hands of the permanent Forest establishment were entertained as were found necessary to carry on the work at each depôt and office. Temporary men were also entertained in this connexion.

The cost of establishment debited to Famine Fodder was as under :—

Section.	Number of depôts.	Cost.		
		Rs.	a.	p.
Direction ...	...	1,543	5	9
G. I. P., South Section ...	17	2,839	9	4

B. B. & C. I. Railway ...	25	1,829	9	6
Navapur ...	12	2,226	9	3
Southern Circle ...	10	.....		
Total ...	76	11,428	0	3

At first it was contemplated to work local forest and to supply grass to Gujarát from the Northern Circle and to Cavalry from the Southern Circle; this programme was sanctioned by Government.

Demand for large supplies in the Deccan districts developed later on, and consequently local grass was reserved for the Deccan (for the most part) under telegraphic orders of Government.

Further arrangements for the purchase of fodder from the Forest Department, Central Provinces and Mr. Abbott of Jhánsi were made especially for Gujarát.

Fodder was obtained and supplied from three sources as under :—

Forests.	Quantity.	Supplied to
<i>(1) Local Forests.</i>		
	Lbs.	
B. B. & C. I. Railway ...	7,134,762	Gujarát.

<i>(3) Mr. Abbott</i>		
	2,869 19 26	Gujarát.
Total ...	36,953 17 36	

*Supply from Local Forests.*

Southern Circle was originally established to furnish 100 lákhs, but later on Mr. Murray reported that 50 lákhs only could be obtained, and even that with difficulty. The Commissariat Department having asked for 30 lákhs for the use of the 1st Cavalry, that amount was so allotted by Government Memorandum No. 273-Fam., dated 22nd October 1899, and the quantity actually furnished was 37 lákhs; the balance, 20 lákhs, was absorbed by Sátára.

G. I. P. Railway North and South Sections were estimated to produce 70 and 30 lákhs, respectively, but thanks to the exertions of the Section Officers, Messrs. Edie and Fagan, they produced 110 and 72 lákhs, respectively. It is not likely the South Section will ever produce a better outturn, but the grass is of excellent quality. The North Section, as will be seen from Mr. Edie's report, could furnish double, but one-seventh only of that produced this time could be counted on as good; any amount above this would necessarily be very coarse.

The B. B. and C. I. Section was estimated to produce 60 lákhs, but this was reckoning on occupied lands. The Native States of Káthiawár sent agents everywhere, and the result was that this grass was found to be unobtainable at reasonable prices, and the operations had to be pushed backwards, giving longer leads to the Railway. Thanks to Mr. Fisher's energetic action, however, the estimated amount was collected, and all of good to fair quality. Fourteen lákhs of green and dry grass were furnished from this section by direct arrangement between the Commissioner, N. D., and the Conservator of Forests, N. C. This was done to tide over the interval before the dry grass of the regular operations was ready for export.

The area in Khándesh, which on the last occasion furnished a very large amount of grass, was found to have none available for export. Fortunately the construction of the Tápti Valley Railway made the grass of the Navápur Petha available, and Mr. Pearson succeeded in collecting and exporting over 100 lákhs, of which 50 were sent to Khándesh and the balance to Gujarát.

• Collection of grass was as under :—

Section.	Number of depôts.	Opened on	Closed on	Weight paid for	Price paid.	Per 1,000 lbs.	Re- marks.
				Lbs.	Rs. a. p.	Rs. a. p.	
G. I. P., South Section ... ..	17	23 10 99	16 4 00	7,217,909	21,121 7 3	2 14 9	Estimate, Rs. 3 per 1,000 lbs.
Do. North Section ... ..	12	13 10 99	13 1 00	8,550,188	22,853 9 3	2 1 1	
B. B. & C. I. ... ..	25	15 10 99	...	7,384,695	27,819 10 9	3 12 3	
Navápur ... ..	12	26 10 99	13 1 00	12,158,907	15,953 5 9	1 5 0	
Southern Circle ... ..	10	5 11 99	17 2 00	5,988,295	14,377 8 10	2 7 3	
Total ... ..	76	..	...	41,299,994	1,02,130 9 10	2 7 6	

The grass was cut and collected by Government Agency except in B. B. & C. I. Section, where contractors were employed for collecting and stacking grass. The grass collected in the G. I. P. Railway Section and B. B. & C. I. Section was chiefly "Bondia," "Telia," "Fulgawat" and "Mota-bare."

Carriage of grass from the forests to the pressing depôts and to the Railway stations was done partly by contract and partly by piece labour, the rates varying according to distance.

The cost incurred on carting was as under :—

	Rs.	a.	p.
B. B. & C. I. ... ..	13,453	0	6
G. I. P., North Section ... ..	9,222	1	9
Do. South Section ... ..	2,517	6	2
Navápur ... ..	9,409	9	4
Southern Circle ... ..	6,297	13	9
Total ... ..	40,899	15	6

*Labour in Baling.*

Section.	Bales.	Presses.	Cost of baling.	Average lbs. per bale.
			Lbs. Rs. a. p.	
B. B. & C. I. ... ..	37,514	5,732,971	4,121 7 6	152-8
G. I. P., North Section ... ..	83,434	11,064,636	5,222 15 7	132-6
Do. South Section ... ..	43,782	6,583,296	3,267 0 9	150-0
Navápur ... ..	70,033	11,734,764	5,437 9 6	167-0
Southern Circle ... ..	38,390	5,984,195	2,894 9 9	156-0
Total ... ..	273,153	41,099,862	20,943 11 1	150

20 Gahagan.  
1 Mitchel.  
34 Richardson and Cruddas.  
1 Mackenzie.

Fifty-six new hand-presses were bought as per margin, and were distributed for working as under :—

G. I. P., North Section	...	...	15
Do. South Section	...	...	6 plus 3 old Gabagan presses.
Navápur	...	...	15 plus 5 presses lent by Mr. Sorabji, and 1 press lent by Mr. Mackenzie.
B. B. & C. I.	...	...	14
Southern Circle...	...	...	6 plus 1 old press.
Total			56 plus 10 presses.

Pressing was carried on day and night.

Wire ties (9' 6" to 7' 10") were purchased from the Tramway Company and Messrs. Richardson and Cruddas, and were supplied to—

Mr. Edie	...	...	...	355,400
" Fisher	...	...	...	174,200
" Fagan	...	...	...	138,000
" Murray	...	...	...	134,500
" Pearson	...	...	...	352,000
Total				1,154,100

Besides, some articles of presses and other dead-stock were purchased.

The total cost incurred on deadstock was Rs. 74,799-15-6.

The cost incurred on loading was—

				Rs.	a.	p.
G. I. P., South Section	...	...	...	1,251	3	0
G. I. P., North Section	...	...	...	2,240	4	0
B. B. & C. I.	...	...	...	671	4	0
Navápur	...	...	...	7,915	13	9
Southern Circle	...	...	...	516	5	0
Total				12,594	13	9

The capacity of railway wagons (open) was found to be—

H. type	...	...	...	47 to 52 bales.
G. and E	...	...	...	46 to 50 "
K. F.	...	...	...	42 to 45 "

Closed wagons were practically of no use as they only carried from 28 to 36 bales each.

#### *Supply from Central Provinces Forests.*

Under Government orders I visited Nágpur in October 1899 and arranged with Mr. Hearle, the Conservator of Forests, Southern Circle, Central Provinces, for the supply of 3,000 tons from Piparia Station, G. I. P. Railway, at Rs. 12 per ton loaded, we supplying the presses and ties. Mr. Hearle shortly after went on leave, and there were frequent changes of Conservators, and on 30th January 1900, when I visited Nágpur, I found but little progress had been made and ultimately only 1,360 tons were received from this source, which we distributed to various Deccan Divisions. Later on 24th March 1900, 4,000 tons, which had been collected for local consumption but were not required, were offered from Warora at Rs. 11 per ton. Under Government Resolution No. 2016, dated 12th April 1900, Famine Department, Mr. Iráni, Forest Ranger, was specially deputed to Warora to take over and despatch this grass. Mr. Iráni between the 13th April 1900 and 23rd May 1900 succeeded in despatching 1,762 tons to various destinations in the Deccan, when he was recalled as the supply ready for despatch failed.

On the 13th October 1899 I visited Jabalpor and arranged with Mr. Fernandez for the supply of 12,000 tons at the marginally noted stations on the G. I. P. Railway at Rs. 10½ per ton pressed and loaded, we supplying the presses. As there were expected to be large supplies at Jabalpor and Sohagpur, it was arranged that the two steam presses purchased under Government Resolution No. 6372, dated 9th September 1899, should be furnished to those stations, hand-presses being furnished to the remainder. Later on 12th Nov-

Jabalpor	...	...	1,700
Sohagpur	...	...	1,600
Itárai (H)	...	...	1,200
Seom (H)	...	...	1,200
Harda	...	...	1,000
Itárai (B)	...	...	4,400
Seoni (B)	...	...	900

ember 1899 it was found that the available supplies had been miscalculated, and though enough was furnished from Sohagpur and Jabalpor to keep the steam-presses going, the balance had to be obtained mostly from the Saugor District, loading Indian Midland Railway. This change of programme threw out all my calculations of cost, &c., as the rates of the two Railways were different, and of course the distances were all changed. I shall refer to this again later. The total amount supplied by the Central Provinces Forests was as follows:—

				Amount.	Supplied to	Cost.
				Tons.		Rs.
Southern Circle—						
Piparia	...	...	...	1,360 0 0	Deccan	17,000
Warora	...	...	...	1,762 0 0	"	19,374
Northern Circle—						
Steam-pressed	...	...	...	4,000 0 0	Gujarát	128,114
Hand-pressed	...	...	...	7,833 11 56		
Total ..				11,833 11 56		

The cost of steam-presses, hand-presses and wire ties, &c., articles furnished to the Central Provinces, was as under:—

				Steam and hand presses.	Ties.
				Rs. a. p.	Rs.
Southern Circle...	...	...	...	3,680 0 0	6,693
Northern Circle	...	...	...	35,611 8 0	35,502
Total ..				39,291 8 0	42,195

Besides, Rs. 12,502-2-2 incurred by the Conservator, Northern Circle, Central Provinces, in purchasing presses and other articles are being adjusted.

#### Supply from Mr. Abbott.

Finally arrangements were made under Government Telegram No. 485, dated 13th November 1899, with Mr. Abbott of Jhansi to supply 100,000 maunds of fodder (karbi, &c.), at 8 annas per maund, of which 75,133 maunds in all were supplied at a total cost of Rs. 37,566. Complaints were received from time to time of the bad quality of consignments of fodder made by Mr. Abbott, but on the whole the supply was satisfactory, considering the circumstances. I had calculated that the whole of this one lakh maunds could be delivered at about Rs. 13 per 1,000 lbs., but my calculations were badly upset. Owing to the refusal of the Indian Midland Railway to grant the same rates as the B. B. & C. I. (*see later*) and partly to undoubted heavy thefts of material *en route*, the final cost of the consignment was very much heavier than expected, amounting to Rs. 16 or 17 per 1,000 lbs. A further arrangement was made with Mr. Abbott for 27,768 maunds under Government Resolution No. 679, dated 7th February 1900, but this time having learnt by experience, the rate was fixed on material delivered at destination at Rs. 15 per 1,000 lbs. Only 3,259 maunds, however, were delivered under this arrangement, the former one even not being completed. This was largely due to the complete break down of the Indian Midland Railway arrangements for carrying the fodder.

#### Pressing Machinery.

Two steam-presses were purchased from Messrs. Jessop and Company. The ideal press is one that will turn out grass pressed to 90 cubic feet to the ton, or, say, 25 lbs. to the cubic foot. These presses are supposed to do this and possibly could do it under favourable circumstances. I am, however, of opinion that no press is possible which should combine this with the other characteristics necessary for famine fodder operations, *viz.*, mobility and simplicity. Mr. Fernandez, who worked these presses, has gone home on furlough, and I have not been able to obtain details of the working, but I gather that 15 to 16 lbs. per cubic foot is the best that can be expected of them. Only under most exceptional circumstances are they suitable. They require steady supplies of coal and water, and even then when worked against time, as they must be for such operations, are constantly breaking down and require workshops for their repair.

All the rest of the pressing was done with hand-presses, mostly of one pattern supplied by Messrs. Richardson and Cruddas and Gahagan. At their best these can do no better than 8 lbs. to the cubic foot and the average is about 6 lbs., but they are simple and can be easily repaired *in situ*. They have, however, several drawbacks, the chief of which is that they are actuated by a chain over a cog wheel. If the chain does not exactly fit or is not absolutely true in all its links, the result is constant and vexatious breakages, and this all the more when the parts are of inferior material. Both the above firms met the sudden and extensive demands made on them most promptly.

#### Railway Freight.

All the Railways concerned, except the Southern Marátha Railway, quoted substantially reduced rates for freight.

The B. B. & C. I. issued a special mileage maund rate with a terminal charge of 3 pies per wagon. The minimum load was 96 maunds, but later they accepted 81 maunds for closed wagons.

The G. I. P. Railway quoted a wagon rate—

Re. 0-2-9	per mile for 1st 100 miles,
Re. 0-2-6	do. 2nd do.
Re. 0-2-3	do. above 200 miles,

with a minimum of 96 maunds for open and 81 maunds for closed wagons.

The Indian Midland Railway quoted the same as the B. B. & C. I., but would accept nothing less than a 96 maund minimum. Moreover, for the short section to Ujjain worked by them they worked out the rate separately from the mileage on their own line. No open wagons were furnished.

The Southern Marátha Railway demanded 2 annas per mile for closed wagons (no open were furnished), which corresponds to 4 annas per mile for standard gauge.

On the whole the B. B. & C. I. rate was slightly more favourable than the G. I. P., except for steam-pressed grass, which could be loaded up to 200 maunds per wagon. On this being represented, however, they agreed to accept the G. I. P. rate at our option. The Indian Midland Railway also accepted this rate for steam-pressed, but as they broke up their mileage into two sections, as stated above, the advantage over their lines was very small, if any.

The G. I. P. Railway furnished throughout open wagons on which 96 maunds of hand-pressed grass could ordinarily be loaded. The B. B. & C. I. while furnishing open wagons also furnished a large proportion of closed ones, in which it was nearly impossible to load 81 maunds, so that in this way freight over their system, though more favourable on paper, was really higher than on the G. I. P.

The Indian Midland Railway, as stated, furnished only closed wagons and these in very small quantities; and when these failed, they furnished 3rd class carriages borrowed from the G. I. P., in which still less could be loaded. As they refused to recognize a lower minimum than 96 maunds, freight over their system was very high.

As noted above, the Northern Circle, Central Provinces, arranged to supply grass to be loaded on the G. I. P., but had to change their programme owing to miscalculation and furnish on the Indian Midland Railway, with the result, as explained, that all my calculations were thrown out, as freight over the Indian Midland Railway system was more than 20 per cent. higher than it would have been if the grass had been loaded in open wagons on the G. I. P. with a minimum of 96 maunds instead of in closed wagons which would not carry 70 maunds at the same minimum of 96 maunds.

On the G. I. P. 21,751 tons were loaded and carried without delay or hitch.

On the B. B. & C. I., including the Tápti Valley, 8,922 tons were despatched to Gujarát; there was considerable congestion and consequent delay in obtaining wagons at one time owing to the enormous quantities of grass, other than Government, requiring to be carried and which were being carried at the same rate as Government grass, but the Company made the greatest exertions to meet the demand, and the whole quantity given above was delivered at destination in fair time.

The Indian Midland Railway broke down hopelessly, although they borrowed wagons and 3rd class carriages from the G. I. P. 3,470 tons only were delivered, though arrangements had been made for the supply of 4,675 tons, besides supplies which would have been available from the Central Provinces Forests estimated by Mr. Fernandez in his Annual Report at more than 40,000 tons.

Although, as stated, grass was largely carried in open wagons by the G. I. P. and B. B. & C. I., yet no case of fire in wagons occurred; yet the danger of this was the reason given by the Indian Midland Railway for refusing open wagons. On the other hand the grass loaded in open wagons was delivered safely, while that loaded in closed wagons in the Indian Midland Railway and in open wagons over that system was subjected to extensive thefts before reaching its destination.

There were a few complaints of obstruction, &c., on the part of local Railway officials, but I have to acknowledge with thanks the courteous manner in which such complaints were listened to, enquired into and dealt with, as well as for the general help given to me by the Administrators of the B. B. & C. I. and G. I. P. Railways, especially the former.

#### *Financial Results.*

The total expenditure, as shown below, amounts to Rs. 11,13,712, as shown by the accounts to date, only allowing for an invoice of Rs. 12,500 due to the Central Provinces still awaiting adjustment. Besides this there are still some small outstandings due, but the whole amount is small, and probably Rs. 11,14,000 will cover the lot. In all 36,541 tons are claimed to have been delivered, which works out to a rate of Rs. 30.6-0 per ton, which is Rs. 13-9-0 per 1,000 lbs. As already stated, the sanctioned all round rate was Rs. 13, and it has, therefore, been exceeded by Re. 0-9-0 per 1,000 lbs.

This excessive rate is due to conditions which could not have been foreseen.

The local operations were carried out well within the sanctioned figure. They averaged under Rs. 11 per 1,000 lbs., equal to Rs. 24 per ton.

The Central Provinces grass to some extent and Mr. Abbott's fodder largely exceeded the sanctioned rate.

Under the section "Railway Freights" it has been recorded that the Indian Midland Railway while charging freights on the same scale as the B. B. & C. I. Railway, refused to recognize any but a 96 maunds minimum load. At the same time they refused to supply any but closed wagons. An open wagon with G. I. P. loading can just carry 96 maunds of hand-pressed grass, but a closed one takes only 70 maunds and even less of loose fodder. Consequently on all fodder loaded in the Indian Midland Railway the freight was at least 20 per cent. higher than estimated, and in the case of Mr. Abbott's loose fodder the difference was still greater. Further, the arrangements on the Indian Midland Railway were very slack, and in spite of protests by Mr. Abbott, no proper arrangements were made for sealing the wagons, and the result was very heavy loss by thefts *en route*.

#### Revenue.

The actual figures to date give the receipts as Rs. 9,47,025, but there are large sums still outstanding owing to the non-receipt of invoices. A further Rs. 1,30,000 to Rs. 1,40,000 are still expected to be credited, giving an expected revenue of Rs. 10,80,000 to Rs. 10,90,000.

Of the total of 36,541 tons claimed as delivered, 34,456 have been invoiced at Rs. 13, the sanctioned rate. 1,721 tons delivered to the Commissariat and 1st Lancers have been charged at Rs. 12 per 1,000 lbs.

244 tons sold locally have been charged at about Rs. 5 per 1,000 lbs., while finally 120 tons of Mr. Abbott's second contract (for free delivery at destination) have been charged at Rs. 15 per 1,000 lbs.

The revenue at the above rates should be Rs. 10,90,126.

The difference between Expenditure and Revenue shows a net loss of about Rs. 24,000 against which, however, have to be set 76 presses (hand) still in hand.

The chief lesson learnt in the matter of expense is that, in future, any fodder purchased from contractors should invariably be on the condition of free delivery at destination. But for the mistake made in not following this rule in Mr. Abbott's first contract the results would not have differed from the estimate as they have done to my great regret.

## APPENDIX 49.

(Referred to in Paragraph 148 of the Report.)

*Government Resolution No. 8361, dated 22nd November 1899.*

Memorandum from the Commissioner, N. D., No. 5485, dated 14th November 1899 :—

“ In forwarding for careful attention to the Collectors of Gujarát, except Surat and others in charge of cattle camps, &c., copies of the Grass Depôt Rules the Commissioner would add the following remarks.

“ 2. The Commissioner has accepted all the depôts proposed by the Collectors, but in view of the need of strict supervision and the difficulty and expense of getting reliable Depôt-Keepers and staff it should be considered whether some of the smaller depôts could not be doubled up. Where there is a camp the man in immediate charge of it may often be made Depôt-Keeper also with advantage.

“ 3. The Collectors are again reminded of the great expense and trouble saved by having the depôt *close to the railway*.

“ 4. Proposals for staff and charges should be made with strict economy consistently with honest management. It is not clear to the Commissioner that anything is wanted but an open piece of ground away from houses and on the railway. It seems unnecessary to make an all round enclosure as chowkeywallas will be needed in any case.

“ 5. It will be seen that the officer authorized under paragraph 4 may not give grass to the persons mentioned in Class II of paragraph 17. He may only give to genuine cultivators at reduced price and to others at the full price of Rs. 20 with the limit of 2,000 lbs. (*vide* paragraph 9); the rest is reserved to the Collector; but of course the Collector may delegate his powers. What is meant is that for the present issues to Class II should be made sparingly and should on no account be made by a Mámlatdár.

“ 6. The Commissioner attaches much importance to the rule forbidding sale in large quantities to one person (Rule 5). To begin with it is only by so doing that we can distribute our limited supply over a wide surface. Then a man who demands a large quantity is presumably able to get it by private enterprise, which our depôts should by no means compete with or discourage. The issue of large quantities to individuals increases the danger of its being misapplied, and also tends to waste. A man who got ten or twenty thousand pounds would be tempted to sell some of it at a profit or to keep less useful animals alive with it, whereas if he only gets 1,000 at a time he will husband it, give it only to his best, and not part with a straw of it.

“ The object of depôt-sale is to enable men who already have a crop of fodder or other little resources to eke them out to the end of the year. It is *not* to give a destitute man enough to last from beginning to end; such a man must send his cattle to the camps. If we have to keep them altogether it is much better to do so in camps, where we are sure that our grass is used economically and is spent in keeping alive only first class cattle belonging to agriculturists (none others being taken in).

“ It is important the people should not be led to expect that Government will supply them with enough grass in their own homes to keep their cattle going for most of the year, and if that idea is prevalent it is hoped the Collector will disabuse them of it.

“ 7. Quantities sold must be multiples of the average weight of bales. The Commissioner awaits more accurate information about weight of bales and will supply it when received. Meanwhile it may be assumed that three hand-pressed bales contain 500 lbs.

“ 8. The prices in paragraph 17 will be notified as occasion arises. For the present the price for both Classes I and II is Rs. 10. Collectors are invited to express their views on this point from time to time with reference to the demand.

“ 9. Attention is invited to the necessity of accurate accounts of receipts (paragraph 1) and of issue (paragraph 20).

“ 10. For the present if the buyer does not bring ropes (paragraph 21) he need not be required to take the tie off the bale on delivery.

“ 11. Finally it may be noted that this grass is being provided by Government at great expense, and it rests with the District Officers to see that it is honestly distributed to the animals for whom it is meant with as little worry and expense as possible.”

The following directions for stacking grass in Cattle Depôts and Camps have been drawn up by Mr. Mollison, and should be carefully attended to by all concerned. At the same time it is not meant that practical local experience should be disregarded :—

(1) The grass will be supplied when regular operations begin in pressed bales. These bales will not be materially damaged by rain, unless the rain is heavy. There is little or no chance of heavy rain now, so it is unnecessary to arrange for thatching the stacks during the fair season by chupper or other means.

(2) There is grave risk of damage by white ants, especially in the very sandy soils of Ahmedabad and to less extent in Kaira and Panch Maháls. The white ants may work up through the centre of a stack and do much harm before the damage is detected. If local agriculturists of experience are consulted, they may be able to suggest useful precautionary measures. If no better precaution is suggested, household ashes mixed freely with common salt should be spread in a thin layer on the site where a stack is intended to be built.

(3) Over the ashes and salt a layer of strong branchwood should be laid of sufficient thickness to keep the bales quite clear of the soil, or where obtainable stones or broken bricks.

(4) The stacks of a cattle camp should be built conveniently near the cattle pens or yards, but well away from any house or place where fires for cooking, &c., are usually lit. Stacks should not be built close to a railway with the risks of fire from passing trains. Smoking by attendants should be strictly prohibited near the stacks; also the lighting of fires for cooking, &c., in the vicinity.

(5) The hay of any particular cattle camp or depôt should be built in several stacks placed if possible, say, a hundred yards apart. A temporary fence of post and rails should be made round each stack to protect it from trespassing cattle, &c.

(6) It will economise labour considerably in building the bales and in removing them if the stacks are made narrow and not too high. The stacks may be of any reasonable length. It is suggested that a stack five bales wide and four bales high to the eaves will be sufficiently wide and high. During the fair season it is unnecessary to build the stacks with tops, but on the approach of next monsoon the bales should be built up as shown in the accompanying sketch which represents an end section of a stack. A stack so built could be protected from rain by chuppers, or better still, by tarpaulins if such are procurable.

(7) In building a stack of baled hay the body of the stack three bales high should first be completed throughout the full length of the stack. Afterwards the stack may be finished to its full height in sections—each section being in length equal to, say, three bales. This arrangement will facilitate work. The following diagram represents the work in progress:—

A B—Body of rick built up 3 bales high.

C D } Section completely built to full height.

E F } Another section being built.

*General rules for the distribution of cut grass supplied by Government for sale at a reduced price to cultivators and on special terms to others.*

1. The Collector should place in charge of each depôt a carefully selected and responsible man, whose name should be communicated to the officer in command of the despatching area or areas from which the depôt is to be supplied. He may be called the Depôt-Keeper. All invoices of grass shall be sent to him. He shall take delivery of each consignment, have it weighed if necessary, checked by the invoice, and entered in a Receiving Book kept as ordered by the Collector.

The Book should contain such details as—

- Date.
- No. of truck.
- From what area consigned.
- From what station consigned.
- Weight.

2. Distinct from the work of receiving will be that of distributing. If the Collector thinks it necessary a man should be appointed for each work. But one of the two should be the head of the whole depôt and responsible for keeping an eye on all the operations. The Collector's proposals for staff and other charges should be submitted for sanction to the Commissioner.

3. The bales will be distributed as follows :—

- (1) To buyers bringing chits.
- (2) To public officers and others upon order from the Collector (*vide* paragraph 16).
- (3) To Cattle Camps.
- (4) Or it may be stored at the depôt as ordered by the Collector.

4. The Collector should authorize the Assistant and Deputy Collectors and also any other officer he may think fit to issue signed chits addressed to the Depôt-Keeper for the purchase of grass. The chits shall be of two classes—white issued on takávi, and red issued on payment of cash.

5. Genuine cultivators in real need, who may be trusted to use the grass for their own animals, shall be charged the reduced price as per paragraph 17. Every such applicant must produce a certificate signed by himself and verified by two reputable persons of his village, of whom one must be the patel or the taláti, stating the amount of land he holds and the number of cattle he possesses. At the most he shall not be allowed more than a supply to last up till the end of June at the rate 300 lbs. per animal per month. If he applies again the date of the previous grant must be entered and the taláti is responsible that this is done. Except in very special cases more than 2,000 lbs. should not be given to any one man. Ordinarily 1,000 lbs., i.e. one cart load, will be enough. A man who applies for a second grant shall ordinarily give way to a man who has had none.

6. If such cultivators have no ready money and if the officer authorized under paragraph 4 above is empowered to grant takávi under Rule 4 of the Rules under the Agriculturists' Loans Act, then the price may be advanced as takávi. Care should be taken that the officer has a sufficient allotment. The Accountant General has been asked to sanction the opening in the treasury of a new heading "Famine Grass Account," to which credit should be made corresponding to debits to takávi.

7. (a).—On the cultivator appearing before the officer authorized under paragraph 4 and applying for takávi in the shape of grass, his application, if not made in writing, will be reduced to writing by the officer. Forms of application should be locally printed and kept ready.

(b).—The officer authorized under paragraph 4 will satisfy himself that the applicant is a fit subject to get grass under paragraph 5 and to receive takávi.

(c).—If the officer decides to give the takávi the applicant will pass the agreement referred to in paragraph 2 of Rule 9 of the Rules under the Agriculturists' Loans Act. *Vide* Appendix B to the Rules.

(d).—The officer will then issue a white chit as per paragraph 4.

(e).—At the close of the day the officer will prepare under his signature a memorandum showing for all the white chits issued by him, (1) the name and residence of the applicant, (2) the amount of takávi and (3) the date of issue of the chit, and forward it to the Mámlatdár of the táluka to which the applicant belongs.

(f).—On receipt of the list the Mámlatdár will prepare the usual cheque under his signature (as if the takávi were granted by him) and debit the amount thereof in Táluka Form No. 15 and the Day Book by transfer to the credit of "Sale of grass" under "Famine Grass Account," the cheque to be stamped "Paid by Transfer." It will be forwarded with the Daily Sheet as a voucher in support of the amount debited.

8. The white chit shall contain the following:—

1. Serial Number.
2. Name of Depôt on which it is issued.
3. Name and Village of the recipient.
4. Quantity of Grass.
5. Price of the whole quantity in takávi.
6. Signature of Officer issuing.
7. Date of issue of chit.
8. Date of issue of grass.
9. Signature of Depôt-Keeper.

and the following note:—

"This chit is to be given up in exchange for the grass. Neither this chit nor the grass received under it is transferable."

9. The officer authorized under paragraph 4 may issue red chits for payment in cash to cultivators at the same price as for takávi. The requirements of paragraph 5 apply also to applicants for purchase on cash. He may also issue red chits for quantities not exceeding 2,000 lbs. for payment in cash (Rs. 20 per thousand) to non-cultivators belonging to Class III in paragraph 17.

10. The red chits shall contain precisely the same details as the white, except that in (5) "cash" shall be substituted for "takávi" and between (7) and (8) shall be entered "Cash received Rs..... dated (signature of) Sub-Treasury Officer."

11. On receiving a red chit the recipient shall take it to the Táluka Treasury and pay the money. The Sub-Treasury Officer shall sign a receipt in the proper place on the chit and return the chit and credit the money to "Famine Grass Account." At the end of each day on which money is taken a statement of receipts shall be sent to the issuing officer, who shall carefully file it so as to be available whenever necessary for comparison.

12. The books of blank chits shall contain counterfoils which shall be filled as far as possible by the officer when issuing the chit. At the close of each day the officer issuing chits shall send to the Depôt-Keeper a list of chits issued by him on the depôt that day, showing for white and red separately the names of the persons to whom issued and the amount of grass to be given to each. This list shall be compared by the Depôt-Keeper with the chits received and filed. It is not necessary for the Depôt-Keeper to wait for the arrival of the list before giving grass according to the chit.

Similarly the Collector shall send to the Depôt-Keeper a list of orders issued by him under paragraph 17 of the Rules.

13. Grass shall be sold by the bale. Bulk shall on no account be broken. Further information about the weight of bales will be furnished hereafter.

14. The Depôt-Keeper shall issue grass as per white or red chit duly filled up and presented to him. He must fill in the date of issue of grass and his own signature. He must keep the chits as vouchers. At the close of every day of issue he must send a statement of all the chits, both white and red he has received, to the officer or officers respectively who issued them. Such officer shall check the statement by his counterfoils and, if correct, file it according to date in his office. From time to time he shall compare these statements with the chits and distribution books at the depôt.

15. Neither the Depôt-Keeper nor any member of his staff shall have anything to do with the payment for the grass.

16. The Depôt-Keeper shall also dispose of grass coming under (2), (3) and (4) of paragraph 3 as per written order from the Collector, which after complying with he shall carefully file with the receipt or receipts of an authorized person. The Collector may give such written order at the prices mentioned in paragraph 17, but he shall not give an order to any one other than a Government servant so long as there is a demand from cultivators. Payment should in every case be arranged for beforehand. To cattle camps it should be debited in the accounts at cost price.

17. The following prices shall be charged for grass whether on a chit issued under paragraph 8 by the officers authorized under paragraph 4 or on an order by the Collector under paragraph 16.

- |      |   |        |                |
|------|---|--------|----------------|
| I.   | To genuine cultivators in real need of grass for use of their agricultural animals as per paragraph 5—<br>cash or takávi ... ..   | Rs.    | per 1,000 lbs. |
| II.  | For Government savárs, Government servants with a travelling allowance of Rs. 20 or under, and a limited number of poor owners whom the Collector may think specially deserving of the concession, as for instance, poor hackney carriage owners who are bound by law to fixed rates of hire ... .. | Rs.    | per 1,000 lbs. |
| III. | For Government servants drawing more than Rs. 20 travelling allowance. Also persons other than the above classes for animals actually in use, so long only as there is no demand by cultivators ... ..  | Rs. 20 | per 1,000 lbs. |

18. The utmost care should be taken to prevent grass being taken for useless animals, or at reduced prices by persons who can afford to pay more. Every recipient should be warned that if he transfers any, the rest will be confiscated and he will get no more on any account whatsoever. The patel and taláti are hereby ordered to report any case in which a man gets grass under these Rules who is not entitled to it, or in which a man having got grass under these Rules transfers it to any one else, other than a member of his own family.

19. It is expected that most of the imported grass will be delivered within three months of commencement. Hence it will be necessary to make some arrangements for storing, as to which reference should be made to Circular forwarded with this office No. 4922, dated 25th October 1899.

20. All grass however disposed of by the Depôt-Keeper shall be carefully recorded by him in a distributing book or books as required by the size of the depôt. He shall also keep a Ledger account. The Collector will arrange for this in each case.

21. The grass will arrive in pressed bales and it will perhaps be necessary to send back the ties. A trained man will be sent round as soon as the depôts are fixed to show how they should be wound off for return. The steam-pressed tie requires somewhat different handling from the hand-pressed. Large quantities should be allowed by the Depôt-Keeper to be taken away without being unloosed, and their ties should be arranged for afterwards. Cultivators and other buyers of small quantities should be required \* to bring a rope with them for each bale to take the place of the tie. Otherwise when the tie is taken off the bale will gradually swell to an inconvenient size.

\* This should be well advertised to prevent harassment.

22. Probably it will be often found convenient to give delivery to recipients direct from the Railway Station. As however the Railway Company will object to the grass being stored within their compound, it will be necessary to select some land for the depôt. For obvious reasons it should be quite close to the railway and should contain ample room for storing grass for a while. Careful arrangements should be made to guard against theft and fire.

23. At the end of every week every Depôt-Keeper shall fill up a return as below and send it to the Collector for transmission to the Commissioner. He shall also send a duplicate to the Assistant or Deputy in charge of the táluka.

*Note.*—The above form is only a specimen. The Collectors should have forms locally printed, leaving sufficient space in each column for at least five figures to be entered clearly.

RESOLUTION.—The instructions issued by the Commissioner, Northern Division, are approved.

2. Government consider it advisable that Assistant and Deputy Collectors and Mámlat-dárs should keep a list of the names of persons receiving chits and of their villages, and should take pains to visit the villages and ascertain how the grass is disposed of.

3. In the rules about stacking grass an instruction should be given that the stacks when placed in line should be at right angles to the prevailing wind as otherwise should one catch fire the whole batch will be destroyed.

4. Copies of the rules should be forwarded to the Commissioner, C. D., and to Collectors of the affected districts of that Division for information.

APPENDIX 50.

(Referred to in Paragraph 150 of the Report.)

*Description of the nutritive value of fodder by Mr. J. Mollison, M.R.A.C.*

It was observed very early that the fodder supplied from the Bombay forests and by the contractor (Mr. Abbott) did not suit the Gujarát cattle. The contractor's grass and karbi were to some extent inferior owing to damage by rain and coarseness induced by manipulation. A proportion of the Central Provinces forest grass was to some extent spoiled by abnormal rain which fell in January apparently after the bales were pressed. But on the whole the Central Pro-

vines forest grass might be classed as of good-quality in comparison with ordinary dried grass in India. Big Gujaráti cattle might possibly have existed on the best of the Central Provinces grass or on the best of Mr. Abbott's karbi without extra feeding, but on Thána, Tápti Valley and inferior Central Provinces grass or karbi they got weaker day by day in the cattle camps. There is no doubt that the majority of the cattle collected in cattle camps would have died on grass alone. The effect of continuous feeding on grass alone was not only reduced condition but also bowel complaints, the most serious of which was impaction of the rumen. The power of digestion of an average Gujaráti bullock was in fact not sufficient to overcome the coarse fibrous character of the grass and inferior karbi. The fibrous undigested material collected as a hard dry mass in the third stomach and stopped digestion altogether. This difficulty was overcome by giving a daily allowance of oil-cake varying from  $\frac{1}{2}$  lb. to  $1\frac{1}{2}$  lbs. according to the size of the animal. The oil of the oil-cake added nutriment to the daily ration and exercised a softening effect during digestion on the dried grass. Without cake a big Gujarát bullock could not be induced to eat more than 12 lbs. of dry grass per day. With cake he ate about 15 lbs. of it. I was curious to know the real nutritive value of the grass, &c., as supplied to us by the Forest Departments of Bombay and the Central Provinces and by contractors. I sent samples to Dr. Leather, Assistant Agricultural Chemist to the Government of India. The result of his analysis is given below. I do not quite agree with Dr. Leather in his conclusions. He estimates the various samples as having about half the feeding value of good karbi. I do not think they are worth so much on an average. Mr. Abbott's grass (contract No. 3) and the Thána grass show by analysis that they were most inferior. This was recognized in Gujarát by practical experience. The Thána grass contained more than two-fifths of its weight of crude fibre and sand and 12 per cent. moisture. These constituents have no nutritive value. Considering that a big Gujarát bullock would not eat more than 12 lbs. of grass per day naturally he starved on such stuff. The  $1\frac{1}{2}$  lbs. of cake which he was given in addition per day contained really more nutrition than the whole of the grass which he could be induced to eat. The Central Provinces grass from Saugor and Jabalpor I considered generally of fair quality and this is borne out by analysis. The Navápur-Tápti Valley Railway grass looked good but Gujarát cattle would not eat it. Its analysis is not bad. This grass has a peculiar aromatic smell and the stalks are exceedingly hard and shining and there is no doubt that it was very difficult to digest. Sample No. 6 was damaged by rain. It was "fusty" and therefore condemned.

*Composition of 10 samples of grass and 2 samples of bhusa, analysed by Dr. Leather,  
Assistant Agricultural Chemist to the Government of India.*

Dr. Leather remarks that—

"In these analysis the true albuminoids have been determined as well as the total nitrogenous substance. In most cases nearly the whole of the nitrogenous substance existed in the form of albuminoids which is usual in fully ripe and over-ripe crops. I have separated the sand and silica from the remainder of the mineral matters. This, the 'pure ash,' consists principally of phosphates of lime and potash. Of the sand and silica a large part is silica belonging to the plant, and in no case do I think that earth had been deliberately mixed with either grass or bhusa. But earth naturally does get mixed with both, with

the former from the air and with the latter on the threshing floor. In sample No. 2 the grass roots held a little earth. Apparently this grass had been pulled up rather than cut. Regarding the feeding qualities of these grasses, they are similar to other samples of Indian grass which have at various times come to my notice. They consist of the refuse stem of the grass after the seed has been scattered and are consequently characterised by a high proportion of the woody fibre with a low proportion of albuminoids. They are worth about half as much as good jowár fodder."

## APPENDIX 52.

(Referred to in Paragraph 152 of the Report.)

*General Rules for Cattle Camps.*

- (1) Each cattle camp should, if possible, be managed by a gentleman of local position and influence, who for the sake of the good work will spare no pains in looking after it.
- (2) Every good citizen, whether official or unofficial, is expected to help the camp and assist in supervision in such manner as can be practically arranged.
- (3) Respectable people should be cordially welcomed at the camp and should be invited to inspect the cattle and the general arrangements.
- (4) A paid establishment will be necessary to carry out daily details of work. The extent of such establishment may necessarily be different at different camps. The Manager shall submit for the sanction of the Collector his proposed list of paid establishment and menial labourers.

Careful provision should be made for—

- (a) receiving and branding cattle as they arrive and keeping such registers and records as are referred to under paragraphs 12, 14, 15, 16 and 17 of these rules,
  - (b) issuing in fairly exact quantities or exact weights the fodder or other food for daily requirements and for preventing any waste of fodder,
  - (c) feeding and watering the animals at regular times and herding during the day,
  - (d) keeping the camp quite clean and storing or selling the manure,
  - (e) detecting and segregating at once any case of sickness.
- (5) The camp should, if possible, be in a shady place with plenty of water conveniently near. Running water in a perennial stream would be the least expensive source of supply, and if at a little distance, it does not matter, as the cattle can be driven to it, but streams which are usually perennial may partially dry up in the hot weather and a good well would give a purer supply for the camp. The arrangement of the camp need not cost more than a trifling amount. It should be divided into sections so that small, medium-sized and large cattle can be kept separate when being watered and fed. Such classes should be kept always separate, otherwise the large and strong will get the better of the small and weak at feeding times. There should be a separate section or enclosure for weak new arrivals and also a separate small camp for animals which show symptoms of disease. Should the camp site not be shaded by trees, shelter of the cheapest possible construction may be necessary for the weakest cattle in the hot weather; but for cattle in fair condition possibly such protection will not be needed. It will save great trouble and expense if the camp adjoins the railway, so that the fodder can be delivered straight into it from the railway trucks.
- (6) In the event of disease breaking out at a camp, segregation of affected animals and their attendants should be at once arranged and application made to the Collector for qualified veterinary assistance.
- (7) A private fund should be subscribed locally to meet, if possible, preliminary expenses, the pay of the establishment and the cost of such cattle as are bought. Government will supply all the grass needed which will be debited to the Camp Fund at cost price.
- (8) Animals may be received in one of four ways—
- (a) by gift unconditionally,
  - (b) by gift conditionally,
  - (c) by purchase unconditionally,
  - (d) by purchase conditionally.
- (9) In cases of conditional gifts or purchases the condition must be written and given to the presenter of each animal so received, and this agreement should bear the signatures of the Manager and presenter. These conditions should also be entered briefly in the remark column of the cattle register. In cases of unconditional purchase a receipt should be taken from each seller stating the fact of sale and the price. Such receipt should be kept on the records.
- (10) Any price given should not generally exceed the value of the animal's hide, horns and bones, but a higher price up to Rs. 7 may be given, but only for such young animals as will be specially valuable as work-cattle during next monsoon.
- (11) Preference will be given to young bullocks or bulls ranging in age from 18 months to 8 years if of good Gujaráti breed, and especially so, if such are sold unconditionally. Heifers and young cows of good class, also good young she-buffaloes from 2 to 7 years old, will also be received if the Manager or committee wish. Lean animals should not be rejected because, if young and sound, they can be fed up.

(12) Each animal as admitted shall be entered in the appended form of register and lightly branded with a distinguishing number if received conditionally, or with a particular form of brand if received unconditionally. The Manager should initial the register daily as long as the camp is being filled as a guarantee of correctness of entries and punctuality in making entries :—

Date of admission.	Brand, mark or number.	Description, i.e., bullock, cow, &c.	Owner's name and address.	Price.		Remarks.	Disposal.
				Rs.	as.		

(13) It is impossible to fix definitely the amount of fodder required daily for maintaining a given number of cattle in fairly thriving condition. So much will depend upon the relative size of the cattle and their class and condition. The animals should get morning and evening such quantity of grass as they can eat up greedily *without any waste*. If the requirements of young and old, large and small, are considered, probably 15 lbs. per animal per day would be a sufficient maximum limit, perhaps less will actually suffice. Weak cattle when first brought in should be sparingly fed for a day or two and get small quantities often (say four times a day) with water three times. A lb. or at most two lbs. per day continued for a fortnight of oil cake or wheat bran will help to strengthen such cattle. Large animals will require the larger amount. The bran should be moistened with water and the oil-cake broken into pieces about one inch in diameter. Such concentrated food should be given in two meals daily and at different times from the grass. Cotton seed is unsuited for weak cattle, not being easily digestible. The camp cattle will thrive best if they get a little salt occasionally. Rock salt will be most economical. If a hole is bored through a lump and the lump suspended by a thin rope to a tree within reach of the cattle it will be licked regularly with no waste. Any description of coarse salt will do.

(14) A grass register in the Form B will be kept and the Manager will initial it daily as a guarantee that it is punctually and honestly kept. The receipts shall from time to time be compared with the accounts of the local grass depot-keeper.

(15) A cash book should be kept as per Form C in which all payments and receipts shall be entered supported by proper vouchers.

(16) The names of all paid employés shall be entered in a muster roll and marked present or absent daily. The muster roll should also show wages paid.

(17) All correspondence must be properly recorded.

*Subsequent modifications in the above.*

In the light of experience gained at the Ahmedabad Cattle Camps, the rules for cattle camps previously issued may be modified to the extent noted below.

2. Cattle ranging in age from one to eight years if in moderate condition when admitted begin to improve almost immediately, whereas emaciated cattle or lean cattle, particularly those previously fed on green leaves, lose condition for some time after admission. The change from green leaves, &c., to dry grass is extreme and exercises an irritating effect on the bowels and intestines of weak cattle causing diarrhoea or dysentery or other bowel disorders. Such cases require veterinary treatment and easily digested food and careful nursing to pull them through. Such expenditure cannot possibly be incurred in a cattle camp. We can only arrange that cattle be fed and watered with unfailing regularity; that a fair allowance of hay or other fodder be given morning and evening, and in addition, during the first fortnight, a small allowance of cake (sesamum, i.e., Til is best) to such animals as appear to be somewhat listless and which do not greedily eat at feeding times. The moral of the foregoing remarks is that only such cattle as are likely to thrive from the start should be admitted. We can only hope to save a certain number; that number should be of the best as there is no difficulty in finding a sufficient number to select from.

3. In the rules it was suggested that cattle as admitted should be separated into various classes. This rule should be strictly adhered to when cattle in small numbers are received from numerous villages. If a number of cattle (say 50) come from one village it is better to leave such cattle in one lot. They know each other and the large and strong will not disturb the small or weak at feeding times. Cattle from two or three villages may be kept together in one lot, provided the feeding yard and fodder rack are sufficiently roomy. Generally not

more than 100 animals should occupy one enclosure. A feed rack arranged so that the cattle can feed on each side and 60 yards long will accommodate 100 animals. Detailed information regarding construction of feed racks, size of enclosures and a cheap method of starting a cattle camp on thoroughly practical lines may be got by inspecting the Sábarmati Camp. The overseer will give full information as regards details of management.

4. Buffaloes should occupy a yard by themselves. They are hardier than bullocks or cows and can be fed on inferior fodder. A certain proportion, say 1/7th to 1/10th of the total number of cattle admitted to each camp, should be she-buffaloes, ranging in age from two to seven years. Some of the grass received from Thána and elsewhere is so coarse that part is rejected by bullocks and cows. Buffaloes will eat this inferior stuff. Such therefore should be removed from the racks in the cattle yards daily, placed in an enclosed space under full exposure to the sun and air for a day, and put in the racks in the buffalo yards the following day. It will certainly be eaten to a considerable extent by buffaloes. They may need a supplementary feed of good grass daily—say 5 lbs. per head. As regards this the Manager of a camp must exercise his discretion. The point to be kept in view is that no fodder should be wasted. At the same time buffaloes must get sufficient nutritive food to keep them in fair condition.

5. The morning feed for cattle should be in the racks before 7-30. The cattle will continue to eat off and on until about 10 A.M. They should be turned out to water by 10-30. If they can be under shade near water during the day they will lie and ruminate and go backwards and forwards to the water in twos and threes at a time—thus drinking at pleasure as they feel thirsty. They should have the opportunity of drinking at 4-30. It is wrong to walk the cattle backwards and forwards to water twice a day if the distance is more than half a mile. Each lot should be brought to the respective yards at 5 P.M. The evening feed of grass should be previously put in the racks. The cattle will eat greedily when they are brought in. Any animal found listlessly standing away from the feed rack at this time may be considered sick or out of sorts and should be removed. Such sickness is mostly due to obstructed digestion. A pint or one pound of sweet oil given in the evening and a like quantity next morning and a pound of oilcake daily for a few days will exercise a softening effect on the other food consumed and probably remedy the disorder referred to. Absolute regularity in feeding and watering will probably prevent such sickness and as already shown is a means of detecting sickness.

6. If a stream adjoins a cattle camp buffaloes should have free access to it daily. They will be in the water during the heat of the day. They should have access to the water at a point down stream and 200 or 300 yards from the place where the cattle drink.

7. If grass from various districts is received at a cattle camp it will be found to vary in quality, &c. Cattle, like human beings, have palates and any little change that can be arranged to give variety to the food will be enjoyed. Karbi instead of grass once a week or one kind of grass one day, another kind the next and so on will prove excellent changes.

8. A big Gujaráti bullock will eat without waste about 16 pounds of grass of fair quality in a day. Ordinary Gujarát cattle as admitted—young and old, large and small—will eat on an average less than 12 pounds and sometimes not more than 10 pounds daily. An observant Manager will soon satisfy himself how much should be allowed for each yard daily. The evening allowance should be somewhat larger than the morning. Rock or other salt is absolutely necessary. This has been proved by experience at the Sábarmati and other Ahmedabad Camps.

---

#### APPENDIX 53.

(Referred to in Paragraph 153 of the Report.)

*Extract from the Annual Administration Report of the Civil Veterinary  
Department for 1899-1900.*

The cattle camps since October 1899 have had something like 7,000 animals through them, and up to the end of April the total casualties from debility (famine), accidents and common diseases amounted to 615 and from rinderpest to only 68. I do not know any similar case in this country, when dealing with rinderpest, where it has been possible amongst so large a number of animals to record statistics that are both accurate and reliable in every way. In this instance every animal was counted once a day, placed in an enclosed yard during the night, fed from a trough and inspected daily by qualified Veterinary Graduates. On the slightest symptom of disease they were at once removed to yards especially set apart for the purpose, and if contagious segregated. I have already stated that rinderpest broke out in four camps, that 140 animals were attacked, of which 68 died and 72 recovered; this out of a total of nearly 7,000 animals.

When it was proposed to inoculate all the animals in these camps, great difficulty was experienced in obtaining virulent blood, and with this object in view four calves were at different times inoculated intravenously with 10 c. c. of virulent blood and others were placed alongside of animals suffering from rinderpest. But in no single instance were we successful in reproducing the disease, and not a single animal showed the slightest reaction. I think that there can be no doubt that nearly all the buffaloes in No. 2 camp (Sháhibág) and 80 per cent. of the cattle in another camp had the disease in a modified form, although no visible symptoms were apparent. These facts are valuable, in that they prove rinderpest is a disease considerably affected by the conditions under which it is placed and the class of cattle attacked. In the cattle camps we had great heat, direct action of the sun on most of the yards, dry absorbent sandy soil and good sanitary arrangements. Under these conditions the disease did not spread, but confined itself to the yards in which it originated, although nothing but post and rails divided the yards, and cattle were in the habit of licking each other through the rails; had these conditions been reversed, and instead of the great heat and dryness, moisture and cold had prevailed, the disease would most probably have spread rapidly and the mortality would have been great. The disease was of the most virulent type, as the majority of deaths occurred within five days. Our unsuccessful efforts to reproduce the disease, the small number actually attacked in proportion to the number unavoidably exposed to contagion, can only be accounted for in the two following ways: that the great heat and desiccating effects of the sun are antagonistic to the disease, or that a very large percentage of the Gujarát cattle are immune.

The great mortality from debility (famine) in Nos. 2 and 7 camps (Sháhibág and Nadiád) was due to the fact that many animals were admitted in the beginning that should have been rejected. It is well known that cattle starved to a certain point never recover. When in this state, even if placed under the most favourable conditions, they linger on a few weeks and eventually die. Mr. Mollison and I endeavoured to some extent to rectify this, and sent many animals, that had already been accepted, to the Pinjrápol.

Should the misfortune ever arise again to form similar camps, no efforts should be spared to procure men with sufficient knowledge of famine cattle to be able to tell at a glance whether animals ought to be accepted or rejected, as I feel sure that on this first careful selection the success or otherwise of a famine cattle camp mainly depends. Those camps, where animals were at first carefully selected, have shown a very slight mortality and scarcely above what was to be expected under normal conditions; but those, on the contrary, where all animals were taken regardless of conditions, show a very high mortality, entirely due to the above cause.

*Review by the Commissioner, Northern Division, of the Cattle Camp Scheme.*

On the 4th August 1899, Government recognizing the enormous economic importance of efforts to save the cattle made a small grant for an experimental relief camp. One was opened by private subscription near the Sháhibág in Ahmedabad under the management of Mr. Lambert, Superintendent of Police, who devoted himself to it with great energy. About a thousand animals were collected but mortality among them soon became excessive. They had not been selected by an expert and were many of them of an inferior class. They were also unhealthy being mostly taken from the droves of Sindhi and other wandering graziers which had felt the pinch of scarcity for two years. The pressure had not yet become severe enough to bring forward the best cattle of the district. The grass sent from Thána district was not only of an inferior description to that of Gujarát but being at that time cut green and insufficiently dried it was more or less decomposed on arrival. The consequence was bowel disorders and other sickness with a very high death rate. The general equipment of the camp was also unnecessarily expensive. All the cost except that of part of the fodder supplied by Government was met by private persons and though mistakes were made they supplied a useful lesson for the rest of the year. On the 20th November the management was handed over to Mr. Mollison and his subordinates of the Agricultural Department. All the animals not considered worth keeping were weeded out and accepted by the Pinjrápol (Native cattle relief institution). Their places were filled up by sound and useful stock, and the camp on regular and economical lines played a useful part throughout the year. Eight others were subsequently started under the general supervision of Mr. Mollison, *viz.*, four at Ahmedabad, one at Nadiád, one at Broach, one at Godhra and one at Umreth. Four of these were immediately managed by non-officials, *viz.*, one at Ahmedabad by Ráo Bahádur Lalshankar Umashankar, another at Ahmedabad by Ráo Bahádur Manibhai Premabhai, the one at Nadiád and the one at Umreth by Local Committees. The charge per month for which the animal was redeemable was fixed according to size at from Rs. 5 down to Rs. 2-8-0 per month so as to cover the cost of grass.

Appended is a statement of the financial results of all the nine camps. In this the Cow Camp comes out the most satisfactorily, for though the animals were paid for at an average of Rs. 14-3-9 each the loss per head saved was only Rs. 1-11-4. The average cost to Government on all the camps of each animal saved to the country was Rs. 7-13-8. This would have been less but for the high rate at Nadiád of Rs. 58-1-2 per head owing to the inferior management there shown both in selection and in treatment.

It should not be forgotten that in these accounts grass is charged at cost price and not at the price of Rs. 10 per thousand pounds at which it was sold to cultivators. If it is intended to compare results with the system of direct sale to cultivators this should not be overlooked.

Furthermore all the ordinary labour in these camps was as much relief labour as that employed on the recognized relief works.

The following are lessons of the year's experience of cattle camps :—

- (1) They should only be extended so far as careful and intelligent management can be secured, with the advice of an expert always available.
- (2) Admissions should be made by an expert according to a high standard of breed, age and health. Animals that are debilitated cannot be restored or only at the cost of trouble and money that can ill be spared. Animals that have been fed largely on leaves or other green food cannot stand the change to dry grass.
- (3) The big Gujaráti bullock requires three times as much fodder as the hardy little Deccani and cannot live only on the coarse grass of Thána and Khándesh. A small daily ration of sesamum cake was found necessary to carry him through.

It is needless to bring to the notice of Government that the whole success attained by the camps was due to the skilful and unremitting care of Mr. Mollison.

Private camps were started at Ankleshvar, Mandál and elsewhere but the only one of sufficient importance to deserve special mention was that of the Mahájan at Ahmedabad. The "Pinjárapól" in that city has besides its head-quarters two extensive grazing grounds at the villages of Ranchorda and Nesdi, 10 and 12 miles respectively from Ahmedabad. All these places are well equipped with buildings, wells, &c.

The institution was run entirely on religious lines. Hence no animal, however emaciated or valueless, was refused admission and food. In all 21,543 cattle and 202 horses were taken in charge of which 16,712 died.

Agents were sent in every direction to buy grass but they, like the Government officers, were much hampered by failure to get carriage. In all 469,68½ local maunds of grass and karbi were delivered. This was supplemented by concentrated food including 40,184½ local maunds of grain.

The surviving cattle have been and are being sold to cultivators only, to recoup expenses. Over 300 well-bred cows have been sold to the Northcote Gowshála for breeding purposes.

The total expenditure is estimated at Rs. 3,50,000 defrayed out of the general funds of the Pinjárapól and also out of a special subscription amounting to Rs. 80,000.

*Review by the Commissioner, N. D., of the different methods adopted for preserving cattle.*

Loans to the people and other aid and encouragement to growing fodder crops by irrigation may be placed in the front rank. It has however its limitations. The mass of people have not the energy to dig wells and could not safely be trusted with money to do so. Much land too is from one cause or another altogether unsuited for such treatment.

Importation of grass by Government is said to be interference with private trade and therefore as unjustifiable as would be importation of grain. The argument would have more force if there existed an organized trade in grass in touch with the great body of consumers. As a matter of fact there were no grass merchants except for the supply of the townspeople, and it was pretty certain that none would spring up owing (1) to the difficulties of getting railway carriage and (2) to the inability of the cultivators at large to pay remunerative prices. Outside the towns the question was not whether Government or private traders should supply the market but whether any should be supplied at all. Hence the operations of Government being confined to "genuine cultivators in real need, who might be trusted to use the grass for their own animals" did not touch the sphere of private trade at all.

If the sale of fodder to the cultivators at a price adapted to their means be admitted as legitimate the next question is whether it should all be so disposed of or whether camps of selected animals have been proved advisable. In favour of sale to the people it is argued that they are better able to look after their own cattle than hired servants in a big camp; that they can do it more economically being able to supplement small stocks of grass by various pickings; that there is more risk of disease in a camp. Finally it is urged to be morally objectionable to do for the rayat what he can do for himself and so complete the lesson of dependence he has learned from the famine.

On the other hand it is pointed out that the cultivators in their own homes tried at first to keep alive all their animals, wasting fodder on the inferior ones. The object of a camp is to select the very best and make sure of them. Disease may be more likely to appear but it is also certain of skilful treatment. As a matter of fact rinderpest broke out twice in the camps but was promptly checked. So was an outbreak of foot and mouth disease. It is impossible to get statistics but it is highly probable that a larger proportion of animals died of disease in the

villages than in the camps. Inoculation is easy in the latter. As for the moral effect on the people they had to pay as heavily for feeding charges in the one case as the other.

On the whole in the case of another famine of equal severity the Commissioner would advocate the fullest extension, consistently with skilled supervision, of camps for cows (which have once calved) only and a limited number of bulls. The people at first tried to save these, but soon gave them up and devoted all their energies to their draught bullocks. The great mass of cows belonged to the professional breeders who had no ready money to buy grass even at a reduced price and to whom it was impossible to lend takávi. Consequently their herds all died, and the number of female animals and entire bulls is so small as to threaten the breed with extinction. The number of cows in the Government camps of 1899-1900 was limited because they were organized with a view to the balance sheet. They were expected to pay their way or nearly so and it was recognized that cows would fetch but a small price in the market compared with bullocks. The latter are immediately more useful but in view of the future the former are immeasurably more valuable.

#### APPENDIX 54.

(Referred to in Paragraph 154 of the Report.)

*Report by Mr. G. Monteath, I. C. S., Assistant Collector, Thána, No. 127, dated 28th January 1901, describing the distant grazing operations in Thána District.*

It was decided in September or October 1899 to send a certain number of cattle from the affected districts of Gujarát, where fodder had failed, to the Thána district, for grazing in specified areas of Government forest during the dry weather. By the end of November, some 15,000 head of cattle had been sent to Pálghar and Dáhánu Stations and drafted thence to forest areas in the Dáhánu, Wáda and Bhuwndi tálukas.

I was not in charge of those sent to Dáhánu during a considerable part of the time they were in the district. As about 11,000 head were sent to Pálghar and only 4,000 or so to Dáhánu, and as both lots fared about the same, I imagine it will be sufficient for the purposes of this report if I give details regarding the former only, of which I was in charge from first to last.

10,267 head arrived at the grazing areas upwards of 30 miles from Pálghar, the rest having died on the way owing to their weak condition, or strayed, generally because their attendants had deserted them. Of these 6,604 were from Broach, 2,512 from Ahmedabad, 764 from the Panch Maháls and 387 from Kaira. The Broach cattle were chiefly bullocks in charge of owners or their servants, those from the other districts mostly cows and calves, in charge of Rahabáris and Bharwáds. There were some buffaloes also from each district.

When they arrived the Broach cattle were, generally speaking, in fairly good condition. The others were mostly in poor or bad condition.

The death-rate was large from the beginning. Of about 7,000 in the week ending on November 5th, 117 died: in that ending November 12th, 165. Up to November 24th, by which time all the cattle (10,267) had arrived at the grazing areas, there were 379 deaths. Many of these deaths at the beginning resulted from surfeit—animals in weak condition eating and drinking more than they could stand as soon as they found food and water abundant.

At the end of November, however, rinderpest appeared in one area in the north of Wáda. It was contracted no doubt from the village cattle among which it had been, and continued to be rife. There is no reason to believe that the disease was imported from Gujarát. In spite of all the measures taken—segregation, shifting of the herds, and splitting them up into smaller ones—it continued till March by which time 3,900 cattle had died, appearing or increasing in one area as it decreased or disappeared in another. Foot and mouth disease was also rife for some time, aggravated no doubt by the nature of the ground to which the cattle were unaccustomed.

Till the beginning of the hot weather those cattle which were not affected by disease kept fairly good condition, the Broach cattle remaining the best. After the beginning of the hot weather, however, the state of things was changed. Though disease had disappeared mortality continued. The Broach cattle lost their condition rapidly and very soon the survivors amongst them presented a wretched appearance. The Rahabáris' and Bharwáds' cattle on the other hand stood the hot weather better, though they had arrived in much worse condition. The Panch Maháls cattle on the whole fared best through the hot weather.

The mortality figures were pretty much the same, averaging about 200 each week from the beginning. They fluctuated a little with the spread and decrease of rinderpest, but on the whole may be said to have remained pretty constant—some 200 a week to the end—though rinderpest disappeared in the beginning of March. That is to say, of course, the percentage of mortality increased every week. Finally, 1,202 head were sent back by rail—541 to Ahmedabad, 325 to Broach, 40 to Kaira and 296 to the Panch Maháls. But 3,964 head had already been returned from time to time to the owners who came for them. These were mostly Broach cattle. That is, of the 10,267 head which reached the grazing grounds, 5,166 were returned. I cannot say how many of these survived ultimately. Judging by their condition when they

went I am afraid a good many must have died. A certain number of cattle were sold in the district by permission—not enough however to make it necessary to take count of them here.

The Dáhānu cattle, 4,000 odd of which arrived at the grazing grounds in that táluka, fared much the same. They suffered likewise from rinderpest and foot and mouth disease and stood the hot weather no better. The percentage of mortality was higher amongst these than among the others, but they had started in worse condition. Roughly, 400 head were finally sent back by rail. A number had already been returned to their owners. I may say counting these some 1,500 were returned in all, but I have not figures from the beginning of those returned to owners who came for them.

Water and grazing were sufficient throughout. Owing to an apprehension that grazing might be insufficient in the hot weather some 12 lákhs of pounds of grass, to which all the cattle had access, had been cut and stacked at different places in the grazing areas as well as along the route back to the railway station by January. Water never failed up to the end. A good deal of the grass remained uneaten. The cattle did not absolutely refuse to eat it, but appeared unable to assimilate it. They could have disposed of twice the amount if they had had any appetite for it. Moving them from one part of the táluka to another was of no avail to stop the mortality.

The reason why the Broach cattle fared rather worse than the others in the hot weather is, I take it, that they had been from the first unaccustomed to roughing it. They were nearly all bullocks and buffaloes belonging more or less to well-to-do owners—Boráhs chiefly. They were unused to moving about and sleeping in the open to any extent, and I gathered that they were accustomed at sometimes at any rate during the year to be hand-fed. I do not think the fact that their herdsmen deserted them wholesale almost at the beginning of things made very much difference to them. The Rahabáris' cattle on the other hand were hardier from their wandering life. But all were unable to withstand the effects of an entirely different climate, different grazing, and different ground from those to which they had been accustomed in Gujarát. That the Panch Maháls cattle did slightly—but only slightly—better in the hot weather may perhaps be due to their having seen country a little less different from the Thána district than the others.

Of 208 head sent to Ráo Bahádur Appáji Ganesh Dándekar, 133 were returned. These cattle did a shade better than those sent to the jungles, possibly because the grazing grounds of the coast patti are (or seem to me) rather more like those of Gujarát. Of 1,000 head or so sent by two Mahájans of the Ahmedabad district, without reference to the Government undertaking, so far as I know, hardly one survived.

---

#### APPENDIX 55.

(Referred to in Paragraph 160 of the Report.)

*Instructions framed by Ráo Bahádur A. Sabhápáti Moodeliar for the preparation of prickly pear fodder.*

The instruments consist of a knife, a pair of tongs and a pincer.

The tongs are intended to hold the leaf and the knife to cut it and the pincers to pluck out the thorns.

After this is done, the leaf should be washed in water to remove any stray thorns that may be sticking to the gummy matter on the leaves and then have the leaves cut into pieces of one inch square, and sprinkle a handful of horse-gram or chenna-gram flour mixed with a little salt over the pieces, when the cattle usually will take to it without any difficulty.

But in the case of such cattle which do not take to it willingly, a few pieces may be put into their mouth, and the two lips be held together till they chew the pieces, and acquire a taste for them.

---

*Report by Mr. J. Mollison, M.R.A.C., No. 195, dated 12th April 1901, on the result of his experience regarding the use of prickly pear as food for cattle.*

My experience is that cattle can be forced to eat prickly pear by starving them; but until they are so starved they do not take to it at first. The experiment of forcing cattle to take the prickly pear would in a famine year be less risky with the small hardy cattle in the Deccan than with big soft debilitated cattle in Gujarát. The change to prickly pear from dry inferior fodder and such other food scraps as an owner of cattle can collect in a famine year would be severe. Extra food of a dry and fairly concentrated nature is in my opinion essential, otherwise debilitated cattle will be subject to diarrhoea and other bowel complaints.

A few buffaloes at the Nadiád Cattle Camp took to the prickly pear and ate the stuff greedily, but without absolute starvation for days other cattle would not take to the stuff. I thought it inadvisable to take the risk in the Gujarát Cattle Camps. At Nadiád the prickles

were deftly removed by toasting each leaf separately over a fire, first one side then the other. The fuel used was cow-dung cakes. This in my opinion is a cheaper method of removing the thorns than by scooping them out with pincers.

Prickly pear in ordinary years occupies ground which if cleared would be more profitably used in growing grass or other crops. No doubt, prickly pear in the Deccan occupies bare barren ground which would grow very poor grass. Still prickly pear spreads with alarming rapidity in good or fairly good land. All things considered I would remove prickly pear as a weed rather than preserve it in the neighbourhood of villages on account of its utility in a famine year.

The construction of wells in favourable positions, and extended cultivation of fodder crops would in my opinion in any part of the Presidency have far greater effect in preserving cattle in a famine year.

*Reports by Rdo Bahddur N. C. Soman on the experiments made by him  
of feeding cattle on prickly pear fodder.*

I have the honour to report that on 3rd December 1899 two young bullocks and one buffalo heifer were purchased in the Athni market for the purpose of trying prickly pear as food. The animals began to eat it after two days' starvation, and now they are subsisting entirely on prickly pear.

As grass and kadbi are scarce and dear it is proposed to feed as many useful animals on the weed as possible.

A subscription list has been started, and Rs. 800 have already been subscribed.

The Committee of the Prince Albert Edward Victor Land Improvement Fund have also agreed to use the fund towards the saving of agricultural cattle. The amount at their disposal is about Rs. 4,300.

I beg to propose the following scheme:—

A cattle camp should be established in the Gadda (island) at Kudchi. There is ample accommodation and excellent shade and water. About one mile from it there is any amount of prickly pear on the outskirts of Ainapur.

The camp should be managed generally on the lines indicated in the accompaniment to Government Resolution No. 7824, dated 4th November 1899.

Except in the case of new arrivals, which would require chuni (tur flour) or bran or similar other food for mixture for the first 3 or 4 days, the cattle should be fed entirely on prickly pear.

The thorns should be removed and the leaves prepared for use by relief workers of Classes I, III and IV. The majority should be of Classes III and IV. About 3 persons of Class I may be employed on cutting prickly pear, and about 20 of Classes III and IV on removing thorns, &c., for, say, every hundred head of cattle.

The leaves may be prepared near the prickly pear thicket. When ready they may be removed on carts to the camp—the bullocks in camp to be used for carts.

The Committee of the Prince Albert Edward Victor Land Improvement Fund wish that the fund may be used in buying bullocks, and they should be reimbursed from the sale-proceeds, if any. Any loss which may result will be borne by them.

The subscribers to the fund of Rs. 800 desire that not only bullocks but useful cows should also be preserved. They are actuated by a religious sentiment. They would be content even if the ratio between bullocks and cows be 4 to 1 or even 6 to 1. The fund, which I expect would be augmented, is of course a gift to the camp.

These are the outlines. If the scheme is approved details can be easily settled.

The great advantage of the scheme is that the labour of relief workers of Classes III and IV and even of the recipients of village dole can be utilized to the best advantage. Another important thing is that the experiment will serve as an object lesson, and the use of prickly pear would be general.

The requirements of the camp may be estimated as follows:—

- (1) A Superintendent with an adequate paid establishment under him.
- (2) Contingencies, ropes for tethering, &c.
- (3) Relief workers—say, three of Class I and 20 of Classes III and IV per 100 head of cattle.
- (4) A few carts for removing the leaves to camp.
- (5) Cost of chuni, &c.
- (6) Cost of apparatus for cutting the pear and removing thorns.

If Government undertake to provide the establishment under heads 1 and 3, a start may be made at once with the funds we have.

There is a large thicket of prickly pear and sufficient supply of water at Telsang in the Athni taluka and other places. The Gokak hills abound in it with water-supply close at hand from the Ghataprabha and the Markandi rivers. Any number of cattle would be accommodated.

The use of prickly pear as food for cattle has already been recommended by Government (Government Resolution No. 8939, dated 11th November 1896, paragraph 6).

You have seen the cattle experimented on during your stay at Athni in the third week of December 1899.

I was at Athni again from 3rd to 13th December 1899, and I am able to report from personal observation that the three animals are fed entirely on prickly pear and that they are in good condition, especially the two bullocks. It may be said they have improved. For want of the necessary appliances no record has been kept of their weight. They devour prickly pear like oil-cake. About twenty pounds is given to each daily.

In the beginning the leaves were cut into small pieces. Now they eat large pieces about two inches square and even the stems.

As the removal of thorns is a tedious affair a device has been introduced. The branches of prickly pear are scorched. This burns the thorns and renders the preparation of the leaves very easy. In fact, the only thing that remains to be done is the removal of the roots of the thorns which do not pierce in any way. After the thorns are burnt it is almost as easy as any vegetable or fruit-stuff. The scorched leaves are eaten with as much taste as the green ones.

To a layman like myself it appears to be a complete success, and I am respectfully of opinion that any number of cattle can be saved by feeding entirely on prickly pear, a little salt being of course added. Prickly pear is to be found in abundance in the above-Ghat districts of the Southern and I believe of the Central Division also. I have no knowledge of Gujarat, but if it is available there it would be of invaluable use.

Its chief recommendations are abundance and cheapness.

Nothing has as yet been done to establish a camp in the Athni taluka for the following reasons:—

- (a) The stunted growth of jowari grass (kadbi) is still available in most places.
- (b) The prices of cattle which had gone down tremendously in November have risen slightly owing to the above reason and those of useful animals are still above one-half of the normal.

If necessary, an inspection of the three animals may be made by any officer of the Veterinary Department.

I have the honor to report that from 3rd December 1899 to 31st January 1900 Rs. 17-4-6 were spent on the feed and keep of the three head of cattle. The details are as follows:—

	Rs.	a.	p.
Grass	...	...	...
Salt	...	...	...
Chaff	...	...	...
Pulse (Chuni)	...	...	...
Purchase of prickly pear leaves by contract	...	2	3
Pay of a servant who prepared leaves at Rs. 6 per mensem	...	11	9
Pay of a boy kept for tending the cattle and watering them at Rs. 2 per mensem...	...	2	4
		17	4
		6	6

The above is for 60 days for three head of cattle. The cost per day per head is, therefore, anna 1 pies 6½.

One man paid at Rs. 6 a month ought to prepare the leaves for six head of cattle. We had however to pay the same amount for three head, partly because we had not more cattle and the man won't receive less as he could not get work elsewhere for half time, and partly owing to the reluctance of the labourers to do this work which involves dealing in thorns. The boy also could very easily tend ten head of cattle. The man who prepared prickly pear leaves could have been employed on watering, &c., but he refused to do it. He knew that we were anxious to carry out the experiment, and that owing to false fears (probably proclaimed by himself) nobody would come forward to do the work. The boy is his own relation and we had to engage him at his suggestion, simply because we wanted to see how the cattle thrived, and did not

much mind expense. I knew that once the people were satisfied by ocular proof that the cattle thrived on it the expense could be easily curtailed. The above figures need not therefore be taken as a standard. I would reduce them by half, which means that the cost per head per day would be 9 pies. Even if rehref labourers of Classes III and IV were employed on this work, the cost per head of cattle would not exceed one anna at the most. Their labour which generally brings little useful outturn would be best utilized. At any rate it may safely be said that the cost would be nothing compared to grass operations now carried on on an extensive scale.

As to feeding on dried prickly pear, it has been found that it is eaten when moistened with salt. I am not yet able to say how it acts on their condition. I shall report separately after it is tried for a sufficiently long time.

#### APPENDIX 56.

(Referred to in Paragraph 161 of the Report.)

*Notes by Mr. J. Mollison, M.R.A.C., Deputy Director of Agriculture, on manual power tillage implements.*

##### I.

The mortality amongst cattle in Gujarát has been great and there will be great scarcity of work cattle for tillage operations during the next sowing season. It has therefore been considered necessary to determine whether ordinary native field implements can be so adapted that they can be worked by men without the aid of work cattle. I take no credit for initiative action. The enquiry was started by several people some months ago, in particular by Mr. Whittle, Wadhwan, and Mr. Seddon, Special Famine Officer, Kathiawar.

2. The chief tillage implement in use throughout the Presidency is, of course, the plough which in different districts varies very considerably in size, construction and effectiveness at work. The lightest bullock power plough in use is the hal of Gujarát. But light though this implement is I do not see how it can readily be adapted for manual draught. The plough is not used every year except in the deep alluvial sandy and loam soils of Northern Gujarát.

3. In many parts of the Presidency particularly in black soil districts the land is prepared for sowing at less expense by means of the ordinary country harrow called vakhar in the Deccan and karab or ramp in Gujarát. The effective working part of this implement is an iron blade ranging in length in different districts from 2 to 2½ feet. This blade at work in the fair season scrapes the surface soil and fills the cracks which in black soil are large and deep. The ramp works more effectively after the rains set in. It then penetrates and loosens the moist soil to a depth of about 3 inches and prepares an excellent seed-bed in any description of soil.

4. Fields are not likely to be prepared for sowing by manual power, until the monsoon rains set in. The recent rain at Ahmedabad moistened the surface soil sufficiently to allow by means of manual draught a practical test with the ramp and other implements. The ramp, which was used, was lighter in all its parts but otherwise similar in construction to the ordinary bullock power implement excepting that the neck yoke was replaced by a handle suitable for manual draught. The implement was tried in a field of sandy soil stocked to a considerable extent with harialli and other deep rooted weeds and grasses. The trial was made purposely severe. It was found that the blade did not penetrate the soil to any extent. It merely scraped the surface. It was possible by means of the guiding handle to lever the blade into the soil and thus increase its penetrative power, but then, the draught became too much for four men. It became clear that sandy soil in weedy condition must be otherwise broken up before the ramp could work effectively.

5. An implement with tines or teeth was considered necessary for the purpose. The ordinary country seed drill appeared to be suitable. It has tines or coulters which as ordinarily worked, open furrows for the reception of seed. The seed drill is convertible into a "grubber" by removing the seed bowl and seed tubes. The tines are of wood pointed with iron. Weedy sandy soil and I believe any description of soil in moist condition can be broken up very well by the tines of this "grubber." I first tried one with three tines placed a foot apart. The work was done well but for four labourers was too heavy. I then tried a "grubber" with two tines set 18 inches apart. This implement did excellent work and the draught was easy for four men. The furrows opened by this implement in the forward journey across a field are shown below by straight lines and in the backward journey by dotted lines:—

Thus furrows were opened 9 inches apart although the tines were actually 18 inches apart and the soil between the furrows was also to some extent stirred. The handle which is used to guide the implement can also be used to lever the tines into the ground. This increases the

depth of furrows. The grubber should first be worked lengthwise, then across a field and an interval of at least a day allowed between these operations. The work is heaviest during the first operation.

6. The *rám* works easily and well after the grubber. It should be worked (I at present think) along the furrows last made by the grubber. A practical test in the sowing season will determine the correctness of this conclusion. One turn of the *rám* was found sufficient. The soil was left friable to a depth of quite 3 inches and in excellent condition for the reception of seed. The extent of preparatory tillage can very well be left to the option of the *rayat*.

7. The seed drill should in drilling the seed be worked across the lines made by the *rám*. The *rám* can be used after the drill to cover the seed and level the surface. This work can also be done by a plank roller (*samar*) horizontally drawn over the surface.

8. The kind of seed drill to be used will depend upon the crop to be sown and the kind of soil. A three coulter drill lighter in construction but otherwise similar to an ordinary three coulter drill with coulters 10 or 11 inches apart will be suitable for sowing the principal *khari* grain crops (*bájri*, *jowári*, *kodra*, &c.) in the sandy or sandy loam (*gorádu*) soils extensively found in Ahmedabad, Kaira, &c. In any district, however, particular crop should be drilled in rows the usual distance apart, and suitable drills can easily be locally arranged for.

9. The three implements mentioned above, viz., grubber, *rám* and a three coulter seed drill each constructed lightly to suit manual draught were subjected to a practical test on a small plot of ground 2 *gunthás* (one-twentieth acre) in extent. The grubber was worked lengthwise and across the plot in 31 minutes. One turn with the *rám* took less than 14 minutes. The soil was now in good order for sowing as proved by working the drill for two or three turns. The preparatory tillage was done at the rate of  $\frac{3}{4}$  acre in a working day of 10 hours, but the plot being small a good deal of time was lost through the numerous turnings. In actual practice in an ordinary field the work could have been done more expeditiously. A field prepared like the experimental plot could have been sown and the seed covered at the rate of 2 acres per day and under pressure at a still faster rate. The draught of the drill in well prepared soil is very light and four labourers pulling ought to swing along at a rapid pace particularly in fields which are neither sticky nor wet.

10. Four labourers (women would probably work as well as men) were required for drawing each implement; also a man to guide or steer. Each implement was fitted with a draught pole not quite so long or so heavy as required for bullocks, but fitted to the implement in precisely the same way as for bullocks. A stout handle or yoke about four feet long is adjusted to the draught pole in the same way as a bullock neck yoke. This handle is extended for two labourers one on each side of the draught pole. They each grasp the cross handle or yoke with both hands and use their strength not by pulling but by shoving. A rope attached to the body of the implement and extending beyond the length of the draught pole is fixed at its free end to the middle of a handle or yoke. The labourers one on each side of the rope grasp the handle with both hands and exert their strength by shoving like the pair of labourers working behind them. The draught rope should be looped up loosely to the draught pole to keep it in proper position.

11. Under the orders of the Commissioner, N. D., I have arranged to get a set of implements such as I have described made for each of the famine-affected Collectorates of the Northern Division, and I am also sending one set to Mr. Seddon, Special Famine Officer, *Káthiawár*, the object being to give patterns which can be copied and possibly be improved upon by village carpenters. The implements when sent will be properly adjusted for work as regards means of draught, &c.

12. It is unnecessary at the present time to demonstrate how other tillage implements can be adapted for manual draught. The cultivators can I believe easily arrange for themselves regarding implements used for interculture and weeding. In fact I am not at all sure that a Gujaráti cultivator of average intelligence requires an object lesson to teach him how to apply manual draught to his tillage implement.

13. It has been suggested that famine labour might possibly be profitably employed in field work with these implements after the rains set in, but I am of opinion that cultivators could make their own arrangements. The employment of home labour would be more satisfactory than hired labour. The work on account of rain would be intermittent and should be pushed on very rapidly when the conditions were favourable for working the land, and no doubt the working hours on particular days would be very long.

*Circular to Agriculturists in Gujarát.*

II.

Many of your work cattle have died through unavoidable starvation. Many of those that have been kept alive are weak. In many villages you cannot hope to get all the fields prepared by your work cattle in proper season for sowing. If men or women or boys do part of the work ordinarily done by work cattle, you may expect to get most of your fields sown in good time.

The plough (hal) cannot easily be drawn by men. But the surface soil can be loosened hand power by means of the two rowed seed drill (phadko) and the bladed harrow (rámp); these implements are modified so as to suit human traction.

2. The Sarkár has had strong light sets of these implements made and it has been proved by working them in moist soil that they can easily be drawn by four men or women and that the soil can be properly prepared for sowing.

3. The modified hand power phadko has the seed bowl (chaloo) and seed tubes (nario) removed. The tines (dánta) do the work of opening and stirring the soil; they should be 18 inches apart. This implement should first be worked lengthwise and then across the field with an interval of a day between these operations. The furrows (chás) made in a field in the forward journey are shown below by straight lines and in the back journey by dotted lines.

The work is made lighter by this method and the furrows (chás) are opened 9 inches apart. The soil between the furrows is also to some extent stirred. The furrows can be made deeper if the tines (dánta) are forced into the soil by using the guiding handle (rumbhanu) as a lever.

4. The rámp works easily and well after the phadko. The blade (pás) should be straight for the gorádu soils of Kaira, Ahmedabad, etc., and bent for the black soils of Surat, Broach, &c. The implement should be worked first in the same direction as the last furrows made by the phadko and across this direction if a second turn is necessary to make the soil friable to a depth of three inches or more. The blade (pás) in the modified rámp is much lighter than usual and therefore to give it sufficient strength it should be made of hardened iron or steel. One man guiding or driving and four people pulling can prepare for sowing 1 bigha of land per day and the work is not hard.

5. The kind of seed drill to be used will depend upon the crop to be sown and the kind of soil. A three tined seed drill (tarfen), lighter in construction but otherwise similar to the ordinary implement with tines (dánta) 10 or 11 inches apart, will be suitable for the principal grain crops (bájri, kodra, &c.) of gorádu soils; but for crops in black soil such as jowári, cotton, &c., the rows must be further apart and a light phadko would be more suitable than a tarfen.

6. The means of traction in the hand implements has been arranged much in the same way as for work cattle. The draft pole (dándi) is shorter and lighter than in the bullock power implements. A stout wooden handle about four feet long is adjusted to the dándi in the same way as the neck yoke (jusari). This handle is intended for two labourers, one on each side of the dándi. They each grasp the handle with both hands and exert their strength by shoving not by pulling. A doubled rope, fixed at its double end round the body (lodhio) of the implement, should be looped up loosely to the dándi at two points along its length. The free ends of the rope should extend beyond the dándi and should be attached to the middle of another handle. Two labourers, one on each side of the rope, grasp the handle and exert their strength, by shoving like the pair of labourers working behind them.

7. The Sarkár has sent specimens of these modified implements to the various districts to be seen and tried by you and as patterns for village carpenters.

8. You will yourselves be able to adapt for manual work the various sizes of bullock hoes (karpi) which you work between the rows of growing crop to kill weeds and stir the soil.

## APPENDIX 57.

## APPENDIX 63.

(Referred to in Paragraph 181 of the Report.)

*Sanitary Commissioner's review of mortality from September 1899 to October 1900.*

The mortality for the famine affected districts is not quite three times the decennial mean ; but in the four worst affected districts of Gujarát, and Khándesh and Thar and Párkar, this is exceeded. I need only then explain as far as I can the mortality in the districts in which it exceeded three times the normal rate. In Gujarát the Collectors of Ahmedabad, Kaira, Panch Maháls and Broach showed these higher rates. The mortality was below the average ten years' mean for the months of September, October and November 1899. In December 1899 it began to rise and continued rising till the maximum was reached in the month of May 1900 and then declined, but was still at the end of October very much above the mean. In Khándesh the death-rate began to rise above the mean in October 1899 and was very high in March and April and again in July and August, and was still double the mean in October 1900. In the Thar and Párkar district of Sind, the death-rate was above the mean in September and continued so till the end of the period under review. The causes of the high mortality in Gujarát are just briefly recapitulated here. They are :—

- (1) The restriction in the food of the people who supplemented it with deleterious and indigestible substances.
- (2) People clung to their homes on this insufficient food to look after their cattle and then came on to works in an impoverished condition and were, therefore, unable or unwilling to do the task imposed in consequence of which the minimum\* wage was given ; being dissatisfied with such wage they would leave and wander away to end by dying in the villages.
- (3) The large influx of people from the Native States round each Collectorate, many of whom arrived in poor condition.
- (4) The disinclination of the mass of the people to leave their homes and go to work for a living wage till too late.
- (5) The great rise in mortality in May, much of which is attributable to the intense heat which prevailed throughout Gujarát.

In Khándesh the cause of the excessive mortality is due to the habits of the Bhils who prefer to live alone and avoid coming to relief works. They got into very low condition. So early as March 1900 the District Medical Officer reported—

'The miserable condition of the Bhils as compared with the Hindu castes and in a lesser degree with the Mahomedans is marked. Famine is undoubtedly extremely severe among the aboriginal tribes in the northern tálukas of the Collectorate ; and it cannot be denied that in spite of all efforts hundreds of these people have died and are dying of slow starvation.'

As regards Thar and Párkar the increase in the death-rate was undoubtedly due to the number of outsiders who marched across the desert, not properly equipped for the journey, and arrived in such a feeble state that recovery from any ailment attacking them was almost hopeless. The cold weather in December and January had, I think, some part in increasing the mortality in Gujarát and the northern parts of Khándesh ; but this was but a contributing cause, as the mortality continued steadily to increase : later on, when the rain fell, the change of temperature, acting on weakened frames which could not readily recover, even with liberal relief, caused the mortality to remain high. An examination of the figures showing the percentage of workers relieved and of those gratuitously relieved to the population of the affected area indicates that, in the most affected districts, however large the relief (which by the middle of November was high in Broach and moderate in the Panch Maháls and Khándesh, whilst it was low in Ahmedabad, Kaira and Thar and Párkar), it made no difference in the steady rise in the death-rates of these Collectorates, and the explanation appears to be that the people in Gujarát and those in parts of Khándesh were suddenly left without resources to fall back on, and delayed too long to avail themselves of the relief works. It seems that there is no practice of storing grain in Gujarát, and the wild tribes of Khándesh habitually live from hand to mouth. In Thar and Párkar it is curious to note how low the percentage of workers and those gratuitously relieved to population is, considering the fact reported, that large numbers came across the desert for work. The influx of outsiders coming in a weak state and filling the hospitals and poor-houses no doubt raised the mortality.

*Sex.*—In every district the deaths of males exceed those of females. For the whole of the affected area deaths are 53.32 per cent. males to 46.68 females, but the excess is much greater in the districts of Kaira, Panch Maháls and Thar and Párkar. These are the districts stated to be most affected by immigration and perhaps this may account for the large excess of male deaths.

*Age.*—If the age periods are examined and divided into periods 'below ten years,' 'above ten years' and 'below 50 years' 'and above 50 years,' it will be seen that in the Gujarát

\* This statement does not appear to be borne out by facts and figures. From the time the Code system was introduced on relief works people received full wages for an appreciable interval after joining the works. The average fine per worker unit relieved from September 1899 to November 1900, was 5 pie in Ahmedabad, 9 pie in Kaira, 27 pies in the Panch Maháls and 6 pie in Broach, which shows that fining for short work or deduction from wages was very moderate.

districts, except Surat, the mortality was heaviest in what may be called the wage earning period of life; and this is especially noticeable in the Ahmedabad and Panch Maháls Collectorates, especially in the Panch Maháls in which more than 50 per cent. of the mortality occurred amongst people at this period of life. The same is noted in the Thána and Thar and Párkar Collectorates. In all the Deccan districts, except Poona and in Belgaum, the mortality amongst children is in excess.

In the districts of Surat, Poona and Belgaum the percentage of deaths amongst those 'below ten years' and those 'above ten and under 50' is about equal. The mortality amongst those 'over 50 years' of age as compared with the total mortality varies from 17.43 in the Panch Maháls to 27.14 in the Kaira district. The only explanation I can offer as to why the percentage of mortality amongst those between '10 and 50 years' should be so heavy in Gujarát is that of immigration. The districts most subject to this, Ahmedabad and Panch Maháls, show high rates and it is not improbable that many children died at home in the outside areas before the parents went out to seek relief and also that on their journeys many infant deaths escaped registration, the child dead being roughly buried as soon as possible. This high mortality amongst adults is also to be noted in the Thána and Thar and Párkar districts into both of which there was immigration. The mortality from different causes will now be briefly alluded to. It must be borne in mind that accuracy in putting the causes of death under their right headings, especially in time of stress, cannot be expected, as the following table giving the mortality per cent. of the total deaths from different causes for the four Collectorates of Gujarát from September 1899 to the end of August 1900 shows:—

District.	Cholera.	Small-pox.	Fever.	Dysentery and Diarrhoea.	Injuries.	Other causes.
Ahmedabad ... ..	10.4	0.07	57.6	9.1	0.4	22.5
Kaira ... ..	11.5	0.06	26.7	15.5	0.7	45.5
Panch Maháls ... ..	7.5	0.20	56.7	23.7	0.2	11.6
Broach ... ..	11.7	0.00	50.3	10.8	0.4	26.7

It is noticeable that where the fever rate is lowest the ratio of deaths attributed to 'other causes' is high, and also in the case of the Panch Maháls the low rate of cholera deaths is counterbalanced by a high ratio of deaths from dysentery and diarrhoea. Cholera from September 1899 to the end of the year was only slightly prevalent in the Southern Division. In January 1900 it practically ceased there, and commenced in Khándesh, appearing first in the Edalabad Petha which borders on Native territory, and then spreading to Bhusával and Ráver tálukas adjoining. In the next month February cholera returns were received from the Jalgaon, Párola and Chopda tálukas, and in March the whole Collectorate was affected, and there was a heavy increase in the next month April, after which it gradually declined, except for a recrudescence in July, and the district was free in October. In the adjoining Collectorate of Násik, cholera appeared in March; and there was an outbreak not so severe as in Khándesh but following the same lines, being at its height in April and subsiding afterwards but not so rapidly, with the same recrudescence in July. In the Gujarát districts the disease was widespread and severe. It was reported first in the Surat district on the 3rd April; then Thásra, a village in the Kaira district, was affected on the 16th, and Nadiád and Borsad, towns in the same district, on the 21st, on which date it also appeared in Godhra town in the Panch Maháls, and on the day previous in Ahmedabad town. The epidemic spread over the whole district; and in May it attained its greatest virulence. As it began to decline in Gujarát there was a severe outbreak in Thána Collectorate though the disease began in April and increased in May. In July there was a general distribution of the disease in the famine affected districts, due to the rains washing the surface dirt into rivers and other unprotected sources of water supply. It is impossible to say that infection was carried from one district to another. The people scattering from an infected camp helped to spread the infection, but the widespread incidence of the disease is more probably due to the decreasing purity of the water supply aided by the heat and the weakened condition of the people, who were unable to withstand any disorder as they would have done in better times. About one-seventh of the total deaths are ascribed to this cause. The incidence of *small-pox* was very light. Vaccinators visited camps regularly and afforded protection to those requiring it. The mortality from *fever* was very heavy being most noticeable in the Gujarát districts. It began to rise above the normal in January being attributed to the cold weather; but it continued steadily through the hot weather, being especially noticeable in the Panch Maháls. Although a careful watch was kept, and expert bacteriological investigation was made, relapsing fever could not be detected. I consider that the trying and prolonged heat was in part the cause during the months of May and June, and later on the damp in the rains acting on weakened frames was the cause of its keeping up so much above the normal. Seeing that it was not subsiding so quickly as it should, and as the period of the year at which fever is very rife in Gujarát was approaching, on the suggestion of the Commissioner, N. D., an extensive system of medical relief was organised, and medicines to combat fever and intestinal disorders were freely distributed up to the end of the year 1900 and much appreciated by the people. The mortality from fever is curiously low in the Collectorates

of Sâtára, Belgaum and Bijápur; and it is difficult to account for this, as the mortality from cholera and dysentery and diarrhoea is not exceptionally high. It may be due to more careful registration on account of plague; but it has not occurred in other areas similarly affected. These three districts however show the lowest death-rates of all the famine affected areas except that the mortality of Poona is slightly lower than that of Sâtára. The mortality from dysentery and diarrhoea was also high, and I am inclined to think it should have been higher, if all the deaths had been entered under their proper headings. It is highest in the Panch Maháls district, and this is probably due to many deaths being entered under this heading which were caused by cholera. Plague did not occur in the Famine Camps or Poor-houses; and the mortality from this in the famine affected districts was comparatively slight, Poona and Belgaum districts alone showing high figures.

*Opinion of the Surgeon-General with the Government of Bombay.*

The undersigned would suggest that the following causes materially contributed to the the increase of mortality :—

- (1) The use of grain and other food stuffs, not necessarily unwholesome, to which the people were unaccustomed;
- (2) Deficiency of milk and butter, and perhaps also of oil;
- (3) Unwholesome and deficient water;
- (4) Imperfect cooking;
- (5) Unwonted exposure to changes of temperature in camps, and whilst moving from place to place;
- (6) Scantiness of clothing.

Although the consumption of old and unsound grain as food in times of scarcity is probably becoming less frequent, it may have played a part in the causation of ill-health and mortality.

*Précis of the report of the Deputy Sanitary Commissioner, Gujardt, No. 190, dated 12th January 1901.*

The total number of deaths recorded in Ahmedabad city during the 6 months June to November 1900 was 15,263 against 3,083, the average of the same period for the five years ending 1898. Of the total number, 7,766 deaths were among males and 7,497 among females. The population of the city according to the Census of 1891 was 144,000. If an addition be made to this on account of the natural increase at the rate at which the population increased during the decade 1881-1891, the deduced population would be 168,000. This would probably be below the mark as a great part of the Mill industry of the city has sprung up during the preceding ten years and must have contributed to the increase in population at a higher rate than during the ten years 1881-1891. The temporary increase owing to famine cannot be even approximately estimated, but the number of deaths among destitute immigrants has been calculated with fair accuracy and amounts to 3,757 for the six months under review. Deaths were registered as occurring among strangers only after careful inquiries failed to elicit any connection of the deceased with the city. Deducting the deaths ascertained to have occurred among destitute immigrants the death-rate on the deduced population works out to 68 *per mille* against 20 *per mille* for the six months. If a further deduction of 10 *per mille* be made on account of the deaths in the poor-houses and orphanages within the city limits (of which there were 3 or 4 in existence at different times) the death-rate among the estimated resident population of the city would be 58 *per mille* for six months. On the whole therefore it may be stated that the mortality was not more than three times the normal, which cannot be considered excessive in a year of famine.

The following table shows the number of deaths for the six months by diseases :—

Causes.	Six months, June to November 1900.	Average of 5 years ending 1898.
Cholera ... ..	612	49
Small-pox ... ..	3	1
Fever ... ..	(a) 7,390	1,739
Dysentery and Diarrhoea...	1,027	117
Injuries ... ..	30	24
Other causes ... ..	(b) 6,201	1,153
Total ... ..	15,263	3,083
(a) Plague ... .. 18		
(b) Starvation ... ..	2,048	1,199
Bronchitis ... ..	449	54
Phthisis ... ..	541	579
Asthma ... ..	747	194
Capillary Bronchitis ... ..	...	...
Measles ... ..	...	...
Want of lactation ... ..	...	...
Erysipelas ... ..	...	...

Cholera prevailed in an epidemic form during June to September. Out of the total 612 deaths from this disease, 70 occurred in June, 150 in July, 315 in August and 77 in September. The Municipal water supply deteriorated during the hot weather, but repeated examination failed to show any contamination with cholera germs. Certain circumstances strongly point to the water of Sabarmati as one of the sources, if not the chief source, of infection. In spite of a good water supply there are many wells still in use within the city limits, and these wells and the wayside pools of water which formed after the fall of the rains no doubt helped to spread the contagion for several months. Fever was answerable for nearly one-half of the total deaths. Eighteen of the deaths under this head were due to plague and there is no reason to suppose that a greater number occurred from this cause than were actually reported. The number of deaths by months was—

June	...	...	855	September	...	...	1,605
July	...	...	1,152	October	...	...	1,024
August	...	...	1,772	November	...	...	982

It was generally remarked that a type of malarial fever associated with jaundice was very prevalent and all classes, Europeans and Natives, suffered. A careful microscopic examination made in June of the blood taken from 41 fever patients in the poor-houses in and around Ahmedabad and from the Civil and Police Hospitals gave negative results as regards famine fever. Deaths from dysentery and diarrhoea increased nearly ten-fold. The diseases were most prevalent during August, September and October. Damp and chill added to privation and consequent use of unsuitable food no doubt were responsible for many of these deaths, but no classes were exempt from attack and many Europeans suffered. The mortality from other causes increased over five-fold. Starvation was credited with 2,048 or over one-third of these deaths. Most of them were among destitute immigrants. Bronchitis, phthisis, asthma and capillary bronchitis—all diseases of the respiratory organs—gave a total of 70 per cent. of deaths from 'other causes' minus deaths from starvation. This denotes a marked increase on the average of 58 per cent. and points to an increase in diseases of the respiratory organs. There has evidently been an increase in respiratory diseases during the last ten years, no doubt a result of the increasing Mill industry which has attracted a class of people who pass their days in impure atmosphere and their nights in crowded and insanitary dwellings. 'Want of lactation' follows next in pre-eminence among 'other causes,' but no adequate explanation of this as a cause of death can be given for want of insight into the real significance of the term.\* Deaths by castes are shown below :—

Mahomedan	...	...	2,373	Jains	...	...	527
Hindus of castes	...	...	10,789	Parsis	...	...	28
Hindus of low caste	...	...	1,505				

It would appear that Hindus † of caste have suffered proportionately more than other classes. All classes suffered, but none to such an extent as the Hindus of caste. In the following table the number of deaths by age is compared with the average :—

Age periods.	During six months, June to November 1900.	Average.
Under 1 year	2,126	771
1 and under 5 years	2,934	630
5 and under 10 years	960	104
10 and under 15 years	772	77
15 and under 20 years	579	91
20 and under 30 years	1,480	266
30 and under 40 years	1,464	246
40 and under 50 years	1,299	221
50 and under 60 years	1,285	242
Over 60 years	2,304	435

The most striking feature is that while the mortality was high in all age periods the two periods (5 to 10 and 10 to 15) which are usually the healthiest were proportionately the greatest sufferers. In these cases the mortality increased nine-fold and ten-fold. Amongst these again boys suffered more than girls. Stated briefly there were 12,180 deaths in excess of the average during the six months, of which one-sixth were due to starvation and the remainder were mainly caused by ordinary diseases acting on constitutions enfeebled by want and privation.

\* The Sanitary Commissioner explains the term as follows :—

"The mother has not sufficient breast milk for the infant. Consequently additional unsuitable food was given to the infant, who gets weaker and eventually succumbs."

† The Sanitary Commissioner notes that only Dheds, Waghris and Bhangis are classed as Hindus of low caste.

## APPENDIX 69.

(Referred to in Paragraph 196 of the Report.)

*Note by the Director of Land Records and Agriculture regarding the traffic in hides, skins, bones and horns.*

With a view to ascertaining to what extent the exports of hides, horns and bones from Gujarát had increased in consequence of the heavy mortality among cattle, the Price Inspector, Northern Division, was deputed to obtain figures of exports from railway stations in Ahmedabad, Kaira, the Panch Maháls and Broach. Surat was excluded from the enquiry as the mortality among cattle was not likely to be heavy in that district, grass and fodder being fairly sufficient. During the five months ending December 1899, 170,000 maunds of hides, 12,000 maunds of skins, 113,000 maunds of bones and 4,400 maunds of horns were exported from railway stations in Ahmedabad, Kaira, the Panch Maháls and Broach. The export trade in hides is confined to certain centres in each district to which hides from smaller stations are sent for transmission to their ultimate destinations. In this way certain quantities of hides appear twice in the district totals of exports. To gauge approximately the actual exports, the exports from the centres alone have been taken into account. The following statement shows the different trade centres with their exports during the period under review:—

District.	Station.	Quantity in Indian maunds.
Ahmedabad ...	Ahmedabad ... ..	40,591
	Viramgám ... ..	19,929
	Ránpur ... ..	13,834
	Total ... ..	74,354
Kaira ... ..	Nadiád ... ..	20,409
Panch Maháls ...	Godhra ... ..	32,583
	Dohad ... ..	2,616
	Total ... ..	35,199
Broach ... ..	Anklesvar ... ..	2 360
	Broach ... ..	1,555
	Baroda ... ..	1,107
	Total ... ..	5,022
Grand Total ... ..		134,984

During the six months ending December 1898, the exports of hides from Gujarát and Káthiáwár amounted to only 8,475 maunds, or 6 per cent. of the exports under review. Hides are mostly exported to Cawnpore and Bombay and in smaller quantities to Madras and even to Calcutta. The greater part of the exports to Bombay are intended for shipment to Europe. The exports from Ahmedabad and Kaira reached the highest point in November and those from the Panch Maháls and Broach in December. Assuming that 6 hides go to an Indian maund, the above figures represent a mortality amounting to more than 800,000 head of cattle. Native States are no doubt responsible for a large proportion. There is not much increase in the exports of skins (of sheep and goats), which are mostly sent from Ahmedabad, Godhra, Dákor and Baroda to Máhim and Kurla, where the Bombay tanneries are located. Bones are exported from different stations directly to Bombay, where they are crushed for shipment to Europe. The occasional consignments to Thána are apparently intended for the local bone-crushing factory. Horns are all sent to Bombay for shipment to Europe. Besides the above exports considerable quantities of bones and horns are said to have been sent by sea from Broach and Anklesvar.

## APPENDIX 70.

(Referred to in Paragraph 200 of the Report.)

Statement showing the rainfall in inches at principal stations in the affected Native States of the Bombay Presidency in 1899 and 1900 as compared with the average of eleven years ending 1897.

) Includes expenditure on gratuitous relief to dependants of relief workers.

) The total expenditure incurred in connection with famine relief is reported to be Rs. 24,10,000, but no details have been given. Elsewhere in the report it is stated that Rs. 2,77,340 were disbursed as advances, loans, &amp;c., and that Rs. 1,250 were spent in connection with measures for the preservation of cattle. These two items are excluded from the famine expenditure shown in this statement.

) Exclusive of Rs. 66,203 on account of salaries and allowances of officers on special duty chargeable to General Revenues.

) Includes expenditure the distribution of which under different heads has not been reported.

) Besides this amount Rs. 17,000 were expended on the construction of new and the repairs of old buildings to provide work for carpenters and other artisans, Rs. 683 on Police establishment and Rs. 3,289 on grain compensation.

) Includes Rs. 2,805 on account of advances to weavers in cash and yarn.

) Includes expenditure on account of grain compensation which has not been separately reported.

) Includes Rs. 12,469 expended on poor-houses, kitchens and village relief for which separate figures have not been reported.

## APPENDIX 79.

(Referred to in Paragraph 222 of the Report.)

*List of non-official gentlemen who rendered useful service during the famine of 1899-1902.*

Name.	Place of residence, occupation, &c.	Nature of service rendered.	Name.	Place of residence, occupation, &c.	Nature of service rendered.
<b>Ahmedabad.</b>			<b>Ahmedabad—continued.</b>		
Mr. A. Whittle ...	Wadhwan. Part owner of mills in Virangám, Ránpur, Wadhwan, &c.	Distributed large sums in charity in the district in 1899-1900.	Mr. Parmanandas Jivandas Vakil.	Gogho. Landowner and Honorary Magistrate.	Did excellent work as Honorary Superintendent of Gogho poor-house in 1899-1900 and 1901-02.
Mr. Joseph Benjamin.	A private medical practitioner and Municipal Commissioner at Ahmedabad.	Was indefatigable in relieving wanderers and the destitute in the city and managed near Gomtipur, not far from Ahmedabad, a private poor-house containing some 300-500 persons in 1899-1900. Distributed food, clothes and medicine from charitable funds, 1901-02.	Mr. Jivajibhai Bapabhai.	Ranpur. Talukdar and Honorary Magistrate.	Acted as Honorary Superintendent of Ránpur poor-house in 1899-1900 and 1901-02.
Mr. Trikamlal Ranchoddas, B.A., LL.B.	Ahmedabad. Practises as a pleader in Bombay.	Managed a poor-house outside Ahmedabad city near Sarangpur Gate from March to August 1900. He acted as Honorary Secretary with a committee of twenty.	Mr. Dulabhrám Jethalal.	Dholka. Municipal Secretary.	Did hard work as Superintendent of Dholka poor-house (1899-1900) and also supervised test works (1899-1900) very conscientiously.
Rev. Mr. J. F. Steele, M.A., B.D.	Irish Presbyterian Mission, Ahmedabad.	Distributed private funds in relief of distress, co-operating with local officers and worked with unremitting energy. In addition to its own particular work the Mission helped the cultivators of 19 villages in Daskroi taluka by the distribution of bullocks (149), money (Rs 1,895), seed and grain (1,295 maunds), the funds being Mission relief funds, 1899-1900.	Mr. Keshavlal Jivabhai.	Ahmedabad. Contractor.	Managed a poor-house near Sháhpur Gate, 1901-02. The average number of inmates was 75. Funds were privately contributed and partly by Mr. Keshavlal himself.
Mrs. Steele (deceased).			Mr. Vadilal Jambadas.	Parántij. Bania...	Acted as Honorary Superintendent of the poor-house at Parántij, December 1899 to December 1900.
Mrs. Taylor, wife of Rev. G. P. Taylor.			Mr. Valavdas Bapuji Desai.	Modása. Bania.	Acted as Honorary Superintendents of the poor-houses at Modása, October 1899 to September 1900.
Rev. Mr. H. V. Andrews.			Mr. Ranchodlal Bhaichand.		
Rev. Mr. T. F. King.	Sánand.	Co-operated with the local officers in the same thorough manner as the Irish Presbyterian Mission. In 1901-02 Revd. Mr. King managed a special relief scheme for benefit of distressed weavers with marked success. Worked throughout the year in 40 villages, supervising gratuitous relief, inspecting works, and generally did invaluable work. Mr. Borup in 1899-1900 supervised test works and managed Gangasar relief work kitchen and Virangam poor-house with great success at a time when such assistance was much needed. In 1901-02 he helped with gratuitous relief in the cold weather (i.e., until he went home on leave).	Mr. Rajpal Daya.	Sánand. Bania...	Acted as Honorary Superintendent of the poor-house at Sánand, November 1899 to January 1901.
Rev. Mr. Borup...	Virangam.		Mr. Harjibhai Madhavji.	Dholera. Trader and Shroff.	Acted as Honorary Superintendent of the poor-house at Dholera, January to October 1901.
Rev. Mr. Back ...	Dholka		Mr. Tribhuvandas Govindji.	Dholera. Trader and Shroff.	Acted as Honorary Superintendent of the poor-house at Dholera, December 1899 to November 1900 and February to October 1902.
Mr. Adamia Karimkhan.	Virangam Landowner and Kasbat.		Mr. Jethalal Ranchoddas.	Dhandhuka. Cultivator, Honorary Magistrate and Municipal Commissioner.	Acted as Honorary Superintendent of the poor-house at Dhandhuka, January to November 1900 and March 1901 to October 1902.
Mr. Mansukhbhai Bhagubhai.	Ahmedabad. Mill owner and landowner.	Mr. Girdharlal Harivalavdas.	Virangám. Kumbi cultivator and money-lender.	Acted as Honorary Superintendent of the poor-house at Virangám through rains of 1901 and following cold weather and did very good service. Also gave much assistance to his tenants throughout the famine.	
		Mr. Jibhai Kevaldas.	Virangám. Millowner and landowner.	Lent his Dharamsála for a Government poor-house in rains of 1902.	

## APPENDIX 79—continued.

Name.	Place of residence, occupation, &c.	Nature of service rendered.	Name.	Place of residence, occupation, &c.	Nature of service rendered.	
<b>Kaira.</b>			<b>Panch Maha'ls—continued.</b>			
Mr. R. Boyd.	Irish Presbyterian Mission, A' mand.	Unceasingly assisted the distressed people; cordially assisted in distributing money and grain to the cultivators, and spared no efforts to give relief.	Mr. Fardunji Caswasji.	Dohad. Abkari Contractor.	Liberal contribution towards relief, particularly in sending a free supply of milk to the Muwalia kitchen. Made himself useful in many ways to the taluka and subdivisional officers, 1901-02.	
Mr. R. Henyon, M.A.	Irish Presbyterian Mission, Borsad.		Mr. Bomanji Ardeshir Dalal.	Ahmedabad. Abkari Contractor and Landholder in Halol Mahal.	Gave relief and advances to all the people residing in Rustumpura village and took all other measures necessary for the preservation of life; improved the water-supply, and imported fodder for the benefit of his cultivators.	
Mr. G. W. Kirk (Awarded a silver medal, Class II, 1902)	Methodist Episcopal Mission, Nadiad.		Mr. C. B. Jefferison.	Bombay. Assistant in the firm of Messrs Grindlay Groom & Co.	Voluntarily served as a relief officer in Jambusar taluka from 17th July to 14th August 1900.	
Mr. Hudson (deceased).	Methodist Episcopal Mission, Umreth.		Mr. Hormusji Kharshedji Avasia.	Broach. Railway Station Master (now retired).	Rendered excellent and timely assistance in connection with the importation of grass and bullocks and depotation of animals to Thana during the whole famine period of 1899-1900.	
Mr. S. P. Milcom.	Christian and Alliance Mission, Mehmabad.	Rendered specially good service in the administration of famine relief.	Khan Bahadur Adarji Mancherji Dalal. (The title of Khan Bahadur was conferred in 1901.)	Broach. Merchant	Took the greatest pains to assist the poor. It was by his exertions that a private poor-house was started at Broach. It was creditably managed by him in 1899-1900.	
Jivram Banod.	Umreth		The Honourable Rao Bahadur Chunnil Venilal, C.I.E.	President, Broach Municipality.	Was an invaluable coadjutor to the Collector in the administration of famine relief.	
Sahab Magan-Jechand.	Kapadvanj		Mr. Pirsahab Amir-sahab.	Inamdar of Bhiwa.	Did good work in distributing the charitable fund money to Mahomedans and Hindus in the city of Broach during the famine of 1899-1900.	
Ranchhodhbhai mbhai.	Borsad		Mr. Dinshaw Fardunji Jinwalla.	Broach. Gin-owner.		
Mohanlal Mital.	Matar		Mr. Hiralal Chunnilal	Broach. Government Pleader.	Was Joint Secretary to the private poor-house at Broach, and gave his services gratuitously in spite of a considerable practice in his profession.	
Mr. Rao Bahadur Becharidas Parotamdas Charidas.	Nadiad		Dr. Barjorji Sorabshaw Munsifna.	Private Practitioner.		
Desaibhai Kasas.	Public Prosecutor, Kaira district (residing in Ahmedabad).		<b>Surat.</b>			
Gordhandas Govandas.	Nadiad		Khan Bahadur Burjorji N. Vakil (The title of Khan Bahadur was conferred in 1901).	Surat. Vakil		Rendered special service in raising subscriptions and in organizing and managing the cheap grain fund in Surat city, from 3rd October 1899 to 26th October 1900.
Amritlal Malal Desai.	Thana		Rao Sahab Hera-chand Motichand (The title of Rao Sahab was conferred in 1901).	Surat. Pearl Merchant.		
<b>Panch Maha'ls.</b>						
Mr. Hemchand Javer.	Godhra. Merchant.	Managed a cheap grain shop on behalf of the Assistant Collector in 1899-1900, and freely contributed towards relief.				
Mr. Musa Jamal.	Godhra. Police Patel; Farmer.	Managed a kitchen; helped in organizing and managing the poor-house; helped in the purchase and distribution of tagai bullocks, 1900-01.				
Mr. Balvantrai Sararam.	Goraj, Halol Mahal. Manager of the Inamdar of Goraj.	Gave relief on behalf of the Inamdar to his own people by opening tank works and by giving bullocks and tagai, 1901-02.				
Mr. Chagan Tulsi.	Malao of Kalol taluka, Police Patel, Inamdar and Cultivator.	Acted as a Circle Inspector; made useful suggestions to the responsible officers of the taluka, 1901-02.				

## APPENDIX '79—continued.

Name.	Place of residence, occupation, &c.	Nature of service rendered.	Name.	Place of residence, occupation, &c.	Nature of service rendered.
<b>Surat—continued.</b>			<b>Tha'na—continued.</b>		
Rev. Mr. H. R. Scott, M.A.	Surat. Irish Presbyterian Mission.	Distributed grants to cultivators of villages in the Mándvi and Bárdoli talukas; opened and managed cheap grain shops at Areth and Bárdoli from 10th June to 27th October 1900; and received orphans into the Mission Orphanages at Areth and Bárdoli.	Mr. Ratansi Mulji.	Bombay. Merchant.	Maintained a poor-house on the relief work at Pokhran near Thána, opened for destitute immigrants into Bombay from Gujarát and Káthiáwar from 10th April to 13th June 1900. Over 1,000 persons were fed there.
Mr. Hardevram Nanabhai Haridas.	Surat. Barrister-at-Law.	Organized and managed the Mahájan Orphanage in Surat city opened 8th July 1900.	Mr. Balkrishna Wamnaji Galwankar.	Bassein. Landlord.	Employed a large number of people on private field work in Bassein taluka by way of relief at a cost of about Rs. 3,000 in 1900.
Mr. Araf Ismail Nakhuda.	Merchant of Ránder.	He and his family managed the Araf Ismail Mehtar cheap grain shop at Ránder from 2nd November 1899 to 30th September 1900.	Mr. Damodar Kisandas (deceased).	Bassein. Sub-Government Pleader.	Distributed cooked food to poor and employed Káthiáwari beggars in excavating tanks in Bassein at his own cost in 1900.
Mr. Kavaji Dhanjibhai Dhanbhurava'a.	Merchant of Bulsár.	Made liberal donations in cash and kind for the relief of the distressed and managed a private kitchen at Bulsár, 1900.	Mr. Hargovan Wanmali.	Bassein. Landlord and money-lender.	Assisted wandering Káthiáwari by feeding them and helping them on their way to Bombay and elsewhere; had those that were sick taken care of and tended till they recovered.
<b>Tha'na.</b>					
Mr. Haji Bakir Sahab Faki (deceased).	Bhiwndi. Trader and landlord.	Spent some thousands in employing people on private field work and also on clearance of public tanks in several villages from January to June 1900.	Mr. Ruttonji Bomanji Dubash.	Bassein. Salt merchant.	Gave Rs. 200 for employment of famine labourers on a dam by which water was stored for famine stricken cattle.
		Provided work for many persons of the Warli caste on their farms and helped them with food; took charge of several hundred head of cattle sent from Gujarát; kept them in good condition for several months at their own expense and sent back to Gujarát those that survived, about 80 per cent; opened cheap grain shops at Kochai, Kawád and Deheri at which rice was sold at rates considerably below the rates prevailing in the bazár, and also sold Rs. 3,000 worth of rice to the petha Relief Committee at rates below the bazár rates; subscribed Rs. 300 to the Charitable Relief Fund for distribution in Dáhanu taluka; purchased 50 pairs of bullocks and sent them to Broach district, charging only the actual cost of purchase and bearing other expenses.	Mr. Naro Raghunath Babre.	Chinchani, Dáhanu taluka. Pensioner, Special Magistrate, 3rd Class.	Assisted in the management of the Famine Orphanage at Chinchani from 24th July 1900 to 19th February 1901.
Mr. Hormuji Dorabji Davierwala (deceased)	Deheri. Landlords.		Seth Narsilal Hirala.	Chinchani, Dáhanu taluka. Landowner and money-lender.	Managed a Famine Orphanage started at Chinchani; also took a leading part in collecting subscriptions for famine relief fund.
Mr. Ardesir Dorabji Davierwala.			Mr. Haribhai Premanand.	Sanján, Umbargaon petha. Money-lender and dealer in timber.	Distributed cooked food to about 400 persons daily from 1st June to 31st July 1900; contributed Rs. 100 towards a famine relief fund for the petha; supervised distribution of dole in Sanján from 25th June to 9th November 1900.
			Mr. Ismail Daud...	Sanján, Umbargaon petha. Timber merchant.	Supervised purchase and distribution of dole in Uplat from 16th June to 7th November 1900.
