PREFACE

THIS book is intended to supplement the discussion contained in, and to supply the illustrations—both verbal and otherwise—which, for reasons explained in the preface, were omitted from, British Railway Operation. Whilst, therefore, it may be necessary to introduce particular cases by a general consideration, it is not proposed to encroach upon the ground already covered by the former work, it being assumed that, so far as may be necessary, the reader is familiar with the principles set out therein. For convenience the same general order will be followed.

In a book of this length one cannot hope to consider all the principal operating problems which are likely to arise, or which should be searched for; nor is it suggested that the method used in any particular case is necessarily the best one for that type of problem under all circumstances. What the writer will endeavour to do is to discuss problems that are typical of the different sections of railway operating, using the method which he has found to be most generally useful in each case.

As on the previous occasion, I must acknowledge my indebtedness to a large number of railway colleagues of all ranks and grades who have, from time to time and in many different ways, helped me to the conclusions which follow. I would especially like to acknowledge my indebtedness to my fellow members of a class, organized on tutorial lines, which was conducted jointly by the Hull University College and the Hull (L.N.E.R.) Railway Lecture and Debating

Society, and of which I had the privilege of acting as chairman. This class, consisting of twelve railwaymen of different grades under the leadership of the head of the department of mathematics of the Hull University College, considered the value of the three-aspect signalling from the operating point of view.* This necessitated a preliminary investigation of the principles underlying present-day signalling, and I must gratefully acknowledge the assistance its discussions gave in clarifying and confirming many of the views expressed in the chapter dealing with line capacity.

[&]quot;Readers who are interested will doubtless be able to obtain copies of the report of this group on application to the University College, Hull.

AN URGENT OUESTION

SHOULD THE STATE ACQUIRE THE TRANSPORT SERVICES?

THE ANSWER IS TO BE FOUND IN

NATIONALISATION of TRANSPORT

- An Impartial Review

With a Foreword by LORD STAMP of SHORTLANDS, G.C.B., G.B.E.

Price 1/- net, post free 1/1

"Sub-divided into ten chapters, its 75 pages comprise a skilful examination of such matters as freedom of choice, a criticism of the railways, a review of efficiency, and probable advantages and repercussions. The final chapter gives the conclusions to be drawn from this impartial examination of the facts, showing clearly that the survey has been carried out by a person or persons eminently suited for an extremely difficult task."—World's Corriers.

"So much is being said nowadays about the nationalisation of public utility services, often with only the vaguest idea of all the complicated issues which are involved, that this little brochure . . . is very welcome as a fair and carefully balanced statement of the pros and cons of an exceedingly difficult problem."
—Dork and Horbour Authority.

"This series of articles constitutes a careful survey of an important subject, and should be welcomed in brochure form as a handy little work of reference even to those who do not necessarily agree with the conclusions." —Railway Gazette.

"For over 100 years the subject of transport nationalisation has cropped up at intervals in Parliament and the Press. It has created a literature of its own. As Lord Stamp says in a "Foreword", this volume will attract interest and afford enlightenment on a highly important and controversial subject. Whilst concise in its treatment, the publication covers a wide field."—Chamber of Commerce Journal.

THE SCIENCE OF TRANSPORT

- In earlier days transport activities were departmentalized: railway men had less need to concern themselves with what was happening in provinces adjacent to their own. But meantime road transport has forged ahead and, like docks and shipping, has come within the sphere of railway activity. In fact, a more appropriate term nowadays for a railway would be a transport undertaking.
- Railwaymen, therefore, need to keep abreast, not only with what is happening in other departments than their own, but in all branches of transport, for even in air transport railways have now an immediate concern. Their requirements are met by MODERN TRANSPORT, which is appropriately known as The Times of the Transport World.
- MODERN TRANSPORT is accordingly regarded by the administrative, engineering and operating officers of the railway companies as the principal medium of information regarding transport activities throughout the world and as the means of acquainting themselves with all the latest devices, manufactures and products affecting transport.
