No. 479 of 1868.

Separate.

Military Department.

To the Right Honourable the Secretary of State for India.

SIR,

We have the honour to forward Minutes by the Right Honourable the Governor General and the Honourable Colonel Norman on the subject of pensions to widows and orphans of officers entering the staff corps from the British Army, as well as of chaplains and medical officers under the new conditions of service.

2. We consider the necessity to secure a provision for the widows and orphans of the above officers to be most urgent, and we very earnestly recommend the proposals contained in the Minute of Colonel Norman to the favourable consideration of Her Majesty's Government.

We have, &c.,

(Signed) JOHN LAWRENCE.
W. R. MANSFIELD.
HENRY S. MAINE.
J. STRACHEY.
R. TEMPLE.
H. W. NORMAN.

Fort William,
The 14th December 1868.

Exd. M. Joseph.

MINUTE by the Honourable Colonel H. W. NORMAN, C.B., on the subject of Pensions to Widows and Orphans of Officers entering the Staff Corps from the British Army, as well as of Chaplains and Medical Officers under the new conditions of service.

ONE of the measures resolved on in connexion with the abolition of a local army for India was the transfer of the several Military and Orphan Funds in the three presidencies to the Government, and their gradual winding up.

By these funds, which were maintained by donations and subscriptions from the officers of the army, aided by not very large subscriptions from Government, pensions were provided for widows and for orphans, and some other advantages given, such as passage money on certain occasions, an income allowance of £50 a year to subalterns on furlough, and an outfit allowance to a sick officer going home.

The advantages, and the rates of subscription, and the rules, differed in all the presidencies, but in all a fair provision was secured for widows and orphans, mainly from the proceeds of the subscription of the officers themselves.

When the Government took over the funds, all advantages were guaranteed to the existing subscribers, who continued, subject to the previous rules as to rates of subscription and donation; but as no new subscribers were to be admitted, the funds would gradually expire.

The Staff Corps is now recruited from the British army, and it has been laid down that in the case of all officers so appointed, their widows and families will be granted a pension "not less than that to which they would be entitled under the provisions of the Royal Warrant of June 15th, 1855."

In communicating this decision, the Secretary of State remarked that it remained "to be decided from what funds those pensions will be provided."

It seems pretty clear, however, that this new pension list will be a charge on the State, while the pensions to widows and orphans formerly given, though far more adequate than the new scale, cost the State only a comparatively small sum in the shape of an annual subscription to each fund.

Annexed are the statements showing the amount of donations and subscriptions paid by officers, under the old system, to the funds of the three presidencies, and of the pensions given to widows and orphans.

There is also attached a copy of the pension scale of the British army, which now will be applicable to the families of officers entering the Staff Corps.

These pensions are manifestly inadequate to the support of the widows and children of gentlemen, and in the case of the Royal army, to avoid the scandal of widows having to be privately aided, to enable them to return home, a Queen's Widows' Fund has been in existence for many years, formed from subscriptions of officers, from which fund grants of money are given to widows to enable them to defray all their expenses till they leave India, and to pay their passage home.

It seems most desirable that some fund should be re-constituted by which the widows and legitimate orphans of officers now entering the Staff Corps should be secured from poverty, as is now the case with the families of officers who belonged to the late Indian army, and of the Civil Service; and in any scheme of the kind medical officers and chaplains might be appropriately included, as they were under the former system, subscribing and receiving advantages, according to their relative rank, with combatant officers.

But, as an improvement on the old system, I think the fund should be entirely a Government institution, with a uniform scale of donations, subscriptions, and pensions for the three presidencies. No advantages beyond pensions to widows and orphans are now needed, as the present system of Furlough Regulations should render it unnecessary for officers to require the aid previously given by funds when they proceeded home.

Looking to the rates of pensions formerly given, and striking somewhere about the average of the three presidencies, I think the following would be a fair scale of pension for widows and orphans :—

	£
Widow of a colonel	240 a year.
" " lieutenant-colonel	200 "
" " major	160 "
" " captain	120 "
" " lieutenant	70 "
Orphan (male or female) under 5 years of age	24 "
Male orphan from 5 to 19 or any earlier age at which provided for	40 "
Female orphan from 5 until married	40 "

Under the old system a small marriage dower for girls, or apprentice fee for boys, was authorized, but this I think need not form a part of the new system.

I think if some such scale of pensions could be secured to the families of officers of the Staff Corps the respectability of the service would be increased, and the advantage of belonging to it more highly prized.

As I do not think Government need be put to more expense than a payment equivalent to the scale of pensions given in the British army to widows and orphans, I would suggest that the donations and subscriptions should be limited to such amount as might fairly meet the cost of the increase of pensions.

For those officers now in the Staff Corps who came from British regiments I would allow subscription or not to be optional, but I think it should be compulsory on all hereafter joining, as it used to be in the Indian army, and is now in the Civil Service.

As no officer who is not married could benefit by the fund I would require no donation from a bachelor joining the Staff Corps, or from a bachelor on promotion from one rank to another, and his subscription I think should not exceed half that of a married officer without children. From the married officer on joining the Staff Corps, or from a Staff Corps officer marrying, or a married officer on promotion, a donation might be exacted ; and besides double the subscription of the bachelor in each grade, I think a monthly subscription for each child eligible to the benefits of pension might be exacted, as is now the case with subscribers to the late Bengal Orphan Fund.

What should be the scale of pensions and donations is a matter for an actuary, and probably could only be soundly reported on at home, and anything I could devise on the subject would probably be incorrect ; but I think there would be no difficulty in doing this on the principles above proposed.

I would solicit the support of the Viceroy and of his Excellency's Council to the scheme I propose, or to some modification of it. The case of a chaplain's widow has already excited public attention, and necessitated a subscription on her behalf, and in a few years such cases will become numerous, and constant appeals come for charitable aid for widows and orphans left in a strange land with means utterly inadequate to support them. It was greatly to remedy this state of things that the old funds were established ; and as I do not ask for an expenditure of public money, but merely for an organized system under government control, by which officers shall subscribe the equivalent between the government rate of pensions and those on a higher, but still moderate scale, I should hope that Her Majesty's Government would view the proposal with favour.

Calcutta,
The 4th December 1868.

H. W. NORMAN.

Not exceeding the annual amount of the half-pay attached to the rank of the officer.

* The widows of half-pay Medical Officers holding any commission giving a rank not included in the above scale may, if eligible, have the rates of pension specified in the scale annexed to the warrant of 13th June 1826.

MINUTE by His Excellency the Right Honourable the Governor General.

I AM most strongly in favour of this proposal, and would urge it very strongly on the Secretary of State for India. It appears to me to be the duty of the Government to establish such funds, and insist on officers subscribing to them on entering the local service. Unless officers are compelled to subscribe for the future maintenance of their widows and children, this sacred duty will in many cases be neglected, and we shall constantly have instances of these relatives of officers, who have held honourable positions under the Government of India, seeking, and seeking even in vain, for assistance from the public. Such a state of things would, I submit, be derogatory to the service at large, and a grave scandal in the eyes of the natives of the country. On public grounds, therefore, as well as to prevent much misery and degradation hereafter to many helpless ladies and children, tenderly brought up, I strongly recommend the proposal for the support of my colleagues and the Secretary of State.

The 5th December 1868.

JOHN LAWRENCE.

I quite agree.

The 6th December 1868.

J. STRACHEY.

And I.

The 7th December 1868.

H. S. MAINE.

And I.

The 7th December 1868.

G. N. TAYLOR.

MINUTE by the Honourable Sir R. TEMPLE, K.C.S.I.

I UNDERSTAND that a limited amount of widows' pension, according to the analogy of the British Service, is to be paid by the State; and that the remainder required to make up the amount to the old Indian scale is to be obtained by enforced subscriptions from the officers themselves. In the general principle, I cordially concur, as being essential to the efficiency and character of the future Staff Corps.

The 5th December 1868.

R. TEMPLE.

Exd. M. Joseph.

India Office, S.W.,
25th February 1869.

Sir,
I AM directed by the Secretary of State for India in Council to forward for your information, copy of a despatch from the Government of India, relating to a proposal to establish a system of Pensions for the benefit of Widows and Children of Officers of the several Staff Corps, and I am to request that, as soon as the work upon which you are now engaged shall have been completed, you will prepare and submit a full report upon the probable financial operation of Colonel Norman's proposal.

I have, &c.

T. T. PEARS,

Major-General, Military Secretary.

Major-General Hannington.

London, 5th April 1869.

BEFORE entering on the money calculations respecting a system of Pensions for the benefit of Widows and Orphans of Officers in the Staff Corps, it is necessary to define the rates of interest and exchange that may be used without disadvantage to the Government or its officers.

I would respectfully suggest four and a half per cent. interest per annum, and one shilling and elevenpence for the rupee, as equitable rates, and I will adopt these if not otherwise instructed.

To Major-General Pears, C.B.,
Military Secretary.

I have, &c.

J. HANNINGTON.

India Office, S.W.,
23d April 1869.

Sir,
I AM directed by the Secretary of State for India in Council to acknowledge the receipt of your letter of the 5th instant, and to acquaint you in reply that you are authorised to adopt the rates therein proposed for interest and exchange in your calculations on the subject of the scheme for Pensions to Widows and Orphans of Officers entering the Staff Corps from the British Army, and of Chaplains and Medical Officers under the new conditions of service.

I have, &c.,

T. T. PEARS,

Major-General, Military Secretary.

Major-General Hannington.

Symbols and Formulae.

Person.		Age.		Number living at that Age.
Officer	-	x	-	l_x
Wife	-	y	-	l_y
Widow	-	w	-	l_w
Son	-	$-$	-	l_s
Daughter, unmarried	-	u	-	l_u

1. $l_x - l_{x+1} = d_x$; the number of officers now aged x , who die in the next, or $(x + 1)^{\text{th}}$ year.
2. $\frac{l_y + l_{y+1}}{2} = l_{y+\frac{1}{2}}$; the number of wives now aged y , who live till the middle of the next, or $(y + 1)^{\text{th}}$ year.
3. r = the rate of interest per cent. per annum.
(In the calculations, $r = .045$.)
4. $v^x = \frac{1}{(1+r)^x}$; the present value of a monetary unit to be received at the end of x years hence.
5. $l_x v^x = D_x$
6. $\sum (D_{x+1}) = N_x$; the sum of $D_{x+1} + D_{x+2}$, &c. to the end of life.
7. $\frac{N_x}{D_x} = a_x$; the present value of a monetary unit, to be received at the end of each year of age during the existence of a life now aged x . This is called a life annuity.
8. $l_x l_y v^y = D_{x,y}$. Note. In the joint life formulae, v^y is used for convenience in the arithmetical operations.
9. $\sum (D_{x,y+1}) = N_{x,y}$; the sum of $D_{x,y+1} + D_{x,y+2}$, &c., to the end of coexistent life.
10. $\frac{N_{x,y}}{D_{x,y}} = a_{x,y}$; the present value of a monetary unit to be received at the end of each year during the coexistence of the lives now aged x and y . This is called a joint life annuity. It ceases on the failure of either life.
11. $d_x l_{y+\frac{1}{2}} v^{y+\frac{1}{2}} a_{w+\frac{1}{2}} = D_{x,y}^2$. Note. $l_{y+\frac{1}{2}} v^{y+\frac{1}{2}} a_{w+\frac{1}{2}} = B_y$
12. $\sum (D_{x,y}^2) = N_{x,y}^2$; the sum of $D_{x,y}^2 + D_{x,y+1}^2$, &c., to the end of life.
13. $\frac{N_{x,y}^2}{D_{x,y}} = a_{x,y}^2$; the present value of a monetary unit, to be received in the middle of each year, after the decease of a male, now aged x , and to continue during the widowhood of his wife now aged y . Payment ceases on re-marriage or death.
14. $ma_{x,y}^2$ = the present value of a reversionary widowhood annuity of m units of money.
15. $S(a_{x,y} + .458)$ = the present value of an annuity of S units of money payable in 12 equal portions during the year.
16. Equating the expressions 14 and 15, we have—

$$m = \frac{S(a_{x,y} + .458)}{a_{x,y}^2}, \text{ and } S = \frac{ma_{x,y}^2}{a_{x,y} + .458}$$

17. If a donation or fine f be paid in reduction of S , then—

$$S = \frac{ma_{x,y}^2 - f}{a_{x,y} + .458}$$

18. When m and S are fixed, the fine f for disparity of age is,—

$$ma_{x,y}^2 - S(a_{x,y} + .458) = f.$$

19. $a_u - a_{x+u}$ = the present value of an annuity, payable so long as a daughter now aged u , may live *unmarried* after the decease of her father now aged x .

20. $S = \frac{m(a_u - a_{x+u})}{a_{x+u}}$; the amount of yearly subscription to be paid during the co-existence of the lives now aged x and u to provide a reversionary annuity m , payable to u while *unmarried* after the death of x .

21. $S = \frac{m(a_u - a_{x+u}) - f}{a_{x+u}}$ = the same, supposing a fine f , to be paid at the beginning.

22. In the case of sons, let it be understood that the annuities are temporary, D_{21} being the limit of D_s , and D_{55+21} the limit of $D_{x,s}$; then, putting s for u , the formulæ 20 and 21 will serve to determine the subscriptions to be paid for sons.

23. The addition to be made to a joint life annuity for monthly payments is in all cases 0.458 .

24. The present value at age x of an annuity to begin at a future age $x+n$ is $\frac{D_{x+n}a_{x+n}}{D_x} = {}^{ln}a_x$, and the form holds when $x \cdot y$ or $\frac{2}{x \cdot y}$ is put for x .

25. The present value at age x , of an annuity which will be reduced to one half at the age $x+n$, is $a_x - \frac{{}^{ln}a_x}{2}$.

26. The present value of an annuity to begin at age x and continue till age $x+n$ is $\frac{N_x - N_{x+n}}{D_x} = {}^n a_x$. This holds when $x \cdot y$ or $\frac{2}{x \cdot y}$ is put for x .

27. The present value of a monetary unit to be received on the death of a person now aged x is, $v - (1-v)a_x = A_x$.

Note on the Construction of the Tables.

1. Nearly all of the calculations in this report have been effected on the "arithmometre" or calculating machine invented by M. Thomas de Colmar. As this machine is not yet known and appreciated as it deserves to be, and as it is necessary to explain some of the processes that I have used, the following details will not be deemed out of place.

2. Let it be understood that the machine will add or subtract numbers up to 1,000 millions; that it will multiply eight figures by eight figures, giving products up to sixteen figures; that it will divide sixteen figures by eight figures, giving the quotient to any extent; and all this without risk of error.

3. I had first occasion to compute a table of v^x from v^0 to v^{100} at $4\frac{1}{2}$ per cent. To effect this I had to compute by hand v^{10} , v^{20} , v^{30} , &c., each tenth value, to a large number of decimal places.

4. The machine gives $v = \frac{1}{1.045} = 0.9569377990430622$, and by tabulating the first nine multiples of this, it becomes easy to form v^2 . Again tabulating we can form v^4 ; from v^4 we get v^8 , and then $v^8 \times v^2$ gives v^{10} . In precisely the same way we can obtain successively v^{20} , v^{30} , v^{40} , and so on. The values are in fact as follows:—

$$\begin{aligned}v^2 &= 0.91572995124 \\v^4 &= 0.83856134359 \\v^8 &= 0.70318512697 \\v^{10} &= 0.64392768203 \\v^{20} &= 0.41464285968 \\v^{30} &= 0.26700001551 \\v^{40} &= 0.17192870109 \\v^{50} &= 0.11070964997 \\v^{60} &= 0.07128900828 \\v^{70} &= 0.04590496586 \\v^{80} &= 0.02955947826 \\v^{90} &= 0.01903416316 \\v^{100} &= 0.01225662660\end{aligned}$$

5. The required table may now be completed in reverse order on the machine, by the formula—

$$v^{n-1} = v^n (1 \times r)$$

an extremely simple process.

6. This done, the next step is to form $D_x = l_x v^x$, to which end v^x is put on the machine, and is multiplied by l_x . The details pass off on the machine, and the values of D_x have only to be transcribed as they arise. The summation on the machine gives N_x , and then $\frac{N_x}{D_x}$ gives a_x , the present value of an annuity on the life x .

7. It is here to be remarked that the last step is one of division, an operation that even on the machine is not nearly so facile as multiplication. I have therefore found it convenient to record D_x^{-1} from the table published by Lieut.-Col. W. H. Oakes, a work of great value, and to which, as will be seen, I am much indebted. Thus we have $N_x D_x^{-1} = a_x$, the product of two factors.

8. By a similar method any of the single life annuity tables may be formed.

9. The joint life tables might be formed in the same way, but although the machine does not err, the computer might in a multitude of *detached* operations commit errors that would elude notice. To prevent this it is always proper to devise continuous processes in which a single error induces a series of errors that cannot escape detection. For, at fixed points, independent values may be interposed, and when the continuous values agree with these, the work must be right, or a disagreement will disclose error to be then corrected.

10. It would be tedious further to explain the various arithmetical details. Suffice it to say that the values of $D_{x,y}$ and $D_{x,y}^{-\frac{1}{2}}$ for each 10th difference of age from -10 to +40 were independently computed on the machine to many places of figures. The intermediate values were constructed by continuous operations, and are certainly free from any material errors. However, to afford a means of verifying them by ordinary methods the logarithms of l_x , D_y , d_x and B_y are given.

11. I may observe that the symbol $D_{x,y}$ is the product of three factors, and that commonly $l_x v^x = D_x$ and $l_y D_y = D_{x,y}$. I have, however, used the form $l_y v^y = D_y$ and $l_x D_y = D_{x,y}$. The reason of this departure from the usual practice is that the symbol $D_{x,y}^{-\frac{1}{2}}$ is the product of four factors, $d_x l_{y+\frac{1}{2}} v^{y+\frac{1}{2}} a_{w+\frac{1}{2}}$, of which three, namely $l_{y+\frac{1}{2}} v^{y+\frac{1}{2}} a_{w+\frac{1}{2}} = B_y$ can be formed once for all (since $w = y$), thus affording the form $d_x B_y = D_{x,y}^{-\frac{1}{2}}$ in which only B_y is partly fractional, d_x being an integer. By this arrangement the formula is better suited to the machine. Then in the form $\frac{N_{x,y}^{-\frac{1}{2}}}{D_{x,y}^{-\frac{1}{2}}} = a_{w-y}^{-\frac{1}{2}}$, because v^y is symmetrically involved, the final result is correct. Here also $D_{x,y}^{-1}$ taken from Colonel Oakes's table of reciprocals has been of much use.

12. In the tables of $D_{x,y}$ and $D_{x,y}^{-\frac{1}{2}}$ the decimal point is noted, the quantities being, however, divided by 100, but in the summation $N_{x,y}$ and $N_{x,y}^{-\frac{1}{2}}$ the decimal point has been omitted, five figures being given without regard to their local value. In like manner the reciprocals are given as integers. This will not cause any real difficulty, and it saves much room. Suppose that in the table of equal ages it were desired to verify the annuity value for $x = 40$, then $15392 \times 61436 = 94562$, or supplying the decimal point 9.4562 . No other value could well be supposed. A glance at the *progression* of the quantities would resolve any doubt that might arise in other cases.

13. On the table for converting annuities into reversions I may remark that such tables were first published by the late Mr. Orchard. To compute them by help of the machine is very easy.

14. From the formula, No. 27., it appears that when $a_x = 0$, then $A_x = v$; and when $a_x = 1$ then $A_x = v - (1 - v)$. Hence by continually subtracting $(1 - v) \times .001$ from v , the required table may be formed to any extent, each turn of the machine giving a new value. A record of these would occupy many pages, and abbreviation is therefore desirable.

15. When $a_x = r$, then $A_x = 1 - r$. In the present case $r = .045$ and $1 - r = .955$. Thus we have a point at which there are no decimals beyond the third place. Again, when $a_x = .254$ then $A_x = .946$ exactly. We may now perceive that the fourth and following decimals are recurrent, and disappear at regular intervals. These intervals correspond with a difference of $.254 - .045 = .209$ in a_x , and of $.955 - .946 = .009$ in A_x , and we may notice that .209 is derived from $2(1 + r)$, and .009 from $2r$. Consequently the first part of the table may be formed by the continual addition of .209 in column a , and subtraction of .009 in column A_x . The second part of the table contains the 208 successive multiples of $1 - v$ to a sufficient number of places.

16. I have explained the construction of this table at some length because the process may be useful in other cases.

17. The arrangement of the table is a good example of *packing*. Here in one page are 315 values, from which, in pairs only, we can readily form 22470 values.

18. The table for finding the addition to be made to an annuity when made payable half-yearly, and to the date of death, is constructed on similar principles, with differences of detail that need not here be shown.

19. The tables for exchanging pounds and rupees at 1s. 11d. the rupee, are peculiar in form, and they contain much in small compass.

DATA AND ELEMENTARY TABLES.

The following hitherto unpublished Abstract of Data obtained from the officers of the Bengal Army in the year 1850 was prepared by the late Mr. Peter Hardy, F.R.S., Actuary to the London Assurance Corporation. It is worth preserving as an authentic contribution to the Statistics of Infant Life in India. The returns furnished by the officers included all their children, living and dead, with the dates of birth and death.

The number of lives of each sex which passed through each age from birth, and the number of deaths which happened at each age, embraced in the register transmitted with Major Hannington's letter, dated 29th July 1852.

Note.—The large number of deaths in the second year of age seems to indicate that some births have not been recorded. But from the completion of the first year of age, the table represents facts.

INTEREST, FOUR AND A HALF PER CENT.

Present Value of £1 to be received any Number of Years hence.

Note.—The first figure in Column 0 is common to all the columns, and the asterisk shows that this leading figure is to be taken from the line next below. Thus, for example, the value for ·024 is 1 0335.

Find in Column a_x the value *next above* that of the given annuity, and note the difference. Then, to the value of A_x so found in the upper part of the Table, *add* the value for the difference, as found in the lower part of the Table. For example,—

$$\begin{aligned} \text{Given annuity } a_x &= 13\cdot475 \\ \text{Next above } - &- 13\cdot630 \quad .370 \\ \text{Difference } - &- 155 \quad 66746 \\ \text{Corresponding value of } A_x &= - \quad \underline{\underline{.3766746}} \end{aligned}$$

INTEREST BEING $4\frac{1}{2}$ PER CENT.

Table showing the Addition to Annuities when made payable half yearly and to the day of Decease.

To use the Table.—Find in the table the annuity nearest in value to the proposed annuity, and take out the quantity opposite thereto. Add this to the proposed annuity.

Example.—Suppose the given annuity to be worth 10·325 years' purchase. Then in the table the nearest value is 10·316, opposite to which is the addition ·381, therefore $10·325 + .381 = 10·706$ is the augmented value, as required.

EXCHANGE TABLE.—Pounds into Rupees, at 1s. 11d.

						For Pounds + Rupees.	—	For Shillings. + Rupees.	—	For Pence. + Rupees.	Fractional Equivalents.

To use the Table.—Find the Pounds in one of the columns headed Pounds, then will the sum of the numbers at the top and in the margin express the value in Rupees.

Example :—

Required the equivalent of 73l.—Here, 720 + 41·739 = Rs. 761. 11. 10.

Required the equivalent of 730l.—Here, 7200 + 417·391 = Rs. 7,617. 6. 3.

Required the equivalent of 15l. 11s. 7d.—Here, 15l. = 156·522

$$\begin{array}{rcl} 11s. & = & 5\cdot739 \\ 10d. & = & 0\cdot304 \end{array}$$

$$161\cdot565 = \text{Rs. } 161. 9. 1.$$

Note.—The value of the decimals in annas and pies will always be found in the small table of fractional equivalents

EXCHANGE.—Rupees into Pounds, at 1s. 11d.

The Table may be read thus:—Of the persons enumerated in 1851, of the age of 20 and under 25, there were 633,842 Bachelors, 598,732 Spinsters, 2,168 Widowers, and 4,326 Widows, while the numbers who were married during the same year and of the same ages were respectively 71,049, 75,972, 667, and 850, being in the proportion of 11·209 Bachelors, 12·672 Spinsters, 30·766 Widowers, and 19·649 Widows married to every 100 living, and so on at other ages. By disregarding the decimal point, the proportions to 10,000 will be represented.

Note.—Of the total number of marriages solemnized in 1851, the ages of the Males and Females were stated only of the following numbers, viz., 48,555 Bachelors, 51,141 Spinsters, 7,792 Widowers, and 5,206 Widows. In this Table these numbers have been proportionally raised to the total numbers married under these respective headings.

London,

26th February 1870.

My dear Dr. Farr,

Having occasion to make a practical application of the rate of marriage among spinsters, I some time since mentioned the matter to you, and you have kindly placed in my hands the Fourteenth Report of the Registrar-General, where, in p. viii, a table (V. c.) is given to show approximately the rate of marriage at different ages for bachelors, spinsters, widowers, and widows.

Of these rates that for spinsters is considerably the lowest. For this class I have supplied the intermediate years by interpolation with differences to the fourth order, and the result is a well graduated scale, which I send herewith.

The benefits derived from the several Funds established in India terminate on remarriage. It has, therefore, been necessary to ascertain the rate of marriage for this class. Investigations on scant data were made by the late Mr. Griffith Davies, by Mr. Neison, and by Mr. Samuel Brown. I have entered some of the results in the table, and you will observe that they are much below the British spinsters' rate. One reason for this may be that the loss of pension restricts marriage.

Comparing the British spinsters and the Indian widows' marriage rates, it seems reasonable to ask whether the widows' rate could fairly be applied to the class for whom I am at present concerned, namely, the daughters of Indian Officers, and if not, how far could the British spinsters' rate be held applicable?

The forfeiture of pensions on marriage has not the same restrictive effect on spinsters as on widows. The pensions are small, and besides this, many daughters marry in their father's lifetime, when their interest in the pension is only reversionary.

It is noticeable that in the Table V. c., the rate of marriage of widows greatly exceeds that of first marriages, but if the British spinsters' rate be compared with the Indian widows' rate, the reverse of this obtains.

Perhaps a safe rate, following the same law of progression as the spinsters' rate, may be deduced by taking an uniform percentage from the British table. Thus, at the age of 20, deducting one-fifth, the marriage rate would become 10·118 per cent. as a maximum, instead of 12·672, and so throughout. Even thus, I find that there would be a wide departure from the Indian widows' rate.

The question is important, and its determination will affect large pecuniary intérêts. Safety is on either hand advantageous, but the exaction of an over-high premium, when only safety and not profit is sought, would be unjust.

In a conflict of data, the leaning must ever be to the largest and most authentic body of facts. That the census of 1851, with its 2,306,009 spinsters and 140,331 marriages, is more to be relied on, than an experience drawn from 635 widows and 119 remarriages, is not open to dispute. But the smaller experience, as applicable to a class, has much weight. I am therefore disposed to reduce the British rate for the purpose in hand.

How far such a reduction should be carried must partly rest on opinion. I submit the subject to you because I have your permission to do so, and because I rely on your judgment.

With sincere apologies for this trespass on your time and attention,

I am, &c.,

(Signed) J. HANNYNGTON.

W. Farr, Esq., M.D.

General Register Office, Somerset House,

7th March 1870.

My dear General Hannyngton,

I have read your paper and the table interpolated, which you have had the goodness to send me. The subject is most difficult, as you are dealing with a class in peculiar conditions, and the observations at your disposal are limited.

Your view appears to be judicious. You take into account all the data relating to the class, and the estimate of the best authorities, and then, after reasoning on probable results, you turn to account the experience of the whole nation in fixing the quota of marriage at the several ages. You must, I imagine, assume that your widows will marry at a slower rate than our spinsters, although in England widows marry more frequently than spinsters. But widows have often fortunes or perquisites, which tempt, while your widows, losing income, may be deterred from marriage, or deter future husbands.

It is a special case. But I know you have given the subject so much thought that I should be quite willing myself to act on your decision.

At the end of every five years you will naturally investigate the progress, and should take power to alter the scheme in accordance with the results of experience.

I am, &c.,
(Signed) WILLIAM FARR.

N.B.—This table is to be used for the valuation of the pensions of incumbent widows.

EXTENDED VALUES OF $D_{x,y}$ FORMED BY ACTUAL MULTIPLICATION OF THE FACTORS I_x AND D_y ON THE ARITHMOMETER. From these the intermediate values for each difference of age were computed on the machine by a continuous process, and verified at each tenth interval.

(INTEREST $4\frac{1}{2}$ PER CENT.)

x	$y = x + 10$	$y = x$	$y = x - 10$	$y = x - 20$	$y = x - 30$	Diff.	The initial values of $D_{x,y}$ for each difference of Age.

NOTE.—The summation of the values on this page is not given, but may easily be made if required in any extreme case.

EXTENDED VALUES OF $D_{x,y}^2$, FORMED BY ACTUAL MULTIPLICATION OF THE FACTORS d_x AND B_y ON THE ARITHMOMETER. From these the intermediate values for each difference of age were computed on the machine by a continuous process, and verified at each tenth interval.

$$B_y = l_y + \frac{1}{12} r^y + \frac{1}{12} a_w + \frac{1}{12}$$

(INTEREST $\frac{1}{12}$ PER CENT.)

x	$y = x + 10$	$y = x$	$y = x - 10$	$y = x - 20$	$y = x - 30$	Diff.	The initial values of $D_{x,y}^2$ for each difference of Age.

		7·194 5·246 4·769 4·138	863 630 572 497	1727 1259 1145 993	2590 1889 1717 1490	3453 2518 2289 1986	4316 3148 2861 2483	46·529 51·777 58·602 66·553	1861 2071 2344 2662	3257 3624 4102 4659	4653 5178 5860 6655	6049 6731 7618 8652	7445 8284 9376 10648	
		45	1086	1101	1409	1428								
		50	1180	1218	1551	1601								

Note.—The differences of the corresponding values show the requisite marriage donations. For example, at age 50 the donation of a colonel for a disparity of 20 years is 7827 - 3014 = Rs. 4813, which amount is entered in the scale. The intermediate values have been interpolated.

SCALE of MARRIAGE DONATIONS. Increased for Disparity of Age.

Age.	Captains.		Majors.		Lieut.-Colonels.			Colonels.

50	-	-	-	-	3692	3947	4183	4499	4813	5100	5136	
51	-	-	-	-	3832	4135	4410	4559	4973	5300	5390	
52	-	-	-	-	3941	4302	4615	4638	5144	5513	5655	
53	-	-	-	-	-	-	-	4735	5324	5738	5931	
54	-	-	-	-	-	-	-	4850	5515	5976	6218	
55	-	-	-	-	-	-	-	4984	5715	6226	6515	
56	-	-	-	-	-	-	-	5136	5925	6489	6823	
57	-	-	-	-	-	-	-	5307	6146	6764	7142	
58	-	-	-	-	-	-	-	5495	6376	7052	7472	
59	-	-	-	-	-	-	-	5702	6616	7352	7813	
60	-	-	-	-	-	-	-	5928	6866	7665	8165	

Example. A captain aged 37 marries a lady aged 22. The difference of age is 15. The marriage donation is Rs. 746, to be paid instead of the ordinary donation.

In like manner, a colonel aged 54 marries a lady aged 29. The difference of age is 25, and the corresponding marriage donation is Rs. 5976.

It will be observed that the amounts depend much more on the age of the husband than on that of the wife, a circumstance which, in the present case, is caused by the re-marriage of young widows being an element in the calculation. It follows that the table will serve for all cases, nearly enough.

COMPUTATION of the FAMILY CONTRIBUTION for SONS.

Son's Age.	Reversionary Pensions.			
	Deferred			
	Immediate.		Deferred	
			till 6.	till 12.
0 to 1	2.064		1.762	1.120

Sum of the above values - 4.946.

$$4.946 \times 10 = £49.46 = \text{Rs. } 516.1$$

Deduct birth donation - 156.0

Balance - - 360.1

The value of the joint life annuity till age 21 is - 8.608.

$$\text{Hence } \frac{360.1}{8.608 \times 12} = \text{Rs. } 3.500 \text{ monthly.}$$

Deduct the rate in aid 2.500 " (See Report, Art. 20.)

Balance family contribution - Rs. 1.000 "

COMPUTATION of the FAMILY CONTRIBUTION for DAUGHTERS.

Daughter's Age.	Reversionary Pensions.			
	Deferred.			
	Immediate.		Deferred.	
			till 6.	till 12.
0 to 1	2.883		2.575	1.919
Add for £5 after the age of 21		-	-	-
				0.919
				0.460
				1.379

Sum of the values - 8.756.

$$8.756 \times 10 = £87.56 = \text{Rs. } 913.67$$

Deduct birth donation - 250.

663.67

The value of the joint life annuity is - 9.135.

$$\text{Hence } \frac{663.67}{9.135 \times 12} = \text{Rs. } 6.054 \text{ monthly.}$$

Deduct the rate in aid 3.500 " (See Report, Art. 20.)

Balance family contribution - Rs. 2.554 "

In accordance with the results herein set forth, the family contributions have been assigned as follows :—
(See Report, Art. 22.)

Donation on Birth. Monthly Subscription.

	Rs.	R.	A.	P.
For Sons -	156	1	0	0
For Daughters -	250	2	8	0

F O R M S

FOR THE

REGISTRY OF MARRIAGES, BIRTHS, AND DEATHS.

M

FORM of Register for Officers.

No.	Names.	MEMBERS.					WIVES.		CHILDREN.										Reference to the Page or Folio of the Children's Register.					
		Present Rank.					Dates of					Dates of		This is to be filled up by merely inserting under the proper number the letter <i>m</i> or <i>f</i> , to denote the sex of the child.										
		Lieutenant.	Captain.	Major.	Lieut.-Colonel.	Colonel.	Entry.	Birth.	Marriage.	Death.	Exit by any other Cause.	Birth.	Death.	1	2	3	4	5	6	7	8	9	10	
39	Anderson, John F.	-	-	-	-	-	71·353	46·238	76·441	87·682	-	53·523	-	m	f	f	m							12

NOTE.—The above entries indicate that the officer named, whose reference number is A 39, entered as a Lieutenant on the 10th May 1871, that he was born on the 29th March 1846, was married on the 11th June 1876, and died, being then a Captain, on the 7th September 1887, leaving a widow and three children him surviving; a fourth child having died in the father's lifetime. For the purposes of any intermediate valuation it would have appeared that this officer was seven years older than his wife; his then present rank, and the number of his children would have also been obtained.

The dates are most briefly and conveniently entered as *decimals of the year*, for which end a table is annexed.

FORM of Register for Children and Widows.

12	Names.	Reference.	Dates of				Remarks.
			Birth.	Marriage.	Death.	Exit.	
	Anderson, John F. - - - -	A. 39.			87·682		
	Children.						
	" John - - - -		78·510				
	" Anne - - - -		80·164				
	" Emily - - - -		81·677				
	" Edward - - - -		83·786		84·033		
	Widow.						
	" Matilda - - - -		53·523				Pension £70.

NOTE.—On the marriage of an officer, his name and the reference number should be entered in this Register, and the dates of births of children, and of any casualties be recorded as they occur. On his decease, the date of that event should be entered, as indicating the time at which the children became wards. The christian name and birth date of the widow should be entered at the close, and any further events respecting her will have place in this Register. Any particulars, other than dates, may be entered in the column of Remarks.
