PREFACE TO THE FIRST EDITION

The end of the last Great War saw the emergence of great social and economic changes in almost all parts of the world. In India the franchise was greatly widened and the administration of the entire field of developmental activities was transferred to responsible ministries in the Provinces. An era of protection was inaugurated shortly afterwards as a result of the recommendations of the Fiscal Commission. A decade of readjustment, in India as elsewhere, was followed by the great depression which affected India adversely in common with the rest of the world. The outbreak of the second World War has brought new and incalculable elements of disturbance with it. A new era of readjustment will have to follow the suspension of hostilities and it is clear that the planning necessary to meet the exigencies of the time will have to cover a very wide ground. To control the future, knowledge of the recent past is indispensable, and it was considered useful, therefore, to attempt a factual survey of the whole position. With this end in view the available statistical material has been brought together in this handbook. The colour diagrams furnished herein illustrate in a clear manner the numerous changes that have taken place in the various fields during the inter-war period. Wherever possible, figures for the period following the outbreak of the present war are also included.

The handbook has been prepared by Mr. S. Subramanian, Statistician to the Economic Adviser.

T. E. GREGORY,

Economic Adviser to the Government of India.

NEW DELHI,

14th June 1944.

NOTE.—The brief compass of this hand-book precludes any detailed reference to the sources of information or the methods of compilation adopted. The peculiarities of individual series prevent absolute uniformity in the periods covered by the several tables. Owing to the gradual expansion of the area covered by the statistical publications (especially in the case of Indian States) strict comparability of the figures for the several years cannot be guaranteed.

PREFACE TO THE REVISED EDITION

In response to the continuous demand for copies of the *Statistical Summary of the Social and Economic Trends in India in the Inter-war Period* which first came out in April 1945, this revised edition is now issued to the public. In this edition, all the tables and charts have been brought up to date, including those on trade and industrial production, which could not previously include the latest figures owing to wartime restrictions. The introduction has also been rewritten in the light of the latest figures.

Other improvements made in the edition are the inclusion of tables showing the distribution of incomes assessed to tax, the amplification of the tables relating to joint stock companies and the insertion of 26 new diagrams.

The greater part of the work of preparing Part II of the revised edition fell on Mr. T. P. Chatterjee, M.A., M.Sc., Assistant Director, Administrative Intelligence Room.

Annual figures for the war period under most of the heads will be included in a forthcoming publication entitled *Statistics relating to India's War Effort* which it is hoped will be shortly released.

T. E. GREGORY,

Economic Adviser to the Govt. of India.

NEW DELHI,

The 20th October 1945.

NOTE.—The brief compass of this hand-book precludes any detailed reference to the sources of information or the methods of compilation adopted. The peculiarities of individual series prevent absolute uniformity in the periods covered by the several tables. Owing to the gradual expansion of the area covered by the statistical publications (especially in the case of Indian States) strict comparability of the figures for the several years cannot be guaranteed.

PART I.—INTRODUCTION

None of the multitudinous events of the last twenty-five years in India can lay claim to a greater measure of social significance than the rapid growth of her population during this period. While many Western countries are deeply concerned with the problem of arresting an imminent decline of population, the immediate problem in India remains one of combating the heavy pressure on the nation's resources caused by an increase in population of more than 4 million people every year.

This high rate of increase has been largely due to a significant fall in the infantile as well as the general mortality rates which declined from 198 to 158 (per *mille*) and from 31 to 22 (per *mille*) respectively between the years 1921 and 1941. It is argued that India's vital statistics are defective and that consequently figures such as the above are not reliable, but it is unlikely that the relative proportion of *unrecorded* deaths was larger in 1941 than in 1921; on the contrary, the more efficient recording of later years may well have hidden a sharper decline in mortality rates. The extension of medical and public health facilities has been an important factor that has contributed towards the decrease in mortality rates. It may be mentioned here, for example, that the number of hospitals and dispensaries nearly doubled during the period and that State expenditure on medical and public health services in 1941 was nearly half as much again as in 1921; epidemics such as cholera, plague, small-pox and malaria have been brought under progressively greater control on the preventive as well as on the curative side. The reduction in mortality from these causes has been particularly marked during the last decade.

The birth-rate has, at the same time, remained at a high level and although very recently it has shown a tendency to decline owing, among other reasons, to the restrictions on child marriage which arose partly from State legislation and partly from a change of outlook among the people—it has a long way to go before it can claim to have neutralized the decline in mortality rates. It may be contended that during the last seventy or eighty years taken as a whole

India's population has not increased as fast as that of other countries and that available statistics (in spite of all their limitations) of *per capita* consumption of articles such as cloth, sugar, kerosene, etc., still indicate that the increase in population has not necessarily resulted in a general fall in the standard of living but it cannot be denied that the desire to have a higher standard of living implies, under present conditions, some restriction of numbers.

When a steadily increasing population is arithmetically divided into a total area which changes little, the overall density of population will naturally show a parallel increase but the density by itself cannot be treated as a reliable index of over or under-population. It is a well known fact that the density of population in India is largely conditioned by rainfall and soil fertility; numerous instances can be pointed out of a rural area having a larger density than an urban area. The position has shown no fundamental change between the censuses of 1921 and 1941, but one should not overlook the fact that during this period the Indian States have shown a larger relative increase in density than British India. It should be stated here that the Indian States are not so densely populated as British India.

It is not generally realized that in this 'land of villages' there has been a steady process of urbanization for the last twenty five years. The pace of urbanization has been particularly rapid during the thirties. This is evident from the fact that during this period the number of cities with a population of 100,000 or more increased from 35 to 58 and the aggregate population of these cities rose from 9 millions to 16½ millions. The decennial rate of increase of urban population in British India was relatively high at about 20 *per cent* in the twenties but it was higher still at more than 33 *per cent* in the thirties as compared with only 9 *per cent* and 13 *per cent* respectively in the case of the rural population. The position is broadly, the same in Indian States. Among the reasons for the shift of population towards the urban areas are—

- (i) industrialization, which tends to produce large aggregations.

- (ii) the attractiveness of city life to the middle class Indian,
- (iii) the availability of the best education only in towns*.

As pointed out by the Census Commissioner for 1941, however, the substitution of electric power for coal may be expected to lead to a gradual dispersion of towns. It should be mentioned in this connection that the electricity statistics of the last six years (earlier figures are not available) reveal an increase in the output of energy of about 50 *per cent*. The greater part of the output is accounted for by industrial consumption.

A feature of Indian population figures which has attracted a great deal of attention is the steady movement of the sex ratio against the female. The declining trend which has been continuous since the beginning of the century applies equally to all communities in the country. In only two Provinces, namely Madras and Orissa, is there anything like numerical equality of the sexes; in all other provinces the deficiency of women is striking. Any attempt to explain this fact involves controversial issues, but one consideration seems to have found general acceptance namely that in all age groups below 40—45 the wastage of female lives is rather high.

One of the most welcome revelations of the Census of 1941 has been the comparatively rapid spread of literacy, particularly during the thirties, among all classes. In 1921 the total number of literates in British India was less than 15 millions. There was a small increase of 3 millions in the decade 1921-31 but it was in the next decade that the real improvement took place; by 1941 the number of literates had exceeded the 37 million mark. The proportion of literates in the total population thus increased from 6 *per cent* to 13 *per cent* in twenty years. The gradual extension of democratic institutions—which meant, incidentally, the conferment of the right to vote on large sections of the population—has perhaps been a powerful indirect force behind the new desire in the common mind to be able to read and write, and it may

not be irrelevant in this context to draw attention to the large number of printing presses and newspapers that were started during the period. The primary education drive initiated in the early twenties by the various Provinces would also claim its share of the credit for the spread of literacy particularly in rural areas but so long as the *absolute* number of illiterates remains at a high level and refuses to show a significant decline, the position can hardly be called satisfactory.

In assessing the full significance of the progress of primary education in recent years allowance has to be made for the wide variety of hostile factors against which the State has had to contend, for instance **Education** the withdrawal of children from school as soon as they reached the working age, the indifferent health of undernourished pupils, and, in the case of girls, the *purdah* system. Again, although a number of Provincial Acts empowered the educational authorities to introduce *compulsory* education upto a certain age, the practical difficulties in the way of enforcing attendance at schools have proved insuperable. Yet another factor has been the dearth of qualified teachers resulting from the low level of salaries offered as well as the fact that rural life remained too dull for persons who had received a higher education. Despite all these difficulties it may be noted that the number of children attending primary schools increased from 6 millions in 1920-21 to nearly 12 millions in 1940-41.

Secondary education has also shown a corresponding improvement. The total number attending secondary schools was just in the neighbourhood of a million in 1920-21 but in 1940-41 it had grown to nearly 3 millions. Only a comparatively small absolute number of scholars have been going into the colleges; but the number of such scholars has shown a proportionate increase, although the strength of the Professional Colleges has not increased as fast as that of the Arts and Science colleges. Vocational education was not popular in India in the early stages of its introduction, but the fact that the strength of technical and industrial schools quadrupled in two decades is positive evidence that the old prejudice against this type of education is vanishing. All these changes are of very great interest, but actually

the most interesting feature of recent educational statistics has been the relative quickness of intellectual awakening among women as illustrated by the trebling of girl scholars in schools and colleges between 1921 and 1941 as compared with a mere doubling in the number of boys during the same period; and while the war provided a temporary setback to male education, female education managed to follow its pre-war trend.

This progress in the field of education could not be achieved without expenditure on a relatively liberal scale from State and other funds. The annual expenditure on recognized educational institutions was less than Rs. 16 crores in 1920-21 but in 1940-41 the figure had increased to Rs. 30 crores and about one half of the expenditure had throughout been met from Government funds. The total expenditure showed a small increase of Rs. 2 crores between 1941 and 1943.

As pointed out in an earlier paragraph, one of the several factors that have contributed to the increasing degree of urbanization of India's population has been

Industrialization the progress of Industrialization and it may now be profitable to study in some detail how this industrialization has come about. Although the basic raw materials of industry were present in great abundance in the country, it was not until the early twenties of this century that general acceptance could be found for the proposition that, with the development of the necessary manufacturing processes, it would be possible to effect a gradual displacement of various categories of imports by home-made articles. The pace of industrial development since that period was greatly accelerated by Government assistance both by way of granting tariff protection in deserving cases and of giving preference to the products of Indian industry in purchasing Government requirements. The prospect of continued Government help and the anticipation of handsome profits encouraged the flow of private capital into industry. The profits of companies were affected to a certain extent in the Depression but in later years all the industries with the exception of jute again began to look up. The War helped all the industries to get over their difficulties and greatly improved their profit-earning capacity, but as it was, jute could not recover its 1928 level of prosperity even by 1943.

The jute manufacturing industry had to face numerous troubles during the last twentyfive years but in the period taken as a whole, it does show a fair degree of improvement.

Jute

The outstanding instance of an industry which was greatly fostered by State encouragement is iron and steel. The real growth of the industry took place in the last twentyfive years and it is remarkable that the industry recorded its most rapid progress during the world depression. Between the year 1932-33 (when the regular collection of production figures started) and the year 1943-44 the ingot output increased from less than 0.6 million tons to 1.4 million tons. During the same period the output of finished steel rose from 359,000 tons to about a million tons although in 1942-43 it had fallen to a rather low figure owing to labour troubles connected with the political uncertainty of the period. This development was accompanied—as can be judged from the figures of employment—by an expansion of the activities of various ancillary industries such as foundries and structural steel and wagon building industries, the last named of which had received an early promise of preference from the railways.

Iron and Steel

The cotton textile industry—which, incidentally, was one of the few Indian industries which could possibly have benefited from the Swadeshi movement—recorded such good progress in the inter-war period that the share of imports in the cloth requirements of the country decreased from about four-fifths to much less than a fifth. The number of mills increased from 255 to 415, the number of spindles from 6.6 millions to 9.8 millions and the number of looms from about 118,000 to 199,000. The output of yarn more than doubled in weight and the output of piece-goods nearly trebled in length. Many technical improvements were effected by the industry during the period the chief among these being the installation of modern machinery for spinning and weaving and the development of new bleaching, dyeing, printing and finishing processes. Despite various wartime difficulties *e.g.*, shortage of mill stores, the industry was able to show an increase in the annual output of piece-goods to the extent of 600 million yds. during the war, but this additional output was clearly too small to be able to

Cotton Textiles

offset the almost complete disappearance of imports and the rising tempo of defence demand.

The history of the sugar industry in India may be said to begin with the grant of protection to the industry. The output of sugar which was only about 300,000 tons in 1932-33 has now risen to over a million tons. The industry had to contend for a time against troubles of an internal character but the outbreak of war enabled the industry to put its house in order. In fact, judging from the record of the industry during the war period it can well be said that it is foremost among the industries which have fully justified the assistance given to them by the State in their initial stages.

The paper industry would have languished in the decade following the last war but for the protection granted to it in 1925. The duty imposed on imported wood-pulp some years later was instrumental in the development of the production of indigenous bamboo pulp which is now the main raw material for paper making in the country. The production of fine writing and printing paper increased rapidly in the thirties; the same was the case with kraft or packing paper. The war has further accelerated the production of these varieties. The experience with newsprint was wholly different, however; in the absence of proper raw materials for making mechanical pulp, the efforts made by the Forest Research Institute to produce newsprint in the country have not proved successful so far and the whole of our annual requirements totalling about 50,000 tons of newsprint has to be imported from abroad. Owing to a severe curtailment of imports, the newsprint situation in India deteriorated considerably during the war and the available supply had to be put under rigorous control.

Among the industries that were struggling for existence in the early years of the period but which stabilised themselves without direct outside assistance, first mention should be made of the cement industry. It staged a surprising recovery in the thirties on the basis of a mutual agreement and the greater part of the credit for the enormous increase in the consumption of this relatively new building material

goes to the industry itself. Indian output of cement was only slightly less than a million tons in 1936-37 and by 1938-39 the figure had risen to more than a million and a half. The new demand created by war requirements helped to maintain the rising trend of production and the latest output figure is around two and a quarter million tons. Imports of foreign made cement simultaneously dwindled to almost nothing.

Steel, Sugar, Paper and Cement are four *major* instances of industries which have been able to find their feet in recent times but there are several smaller industries which may be said to have been born **Paints and Soap** in the thirties of this country. Among these comparatively new industries are paints and soap; at the outbreak of the World War II, although many important constituents *e.g.*, the finer varieties of pigments for the paints industry and soda-ash for the soap industry had still to be imported from abroad, the position was that two-thirds of the country's requirements of paints and almost the whole of the supply of soap came from local production whereas at the end of the last war only a very small proportion was so met in either case. Both the paints and soap industries appear to have successfully withstood the raw material shortage during the war and have actually forged ahead as is evidenced by a doubling of production in the case of the former and a 75 *per cent* increase* of employment in the case of the latter.

The rapid progress of the 'Indian' match industry which commenced in 1926 when it was given protection was further accelerated by the discovery of indigenous **Matches** supplies of splint wood and by 1938-39 the production of matches had risen to 21 million gross boxes representing roughly 95 *per cent* of the total consumption. The output showed a further increase to 23 million gross boxes in 1940-41 but owing to the acute shortage that had arisen by that time in the supply of chemicals the production declined sharply to 15 million gross boxes in 1942-43, although the latest figure shows a slight improvement. Imports which had become negligible even by 1936-37 improved temporarily to about 2 million gross boxes, but this could hardly offset the decline in local production.

*In British India, the average daily number of persons employed in soap industry was 3,222 in 1944, as against 1,838 in 1938.

The development of the Indian chemical industry was handicapped from the beginning by the absence of indigenous supplies of sulphur and, in view of the fact that the industry had no outside assistance other than a measure of protection for the short period of less than 2 years in the early stages, the increase in the output of sulphuric acid by more than 75 per cent in ten years should be considered a creditable achievement for the industry. It should also be mentioned that almost the entire increase in output was accomplished during the war. The other acids also showed a similar improvements; but in the case of *salts*, the progress was not an uninterrupted one. The production of ammonium sulphate, to take one instance, which increased from 8,000 tons in 1932-33 to 18,000 tons in 1936-37 fell to 15,000 tons in 1938-39. It has been suggested that the withdrawal of protection from the chemical industry did not affect the production of *acids* greatly as the high freight rates on imported acids provided a fortuitous measure of protection to Indian producers, but the contrary was the case in respect of *salts*. It is true that the annual production of ammonium sulphate increased to about 28,000 tons in 1940-41 but it has since fallen to less than 22,000 tons. The fact is that, although the war opened up splendid opportunities for the industry both directly and indirectly *e.g.*, the propaganda for nitrogenous manures in connexion with the campaign for growing more food on the one hand and the cessation of foreign competition owing to wartime conditions of trade and transport on the other, the *capacity* of the industry clearly acted as an unfortunate limiting factor in this direction.

An obvious gap in the country's production of chemicals is in respect of *alkalis* particularly soda-ash, the available supply of which remained the only obstacle in the way of a more rapid expansion of the soap and glass industries in recent years.

The growth of organised industry could not but necessitate various readjustments in the social and economic set-up of the country. In the first place, the rural handicrafts which had already been greatly shaken by the relative cheapness of imported articles presumably received a further setback from Indian factory products. There were however two favourable factors which enabled the *handloom*

industry to face its troubles successfully and these were first, the impetus given by the national movement for the revival of the *charka* and second, the encouragement given to the industry by the Central and Provincial Governments by way of money grants, establishment of weavers' co-operative societies and other measures. With the shrinkage of other handicrafts, a large number of artisans must have been thrown out of work and while a proportion of these were no doubt absorbed by the expanding organised industries, the rest had to fall back on agriculture for their livelihood, thus increasing the already heavy pressure on land.

Another and more complicated social problem created by industrialization was that of industrial labour. A growing consciousness of its rights on the part of labour and the fast increasing strength of labour organisations (as evidenced by a six-fold increase in the number of trade unions in ten years) resulted in frequent outbreaks of strikes, the most severe of which occurred in 1928, affecting three important industries *viz.* cotton textiles, iron and steel, and railways. While labour was attempting by means of concerted action to effect an improvement in its economic position—and the scanty material that is available in regard to the *earnings* of labour would indicate a sustained rise in real wages in the last twentyfive years—the State was actively engaged in the task of ameliorating the working conditions of labour by means of legislative action. Among the important reforms effected in this way were the regularisation of the hours of work in factories, the prohibition of night work for women and children, the raising of the minimum age for children, widening the scope of the Factories Act so as to include smaller factories as well, the guarantee of compensation for workers disabled by industrial accidents, and the prohibition of unauthorised deductions from wages. But a great deal remains yet to be done particularly in regard to the provision of medical, educational and housing facilities, although some progress has already been achieved in these directions as a result of the efforts of employers and private philanthropic organisations. The part played by the system of inspection prescribed under the Factories Act in accelerating the progress has not been inconsiderable.

The third and most important outcome of the policy of industrialization was a significant change in the composition of India's import trade. Imports of finished goods accounted for 84 *per cent* of the total value of imports into British India (including Burma) in 1920-21. In 1936-37 the corresponding percentage had declined to 75 and in values the fall was from Rs. 274 crores to 92 crores; if imports of machinery and millwork were excluded, the percentage figures would show a decline from 77 to 63 corresponding to a fall in values from Rs. 252 crores to Rs. 78 crores. The striking fall in the physical volume of imports of cotton piecegoods, iron and steel manufactures and cement and the almost complete disappearance of imports of sugar, soap and matches, together with the simultaneous increase in the volume of inland trade in these articles, should serve as a measure of the extent to which imports of finished goods had been displaced by indigenous production.

An even more remarkable development on the import side was the steady increase in the share of raw materials from 5 *per cent* in 1920-21 to 16 *per cent* in 1936-37; and during a period in which the total value of imports declined by nearly two-thirds, the value of imports of raw materials increased by more than a tenth.

The above tendencies were greatly accentuated by the war and the position in regard to trade in 'private merchandise' as revealed by the latest figures is that in 1944-45, manufactured articles formed only 31 *per cent* of total imports while the share of raw materials had risen to the high figure of 58 *per cent*.

India's increased demand for foreign raw materials before the war was not, however, accompanied by a decline in her raw material exports; on the contrary, between 1920-21 and 1936-37 the proportion of raw materials in total exports increased from 45 *per cent* to 53 *per cent*. During the same period the percentage share of manufactured goods in the total exports declined from 36 to 26, owing chiefly to a steep fall in the value of exports of cotton and jute manufactures.

Thus it would appear that, before the outbreak of war, the progress of industrialization was reflected to a greater extent in the development of the *existing* industries catering mostly for the internal demand for finished

goods than in the establishment of new industries with a view to utilizing the indigeneous raw materials in manufacture for export purposes. The outlook, however, has obviously undergone a vital change during the war; this is well illustrated by the fact that the proportion of raw materials in exports has fallen to 21 *per cent* while the export of manufactures has risen to 53 *per cent*.

The changes in the composition of trade were accompanied by even more remarkable changes in its *direction*. In 1920-21, 61 *per cent* of the imports were derived from the United Kingdom but in 1936-37 only 38 *per cent* came from that country. Only a small portion of the trade lost by the United Kingdom was captured by the other Empire countries whose share increased from 5 *per cent* to 11 *per cent* while foreign countries (particularly Germany and Japan) improved their position from 23 *per cent* to 44 *per cent* but at the same time the share of the United States declined from 11 *per cent* to 7 *per cent*.

During the war the share of the United Kingdom fell steeply to 20 *per cent* but the United States wholly filled the gap. The share of the Empire Countries showed a marked rise in the first two years of the war but with the loss of Burma their share declined to 19 *per cent*. The friendly foreign countries which initially exhibited a declining tendency improved greatly in the last years of war owing chiefly to the large imports of mineral oils from Iran.

The main changes noticeable in the direction of *export* trade were an increase in the share of the United Kingdom from 22 *per cent* to 33 *per cent* between 1920-21 and 1936-37, a decrease in the share of the rest of the Empire and the United States from 21 *per cent* to 14 *per cent* and from 15 *per cent* to 9 *per cent* and a relative stability in regard to the other foreign countries. The war reduced the share of the United Kingdom but this reduction was more than balanced by an increase in the share of the United States: while the decrease in the share of the other foreign countries was nearly offset by the increase in the relative offtake of the Empire Countries other than the United Kingdom.

An interesting consequence of the above shifts in the direction of trade was the introduction of a 'bilateral'

tendency in India's trade with the Empire as a whole. In 1920-21 the Empire took only 43 *per cent* of India's exports but supplied 66 *per cent* of her imports but by 1936-37, the proportions had very nearly balanced themselves at 47 and 49 *per cent* respectively. This movement was further accelerated by the outbreak of World War II and before the loss of Burma (1941-42) the Empire's share of India's exports as well as imports was 61 *per cent*. In 1944-45 however, the Empire took 65 *per cent* of India's exports but supplied only 39 *per cent* of her imports*.

Of equal importance with the remarkable changes that took place in the composition and direction of India's trade were the developments concerning her **Balance of Trade** balance of trade. Only on rare occasions did India's total imports exceed her exports as for instance in 1920-21 and in the succeeding year; the merchandise balance of trade has remained continuously in her favour since then and the size of the balance was large enough to permit a considerable importation of gold and silver even after meeting the country's external obligations. This continued upto the early thirties, but the trade depression had become very severe by this time and the prices of India's exports had fallen more heavily than those of her imports; and as a consequence the merchandise balance of trade dwindled to almost nothing. This would have led to difficulties with regard to India's external payments, but following the steep rise in the rupee price of gold resulting from the monetary events of the period, India had become a net exporter of this precious metal. The balance of transactions in treasure which had thus turned in India's favour largely made up for the decline in the merchandise balance of trade. Exports of precious metals declined during the war but the merchandise balance remained at a relatively high level upto 1943-44; in 1944-45, on the other hand, owing to a large increase in imports, the visible balance of trade fell to Rs. 31 crores from Rs. 95 crores in the previous year. A decrease in the balance of trade does not, however, have the same significance now as it had before the war for India's external debt position has undergone a fundamental change during the war.

*The separation of Burma in April 1937 might affect comparability somewhat but it is not likely to affect appreciably the broad conclusions embodied in the preceding paragraphs.

The gradual displacement of imports by indigenous production did not, apparently, have any adverse effect on the customs revenues of the country. This was due, on the one hand, to the greatly increased duties imposed on imported manufactures in pursuance of the policy of protection and on the other, to the increased revenue derived from the larger imports of foreign raw materials. Further, as more and more industries became firmly established, it was found possible to levy small excises on the products of those industries. The pre-war yield of the excise duties was, however, not of a very high order relative to the yield of customs duties. (The increased receipts shown under excises during the period 1934-35 to 1936-37 were attributable to the duties on motor spirit and kerosene which brought in a larger income, chiefly from Burma). With the outbreak of the war and the contraction of customs receipts resulting from the shrinkage of overseas trade, an increasing portion of the gap thus created had to be filled by the excises. By 1943-44 the yield from central excise duties had increased to nearly 25 crores of rupees with the result that it had levelled up with the yield of customs, whereas in 1921-22 the ratio of excise revenue to customs was hardly 1 in 11.

An equally important development relating to the revenues of the Central Government has been the steady shift from indirect to direct taxation. In 1921-22, **Incomes Assessed to Tax** come and corporation taxes contributed only half as much as customs and central excises, but in 1943-44 the latter sources yielded only half as much as the former; thus the position had been completely reversed. An interesting sidelight of the income tax assessment statistics is the stability of the total income of assesseees ranging between Rs. 2,000 and Rs. 10,000 per year in the decade preceding the War. The higher incomes fell steeply during the period, but in five years of war they had more than recovered the lost ground and in number, as well as in aggregate value, they had doubled and trebled. Individual incomes other than salaries more than trebled in total amount during war time, while the total income from salaries showed only a moderate increase of 22 per cent. Incomes of Hindu undivided families which had fallen to a rather low figure in 1938-39 had increased nearly three-fold by 1943-44. Income from interest on securities showed an

appreciable fall during the war, the worst affected securities in this respect being those issued by local authorities and companies. Company profits very nearly quadrupled between 1938-39 and 1943-44, but it should be remembered that the greater part of the increase had to be set off against the excess profits tax.

For full twenty years after World War I, civil expenditure in India remained more or less stationary while expenditure on Defence Services declined by nearly 25 crores of rupees. The proportion of the **Central Expenditure** total expenditure of the Central Government accounted for by Defence Services was about 55 *per cent* in 1920-21 but by 1938-39 it had fallen to 43 *per cent*. After five years of World War II, it rose to the high figure of 75 *per cent* of the total expenditure; and while Defence expenditure had increased nearly sevenfold, civil expenditure did not even double itself between 1938-39 and 1943-44.

A noteworthy feature of the Provincial budgets of the inter-war period was the increase in the incomings of the Provincial Governments notwithstanding a significant decline in their receipts from land revenue, liquor excise, and stamp duties which between themselves accounted for about 90 *per cent* of the total receipts of Provinces in 1921-22; by 1936-37 the share of these major items had fallen to about 60 *per cent*. Among the factors which contributed to this transformation in the composition of provincial revenues were:—

- (i) The increased revenue from the greatly extended irrigation works,
- (ii) larger receipts from State-owned educational, medical, and public health institutions and also from the Departments of Agriculture and Industries,
- (iii) the refunding of a portion of the proceeds of the jute export duty to the jute growing Provinces,
- (iv) the initiation of a system of subventions to the deficit Provinces in the early thirties.

The remission in 1927-28 of the contributions which had to be made to the Central Exchequer by the Provinces under the Meston Settlement released further

funds which were badly needed by the latter. With the inauguration of Provincial Autonomy in 1937-38 and grants made to the Provinces by the Central Government under the Niemeyer Award from the proceeds of income-tax, Provincial revenues showed further increases. The Provincial Governments have also levied new taxes to augment their revenues and the present position is that much less than half the total revenue is found from the once major items, land revenue, liquor excise and stamps.

The only restrictions on the scale of expenditure of the Provinces at the moment arise from the need to find funds from taxes or loans and it is noteworthy that the Provinces have now the right to borrow freely on the security of their revenues subject, in the case of one or two Provinces, to the formal permission of the Central Government.

A concomitant of the vast structural changes in India's foreign trade in recent years was their somewhat adverse effect on Railway revenues. Previously many of the consumption needs of the country used to be met from imports and the transportation of these goods to the remote centres of consumption involved long haulages by the railways; the exports of raw materials involved equally long hauls to ports. In later years, however, many of the articles of consumption were in an increasing measure manufactured locally, and in most cases from indigenous raw materials, and this caused a general decrease in the volume of railway traffic in both directions. Added to this was the gradual dispersion of manufacturing centres in the interior which resulted in a general shortening of the hauls of even indigenous raw materials and manufactures. This is amply illustrated by the fact that although between 1923-24 and 1938-39 the volume of goods traffic increased by 29 *per cent*, the number of goods 'ton-miles' rose by about 21 *per cent* only. But the trend was reversed during the war owing to movements for Defence purposes; and an increase of less than 16 *per cent* in the volume of goods moved led to a rise of nearly 28 *per cent* in the ton-mileage.

Another factor which contributed to the difficulties of railways in the pre-war years was the problem of

road competition in regard to goods as well as passenger-traffic. The development of road transport was really necessary in the wide countryside which remained outside the reach of railways, but what happened was that motor transport tended to concentrate rather on routes that were already served by railways. It also turned out that as a result of the high wear and tear of the main routes resulting from the heavy traffic, the larger part of the funds earmarked for road improvement had to be spent in keeping these routes in good condition. The extension of metalled road mileage in remote areas was thus retarded and the bullock cart continued to remain the mainstay of rural economy. A noteworthy feature of the wartime road transport statistics was the sharp decrease in the number of registered motor vehicles running which resulted from lack of imports of vehicles for ordinary transport purposes and the shortage of motor fuel, but it may be expected that the end of the war will alter the entire position.

Thanks to the Empire Air Mail Scheme which was inaugurated in the early thirties, air transport in India developed at great speed and private enterprise could justifiably claim a large share of the credit for the progress made. Side by side with the development of wireless facilities for aviation purposes, considerable improvements were effected in wireless broadcasting. There has been a very large increase in the number of civilian broadcast receiver licences in the course of the last seventeen years but the latest figure of 194,000 would appear highly inadequate when viewed against the immense possibilities afforded by a large population, growing literacy, and increased interest in world affairs.

In the last twenty-five years there has been some appreciable expansion in the postal and telegraph services. In addition to this, the country has been provided with a network of telephone communications; the number of telephones connected increased from 37,000 to 89,000 between 1923-24 and 1939-40. By 1943-44 the number had increased to 116,000.

Included among the activities of the Post Offices are the provision of Money Order facilities for small sums, the Value Payable system and the Post Office Savings Bank whose primary aim is to provide a safe investment for the small saver. The

popularity of the bank increased greatly in the period between the wars as evidenced by the increase in the number of depositors from 1.8 millions in 1921 to 4.2 millions in 1939; during the same period the balance of deposits nearly quadrupled itself. The outbreak of War which was accompanied by the inevitable psychological stresses and strains, however, caused a decline in both the number of depositors and the balance of deposits, the former declining to 2.6 millions and the latter to Rs. 52 crores by 1943. But the position showed a quick improvement after that period. The newly started Defence Savings Bank alone had 2.3 million depositors with a balance of Rs. 3½ crores on 31st March 1944 giving an average deposit of Rs. 15 per head.

Mention should be made, in this context, of the progress made by Indian Joint Stock Banks in recent years. The banking crisis of 1922-23 seriously affected the volume of deposits of these banks and the **Banking** recovery was so slow that it was only after ten years that the deposits again reached the 1921 level. The improvement was rapid after 1933 and by 1937, the deposits had reached the figure of Rs. 109 crores. The Co-operative Banks which formed the main source of finance for agricultural operations were, on the other hand, greatly affected by the trade depression; the deposits and loans held by these banks which were about Rs. 40 crores in all in 1931 declined by more than Rs. 7 crores in the succeeding year and the improvement noticed from 1933 was so slow that even by 1941 the deposits had not been restored to the 1931 figure. By 1943, however, the deposits had increased to Rs. 48 crores.

The Exchange Banks which were in the earlier years mainly concerned with the financing of foreign trade had, perhaps, lately begun to look upon deposit banking as of greater importance; but although they were able to show a fairly large increase in deposits in the war years, the Indian Joint Stock Banks did better still in this respect; the latter class of banks had increased their deposits from Rs. 107 crores in 1938 to Rs. 360 crores in 1943, whereas the former could go up to only Rs. 140 crores from Rs. 67 crores in 1938. The greater part of the increased deposits of both classes of banks went into investment in Government securities directly or through the Reserve Bank and only a relatively small portion was

accounted for by business advances. Thus, while in 1938-39, one half of the liabilities of Scheduled banks was taken up by advances and bills discounted, in 1943-44 only a quarter could be accounted for in this way. The ratio improved to 30 *per cent* in 1944-45 and it may be expected to increase further.

An important landmark in the banking history of the last twenty-five years was the inauguration of the Reserve Bank of India in 1935. The supervision exercised by this body in banking matters generally should greatly have benefited both banks and depositors.

In the allied field of insurance the outstanding development was the rapid progress of the new life business of Indian Companies and the gradual reduction in the **Life Assurance** new business of non-Indian companies in the pre-war years. The outbreak of war which coincided with the tightening up of the control of insurance business saw a shrinkage in both the number of new lives assured and the sum assured by Indian companies and it was only in 1943 that this business began to look up. The non-Indian companies which had touched bottom in 1940 improved slowly but they are still far from their peak of 1929.

The Indian insurers doing non-life business have shown a steady increase in their premium income over the last fifteen years but they have not yet overtaken the **[Non-life Business]** non-Indian companies. The total premium income of the latter class of companies showed a decrease between 1942 and 1943.

According to figures furnished by the Registrar of Joint Stock Companies the total number of banking, loan and insurance companies increased three-fold **Joint Stock Companies** between 1920-21 and 1942-43, but their aggregate paid-up capital increased by only 54 *per cent*. The average paid-up capital per company was more than Rs. 2.6 lakhs in 1920-21 whereas in 1942-43 the average figure was only Rs. 1.4 lakhs.

A contrast to this is provided by the mining and quarrying companies which increased their total paid-up capital by more than 50 *per cent* with only a 10 *per cent* increase in their number. The mining **Mines** industry could, however, make only a modest claim to a measure of progress in the inter-war period

and considered as a whole and in terms of values all that can be recorded is a general tone of stability.

The annual output of *coal* which was 19 million tons in 1921 increased to more than 29 million in 1941, but fell to 25 million tons in 1943 owing chiefly to shortage of colliery labour. The production of *iron ore* which was less than 900,000 tons in 1921 had by 1941 exceeded 3 million tons and the bulk of this production was meant for the consumption of the Indian Steel Industry. By 1943, however, it decreased to 2.6 million tons owing, perhaps, to the sudden cessation of exports of pig iron to Japan coupled later with the general scarcity of mining labour.

India's normal annual output of *manganese* is slightly more than a million tons representing roughly a third of the world production. But during the slump period the output declined to 200,000 tons equivalent to a fifth of the 1929 figure; in terms of value the proportion was a great deal smaller. The steep fall in the price of manganese ore has been explained as due to the fact that, between 1924 and 1927, the world production of this mineral increased faster than that of pig-iron and steel and consequently the available supplies of ore later on greatly exceeded the normal requirements. In fact manganese was the mineral most severely affected by the last depression, but the increased foreign as well as internal demand in later years had so greatly accelerated the recovery in prices in this case that, by the outbreak of war, the *value* of the output had doubled as compared with 1929, although the volume remained the same.

With a five-fold increase in the output of *mica* in the course of twenty years, India had become the world's biggest supplier of this mineral.

The history of the petroleum industry in India has been one of quick development. Starting from a modest figure of 9½ million gallons in 1921, the annual output of the Punjab and Assam Oil Fields, rose steadily to more than a hundred million gallons in 1941.

Among the minerals that showed a continuous decrease in output, gold was the most prominent. The

steady decline in India's output of gold in spite of the steep rise in the price of the metal during the thirties cannot be easily explained, but it is probably due to the increased difficulties arising out of the high temperature in the depths of the Kolar gold fields which account for the entire output of gold in the country; the mines go down to 10,000 feet below ground level, that is, roughly 7,000 feet below sea level.

1941 was the peak year for mineral production; in the succeeding years *every* mineral has shown a decline in output and scarcity of mining labour has admittedly been the chief contributory cause for the general decline. The position regarding coal, which had deteriorated very greatly, has recently shown signs of improvement.

While in every field the inter-war period had seen very significant changes, agriculture remained surprisingly static upon the whole, but for the experience of crops like cotton sugarcane and groundnut.

Twenty-five years ago, in this country—the second largest producer of cotton in the world—long staple varieties were almost unknown and what her textile industry needed in such varieties had to be wholly imported from abroad. The position at the outbreak of War, on the other hand, was that the industry was meeting a considerable portion of its long staple requirements from indigenous production. The improvement in the quality of the crop was accompanied by an increase in the average yield per acre of about 30 per cent.

The record of jute, however, has not been one of uninterrupted progress. The fall in the prices of raw jute during the Depression was steeper than in the case of any other commodity and this accompanied by a curtailment of acreage owing to the shrinkage of world demand was estimated to have reduced the income of the average jute-grower by about two-thirds. The situation of the cultivator no doubt improved later, but the difficulties of the jute manufacturing industry caused a fall in the consumption of raw jute and this necessitated a large measure of state control in regard to the area under this crop. Jute is of such profound importance to the country, and particularly to the Province of Bengal, that it is very necessary

to maintain a *remunerative price* for the commodity subject only to the consideration that the comparative cheapness of jute in relation to the competing fibres should be maintained if a permanent falling off of the world demand for jute products is to be averted.

The progress of sugarcane cultivation was limited solely by the capacity of the internal market to absorb supplies. The estimated production of *cane* in 1924-25 was less than 30 million tons but by 1936-37 **Sugarcane** it had exceeded 67 million tons. This turned out to be far in excess of the effective demand and the manufacturing industry was in a state of overproduction; as a result, cane production came down to the low figure of 36 million tons in 1938-39 but it improved to 48 million tons in the next year. A large proportion of the total area under sugarcane in India is now devoted to the improved *Coimbatore* varieties with a yield per acre higher than that of other varieties by more than 30 *per cent.*

The one agricultural commodity whose fortunes were not greatly affected by the Depression was *groundnut*. A quadrupling of the area and a proportionate increase in **Groundnut** output in the course of twenty years is a record which is not shared by any other crop. The phenomenal increase in the acreage under groundnut has been explained as due to the highly remunerative nature of the crop coupled with the discovery of the property attributed to the plant of rectifying the nitrogen deficiencies of the soil.

The greater part of the increased output of groundnut was exported; in the result, groundnut had steadily displaced the other oilseeds from the export trade of India. An important factor which is likely to guarantee for this oilseed a future as bright as its past is the greatly increased internal demand for groundnut oil for the manufacture of *Vanaspati ghee* as well as for various other industrial purposes.

The production of linseed has remained remarkably steady for a long time; the internal consumption of this **Linseed** seed is likely to increase with the progress of the relatively new paints industry whose demand for linseed oil is bound to grow in the future.

This story of continued progress has to be varied somewhat in relation to the production of foodgrains. In

spite of the best efforts in recent years on the part of Agricultural Departments to improve quality and yield, the output of rice has obstinately refused to improve. About 4½ million acres were brought under improved varieties but this had no perceptible effect on the total production; actually the output declined by something like 10 per cent between 1920-21 and 1940-41. A part of this decrease is accounted for by the vagaries of the monsoon, but there are two other factors to be taken into account. The first is that in the case of rice the utilization of new varieties and methods has not proceeded so favourably as in the case of cotton and sugarcane. The second consideration is that the average cultivator in India, whatever his defects, has an undoubted capacity to choose his crops so as to maximise the money return; had not the 'cash' crops been comparatively more profitable, there was a fair probability that the greater part of the new area under irrigation would have been brought under rice. The tendency to substitute other crops for rice was greatly accentuated by the easy availability of an abundant supply of cheaper varieties of imported rice.

The results of research have been applied with much greater success in the case of wheat. About a third of the total area under wheat has been brought under improved varieties and between 1920-21 and 1940-41 the total output of wheat has increased from 6 million tons to 8 million tons. The cost of production in India, however, remained very high in comparison with that in other wheat producing countries and the Indian wheat grower was hit so hard by the fall in the world price of wheat during the Depression that, in his interest, a protective duty had to be imposed on imports of wheat. The need for further improvements in quality and yield is consequently as great as ever.

The experience of other cereals, particularly millets, was more or less similar to that of rice. The millet crops are concentrated in areas of poor rainfall and it is in such areas that any improvement in cultivation meets with peculiar difficulties.

The trends of the inter-war period in regard to food grains were reversed during the war and, according to

the 1943-44 figures, the area under rice showed an advance of about 6.7 million acres and an additional output of 6.6 million tons of cleaned rice. Wheat has remained stationary during the war. The other cereals showed an increase of output of about two million tons. All this was accomplished mainly by depriving cotton and jute of a large portion of the area that belonged to them before the war; in British India alone cotton and jute lost 2 million acres each in this way; oilseeds also gave up a considerable area in British India but this was more than offset by an increase in the area under oilseeds in the Indian States.

The plantation crops showed a moderate degree of improvement during the whole period. In the case of rubber, however, it is doubtful if the threefold increase **Tea, Coffee and Rubber** in the yield per acre is wholly due to improved methods of extraction; much of the increase could well have been due to the "slaughter" tapping of recent years.

The cattle population of India remained stable in the twenty years between 1920-21 and 1940-41 but sheep and goats showed appreciable increases. The area under fodder crops increased by a third during the **Maize** period. Although the experience of agriculture in the recent past has not been uniformly happy, there have been one or two developments which clearly add strength to the hope that it is on the threshold of better days.

Firstly it is a fact that nearly ten million acres have come under irrigation in the last two decades and the lion's share of this increase in acreage can be put to the credit of Government canals. And, with **Irrigation** the high priority assigned to irrigation projects in the reconstruction programme of Government, a still greater measure of improvement may be expected.

Secondly, the co-operative movement has come to stay—witness the quadrupling of the figures all round; whether the number of societies, or the number of members **Co-operation** or even the loan transactions be considered. Seven out of every eight societies are concerned with the provision of cheap credit to the small agriculturist.

Thirdly, the comparatively new marketing organization set up by the Government of India in co-operation with the Provincial and State Administrations is actively engaged in the task of improving the **Agricultural Marketing** methods of grading and distribution of agricultural produce. The increase in the value of commodities graded under their 'Agmark' scheme from the modest sum of Rs. 25,000 to the figure of Rs. 8 crores in less than ten years is illustrative of the progress already achieved in this direction.

Such in brief have been the important trends in India in the social and economic field in recent years. India has still considerable gaps to fill in her industrial structure.

Conclusion Her agriculture is capable of further development. Her social services have room for improvement. But all in all there has been not inconsiderable progress in the last twenty-five years and what India has achieved in this difficult period in the affairs of the world does provide a measure of what she can—with a long-term plan before her—attain in the years to come.

PART II—TABLES

I (a).—AREA AND POPULATION

(All figures are exclusive of Burma, Aden, Andaman and Nicobar Islands)

	British India			Indian States		
	1921	1931	1941	1921	1931	1941
I. Area (sq. miles)	857,370	859,456	865,446	711,032	712,508	715,964
II. Total population (000)	233,708	256,778	295,808	71,939	81,311	93,189
Density per sq. mile	273	299	341	101	114	130
III. Distribution according to sex— (000)
