TRIENNIAL IRRIGATION REVENUE REPORT, BOMBAY  
PRESIDENCY (EXCLUDING SIND), 1899-1900 to 1901-1902.

*General Remarks.*

This is the first Triennial Revenue Report of Irrigation Works prepared in accordance with the orders of the Government of India conveyed in their Resolution No. 670—C.W.I., dated the 6th June 1901, contained in Government Resolution No. W.I.—1396, dated 5th July 1901.

2. The report is intended to contain the statistical information of which it is important to maintain a permanent and continuous record. Accordingly statements showing various working details and the results attained in four successive triennial periods have been prepared and brief general remarks appended to each.

3. The works in the Deccan and Gujarát for which both Capital and Revenue Accounts are kept are divided into two classes—Major Irrigation Works, and Minor Works and Navigation—and are used for irrigation purposes only.

The "Major Irrigation Works" are—

*Protective Works.*

1. Nirã Canal.
2. Mhasvad Tank.
3. Shetphal Tank.
4. Chankapur Tank.
5. Maladevi Tank.

*Productive Works.*

6. Hathmati Canal.
7. Lower Panjhra River Works.
8. Kadva River Works.
9. Pravara River Works—Lakh Canal.
10. Mutha Canals.
11. Ekruk Tank.
12. Krishna Canal;

and those classed under the head "Minor Works and Navigation" are—

13. Khari Cut.
14. Hartala Tank.
15. Mhasva do.
16. Jamda Canals.
17. Parsul Tank.
18. Pravara River Works—Ojhar Canal.
19. Bhatodi Tank.
20. Matoba do.
21. Kasurdi do.
22. Shirsuphal do.
23. Bhadalvadi do.
24. Koregaon do.
25. Ashti do.
26. Revari Canal.
27. Upper Man River Works.
28. Yerla River Irrigation Works.
29. Chikli Canal.
30. Maini Tank.

31. Muchkundi Tank.
32. Gadikeri do.
33. Dambal do.
34. Medleri do.
35. Madag do.
36. Asundi do.
37. Mavinkop do.
38. Gokak Canal—Second Section.
39. Gokak Canal—First Section and Storage Works.

4. Of these 39 works, 36 are in operation, 2 (Chankapur and Maladevi Tanks) under construction and the remaining one (Gokak Canal—Second Section) is in abeyance.

5. The following table gives the average rainfall at all stations connected with works in operation at which it is gauged :—

Average of 12 years, 1890-1891 to 1901-1902.	DURING			AVERAGE FOR			
	1899-1900.	1900-1901.	1901-1902.	1899-1900 to 1901-1902.	1896-1897 to 1898-1899.	1893-1894 to 1895-1896.	1890-1891 to 1892-1893.
Inches.	Inches.	Inches.	Inches.	Inches.	Inches.	Inches.	Inches.
21.41	10.70	19.09	18.95	16.25	21.34	23.47	24.58

The rainfall during the triennium under report was below the average and considerably less than that of the triennia ending 1893 and 1896.

6. The Capital outlay and financial results of the works classed as Major Works—Protective—are shown in the following table :—

	AVERAGE FOR			
	1899-1900 to 1901-1902.	1896-1897 to 1898-1899.	1893-1894 to 1895-1896.	1890-1891 to 1892-1893.
	Rs.	Rs.	Rs.	Rs.
Capital outlay to end of triennial period ... ..	86,81,778	80,79,379	78,28,357	73,72,902
	Acres.	Acres.	Acres.	Acres.
Area irrigated ... ..	52,698	48,030	23,772	28,144
	Rs.	Rs.	Rs.	Rs.
Revenue ... ..	1,93,628	1,35,585	99,927	77,032
Working Expenses ... ..	69,161	83,407	77,652	57,536
Net Revenue ... ..	1,24,467	52,178	22,275	19,496

7. There is a steady increase in the area under irrigation and revenue earned. The working expenses show signs of decreasing, the need of which is constantly impressed on the local officers. The net revenue of the triennium under review shows a return of nearly  $1\frac{1}{2}$  per cent. on the Capital spent, about eighty-seven lakhs, excluding interest charges. Omitting outlay on the two works under construction and the Shetphal Tank brought in operation only during the rabi season of 1901-1902, the percentage of return comes to 1.60, showing a very satisfactory increase over that of the previous triennia. The general remarks at foot of the detailed statements describe the progress of each individual work.

8. The following statement gives Capital outlay and financial results in respect of the works classed as Major Works—Productive :—

	AVERAGE FOR			
	1899-1900 to 1901-1902.	1896-1897 to 1898-1899.	1893-1894 to 1895-1896.	1890-1891 to 1892-1893.
	Acres.	Acres.	Acres.	Acres.
Area irrigated ... ..	26,904	30,096	25,709	26,631
	Rs.	Rs.	Rs.	Rs.
Capital outlay to end of triennial period ... ..	1,10,53,704	1,00,50,247	1,08,71,463	1,06,19,678
Revenue ... ..	3,65,465	3,53,057	3,61,360	3,29,807
Working Expenses ... ..	1,62,162	1,83,170	1,38,814	1,43,536
Net Revenue ... ..	2,03,303	1,74,887	2,22,546	1,86,171

9. The Capital outlay under this head amounts to nearly Rs. 1,11,00,000 upon which a return of nearly  $1\frac{3}{4}$  per cent. is obtained. The smallness of the profit is mainly due to the meagre use made of the water available by the cultivators who prefer to depend on the rainfall. The working expenses are proportionately high owing to the restricted area of cultivation. The total area under irrigation, however, remains fairly stationary.

10. The Capital expenditure on (1) Lower Panjhra River Works, (2) Kadva River Works, (3) Pravara River Works—Lakh Canal, and (4) Mutha Canals, originally classed as Productive Works and still maintained on the list of works of that class, has from 1885-86 been met from funds provided under "Minor Works and Navigation" as they were found not to fulfil the conditions prescribed in the case of Productive Works, the amount so charged being Rs. 9,08,391. This expenditure is included in the figures entered in the table in paragraph 8.

11. The Capital outlay and financial results in respect of "Minor Works and Navigation—Works for which Capital and Revenue Accounts are kept" are as follows :—

	AVERAGE FOR			
	1899-1900 to 1901-1902.	1896-1897 to 1898-1899.	1893-1894 to 1895-1896.	1890-1891 to 1892-1893.
	Acres.	Acres.	Acres.	Acres.
Area irrigated ... ..	40,863	39,146	25,359	25,049
	Rs.	Rs.	Rs.	Rs.
Capital outlay to end of triennial period ... ..	81,08,867	76,65,147	75,52,399	73,15,128
Revenue ... ..	1,06,373	1,36,683	1,17,402	99,304
Working Expenses ... ..	1,59,793	1,00,304	94,392	76,574
Net Revenue ... ..	—53,420	36,379	23,010	22,730

The works, as a whole, are run at a loss. The working expenses per acre are lower than in the previous class, however, and the area under irrigation shows a steady improvement. Details of these works are given in the individual statements.

12. Besides the works detailed in paragraph 3 under Minor Works and Navigation, there are two classes, namely (1) Works for which only Revenue Accounts are kept, and (2) Works for which neither Capital nor Revenue Accounts are kept.

---

**CONSOLIDATED STATEMENT.**

---

**MAJOR WORKS—PRODUCTIVE WORKS.**

---

13. The particulars of "Works for which only Revenue Accounts are kept" are as follows:—

	AVERAGE FOR			
	1899-1900 to 1901-1902.	1896-1897 to 1898-1899.	1893-1894 to 1895-1896.	1890-1891 to 1892-1893.
	Acres.	Acres.	Acres.	Acres.
Area irrigated ... ..	131,372	145,985	145,036	145,782
	Rs.	Rs.	Rs.	Rs.
Revenue ... ..	5,53,072	5,64,244	5,47,497	5,33,434
Working Expenses ... ..	2,32,089	2,19,698	2,65,652	1,87,877
Net Revenue ... ..	3,20,983	3,44,546	2,81,845	3,45,557

The works included are small Tanks and Bandharas and are a source of considerable revenue.

The whole question of maintaining this class of works is under careful consideration, and probably a much larger number will be brought on the returns of this Department.

14. Particulars in respect of Works for which neither Capital nor Revenue Accounts are kept are as follows:—

	AVERAGE FOR			
	1899-1900 to 1901-1902.	1896-1897 to 1898-1899.	1893-1894 to 1895-1896.	1890-1891 to 1892-1893.
	Rs.	Rs.	Rs.	Rs.
Revenue ... ..	1,785	537	535	771
Expenditure ... ..	1,19,049	62,686	28,032	27,977

The expenditure under this head is on drainage channels, surveys, &c., and calls for no remarks.

*General Remarks.*—These canals have not yet been completed, and therefore it will not cattle a greater proportion than one quarter of the culturable area cannot be expected to be increase. As this is, however, accompanied by an increase in working expenses the net and Canals as originally proposed is under consideration.

*General Remarks.*—The Canal and distributaries were designed on the assumption experience proves they will only irrigate the alluvial lands. The work has been a failure for consideration whether the Canal should continue to be maintained. A portion of the main remedy for improving the results appears to be in the construction of a storage work

In 1893 the Government of India directed attention to (1) the comparatively small returns management, and suggested the advisability of closing some miles of the unprofitable commercial basis, water being allowed for the high rated crops only. The area of perennial on this account is considerable. The storage is now being increased by the addition of struction of two tanks above Lake Fife has also been proposed and the projects are under

*General Remarks.*—The area irrigated shows a gradual increase. This is not, however, actually realized being small the net return is not encouraging. The anticipated irrigable area This is under consideration. The extension of the Canal has also been proposed. This Report the Government of India remarked that the project did not fulfil the conditions of a Minor Works.

If the supply can by any means be increased it is believed it would all be utilised.

*General Remarks.*—The country under the Canal is liable to periodical famines and for garden irrigation. It has, however, not proved as advantageous as anticipated chiefly appreciate the value of irrigation for ordinary crops and the uncertainty of hot weather area was found impracticable and abandoned in 1897. A feeder to the tank is much wanted valley to the south of the tank, but no definite conclusion has been arrived at.

*Triennial Revenue Report of Irrigation Works in the Bombay Presidency, excluding Sind, for 1899-1900 to 1901-1902—Review of the.*

No. W. I.—2016 OF 1903.

Public Works Department.

Bombay Castle,  
17th August 1903.

Read—

Triennial Revenue Report of Irrigation Works in the Bombay Presidency, excluding Sind, for 1899-1900 to 1901-1902.

RESOLUTION.—Copies of the Report should be forwarded to the Government of India and the Secretary of State.

2. It has been somewhat difficult to decide the form the report should take, but it is hoped the statements prepared for each canal or group of canals will enable the position of irrigation in the Deccan and Gujarát during the past triennium as compared with the previous ones to be appreciated. Minor details as to the working in any particular year can be obtained from the Annual Reports which have been published.

3. The whole question regarding the efficiency, management and progress of the Deccan Irrigation Works was fully discussed some 9 years ago, which discussion culminated in this Government's letter to the Government of India, No. 134 W. I.—1688, dated 31st October 1894, a copy of which is attached. There is no doubt there are signs that the people generally are becoming more alive to the benefits of irrigation especially during years of drought, while on some of the canals the area under irrigation is limited only by the storage available. There can be no doubt that the works, though not directly profitable to Government, have been of very great use in mitigating distress.

4. His Excellency the Governor in Council regrets the delay in the submission of this report, the figures in which required careful compilation which was greatly interfered with by the heavy pressure of work caused by the recent famine.

TO

THE SECRETARY TO THE GOVERNMENT OF INDIA,  
PUBLIC WORKS DEPARTMENT.

VIII.—Irrigation (Works.)

SIR,

I am directed to reply as below to the questions raised in paragraph 9 of the Resolution of the Government of India, Public Works Department, No. 53 I., dated 9th March 1893, reviewing the Revenue Report of Irrigation Works in the Bombay Presidency (excluding Sind) for 1891-92.

2. The questions are three in number:—

(1.)—Why has not greater progress been achieved in extending the irrigated areas below new works of irrigation in the Deccan?

(2.)—What is the efficiency of the several works in furnishing a water-supply for cultivation in seasons of deficient rainfall? and

(3.)—Are these works managed with a careful regard to their effective utilization for that service?

3. Nos. (2) and (3) of these questions have reference to seasons of deficient rainfall, but No. (1) should, it is thought, be considered first of all with reference to years of good or normal rainfall, as a spasmodic increase in area which may be caused by deficient rainfall is no criterion of the extension of irrigation, for most of it is likely to cease with the cause that produced it. I am accordingly directed to deal with question No. (1) from this standpoint, and I am in the first place to offer a few general observations on the conditions which obtain in the Deccan, so that the Government of India may be placed in possession of data which will enable them to obtain a more accurate idea of the circumstances than it is believed has yet been placed before them.

4. The Deccan formation is of volcanic origin, and the country is rugged and broken up, stretches of barren rocky high land alternating with fertile valleys, the descent from the former into the latter being marked by the gradually increasing depth and richness of the soil, which varies from a poor shallow red to a rich black soil often of considerable depth, the product of centuries of denudation of the volcanic rocks. Given a sufficient and timely rainfall, this soil is capable of producing ample crops. There are no perennial rivers of any size, the feature of the country being the numerous rain-fed 'nálas,' in flood for perhaps a few hours at a time and dry for many months of the year. This country produces, in the valleys, an ample supply of food crops in years of good or normal rainfall, but the result of a failure of the monsoon rain is, as the Government of India are too well aware, a failure of crops and widespread distress, and it is here, with a view to provide in some measure against the uncertainties of the rainfall, that the majority of the works in question have been constructed. The works consist for the most part of reservoirs, formed by damming up some of the rain-fed torrents, to store for future use some of the many millions of cubic feet of water which run to waste in the monsoon season, but others consist of weirs to raise the level of some of the better fed streams whence distributing channels are led to the land under command.

5. The conditions thus differ essentially from those which obtain in the Panjáb and Sind (for instance), and no comparison of results with what is obtained in those provinces is possible.

being considered, *viz.* years of normal rainfall, it is assumed that no irrigation is required for the ordinary staple crops. The available water is, roughly speaking, confined to (1) special hot-weather crops, and (2) to a certain limited quantity of rice, ground-nuts, and other crops which depend on a timely and abundant supply of water. There is an essential difference in the character of the water of reservoirs as compared with that of deltaic rivers. Whereas the waters of such a river as the Indus carry with them for distribution, free of charge and without labour, a most valuable manure in their silt, crops irrigated from reservoirs or clear water streams require artificial manuring at considerable expense to the farmer. Perennial crops especially require heavy manuring, and on the removal of the crop, the ground is sufficiently enriched to serve for 2 or 3 seasons of rabi or special eight-months' kharif crops. The cultivator in the Deccan does not, as a rule, find it profitable to manure his land for a rabi crop alone, and the use of canal water, as already stated, necessitates manure. But after a perennial crop has been removed, he has not to go to the expense of any further manuring, and for the small water charge only he obtains a superior rabi crop, the superiority of which, however, over an unirrigated crop would not, as a rule, be sufficient to justify the required extra outlay on manure.

7. It will be seen then that there are two factors which determine the probable extent of irrigation under the ordinary irrigation works of the Deccan, and these are firstly and mainly the water-supply which can be depended upon to irrigate perennial crops *in the hot season*, and secondly the available supply of manure. There is a third factor, *viz.*, the wealth of the cultivator, but this will not help him if the water-supply is deficient, though it is only a well-to-do rayat who can afford the outlay necessary to grow special crops.

8. The area of perennial irrigation being practically limited by the assured hot-weather supply of water, it follows that the total area is, to a great extent, dependent on the hot-weather supply.

9. It will be understood that this is a generalization only, the irrigation of ground-nut, for instance, which is in increasing favour, being independent of this rule, as is also rice irrigation, and these two in 1892-93 accounted for 14,000 out of the 66,000 acres irrigated, but it affords a very fair explanation of the reason why the area does not increase more rapidly. Irrigators under these works have seen the water in the tank or in the river very low, or even fail completely in the hot season after an unfavourable monsoon. There is always the risk of this, and they naturally hesitate to go to the expense of preparing their fields unless they have wells to fall back upon, and it has often been necessary on many of the works to grant applications only to those who have such wells.

10. In the opinion of this Government, therefore, it is the uncertainty of the hot-season supply that mainly limits the extension of perennial irrigation, and it is the fact that the ordinary rainfall suffices for the staple food-grains, while the use of canal water necessitates the expense of manuring, that prevents, as a general rule in ordinary years, the extensive irrigation of other classes of crops beyond such as are grown in rotation with perennial crops.

11. I am to say that the remarks in regard to supply should not be held as applicable to the Mutha, Nira, or Krishna Canals. The two former are supplied from large reservoirs, with catchment areas favoured with unfailing rainfall, and the Krishna Canal takes off from a river, the hot-weather discharge of which is always considerable. The Nira Canal is not yet fully developed, and is avowedly a 'Protective' Work, while the others have special facilities as regards communication and proximity to large markets.

12. The very nature of the majority of these works renders the hot-weather supply, which is such a main factor in their utility, an uncertainty. Whereas in the case of the Mutha and Nira Canals, the reservoirs are fed by ghat rainfall which never fails, the Ekruk, Ashti, Mhaswa, Bhadalwadi, Medleri and other tanks similarly situated depend for their supply on local rainfall, and not only on the total amount of such rainfall but on the manner in which it falls, a few heavy rain storms doing more to fill the tank than

weeks of light soaking showers which, instead of tank, soak into the ground. And similarly there is hot-weather supply in the Pravara river (Lákh and Ojhar) and the Girna river (Jámda Canals), both of which rivers have failed in hot-weather. Results as regards these canals would be very much improved if storage tanks fed from ghát rainfall constructed for them, and reservoirs are projected at Sámrad for the Ojhar and Lákh Canals, and at Chámbur for the Jámda Canals.

13. The extension of means of communication has to some extent aided in such increase in irrigated area as has taken place, by rendering the importation of manure and the export of produce to markets cheaper and more rapid, and further extension on this account may be looked for on some of the better situated works, and also some development in regard to rice, ground-nuts, &c. ; but this Government fear that development will not be rapid. I am to say that His Excellency the Governor in Council has arrived at this conclusion with reluctance, but considers that the time has arrived when all idea that the irrigation under these works will approximate to the figures originally estimated should be put aside.

14. That even in a year of deficient rainfall, such as 1891-92, the irrigated area did not increase to a greater extent is due to the fact that the cultivator, who is not accustomed to irrigation, hesitates to apply for water until the very last moment, in the hope that the rain may yet fall in time to save his crop, and he often waits so long that the time has passed before he can make the necessary arrangements, and the crop is lost. At such a time too the land is full of cracks and absorbs so much water that only a limited number of applicants can be supplied, and in addition to this the dry-crop fields not being levelled, if water is turned on to them the lower portions are flooded and more harm than good may be done, while the higher portions do not get water enough.

15. The second and third questions relating to the efficiency of the works to afford supply in time of deficient rainfall may be taken together. As stated above, the nature of the majority of these works is such that if the rain fails they also fail, and thus, when wanted most, they are of least use. But as there is never a *complete* failure of rain there will always be *some* supply during the monsoon which could be applied to save dry crops, and given a good season the year before, some of the tanks would have a balance to start on ; but in a bad year following on an indifferent one such works would be useless, as a rule, for protective duty. It is to be noted also that, whereas it cannot be said earlier than July or August that the first rainfall is deficient, it may be that the second rainfall in September or October will be very good, and then the additional rabi cultivation will in many cases compensate the rayat for short kharif, and cultivators hold back often in the hope of this. Should the later rains also fail, there will be increased demands for rabi irrigation, and the tank insufficiently replenished itself, and already pledged to supply perennial crops, will very probably be unequal to the demand.

16. To be always ready to give water in case of a failure of rainfall, it would be necessary to always maintain the water in the reservoirs at a certain height, which would mean the practical cessation of perennial irrigation, to which is due almost entirely such revenue as is derived from these works in normal years ; and it would also be necessary to keep in proper order additional lengths of channels to convey the water, should it be wanted, to fields which now never so much as see it, and to keep the main canals ready to supply a quantity of water much in excess of what they are now ever called upon to supply. The works in fact are not now maintained with due regard to their efficiency for protective service, and to so maintain them would entail largely increased charges, and the sacrifice of the greater part of such revenue as is now derived from them ; and I am to express the opinion of this Government that the protective service to be looked for from these works must be small. The Nira Canal and Mhaswad Tank, which are avowedly 'Protective,' are on a different footing, but the other works should, I am to submit, be managed mainly with regard to their productive and not their protective capacity. The extension of roads and

Deccan has modified and reduced the effect of year as 1876-77, and I am to say that even were the ed to a great extent and the maintenance charges of y increased, their effect in a time of scarcity on the produc- 3. rains would be inappreciable. The main result would be to pre- to the well-to-do rayats who now practise irrigation, and who are best atred to meet a famine while in no appreciable degree, if at all, would they mitigate the sufferings of the really poor who are the first to feel the pinch of scarcity.

17. His Excellency the Governor in Council considers that to expect both a return on capital expenditure and efficiency for protection from scarcity, would, as regards the works in question, be to expect what is impossible. Managed with a view to revenue, these works have failed to realize the anticipations of their projectors, and though it is hoped that they may improve considerably, they are not, it is feared, likely to give any remunerative return on the capital expended on them. If instead of working them with a view to revenue, they were to be managed with a view to their efficiency for protecting ordinary crops in seasons of deficient rainfall, the financial outlook would be much more gloomy, and this Government are of opinion that it is better for the general prosperity that the greatest use should be made of the water, rather than that it should be held as a reserve and its efficiency as a producing agent seriously diminished.

18. Though the success of the majority of the works as commercial concerns cannot, it is feared, be looked for, there is no doubt that the water has added considerably to the wealth of the localities concerned. In 1892-93 the value of the irrigated crops grown on 65,487 acres was estimated at Rs. 39,47,775, and of this total 8,851 acres were under sugarcane, the produce being valued at Rs. 22,85,815. Though it may be necessary to abandon the idea that the irrigation works of the Deccan will play any important part in saving ordinary kharif crops in years of scanty rainfall, they will have considerable influence in producing the more expensive crops, and the wealth which they will create, and the labour which they will employ, will do something to mitigate distress in seasons of insufficient rainfall.

19. I am to state that your letter No. 199 J., dated 23rd August 1893, is receiving separate consideration, and will be replied to in due course.

I have the honour to be,  
Sir,  
Your most obedient Servant,  
T. D. LITTLE,  
Secretary to Government.
