FARM-PROPERTY TAXATION IN MAINE

CHARLES H. MERCHANT AND MERTON S. PARSONS¹

INTRODUCTION

One of the most serious problems facing Maine agriculture today is the farm tax situation. Farm real estate taxes, which constitute a large part of the taxes paid by farmers in Maine, rose very rapidly during and following the World War. In 1932 taxes on real estate were at an index of 246 as compared with 100 in 1913. In contrast to real estate taxes, farm prices in the State declined to 33 per cent below pre-war prices. Farmers found that it required about three and one-half times the amount of farm products to pay their taxes in 1932 as in 1913. This should show the seriousness of the farmers' tax burden. The phenomenal increase in farm real estate taxes since 1916 has been due to the desire of the public for more and better governmental services, especially in schools and roads. These services can be performed more economically by the State or local governmental units than by private individuals.

It is a commonly accepted principle that farmers, as well as other individuals, should be taxed according to their ability to pay. There can be little criticism of this principle which is by no means a new one. In 1776, Adam Smith stated that the cost of government should be borne in proportion to the individual ability to pay.² During the early development of Maine, and in fact of the whole country, the general-property tax probably represented rather accurately the ability of individuals to pay. At that time real estate and other tangible property represented a very considerable part of the wealth and sources of income of the na-

¹ The authors wish to acknowledge the splendid cooperation of farmers, selectmen, and tax collectors of various towns; State Department officials; and others who have furnished information for this study. The authors wish to extend their appreciation to Miss Elaine M. Pooler who assisted in the tabulation and analysis of the statistical material.

² Smith, Adam, *An Inquiry into the Nature and Causes of the Wealth of Nations*, George Bell and Sons, publishers, Vol. 2, 1901, pp. 351-354.

tion. Conditions today are vastly different. Real estate accounts for approximately only one-fourth of the national income.³ On the other hand, intangible property, most of which escapes taxation under the general-property tax, furnishes a large part of the national income.

Although economic conditions have materially changed, the taxation of real and personal property remains practically unchanged. William D. Williamson in 1832 gave the following statements relative to taxes three centuries ago.

" At first, taxes were paid in that colony by towns and plantations, according to their population; afterwards in 1634, the manner was changed, and they were taxed in proportion to the value of their property real and personal, and the number of their inhabitants. At length, in 1646, the system was amended and improved; a single tax was set at £1,500, of which every poll, or male 16 years of age or upwards paid 12 pence, and 20s. worth of property paid a penny. In this way, apportionments were assigned to the several towns and plantations.

"This method rendered it necessary to take a census of the taxable polls, and an inventory of the rateable estate; a business performed in each town by the selectmen and a commissioner chosen for the purpose. When completed, a session was holden by them in the shire town of the county, and the whole were revised, equalized and settled. (In 1646, cows were valued £5; and cattle between 3 and 4 years old at £4.—1 Mass. Rec. p. 461. But A. D. 1651-7, the valuation was thus, cows, £3; cattle between 3 and 4 years old £2 10s; between 2 and 3, £2,—between 1 and 2, £1; every ox 4 years old £5; every horse-kind 3 years old £5; an ass, £2; a sheep 10s; a goat 8s; and a yearling swine 20s. All cattle under a year old were exempt from taxation.—Col. Laws, p. 70. 3 Mass. Rec. p. 16.)

"The commissioners, appointed in the first instance by the General Court in 1654 for the towns in Maine, were Richard Nason of Kittery, Abraham Preble of York, Jonathan Thing of Wells, Robert Boothe of Saco, and Griffin Montague of Cape Porpoise; who were required with the assistance of the selectmen, and the advice of their deputies in the legislature, to take and equalize the census and inventory, 'and assign to each town of their county its just proportion to pay, according to the custom of the country rates'. The sum of £91, 15s. mentioned, was apportioned in the spring of 1655, to the several towns according to property and taxable polls."⁴

³ Recent Economic Changes, Report of the Committee on Recent Changes of the President's Conference on Unemployment, McGraw Hill Book Company, publishers, 1929 II, p. 768.

⁴ Williamson, William D., Williamson's History of Maine, Glazier, Masters, and Company, publishers, Vol. 1, 1832, pp. 385-386.

After three centuries the town continues to be the local unit of government. In fact most of the towns in the seventeenth century have since been divided into several towns. While there are some advantages in small local governmental units there are many disadvantages, especially the inefficiencies in performing various services.

At the present time the general public is clamoring for a reduction in taxes. It should be clearly understood that a general

United States	\$181,882,204	\$14,467,695,918	\$1.26

revision downward in taxes affecting all alike would still leave the general-property tax in the same relative position that it is today. The revision should be in accordance with the individual's ability to pay. This would mean widening the base of taxation

FIG. 87—Farm taxes per \$100 of value in land and buildings in the various states. Taxes were the highest in Mississippi, Michigan, New Hampshire, Indiana, Maine, and Ohio and the lowest in Virginia, Delaware, Texas, Nebraska, Missouri, and District of Columbia, in the order named respectively.

to include a higher tax on incomes, taxes on intangible property, inheritance and sales taxes along with several others, and a reduction in property taxes. It is still desirable to maintain some tax on real and personal property but revision downward is necessary to maintain the present standard of living on Maine farms.

According to the 1930 census, Maine farmers were taxed \$1.82 per \$100 of real estate values. This represents a tax of nearly 2 per cent on their property. There are only four other states in the United States which have a higher real estate tax than Maine. These states are New Hampshire, Indiana, Michigan, and Mississippi (Table 1 and Figure 87). In Maine this problem is more serious than the figures would indicate. With the transition which is taking place in Maine's agriculture many farms are being abandoned and cease to furnish a revenue to the town, county, and State governments. This situation increases the tax burden on those farmers who continue to operate.

SOURCES OF MATERIAL USED IN STUDY

This study is a preliminary survey of the farmers' tax burden. With limited funds available it was necessary to confine the study to material already available or easily accessible. Farm management records had been secured in connection with other projects on four types of farming in Maine. These types were apple, blueberry, dairy, and potato. Each of these studies included information on the value of real and personal farm property, taxes paid by farmers, and farm incomes. In order to have a representative sample of all the principal types of farming in the State, 28 poultry farmers were interviewed to secure the necessary information on this enterprise. In addition to the farm records, a complete file of State Board of Assessors' reports were available which furnished much valuable information on property taxes. Information was also secured from town selectmen and tax collectors on the assessed valuation of property of those farmers who had furnished information regarding their farm businesses.

In this preliminary survey an attempt will be made (1) to show the tax burden of Maine farmers, and (2) to present suggestions for improving the present tax system. It is hoped that the information furnished will arouse interest among the people

FIG. 88—Towns in which farm records were secured are shown in black. Areas are identified as follows: A represents apple farms, B blueberry farms, D dairy farms, Pt potato farms, Py poultry farms, and DP dairy and potato farms.

of the State and result in definite steps being taken to improve our tax system, especially the general-property tax.

FARM TAXES AND TREND IN FARM-PROPERTY TAXES

Larger amounts of capital are required today to carry on farming operations than a generation ago. Farmers' investments are largely in real estate and tangible personal property. Very few farmers find that they have funds which they can invest in intangibles such as mortgages, loans, stocks, bonds, saving accounts, and endowment insurances. Inasmuch as the farmer's property is visible to the selectmen, it is appraised and taxes assessed accordingly. It has been long recognized that real estate property holders have paid an unfair burden of taxation. In 1879, Governor Garcelon of Maine stated that intangibles did not bear a just portion of the public tax burden. An organized movement to tax intangible property in the State began in 1889 when Governor Burleigh requested the legislature to appoint a commission to undertake a revision of the Maine tax laws.⁶ During the 43 years from 1889 to 1932, 43 bills have been introduced in the legislature to adjust and equalize the tax burden by assessments on intangible property. Each of these attempts to tax intangibles has failed. Today, as in 1889, intangibles are completely escaping assessment.

TAX BURDENS OF FARMERS IN MAINE

The more important tax burdens of the farmer are the general-property tax including real and personal property, gasoline tax and automobile license, inheritance tax, federal income tax, and the poll tax. The most important of these is the general-property tax, which comprised over 76 per cent of the taxes paid by farmers in 1930.

Many taxes and revenues, including tariff duties, can sometimes be passed on to the farmers. To some extent even the retailers and wholesalers are able to pass on to their customers a

⁶ Hormell, Orren Chalmer, Maine Towns, Bowdoin College Publishers, 1932, p. 60.

FIG. 89—Taxes paid by Maine farmers in 1930. The farm-property tax comprised three-fourths of the tax burden of farmers.

proportion of their own tax on real estate. However, the taxes which are or can be passed on to farmers are relatively unimportant as compared with the general farm-property tax. As shown in Table 2 and Figure 89, the general-property tax is of such importance that it overshadows all other forms of farm taxation and for this reason will be the principal tax considered in the study.

TABLE 2

Taxes Paid by Farmers in Maine for 1930¹

Tax	Amount	Per cent of total
General property	\$4,343,082	76.3
Gasoline	589,025	10.2
Automobile license	535,202	9.4
All others	235,079	4.1
Total	\$5,695,788	100.0

TREND IN REAL ESTATE TAXES

The tax on real estate per acre in Maine increased from an index of 100 in 1913 to an index of 256 in 1931. A slight decline

¹ Computed from data in U. S. Dept. of Agr. Technical Bulletin No. 172, Taxation of Farm Property by Whitney Coombs, February, 1930, p. 3; and Fifteenth Census of the United States, Vol. 2, Part I, The Northern States, p. 46.

took place in 1932 and probably a further decline will occur in 1933. Taxes per acre have increased about two and one-half times during the last 20 years. The situation in other states has been similar to that of Maine. In Table 3 is shown the trend in real estate taxes per acre in each of the six New England States and for twenty-six states of the union.

TABLE 3

Index of Estimated Real Estate Taxes Per Acre on all Farm Land in Each of the New England States^a and the Average for Twenty-Six States^b

1931	256*						
1932	246*						

* Data for 1931 and 1932 estimated from trend in property taxes in Maine.

A comparison of the real estate taxes in Maine with twenty-six states (data not available for the entire country) shows that taxes in Maine did not increase as rapidly from 1915 to 1921 as the average for the twenty-six states. Since 1921 the rate of increase has been more rapid in Maine. In 1930 real estate taxes in Maine were approximately at the same level as the average for the twenty-six states. In general, this indicates that farmers in

^a Allin, Bushrod W., Jackson, Donald, and Weston, Janet L., *Farm Real Estate Taxes, 1913-1930*, Bur. of Agr. Ec., U. S. Dept. of Agr., September, 1932, mimeographed report, p. 4.

^b Computed from *The Agricultural Situation*, Vol. 16, No. 11, November, 1932, p. 9.

other states on the average experienced a relatively much higher rate of taxation from about 1915 to 1929 than farmers in Maine (Figure 91).

FIG. 90—Trend of real estate taxes per acre in Maine. Taxes have increased almost uninterruptedly since 1913.

FIG. 91—Real estate taxes in Maine and the average for twenty-six states in the country. Taxes in Maine were not as high as the average for the twenty-six states from 1915 to 1929.

Similarly, real estate taxes in Maine have not advanced as rapidly as in most of the other New England States. However, the trend has been decidedly upward for each of the New England States (Figure 92).

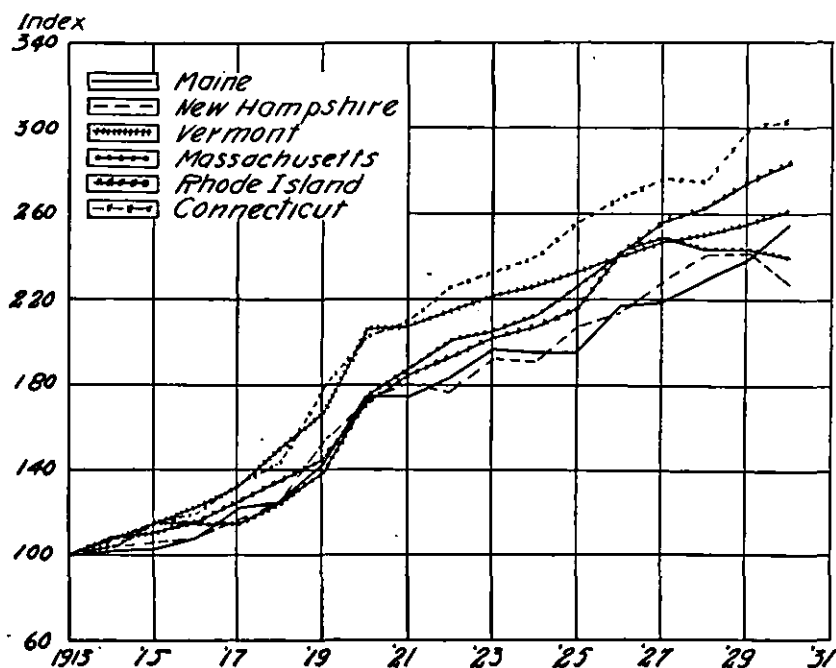

FIG. 92—Real estate taxes per acre in each of the New England States. Taxes have increased less rapidly in New Hampshire and Maine than in the other New England States.

Real estate taxes in Maine were at an index of 143 in 1919 as compared with an index of 202 for wholesale prices of all commodities in the United States. Instead of real estate taxes following the declines of wholesale prices in 1920 and again in 1929, the trend has been continuously upward. Farm prices in Maine in 1932 were 33 per cent below the pre-war level of 1913. Taxes at a level of nearly two and one-half times the pre-war average and farm prices at 33 per cent below the pre-war average made it necessary for farmers to sell about three and one-half times the volume of farm products to pay their taxes in 1932 as in 1913. Real estate values in the State increased less rapidly during the World War

than farm prices and since 1920 have declined less rapidly than farm prices. Farm real estate values in Maine were at the peak in 1920 with an index of 139 as compared with 100 in 1913 and 109 in 1932. In Table 4 and Figure 93 are shown the indices of real estate taxes, real estate values, and farm prices in Maine.

TABLE 4

¹² Same as footnote 11, p. 21.

¹³ Computed from Crops and Markets, Vol. 9, No. 5, U. S. Dept. of Agr., May, 1932, p. 183.

FIG. 93—Farm prices, farm real estate taxes, and farm real estate values in Maine. Farm prices rose very rapidly during the World War and declined precipitously in 1920 with some recovery in 1925-26 followed by declines beginning in 1927 and again in 1930. Fluctuations in farm real estate values have been relatively small. Real estate taxes have increased almost uninterruptedly since 1913. Prices of farm products are the result of supply and demand conditions while taxes result from governmental expenditures.

TREND IN QUANTITY OF FARM PRODUCTS REQUIRED TO PAY REAL ESTATE TAXES

In Table 5 are shown the quantities of farm products required to pay farm real estate taxes on 100 acres in Maine for each year from 1913 to 1932. The trend in the quantity of farm products required to pay real estate taxes has been generally upward. In the case of milk, 14.35 hundredweight were required to pay the tax on 100 acres of real estate in 1913 as compared with 52.32 hundredweight in 1932. Similarly, 110.34 dozen of eggs were required in 1913 as compared with 303.85 dozen of eggs in 1932. Due to wide variations in the price of potatoes, the quantity of potatoes required to pay taxes on 100 acres has fluctuated widely, ranging from 19.80 bushels in 1917 to 316.00 bushels in 1932, or a variation of 1,596 per cent between the lowest and highest amounts required. It should be understood that land values are much higher in Aroostook County, where approxi-

mately 80 per cent of Maine potatoes are produced, than the average for the State. Therefore, the quantity of potatoes required to pay the tax on 100 acres of land for the State as a whole is too low for Aroostook County. If variations in the amount of potatoes required to pay taxes were expressed in percentage they would be applicable to Aroostook County and the entire State alike. Trends in the quantity of other farm products required to pay farm real estate taxes on 100 acres in Maine are given in Table 5.

TREND IN LIVESTOCK TAXES

In Maine taxes are levied on various classes of livestock: horses, colts, cows, heifers, oxen, sheep (where the number ex-

FARM-PROPERTY TAXES AND FARM INCOMES

There are many factors which affect the income of a farmer. Some of these are within his control while others are not. The more important factors affecting income are the size of the farm business, efficiency of organization and management of the farm,

¹⁰ Same as footnote 11, p. 103.

¹⁷ Same as footnote 15.

prices received for farm products, prices of commodities bought, freight rates, taxes, soil and climatic conditions, nearness to markets, and type of farming. Incomes of farmers necessarily vary from year to year, due to changes in one or more of these or other factors. If farmers are to be taxed on their ability to pay, farm taxes should be assessed on income and not on the valuation of their property. However, it should be recognized that the government revenue (local, county, State, and federal) should not fluctuate as widely from year to year as incomes of farmers. The cost of maintaining schools, roads, courts, jails, and other governmental activities ordinarily does not vary greatly from one year to the next.

The general-property tax is very burdensome under our present system of taxation. The average tax assessed on apple farms (farms included in the study) during 1924 to 1926 amounted to 20.52 per cent of the farm income;* on blueberry farms in 1926, to 10.83 per cent; on dairy farms in 1927, to 15.82 per cent; on potato farms in Aroostook County for the three years 1928 to

TABLE 8

	Av. for two years	18	234	2,732	8.58
Poultry farms	1930	28	101	1,195	8.46

* Farm income as used in this study is the amount that the farmer receives for his labor after all farm expenses have been deducted except taxes and interest on the investment. In addition he receives a house to live in and products from the farm.

1930, to 12.54 per cent; on potato farms in Central Maine for the two years 1929 and 1930, to 8.58 per cent; and on poultry farms in 1930, to 8.46 per cent (Table 8). For the 422 farms included, farm-property taxes averaged 12.70 per cent of the farm incomes. This shows the tax burden of the farmer in the principal agricultural regions of the State during various periods from 1924 to 1930. Agricultural conditions in Maine from 1924 to 1930 were, in general, fairly satisfactory. However, under present (April, 1933) conditions of very low farm incomes farmers find it extremely difficult and in many cases impossible to pay their taxes.

Real estate property owners (including farmers) as a group have more tangible property, in proportion to income, than any other large occupational group. As long as property taxes are assessed on the present basis, farmers and other tangible property owners will carry a disproportionate share of the tax burden. In contrast, many persons derive the major proportion of their incomes out of business transactions and not out of ownership of tangible property. If their net incomes are sufficiently large they are required to pay a federal income tax and in some states also a State income tax. However, the burden of income taxes is relatively light as compared with the general-property tax. Farmers must also pay income taxes if their net income exceeds the minimum exemptions. Over a period of years, Maine farmers pay a relatively small burden in the form of income taxes but an extremely heavy burden in the form of property taxes.

SIZE OF FARM BUSINESS AND FARM INCOME

The average capital investment is used to indicate the relative size of the farm business. As the size of the farm business increased, as measured by the capital investment, the farm income increased during favorable years and decreased during unfavorable years. Conditions referred to as favorable and unfavorable usually indicate satisfactory or unsatisfactory prices of farm products. In showing the relationship between capital investment and farm income, the three-year average is used for apple farms in Oxford County and potato farms in Aroostook County and the two-year average for potato farms in Central Maine. These two- and three-year averages have tended to offset variations in prices received for farm products from one year to another and should represent more nearly normal conditions than information for any one year. The information for the other

types of farming, namely blueberry, dairy, and poultry, are for one year but the year selected represents fairly normal conditions for each enterprise. Therefore, it would seem that an average for all farms should give an accurate picture of the relationship between farmers' capital investment and their farm incomes.

Farmers with less than \$5,000 capital investment received an average farm income of \$519; farmers with \$5,000 to \$9,999 capital investment, \$950; farmers with \$10,000 to \$14,999 capital investment, \$1,232; and farmers with the largest farms received from \$5,000 to \$7,000 farm income (Table 9 and Figure 96). In general, as the size of the farm business increased there was an increase in farm income.

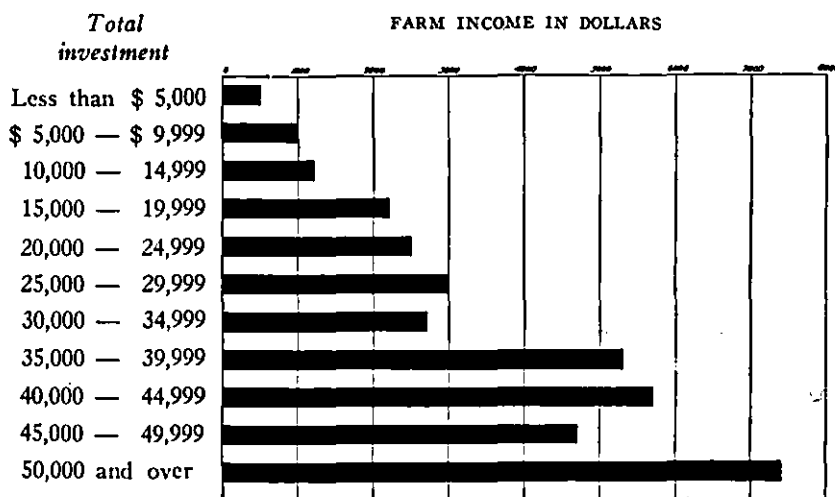

FIG. 96—Relation of farm income to capital investment on 422 farms in Maine. Under normal conditions there is a tendency for the farm income to increase as the size of the farm business increases.

On the basis of farm income, a farmer who received only \$519 should be taxed relatively less than one who received several thousand dollars as an income. To illustrate, a tax of \$50 on an income of \$500 is more burdensome than a tax of \$500 on an income of \$5,000. The tax rate is 10 per cent in each case. Inasmuch as the tax must be paid out of income, the larger the income the greater is the ability of the farmer to pay. However, the general-property tax is assessed on property and not on income.

VARIATIONS IN FARM INCOME

There is considerable variation in the income of farmers on the same farms from year to year. The variations are usually considerably larger on crop than on livestock farms. This is due largely to the wide fluctuations in prices received for annual crops. In Maine the variations in farm income from one year to the next are the largest on potato farms in Aroostook County. The prices of potatoes were unsatisfactory during the season of 1928 and nearly every farmer lost money. The amount of the loss increased as the size of the farm business increased. Farmers having the smallest farms received an average farm income of minus \$463 (that is, a loss of \$463) as compared with farmers having the largest farms with an average farm income of minus nearly \$2,000. On the same farms during the next year, when potato prices were relatively favorable, the farm income increased with an increase in the size of the farm business. The range was from \$4,126 on the smallest sized farms to \$19,254 on the largest sized farms. In 1928 these farmers found it extremely difficult to pay their taxes while in 1929 the tax burden was relatively insignificant. As long as our present tax system is based largely on the general-property tax, and agricultural prices fluctuate widely from year to year, this and similar situations will continue to occur. It would not be advisable to eliminate entirely the general-property tax but the burden should be lessened and other sources of reve-

nue should be substituted, especially a State income tax. Table 10 shows variations in farm incomes on 118 potato farms in Aroostook County in 1928 and 1929.

RELATION OF FARM INCOME AND FARM-PROPERTY TAXES

Under our system of taxation, farmers with low incomes were taxed more heavily than those with large incomes. In Table 11 and Figure 97 it is shown that farmers with farm incomes of less than \$1,000 paid one-fifth of their incomes in the form of property taxes. Farmers with farm incomes of \$7,000 and over paid to the town in which they resided an average of about one-fourteenth of their farm income. It should be mentioned, however, that some farmers received low incomes due to misfortunes or by poor management. No tax system can be expected to correct conditions of this nature. However, the farmers with large incomes are in a position to pay a much larger proportion of their farm incomes in the form of taxes than those with low incomes.

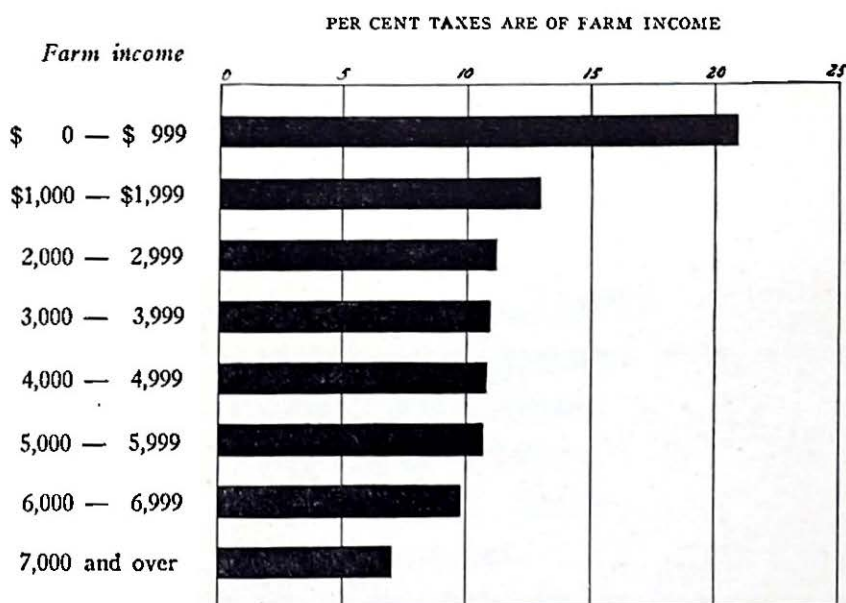

FIG. 97—Relation of farm-property taxes to farm incomes on 422 Maine farms. Farmers with low incomes were more heavily taxed in relation to their ability to pay than those with large incomes.

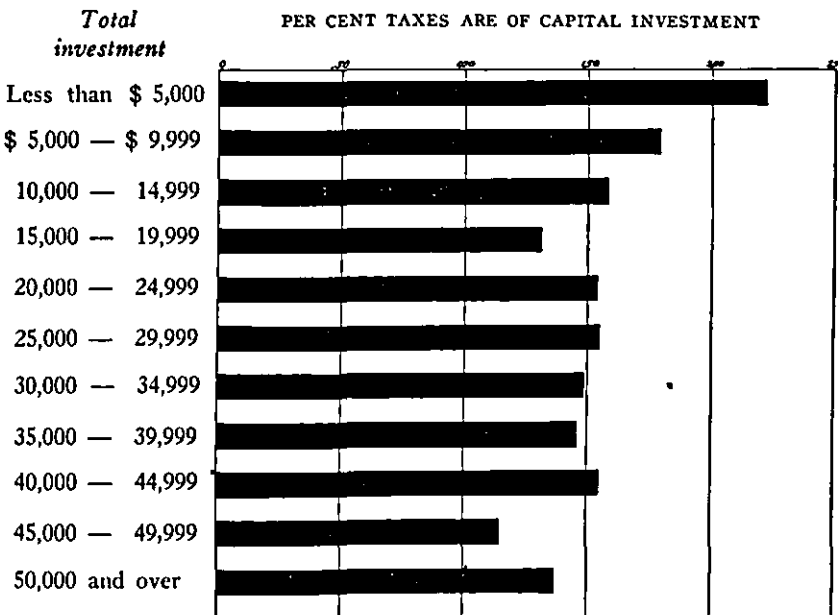

FIG. 98—Small farm businesses were taxed relatively more heavily than large farm businesses.

ued at less than \$5,000 paid taxes equal to 2.22 per cent of the capital investment. On large farms the percentage was considerably less, ranging from 1.15 per cent to about 1.55 per cent. This would indicate that small farm businesses were taxed relatively more than large farm businesses. This discrepancy places an unfavorable burden on the small farm owner. Perhaps some inequality might be justified if it would encourage larger farm businesses which under normal conditions give larger farm incomes.

ASSESSMENT OF PROPERTY AND FARM-PROPERTY TAXES

One of the chief difficulties with the general-property tax is in the assessment of property. The basis of assessment of real and personal property in Maine is 100 per cent of its actual value.¹⁸ In practice the assessments are seldom made at actual value. In most cases local taxes are assessed by a board of selectmen. This board of selectmen is elected annually at a town meeting. In appraising farm real estate there is a tendency to over-value small farms. In the assessment of small farms nearly all the

FIG. 99—Real estate owners have little opportunity to hide their property under the mattress.

¹⁸ Financial Statistics of States, U. S. Dept. of Commerce, Bur. of Census, 1930, p. 122.

improvements in land and buildings are taken into consideration while on large farms such improvements may go unnoticed or seem relatively unimportant.

The assessment of personal property is often more difficult than that of real estate. Nearly all intangible property escapes the attention of selectmen and is not taxed. Likewise much tangible personal property is not discovered and bears no part of the tax burden. In this respect, there is considerable disparity of assessment between towns, especially in regard to machinery, musical instruments, and household furniture. Tangible property like valuable jewelry, ornaments, antiques, and other similar property when owned by farmers and their families is seldom assessed. Conditions relative to tangible and intangible personal property are very similar for all occupational groups in the State.

ACTUAL AND ASSESSED VALUATION OF FARM PROPERTY

The 422 farmers whose records are included in this study estimated the value of their real and personal property. Valuations were based on what the farm and personal property would reasonably sell for under average conditions, but not at a forced sale. Farmers in arriving at an estimated value considered recent sales within the community and other facts which might have a bearing on the valuation of their property. Some farmers probably overestimated the value of their property, while others probably underestimated the actual worth of their property. It is reasonable to assume that for any sizeable group of farms the average valuation would represent the true valuation of the property.

In Table 13 is given the estimated and assessed valuation of real estate and personal property on 422 farms. These farms comprise the five principal types of farming in the State: apple, blueberry, dairy, potato, and poultry. The information shows very little variation in the percentage that the assessed value was of the estimated value on the same farms from year to year but considerable variation in different sections of the State. Further, the personal property was assessed at a much lower percentage of its estimated value than real estate property. This situation was probably due in part to the greater difficulty in assessing personal property and in part to the fact that some towns assessed only part of the personal property.

TABLE 13

Estimated and Assessed Valuation of Farm Property in Maine

Poultry farms	1930	28	41.31	18.50

ASSESSMENT OF SMALL AND LARGE FARMS

The assessments of small farms were relatively higher than assessments on large farms (Table 14). Farms valued at less than \$5,000 were assessed about 40 per cent of their estimated value while farms valued at \$40,000 or more were assessed about 25 per cent of their estimated value. Assessment of personal property showed the same situation; on farms valued at less than \$5,000, personal property was assessed 26 per cent of its estimated value while on large farms it was assessed at less than 10 per cent of the estimated value. In some towns it was difficult for the selectmen to assess large farms as they had little or no basis for comparison. Many discrepancies exist in assessments and they cause much injustice to farmers, especially those with small businesses.

Also large variations existed between assessed and estimated valuations on different types of farms (Table 15). On potato farms in Aroostook County the variations were less than in other areas. This may be expected as the agriculture in Aroostook County consists more nearly of one type carried on under similar physical conditions than does the agriculture of any other section of the State. Also the variations in size of Aroostook County

TABLE 14

Relation of Assessed to Estimated Value of Real and Personal Farm Property

farms included in this study were less than for the other types of farming.

It is important to ascertain the significance of the apparent discrepancies in the assessment of real and personal property. There is a general feeling that where assessments are relatively

TABLE 16

Average	422	\$205	\$1,612	\$13,180	\$.054	12.70	1.55	\$10.44

high lower tax rates will offset the disparities in assessments. Farms where the assessments were less than 20 per cent of the estimated value (this group comprised the largest farms) had the highest tax rate but the tax levied amounted to only 9.65 per cent of the farm income and .95 per cent of the capital investment. In contrast, farms where the assessments were 80 per cent and over of the estimated value (this group consisted of the smallest farms) had a low tax rate but taxes required nearly 21 per cent of the farm income and were equal to 4.71 per cent of the capital investment. In this latter group, taxes amounted to \$48.64 per \$1,000 of estimated value as compared with \$9.53 for the group with the lowest assessment. Information on the effect of variations in assessments is given in Table 16.

ASSESSMENT OF PERSONAL PROPERTY

There was considerable variation in the assessment of personal property. The most important personal property of farmers is livestock. Inasmuch as livestock is frequently bought and sold, the assessment on this kind of personal property should be relatively easy. However, wide variations existed between towns. For horses the assessed value per head ranged from less than \$36 to more than \$150, for cows from less than \$25 to more than \$65, for sheep from less than \$2 to more than \$20, for hogs from less than \$6 to more than \$26, and for hens from less than 25 cents to more than \$3. Considerable variation in assessments should exist as there are wide variations in the sale price of animals. However, the variations that were found to exist were not justified. As in the case of real estate assessments, the variations in tax rates did not offset the wide variations in assessments of personal property. Taxes on horses varied from an average of \$1.82 to \$7.48 per head. This large variation was due largely to variations in assessments.

Tax officials should be interested not only in assessing personal property equitably but also in the amount of property required to furnish \$100 of tax revenue. In towns where horses were assessed less than \$40 per head and the average tax rate was \$.0517, 54.9 horses were required to furnish \$100 of revenue. In towns where the assessed valuation averaged nearly \$150 per head and the tax rate was \$.0500, 13.4 horses were required to

furnish the same amount of revenue. Table 17 shows variations in the assessed valuation and taxes on horses in 514 towns of the State in 1930. Since this part of the manuscript was prepared, the information for 1932 has become available. The more recent information shows the same situation that existed in 1930.

TABLE 17

Assessed Valuations and Taxes on Horses in Maine for 1930¹⁰

Assessed value per head	Number of towns	Average value	Average tax rate	Tax per head	Number of horses for \$100 revenue
Less than \$40	19	\$35.16	\$.0517	\$1.82	54.0
\$ 40 — \$49	35	44.94	.0553	2.48	40.3
50 — 59	88	55.03	.0538	2.96	33.8
60 — 69	127	64.50	.0516	3.33	30.0

80 — 89	68	84.16	.0515	4.34	23.0
90 — 99	38	93.08	.0504	5.25	19.0
100 — 109	26	103.81	.0529	5.49	18.2
110 — 119	8	113.12	.0600	6.79	14.7
120 and over	3	149.07	.0500	7.48	13.4
Average	514	\$70.42	\$.0527	\$3.71	27.0

A situation similar to that of horses existed for other classes of livestock. Taxes on cows varied from an average of \$1.34 to \$2.98 per head (Table 18). This is a difference of 122.39 per cent. In the first case it would require 74.6 cows to provide a tax revenue of \$100 and in the latter only 33.6 cows. The tax on sheep varied from 17 cents to 78 cents per head, for hogs from 36 cents to \$1.53 per head, and for poultry from 1.2 to 7.5 cents per bird.

There are many ways in which improvements may be made in the assessment of farm property. If detailed information were kept concerning the sale of farm real estate and personal property over a period of years it would form a partial basis for improvement in assessments. This information should be not of a general nature but in detail, giving the sale price along with such information as acres in farm, acres in various crops, soil type, distance to market, kind of roads, and other similar information. In addition to reports of sales, maps showing the location of farms,

¹⁰ Material taken or computed from Report of Board of State Assessors for 1929 and 1930.

soil and topographical maps, cover maps if available, and other material would be very helpful. Further, careful attention should be given to the election of selectmen relative to their training, experience, and tenure of office. As the general-property tax forms the major source of tax revenue for local units of government, improvements should be made to eliminate the many inequalities in assessments which now exist.

ADMINISTRATION OF THE GENERAL-PROPERTY TAX

The information secured from town and city officials and from published reports of town, county, and State governments has supplied much material on the collection of the general-property tax and the expenditure of public revenue. While it is not the purpose of this study to include a complete and detailed analysis of the administration of the general-property tax, it is felt that the information obtained may prove helpful.

Local governments in incorporated places in Maine, consisting of cities, towns, and many plantations and townships, make the assessments on real and personal property and collect the municipal or local, county, and State taxes. Each local government evaluates all real and personal property annually within its town limits. These valuations form the basis upon which property taxes are apportioned and furnish valuable information in the

²⁰ Same as footnote 19.

preparation of the State valuations. Every two years (or even numbered years) the Bureau of Taxation (prior to 1932 the State Board of Assessors) evaluates all real estate property in the State. These are known as State valuations. The State valuations form the basis for apportioning the State and county taxes. The amount of county taxes is decided by legislative action every two years for each of the next two years. The amount of each county tax is apportioned to each town within the county on the basis of its State valuations, after consideration has been given to "wild land" located in unincorporated places within the county. Each town within the county includes the county tax on property in making up its tax rate.

The State tax on property is apportioned to each town in the State on the basis of the State valuation of the towns. State tax, like the county tax, is collected by the individual local governments, except in unorganized communities. The property tax on "wild land" situated in unincorporated places is administrated entirely by the State. Inhabitants in these places pay taxes directly to the State treasurer rather than to any local government. However, this tax is on property and constitutes part of the property tax levied in the State.

The taxes on real and personal property in Maine for the year 1932 amounted to \$28,300,785.00. This amount included \$21,051,141.36 as municipal (local) taxes, \$1,567,816.27 as county taxes, and \$5,681,827.37 as State taxes. The local governments collected the total amount of the general-property tax with the exception of \$169,185.10, which was collected by the State on "wild land" in unincorporated places. Expressed on a percentage basis, local taxes on property amounted to 74.38 per cent of the total general-property tax, State taxes 20.08 per cent, and county taxes 5.54 per cent. These data show that the local units of government collected practically the entire property tax and that nearly three-fourths of the amount of the tax is used in the community where collected. Therefore, taxpayers in each individual local town or city are largely responsible for the taxes levied.

Many persons may have the impression that a reduction in the State property tax would relieve the present heavy tax burden of property owners. The State property tax amounts to only one-fifth of the total general-property tax and a large proportion of the revenue derived is returned to the local governments as

FIG. 100—State, county, and municipal or local property taxes in Maine. Since the World War, municipal taxes on property have increased much more rapidly than either State or county taxes.

equalization funds. Even a drastic reduction in the State property tax would relieve property owners very little. Also it is very likely that in many cases the local taxes would be increased to offset the reductions from State funds if schools and roads were maintained at the present degree of efficiency. Therefore, the major attention should be directed towards improving the efficiency of local units of government. In this connection suggestions are offered in this bulletin under the heading of local governments.

1931	236	237	321	296
1932	253	237	301	286

The tax on real and personal property in Maine has increased each year from 1901 to 1931. The amount assessed in 1901 was \$6,550,037.00 and in 1931, \$29,335,466.00. The increase in the total general-property tax during the last 32 years was 348 per cent. This increase is due in part to improvements in real estate

values and in part to higher tax rates. The latter has increased more rapidly than property values. In Table 19 are shown the amounts of the general-property tax assessed in Maine from 1900 to 1932.

Local taxes on property have increased more rapidly since the World War than either the State or county taxes on property (Table 20 and Figure 100). In 1932 local taxes were at an index of 301 as compared with 100 in 1910 to 1914, while county and State taxes were 237 and 253 respectively.

LOCAL GOVERNMENTS

When Maine was admitted to the Union as a State in 1820 there were 236 local units of government.²³ In 1931 there were 435 towns, 20 cities, 360 townships, 65 plantations, 80 islands, and 21 communities having various names (Table 21). This classification is largely on the basis of density of population. Plantations are usually more sparsely inhabited than either towns or cities. Many of the towns, cities, and plantations have practically the same system of local government. In most cases the local government is administered by a board of selectmen (usually consisting of three), secretary and treasurer, and tax collector. Many additional officers with various titles and duties comprise the officials of large towns. In general, this system of local government was followed before Maine became a State in the Union. Only recently some of the local governments have considered a change necessary. The change in the administration of local governments from a board of selectmen to a town manager has become effective in several communities.

Each local government publishes an annual report of the town's expenditures of public funds. This report is made available just prior to the annual town meeting. A fairly complete file of these annual reports may be found in the State library at Augusta. In general, the town report includes the receipts and expenditures of funds and a brief report of the officers of the town. Further, it includes a list of business to be done at the next town meeting. The size of the annual report depends primarily on the size of the local government and the amount of details incorporated in the report. An examination of the annual

²⁴ Same as footnote 6, p. 11.

reports indicates that no uniform system of procedure has been followed. In general, each town government follows the same practice year after year but the method of procedure of one town may differ materially from that of another.

A criticism of most annual reports is that they do not present the town business in such a way that an interested person can become acquainted with it. It would be impossible to make a study of local governments from these reports. Hormell after attempting to make a study of town reports states:

" An examination of the reports of our towns convinces one that in most cases they are intended for printing only,—not to be read, much less to be understood. It would require the patience of Job and more than the skill of an expert accountant to extract from the average annual report complete and correct information concerning the business transactions of the year and the financial condition of the municipality. The would-be businesslike official or the conscientious information-seeking citizen who tries to obtain useful information from the annual reports of the average town is to be pitied. A single experience is sufficient to convince one of the hopelessness of attempting to acquire intelligent information from the minutely itemized schedules of receipts and payments. Such schedules are often merely the unintelligible transcripts of account books with no summaries and no classifications.

"The custom is surprisingly prevalent for the officials entrusted with the town's business to keep no summarized accounts showing the relation of expenditures to available revenues. To keep the total expenditures within the total revenues they trust to luck or blind fate rather than to systematic accounting. During the fiscal year ledger accounts have been of no practical value as a guide to business transactions. The report at the end of the year is equally valueless as a guide to popular control. " ²⁵

It should be clear that if town reports are to be published they should be in such form that the average citizen can readily understand them. The cost of printing these reports varies almost directly with the size of the report, amounting to several hundred dollars for many towns.

The authors believe that a uniform but simple system of accounting for all local governments would be very helpful. An adequate accounting system would greatly aid town officers in publishing desirable annual reports and furnish a basis on which to bring about efficiency in the expenditure of public funds.

²⁵ Same as footnote 6, pp. 92-93.

In order to transact the business of these local governments, an annual town meeting is held. Each resident voter has one vote in all matters pertaining to the local government. This includes the election of officers and the appropriation of funds for all town purposes. The advantage of this system is that it is democratic and affords an opportunity for each voter to express his or her opinion on all local matters. This system, however, has many disadvantages. A voter with no property has an equal voice in the government but furnishes no revenue, except possibly a poll tax (three dollars), towards the support of measures that he or she may approve. Further, it frequently happens that a non-property holder is a very able and convincing speaker but one who has impractical ideas. Such a person may not only take up much valuable time at the meeting but may be persuasive enough to cause the expenditure of funds in undertakings which are not justifiable. In the town meeting the town officers are elected for the ensuing year. The selection of all officers is very important. Selection should be made on ability and experience rather than on political power and oratorical ability.

Taxpayers and the people in general should be keenly interested in the maximum efficiency in government. Improvements in local governments would be a step in this direction. There are over 500 local units of government in Maine. This indicates at once the possibility of an expensive overhead cost of local government. A brief survey of this situation shows that the tax rate on property decreases as the size of the towns increases. In other words, the rate of taxation is highest in towns with valuations of less than one-fourth of a million dollars and the lowest in towns with valuations of five million dollars or over (Table 22 and Figure 101). Considering the tax rate alone, property in small towns has a tax rate 30 per cent higher than in large towns.

In addition to the tax rate, property in small towns is usually assessed at a higher rate of the estimated value than property in large towns. Where the total valuation of the town property was less than one-fourth of a million dollars, farm real estate was assessed nearly 40 per cent of its estimated value while in the towns where the total valuation was three-fourths of a million dollars or over the assessed valuation was only 25 per cent of the estimated value.

TABLE 22

Size of Towns and Tax Rate on Real Estate in Maine in 1930²⁶

Total valuation	Number of towns	Average tax rate	Difference between rate and av. rate
Less than \$250,000	197	\$.0553	\$+.0026
\$ 250,000—\$ 499,999	132	.0548	+.0021

Total	518	\$.0527	

FIG. 101—Relation of tax rates to size of local governments. As the size of the towns increases the tax rate on property decreases.

²⁶ Same as footnote 19.

The taxes on livestock are relatively higher in small towns than in large towns (Table 23). However, the total value of livestock on most farms in Maine is of minor importance as compared with the value of real estate property. Therefore, variations in livestock taxes between small and large towns are less significant than real estate taxes.

TABLE 23

Size of Towns and Taxes on Livestock in Maine in 1930²⁷

Total valuation	Taxes per head				
	Horses	Cows	Sheep	Hogs	Hens
Less than \$500,000	\$3.83	\$2.06	\$.37	\$.80	\$.046
\$ 500,000 — \$999,999	3.50	2.03	.32	.72	.041
1,000,000 and over	3.53	1.88	.37	.54	.038
Average	\$3.71	\$2.02	\$.36	\$.66	\$.043

It seems that a logical step in the improvement of the administration of the general-property tax would be the consolidation of small towns into larger and more efficient units of government. This idea is not new. In fact most states of the Union collect the general-property tax on a county basis.²⁸ The New England States, New York, Pennsylvania, New Jersey, Michigan, and Wisconsin are the only states where collection is made entirely on a town basis. The trend in recent years has been for counties to assume more and more responsibility in the administration of property taxes. In some cases even the county unit may be too small for maximum efficiency. The trend which has taken place is a natural one. In the early history of this country, transportation was slow and difficult and the unit of government necessarily covered a small area. Now with improved roads and automobiles a larger area than the town should constitute the local unit. Ex-Governor Frank O. Lowden of Illinois in an address at the four-

²⁷ Same as footnote 19.

²⁸ Kendrick, Slade M., *The Collection of General-Property Taxes on Farm Property in the United States, with Emphasis on New York*, Cornell Univ., Agr. Exp. Sta. Bul. 469, June, 1928, p. 5.

teenth annual meeting of the American Country Life Conference at Ithaca, New York, in August, 1931 stated:

" During my service as governor of the state we abolished these township collectors, who, as it happened, were the only town officers not protected by the constitution. The result has been a direct saving to the state of more than two million dollars annually, with the taxes collected more efficiently than before by the county officials. Competent authority estimates that the indirect saving has been in excess of this two million dollars. Even the township assessor, the last of the town officials who is really active, seems on the way to extinction, as county assessment of all property is now regarded a more equitable method than township assessment. " ²⁹

Larger units of local government, such as the county or district rather than towns, are conducive to more efficient methods of assessing and collecting property taxes. The unit should be of such size that the use of modern business methods would be justified. Then full time men could be employed with such facilities as calculating machines, addressographs, filing cabinets, and other necessary equipment for efficient handling of the business of the governmental unit. These units would probably justify the employment of a purchasing agent who could bring about savings in the buying of equipment and supplies. Also such units would be in a better position to equalize the tax burdens in rural and urban communities and between individuals.

COUNTY GOVERNMENTS

There are 16 county governments, one in each county, in the State. These governments are financed very largely by the general-property tax. The tax on general property levied for the partial support of all county governments in the State amounted to \$455,000 in 1900 as compared with \$1,568,000 in 1932 (Table 19). This represents an increase of 245 per cent during the 33-year period. The amount of the county tax is decided by legislative action every two years for each county for each of the next two years. Each county in the State prorates its county tax to the various towns within the county on the basis of the State valuation of property.

²⁹ Rural Government, Proceedings Fourteenth National Country Life Conference, address by Frank O. Lowden, pp. 7-8.

Although the county tax on general property has increased materially for each county during the last 33 years, the rate of increase has been more rapid in some counties than in others. The tax in Oxford County in 1932 was 150 per cent higher than that levied during the pre-war period 1910 to 1914. In Washington County the increase during the same period was only about 50 per cent of the pre-war average.

Although the county tax is relatively less important than either the State or local tax on property, farmers and others are interested in the proper and efficient operation of county governments. In some sections of the country the county government is less important now than it was a generation or two ago. Many of its former activities have been taken over by the State. This change has taken place in order to bring about greater efficiency in the use of funds and to render greater service to the people. In this connection, some states have practically abandoned the county jail, county court, and other allied activities of county governments to reduce expenses and to improve conditions. While it may not be advisable to follow changes which have taken place in other states, states outside of New England, careful study and consideration should be given to county governments. While this study does not logically include the cost of the government or the administration of various governmental units, a detailed study of county governments would be desirable. A very cursory study of annual reports of county governments in Maine indicates an opportunity on the part of some counties to bring about economies in the purchases of supplies and increased efficiency in the administration of certain departments.

STATE GOVERNMENT

The State government levies a tax on all real estate property on the basis of the State valuations. The amount of this tax is prorated to all incorporated and unincorporated towns. In incorporated places the town collects the tax as part of the general-property tax and transmits the funds to the State treasury. Through the equalization system a large part of the State tax is returned to the towns. In the case of unincorporated places, the payment of the tax is directly to the State treasury. In Table 24 are shown the State valuations of property, the State tax, and rate

of taxation from 1820 to 1932. During the last twenty years the State tax has increased rapidly from less than two million to over five million dollars annually.

While this study includes the amount of the State tax, no attempt has been made to study the State government. Attention of the readers of this publication is called to a recent report by the National Institute of Public Administration, entitled "State Administrative Consolidation in Maine." This report comprises a survey of the State government, sponsored by Governor William

Tudor Gardiner and published in 1930. This survey is very comprehensive in nature and includes recommendations for efficient use of public funds in each major division of the State government.

SUMMARY

This study represents a general survey of the farm-tax situation in Maine. It covers the principal types of farming in the State, namely apple, blueberry, dairy, potato, and poultry. No attempt has been made to show the tax burden of farmers carrying on general farming or part-time farming near cities and towns.

Of the many tax burdens of the farmer, the general-property tax is by far the most important, representing approximately three-fourths of the entire tax burden of farmers.

The tax on real estate per acre in Maine in 1931 was two and one-half times that of 1913. A slight decline took place in 1932 and a further decline may be expected in 1933. The upward trend in real estate taxes has continued almost uninterruptedly since 1913. While the trend in taxes has been upward, farm prices in Maine declined very rapidly in 1920 with some recovery in 1925 and 1926 followed by declines in 1927 and 1930. Real estate taxes in Maine in 1932 were at an index of 246 as compared with 100 in 1913 while farm prices were at an index of 67 and real estate values at 109. The property tax on livestock has tended to increase more rapidly than livestock values when prices of livestock were rising and to decline less rapidly than livestock values when prices of livestock were declining.

The average tax levied on apple farms included in the study during 1924 to 1926 amounted to 20.52 per cent of the farm income; on blueberry farms in 1926, to 10.83 per cent; on dairy farms in 1927, to 15.82 per cent; on potato farms in Aroostook County for the three-year period 1928 to 1930, to 12.54 per cent; on potato farms in Central Maine for the two years 1929 and 1930, to 8.58 per cent; and on poultry farms in 1930, to 8.46 per cent. The average property tax on the 422 farms included in the study amounted to 12.70 per cent of the farm income. This shows the tax burden of the farmer in the principal agricultural regions of the State during various periods from 1924 to 1930.

Agricultural conditions in Maine from 1924 to 1930 were, in general, fairly satisfactory. However, under present (April, 1933) conditions of very low farm incomes farmers find it extremely difficult and in many cases impossible to pay their taxes.

Large farms are taxed relatively less than small farms. This is due in part to relatively low assessments and in part to relatively large incomes on large farms.

Many inequalities were found to exist in the assessment of farm property, both real and personal. Very frequently large farms were assessed relatively less than small farms. Similarly, personal property on large farms often was assessed relatively less than on small farms.

The administration of the general-property tax is by local, county, and State governments. The tax on real and personal property for the year 1932 amounted to \$28,300,785.00. This amount included \$21,051,141.36 as local taxes, \$1,567,816.27 as county taxes, and \$5,681,827.37 as State taxes. The State property tax amounted to only one-fifth of the total general-property tax and a large part of the revenue derived is returned to the local governments in the form of equalization funds. Even a drastic reduction in the State property tax would relieve property owners very little. Also it is very likely that in many cases the local taxes would be increased to offset the reduction of State funds if schools and roads were maintained at the present degree of efficiency.

Many towns are too small for the maximum efficiency in government. The suggestion has been offered to consolidate local units to bring about increased efficiency.

APPENDIX A

Tables in Appendix A show the assessed valuations, tax rates, and taxes on taxable livestock³¹ with the exceptions of horses and cows. For information on horses and cows see pages 237-239.

1928	6.29	.041	.26	371
1929	6.46	.043	.28	400
1930	6.00	.044	.26	371
1931	4.82	.044	.21	300
1932	3.57	.043	.15	214

† From 1900 to 1915 inclusive the assessed value per head each year was based on the total number of sheep. Since 1918 the assessed value per head was based on the number of sheep in excess of 35 per farm. The change in assessments partly accounts for the rapid increase in values from 1915 to 1918.

* No taxes assessed.
