## P R E F A C E .

This bulletin has been prepared by Mr. S. B. Dave, M.A., LL.B., Extra-Assistant Commissioner, who was placed on special duty in the Department of Industries for about a period of one year in 1926 and 1927. My special thanks are due to Mr. A. G. Clow, C.I.E., I.C.S., Officiating Secretary, Department of Industries and Labour, Government of India, (now on leave) who was good enough to read the bulletin and to make a number of valuable suggestions. I also thank the Managers, the Empress Mills, Nagpur, Messrs. Burn and Company's Pottery Works and the Perfect Pottery Works, Jubbulpore, the Young Men's Christian Association and the Professors of Economics of Colleges at Nagpur and Jubbulpore for their help in the collection of budgets.

2. It is proposed to issue every month the cost of living index number for industrial workers at Nagpur and Jubbulpore.

C. M. TRIVEDI,

NAGPUR : Director of Industries,

The 12th December 1928. Central Provinces and Berar.

## INDEX NUMBERS

### Showing the changes in the cost of living of industrial workers at Nagpur and Jubbulpore.

---

**Index Numbers and their use.**—During and after the War, a large number of strikes and lockouts in India and other countries has been due to wage disputes, and contradictory assertions have often been made about the comparative relation of the cost of living and wages. The absence of reliable *data* regarding the price movements and their effect on the cost of living has been found to be one of the greatest obstacles in the way of early settlement of such disputes. Most of the European countries now regularly compile index numbers to measure changes in the cost of living, and in India also some provinces have begun their publication. A beginning has now been made in the Central Provinces also to prepare such index numbers for the two towns of Nagpur and Jubbulpore.

2. A change in the cost of living may be due to a change in the articles consumed or in their quantities or in their prices. It is quite possible that, with the same level of prices but for a different standard of living, the cost of living may show a change, but in the preparation of index numbers no account is taken of changes in standards of living and habits of consumption. The reason for this is that the ordinary cost of living index number is designed to measure the cost at different periods of maintaining the same standard of living. Consequently it is only the effect of changes in the prices that is taken into consideration. A list of the most important articles of consumption is drawn up and a period is selected as the standard or base. The total cost at the base period of the commodities so selected is compared with the cost in other periods, the latter being expressed as percentages of the former. It must be noted here that such index numbers have a purely relative character and only show changes in the cost of living. They do not attempt to show what the minimum amount necessary for subsistence at different periods ought to be, but only give a comparison of what it actually costs a person to live at the two periods under his own standard of living regardless of the fact whether that standard is above or below what it ought to be.

3. **Methods.**—Thus it will appear that in the preparation of these index numbers we are mainly concerned with the fluctuations in the prices of commodities. But in combining these price variations it is also necessary to take into account their relative importance, because it would be wrong to give to a rise of, say, 10 per cent in the price of wheat the same importance as to a similar rise in the price of articles like spices or potatoes. The former change will naturally have a far greater effect on the cost

of living than the latter. The methods most generally adopted are the following :—

- (i) The Theoretical Budget method.
- (ii) The Aggregate Expenditure method.
- (iii) The Family Budget method.

4. In the *Theoretical Budget method* the minimum quantities of the different articles of food necessary to maintain an individual of the particular community in health and efficiency are found by taking into account their nutritive values based on chemical analysis and the total costs for these quantities at the two different periods are calculated and compared. A serious defect of this method is that its application is limited to the food group only. The cost of such important items, as clothing, fuel and lighting, cannot be determined and they have to be neglected. Therefore although more convincing and interesting to a layman it has not been widely used. The data found according to this method have been used in some countries, e.g., Germany or Hungary, only to supplement the information found by the Family Budget method.

5. In the *Aggregate Expenditure method*, which is used in Australia, South Africa, New Zealand and other countries and also by the Bombay Labour Office, a list of the commodities commonly consumed is drawn up and their relative importance is found by taking the figures for national consumption (production *plus* imports *minus* exports). The aggregate expenditure during a particular period is found by multiplying the prices by the figures for national consumption, and the total is expressed as a ratio of the aggregate expenditure at the base period. For finding such consumption figures for the whole of India, there are no reliable statistics for the production or consumption of such articles as fish, milk, ghee, chillies, firewood, etc., and the consumption figures would be more or less rough approximations based on a number of assumptions of doubtful validity. Even if the figures were quite correct for India as a whole, the standards of living of the people of the various provinces differ so widely that local peculiarities cannot be ignored, and the application of these figures to the Central Provinces would not lead to satisfactory results. As regards this method, the Government of India also expressed the following views :—

“ An alternative method of assessing the comparative expenditure is to estimate the exports, imports and production of different commodities for a particular area, and thus arrive at the average quantity consumed by each inhabitant of that area. It will be evident that if an index number based on the latter method is to be even approximately accurate, the average consumption for the inhabitants of the area concerned must not differ essentially from the average consumption for the particular class of inhabitants, i.e., industrial workers, to whom

the index number is designed to refer. Moreover, the only area for which it is possible to obtain statistics of exports, imports and production is India as a whole. So that an index number for India or for any part of India constructed on these lines is open to criticism on two grounds, apart from any inherent errors in the statistics used. In the first place, it assumes that the differences between one province and another are not such as to vitiate the application of averages based on all-India figures to particular industrial centres. Secondly, it ignores differences between the mode of living of the industrial classes and that of the population of India as a whole.

The Government of India thus reached the conclusion that, while the method discussed above afforded the only means of constructing an index number with the material already available, no reliance could be placed on index numbers so constructed until they had been checked by the collection of family budgets." (Government of India, Department of Industries, Resolution No. L-919, dated the 1st May 1922.)

6. In the *Family Budget method*, which is used in Great Britain, the United States, Ireland, Denmark and several other countries, the *data* necessary for the determination of the 'weights' are obtained by collecting from a number of the families concerned information regarding the distribution of their expenditure. The collection of such family budgets is no doubt a tedious and difficult task, but if a fairly large number of reliable budgets can be obtained and averaged, this method gives a very satisfactory indication of the relative importance of different commodities and the figures thus obtained can then be combined with the price variations in order to determine the changes in the cost of living. This method has been adopted in the present enquiries, and family budgets have been collected in order to find out the relative importance of the different articles of consumption.

7. *Scope.*—As the averages based on the information collected from families with widely differing standards of living are of little value, it was found necessary to confine the enquiries to particular groups. The budgets collected at Jubbulpore and Nagpur relate to the labourers working in the organized industries (*i.e.*, in mills, factories, etc.) in these two cities. As the standard of living also varies with the income of the family, the enquiries have been confined to families having a total monthly income of less than Rs. 100. This limitation has excluded only a very small number of families of industrial workers. The budgets were collected during September 1926 to January 1927. During this period the prices of commodities were fairly steady and exhibited only trifling variations.

In the case of articles bought every month, for example, food-stuffs, information was obtained regarding the actual consumption

and expenditure during the month preceding that in which the enquiry was held. For each article, the investigators were required to report the actual quantity of the article purchased by the family during the month and also the exact amount of money paid for it. This was necessary, because the actual prices paid by different persons for the same article were different depending upon the quality of the article, the shop from which it was purchased, the labourer's personal relations with the shopkeepers and his ability to drive favourable bargains by proper higgling. For finding the average quantity consumed per family, these actual quantities were averaged and for arriving at the average expenditure per family the figures for actual amounts spent have been used. For certain other articles, for example, clothing, shoes, bedding, etc., which are not bought every month, monthly expenditure figures would not have given reliable averages. Therefore for such articles the families were asked to give particulars of the number of articles in use, the cost of each article when bought, and the number of months that each article would last, and then the average cost of each article per month was estimated.

**8. Collection of Budgets.**—Almost all the budgets were collected by the non-official investigators of the Department. These investigators were mostly graduate and undergraduate students of the local colleges or other persons interested in such enquiries and living in the locality. It was found that the labourers were not quite willing to disclose true facts to strangers. Therefore only those persons who were in touch with the workers were allowed to collect the information. Very valuable help was received from the Young Men's Christian Association Welfare Workers and also from the Professors of Economics of the local colleges. The Managers of the Empress Mills at Nagpur and of Messrs. Burn and Co. and the Perfect Pottery Company at Jubbulpore also co-operated in the work and gave all possible assistance.

All the budgets were collected at the houses of the labourers, and in a number of cases it was found necessary to visit each house many times before complete information could be obtained. An attempt was also made to collect the information during working hours in the Empress Mills, but it was found that the male labourer was often unable to give complete and correct information about the family expenditure without enquiring from his wife who very often was not working at the same place and could not be questioned there. Therefore all the budgets thus collected during working hours had to be excluded from tabulation, and only those collected at the houses of the labourers have been tabulated. The budgets received from the investigators were closely scrutinized and compared and all doubtful items were verified by fresh visits when necessary. Such investigation requires persons with a capacity to make friends among the labourers and to elicit information tactfully from them. A certain amount of experience in this work is also necessary before reliable figures can be obtained. Therefore the first few budgets collected by each investigator in the early part of the enquiry have been excluded

from tabulation. Moreover, in order to test the capacity of the investigators and to exclude budgets carelessly collected, a few of the families examined by them were re-examined and as a result of this verification, only those persons who were found to have succeeded in getting correct information were allowed to continue the investigation. The investigators were also asked not to collect budgets from persons who showed the slightest unwillingness or suspicion, and as far as possible to choose families where they were previously known. As a result of these checks it is hoped that the information obtained is as reliable as it is possible to get in the circumstances.

Thus excluding the budgets rejected as incomplete or doubtful, 1,002 satisfactory budgets have been averaged at Nagpur and 507 at Jubbulpore.

The total number of adult men, adult women, boys under 14 years and girls under 14 years found in the 1,002 families whose budgets were accepted in Nagpur are 1,469, 1,467, 782 and 616, respectively. The corresponding figures for 507 families relating to Jubbulpore are 648, 593, 349 and 312. These figures give an average of 1·47 men, 1·47 women, 0·78 boys and 0·61 girls per family at Nagpur, the corresponding figures for Jubbulpore being 1·28, 1·17, 0·69 and 0·62.

**9. Selection of Commodities.**—For the calculation of the cost of living index numbers the articles have been divided into the following groups and sub-groups:—

**I.—Food—**

1. *Cereals*—Rice, wheat and jawar.
2. *Pulses*—Arhar (tur) dal, gram dal, lakhori, masur and urad.
3. *Other articles of food*—Raw sugar (gur), sugar (refined), tea, fish, beef, mutton, milk, ghee, salt, chillies, turmeric, potatoes, onions, mustard oil, sesamum (til) oil and cocoanut oil.

**II.—Fuel and lighting**—Charcoal, firewood and kerosene oil.

**III.—Clothing**—Dhotis, shirtings, coatings, saris, turban cloth and chaddars.

**IV.—Miscellaneous**—Tobacco, bidis and supari.

In view of the fact that the index numbers have a purely relative value and only attempt to give a comparison of the cost of living at two different periods without claiming to estimate the actual total cost of all the articles at a particular period, it is sufficient to include in the list only the most important and representative commodities. Unimportant articles can be omitted without materially affecting the results. Therefore the list excludes the less important articles consumed by the industrial labourers of Nagpur and Jubbulpore.

Besides those included in the list, there are no doubt a number of other items of expenditure, but they have been omitted from consideration, partly because it was difficult to obtain reliable figures about their consumption or prices and partly because the items included in the list give sufficient indication of the rise and fall in the cost of living. Reliable figures for the consumption of liquor could not be obtained from the labourers. Therefore, as has been done in Bombay as well as in Bihar and Orissa, this item has been omitted from the list. It was also found necessary to exclude different kinds of vegetables, because most of them are available only in particular seasons and it is impossible to obtain regular statistics regarding the monthly fluctuations in their prices all the year round. House rent is another item which had to be excluded, partly because of the impossibility of getting regular statistics regarding monthly fluctuations, and partly because it is not such a serious item in the Central Provinces as in places like Bombay or Calcutta. At Jubbulpore most of the labourers working in Burn and Co. and the Perfect Pottery Company live in quarters supplied by the employers free of rent. A large proportion of the labourers working in the Gun Carriage Factory live in factory quarters for which the rents are constant for long periods, while some others live in their own houses. In Nagpur, although the proportion of persons living in rented houses is greater than at Jubbulpore, there are still a fairly large number of persons in Indora and other localities living in their own houses. It is usual to exclude the miscellaneous group altogether because the articles in this group have infinite variety and cannot be easily classified. The prices of these items ordinarily move in the same direction as of those included and approximately to the same extent. Moreover, a large number of them are items of unusual expenditure. Therefore most of the articles of the miscellaneous class have been omitted, but Tobacco, Bidis and Supari have been found easy to classify. They are also of sufficient importance and have therefore been included. For the Jubbulpore index numbers, Jawar and Lakhori also had to be excluded, because these grains are not used much in that city, the percentage expenditures on these items being only 0·03 and 0·05, respectively. Moreover, these grains are sold in the market at Jubbulpore for only a few months in the year and it is impossible to obtain prices month by month for the whole year. Although at Jubbulpore, the percentage expenditure on 'other cereals' amounts to 1·45, this group is composed of many different species of cereals none of which has been found of sufficient importance to be included in the list of commodities for the cost of living index numbers. Shoes also have been excluded on account of the comparatively trifling percentage borne by the expenditure on this article.

Except for these necessary limitations, the list of commodities included for the calculation of the cost of living index numbers at the two centres has been made as exhaustive as possible.

The items included for the compilation of the cost of living index numbers published in Switzerland, Belgium and Finland

represent about 80 per cent of the total expenditure; those published in Canada and South Africa represent about 65 per cent and those compiled in Australia about 60 per cent. In the index numbers published by the British Ministry of Labour, the cost of food-stuffs included constitutes about 75 per cent of the total family expenditure on food. The items included in the different groups for the Nagpur index number represent about 99·8 per cent of the expenditure on Cereals, 99·5 per cent of that on Pulses, 91·4 per cent of that on Other Food Articles, 98·9 per cent of that on Fuel and Lighting and 74·8 per cent of that on Clothing and Bedding. Instead of omitting the Miscellaneous group altogether, three items representing 15·3 per cent of the expenditure on that group have also been included. Thus the items included in the list represent about 82 per cent of the total family expenditure. For Jubbulpore, the items included represent 95·9 per cent of the expenditure on Cereals, 95·7 per cent of that on Pulses, 88·4 per cent of that on Other Food Articles, 98·1 per cent of the expenditure on Fuel and Lighting, 70·6 per cent of that on Clothing and Bedding, and 18·2 per cent of that on Miscellaneous articles. The items included represent about 80 per cent of the total family expenditure.

**10. Percentage Expenditure.**—Table I shows the percentage expenditure on different articles found from an analysis of the budgets collected at Nagpur and Jubbulpore. It will be seen that more than 60 per cent of the expenditure is on food articles, that on Cereals being about 36 per cent and on Pulses about 6 to 7 per cent. Fuel and Lighting account for about 9 per cent at Nagpur and about 8 per cent at Jubbulpore. The expenditure on Clothing and Bedding is about 11 per cent at both the places. Although there is a striking similarity in the total percentage expenditure on different groups at the two places, local peculiarities have affected the distribution of this expenditure among the different items. The percentage expenditure on Rice and Jawar at Nagpur is more than that at Jubbulpore, while that on Wheat is less. Lakhori is practically unknown at Jubbulpore, except to people who have gone from the Nagpur division. The labourers at Nagpur are mostly Mahars who are non-vegetarians so that the expenditure on mutton is greater at that place than at Jubbulpore. These Mahars are also well known for eating a comparatively larger amount of Chillies and this accounts for the higher percentage expenditure on this item at Nagpur. It is also a matter of common knowledge that the labourers of the south of the province use Til oil for some purposes for which the workers in the north would use Ghee, so that the percentage expenditure at Jubbulpore on Ghee is more and on Til oil is less than at Nagpur. At Jubbulpore firewood is cheaper than at Nagpur, and many labourers, especially of the Gun Carriage Factory, also obtain a portion of their requirements of fuel at concession rates. This accounts for the lower percentage expenditure on firewood at that place. But, as is to be expected, this has not affected the average quantity of firewood consumed. This quantity figure does not show much divergence from the corresponding figure for Nagpur.

From the above it will be seen that there are striking differences in the relative importance of the commodities at the two places. Therefore, different sets of consumption figures have been used for the cost of living index numbers at the two places.

Even in the same locality it is possible to find differences in the relative importance of the commodities from family to family according to the caste, habits of consumption and tastes of the members. But such differences have not been found of sufficient importance and it is neither practicable nor necessary to have separate sets of index numbers for different castes and classes of labourers of the same locality.

11. Quantities.—The corresponding quantities consumed per family as found in the budgets are given in Table II. The list excludes those articles which have been omitted from consideration in the calculation of the index numbers, and the quantities given represent the estimated annual consumption. It is possible that the figures given in the table may be considered too low by some families and too high by others. But it has to be remembered that it is not the exact quantities with which we are concerned but only with their mutual relation. Therefore, even if all the figures were simultaneously doubled or halved the index numbers will not be affected. The figures in Table II show the relative importance of the commodities under the present standard of living and have no connection with what the absolute minimum ought to be.

12. Weights.—As remarked before, in the construction of the cost of living index numbers, account is taken only of the effect of the changes in the prices without any reference to changes in the standard of living. Therefore the figures representing the relative importance of commodities remain unaltered at different periods.

The figures given in Table II for the annual consumption and for those in Table I for the percentage expenditure both can be used to indicate the relative importance of the commodities. In the calculation of the cost of living index numbers it is immaterial whether this relative importance is expressed in the form of figures for annual consumption or of figures representing the percentages of total expenditure.

In the "quantity consumption method" which is used by the United States Bureau of Labour Statistics and also in some other countries, the average price per unit of each commodity during the base period is multiplied by the quantity consumed by the average family and the products are added together to represent the total money cost of these items. A similar operation with corresponding prices gives the total money cost at a subsequent date, and the latter total is expressed as a percentage of the total in the base period.

In 'the percentage expenditure method' which is used by the British Ministry of Labour, the prices of the commodities at the base and the subsequent period are found, and the latter prices are expressed as percentages of those in the base period. The price relatives are then multiplied by numbers representing the *percentage expenditures* on those commodities and the sum of the products at the given period is expressed as a percentage of the sum in the base period.

These are, of course, only alternative ways of arriving at the same solution, but the former method being more intelligible to a layman has been adopted, and the annual consumption figures given in Table II have been used to indicate the relative importance of the commodities.

**13. Base period.**—Most of the countries of the world have fixed some pre-war month or year as the base period. July 1914 has been taken as the base for the index numbers published in Great Britain, Ireland, Austria, Denmark, Hungary, Norway and Bombay, while April 1914 has been used in Belgium, November 1914 in Australia, 1913 in the United States of America and 1913-14 in Germany. This was done either because the beginning of the publication was made at that time or soon after the war when it was considered desirable to compare the cost of living with the pre-war period. But some of these index numbers, especially those combining post-war weights with pre-war prices, have often been criticized on the ground that the base price and the standard of living denoted by the budgets do not refer to the same period and that the 'weights' may have become inapplicable as a result of radical changes in the consumption habits during and after the war. At Nagpur and Jubbulpore also during the last 13 years there have been some changes in the standards of living of the industrial labourers, and the mutual relation of the commodities in order of importance must have undergone some alteration. At Nagpur the substitution of wheat for jawar is a striking example of such a change.

Post-war periods have been used as base in Italy, where July 1920 is the base, and in Estonia where the base prices are the averages of those ruling in 1921. The second International Conference of Labour Statisticians which met at Geneva in April 1925 also recommended the adoption of a post-war period as the base in all countries.

Now that the immediate effects of the war have disappeared and conditions have stabilized, it is possible to avoid the errors that are involved in adopting a base period not corresponding with the period for which the budgets are collected. Therefore January 1927 has been adopted as the base. Thus the standard of living and the prices will relate to the same period. On account of the possibility of more exact comparisons with index numbers of other places, having with different basic periods and the difficulty of getting completely reliable prices for the preceding months or years, a particular month has been considered more satisfactory as the base period than the average of a series of months or years. Thus, taking January 1927 as the base, the cost of

living index numbers have been prepared from January 1925 onwards. An attempt has also been made to ascertain the prices prevailing in the pre-war month of July 1914 and to prepare an index number for this month. These index numbers are given in Tables III and IV. The details of calculations will be found in Tables VIII and IX. It was found impossible to obtain perfectly reliable prices for the intervening period. Moreover, such index numbers would not have been of much practical use now after so many years. Therefore no attempt has been made to prepare index numbers for this intervening period from 1914 to 1925.

However, in order to obtain a rough idea of the rise in the cost of living as compared with the pre-war period and to facilitate comparisons with index numbers published elsewhere with July 1914 as the base, index numbers have also been calculated taking July 1914 as the base, i.e., the expenditure in July 1914 as 100. They are given in Tables V and VI. This is, of course, the same series of index numbers expressed as percentages of the index number in July 1914. It must, however, be remembered that no budgets collected in July 1914 are available to show the relative importance of the commodities at that time, so that in comparing the present cost of living with the pre-war period, it had to be presumed that the standard of living and consequently the relative importance of the articles have remained unchanged during this period, and the results may, therefore, be considered defective to that extent. As a matter of fact, these index numbers with July 1914 as the base indicate only the pre-war cost of the present standard of living and not the present cost of the pre-war standard of living. The details of calculations will be found in Tables X and XI.

**14. Prices.**—In the calculation of the cost of living index numbers, the most important work is the collection of prices. Small errors in the prices normally affect the index number more than even fairly large errors in 'weights' do. Therefore the utmost care has been taken to collect reliable prices. The selection of the qualities or grades of the articles is equally important and only those qualities have been selected which are most commonly used by the labourers. These grades were determined by a careful examination of the articles in the houses of the labourers and further checked by enquiries from the workers and the sellers. A sample of the quality selected is kept in the Department and all the prices from month to month relate to the same quality. The retail prices for Wheat, Rice, Jawar, Arhar (Tur) Dal, Salt and Firewood are taken from the fortnightly publications in the Government Gazette. Wholesale prices for Ghee and Kerosene oil are also available in these publications, but as only the retail prices for these articles are required for the index numbers and it is not possible to determine any definite relation between wholesale and retail prices, the Gazette prices of these articles could not be of any use for the present purpose. The prices of these and the remaining articles are collected by actual enquiry in the markets. The prices for the clothing group (except saris) are obtained from the Empress

Mills and relate to the same number, size and quality from month to month. Samples of these articles are also kept in the Department. As *saris* of the quality commonly used are not made in the Empress Mills, the prices have been obtained from local sellers.

The prices for July 1914 and the years 1925 and 1926 have been obtained from the account books of the shopkeepers dealing with the labouring population. It was found that the grades of the articles selected for Drill, Shirting and Turban Cloth which are in common use among the labourers were not made in the Empress Mills before March 1915, June 1916 and November 1916, respectively. Therefore the prices for July 1914 of exactly similar grades of the articles made in other mills and sold in the market have been used.

As regards the actual dates for the collection of prices, there is no uniformity in the methods adopted in different countries. In some places the date is the first of the month while some others use either the middle or the last day of the month or an average of certain dates. In Great Britain the prices for the computation of the index numbers are collected in the beginning of the month, in Denmark during the first week of every quarter, while in Bombay they are collected twice a week. It would certainly have been desirable if the prices of all the articles were collected by a special agency on a number of days during the month and then the average for the whole month were calculated. But as there is no special staff for this purpose in the Department, the future collection of such prices would have been unmanageable. The market conditions also are now fairly stable and prices do not fluctuate so frequently as they did during and immediately after the war. Therefore the prices relate to the 15th of every month. The prices of those articles which are not available in the Gazette are obtained by enquiry from a number of shops in the markets of the two cities on the 15th of every month and an average is obtained from a number of quotations.

**15. Other information.**—Although for the preparation of the cost of living index numbers information regarding the consumption of certain selected items is all that is required in order to give the commodities their relative importance, incidentally during the course of the enquiry some other information became available and has been tabulated in the statements given in the Appendix at the end. It may, however, be noted that in spite of all the precautions and efforts, it is difficult to get exact figures. The labourers are most unwilling to submit to a lengthy examination about their family affairs and would sometimes give incorrect facts, especially about their income. Therefore the absolute accuracy of the figures cannot be vouchsafed, but it is hoped that the information elicited is very near the actual facts.
