(3) MEMORANDUM

ON THE

WORLD'S MONETARY
PROBLEMS

BY

GUSTAV CASSEL

PRINTED FOR THE LEAGUE OF NATIONS
HARRISON & SONS LTD. ST. MARTIN'S LANE
LONDON W.C.2.

SUMMARY OF CONTENTS.

I.—THE FUNDAMENTAL FACTS OF THE MONETARY SITUATION.

Increased supply of money. The gold standard replaced by paper standards. Relative increase of bank-deposits used as means of payment. Subordinate *role* of the scarcity of commodities. The rise of prices; figures influenced by government interference; paper price-levels independent of one another.

II.—THE PROCESS OF INFLATION.

Creation of artificial buying capacity. Effect on prices and on the quantity of money kept in circulation. Special importance of the supply of legal tender money. Loans and taxes causing inflation. Inflation as a source of State revenue. Inflation in neutral countries. Inflation after the war, mainly caused by extravagant government expenditure; influence of certain forms of taxation; and of a too low rate of interest. •

III.—EFFECT ON THE VALUE OF GOLD.

Gold driven out of circulation; has lost a considerable part of its value.

IV.—THE ENHANCEMENT OF PRICES.

An increase of the stock of money and a reduction of the supply of commodities co-operate to enhance prices. Meaning of the term "inflation."

V.—INTERNATIONAL EXCHANGES. PURCHASING POWER PARITIES.

The purchasing power parities essentially altered since the outbreak of the war; represent the true equilibrium of the exchanges. A rise of prices in one paper standard cannot cause a rise of prices in another.

VI.—ABNORMAL DEVIATIONS OF THE EXCHANGES.

Restrictions on the exports of a country tend to depress the international value of its money beneath the purchasing power parity. Other factors working in the same direction. Danger of the use of a paper currency as an article of export.

VII.—EFFECTS ON INTERNATIONAL TRADE.

With exchanges stabilised at the purchasing power parities international trade is independent of whether exchanges are "high" or "low." Pernicious effects of deviations from these parities. Pre-war parities will never be restored and are of no importance for present problems of international trade. An adverse balance of trade cannot explain a lasting depression of the exchange value of the currency of a country; nor can an improved balance of trade raise this value above the purchasing power parity.

VIII.—THE STABILISATION OF THE DIFFERENT MONETARY STANDARDS.

Primary importance of stopping further inflation. Necessity of a high rate of discount. Other restrictions of the demand of capital. Increased gold holdings or improved State credit cannot raise the internal value of a currency as long as the supply of means of payment is not restricted. Such restriction cannot be attained only by enactment of a rigid maximum for the issue of legal tender money.

IX.—CONSEQUENCES FOR STATE FINANCE.

Necessity of restricting government demands for money. This involves cessation of all subsidies to consumption and of all unnecessary military expenditure. Help from abroad sometimes necessary for restoration of equilibrium in State finance. Guarantees against inflationistic finance required. Danger of restrictions of the capital market without corresponding restrictions of the demands of the State.

X.—THE PROBLEM OF DEFLATION.

Futility of the idea of a restoration of pre-war prices. Deflation means artificial restriction of purchasing power. Practical possibilities of such a policy rather narrow. Desirability of deflation. The question of resumption of gold payments. Depreciated standards should be stabilised, not abandoned.

XI.—THE STABILISATION OF INTERNATIONAL EXCHANGES.

The new normal rates. Every country has to stabilise the internal value of its own money; this would lead to stable purchasing power parities. The stabilisation of exchanges at these parities requires in some cases foreign loans for redemption of currency held abroad and for restoration of equilibrium in State finance; and generally a restoration of freedom and equality of conditions in international trade. Desirability of an international agreement to discontinue all discriminating between foreign and inland buyers on the home market. Futility of the idea of an international standard of money.

✓ XII.—THE GOLD QUESTION.

Resumption of gold payments on the old basis possible for some countries. Special importance of the monetary policy of the United States. Desirability of preventing gold from rising in value. Importance of a stable value of gold. Insufficiency of the present gold-production. Necessity of restrictions on the monetary demand for gold.

XIII.—RECONSTRUCTION.

Aggravation of economic difficulties after the war. Pernicious influence of protectionist interests. Position of Central and Eastern Europe. Necessity of a thorough re-modelling of the external conditions of economic life in these countries. General pre-requisitions for positive work of reconstruction. The aim of all positive measures of reconstruction must be the fullest development of production and trade. Provisional measures for exchange of commodities. The organisation of railway transport in Central Europe. Other ways of help. Importance of the development of non-European countries, and of some emigration from Europe.

XIV.—INTERNATIONAL LOANS.

Loans for reconstruction can only come from current savings of lending countries; are a form for financing an export surplus of these countries. Limitation of lending capacity. Consequent importance of severe restrictions of the use of capital for reconstruction. The desirable increase in the supply of savings requires increased production in the whole world. Attention should be paid to the interests of the lenders. Bearing of the indemnity question upon the question of international loans.
