NUMBER 220

## Tables with Notes on THE ENQUIRY ON PHYSICALLY HANDICAPPED PERSONS

*The report entitled "Tables with notes on the enquiry on physically handicapped persons, NSS 24th Round (July 1969—June 1970) and 28th Round (October 1973—June 1974)" was prepared by the National Sample Survey Organisation under the guidance of the Governing Council for the NSS and the views contained in the Report are not necessarily those of the Government of India\*.*

### I. Introduction and Background

1. The survey on Physically handicapped persons was included in the programme of the National Sample Survey (NSS) in the past from time to time at the request of the Social Welfare Board of the Planning Commission. An exploratory survey carried out in the rural areas of the country in the 15th round of NSS (July 1959—June 1960) was the first of this series. In NSS 16th round (July 1960—June 1961) it was extended also to cover the urban sector. The subject was repeated in the 24th round (July 1969—June 1970) and the 28th round (October 1973—June 1974) of NSS. The present report gives the results obtained from the enquiries carried out in the 24th and the 28th rounds of NSS.

2. The objective of these enquiries was limited to estimating the number of persons in this country who suffer from certain specified physical disabilities. There were some slight variations in the type of disabilities included in the schedules over the rounds. In the 15th round count was taken of persons who were blind, deaf, dumb, or were afflicted with leprosy. In the 16th round the lame and the crippled were also included in the coverage. In the 24th round persons afflicted with leprosy were dropped from the coverage of 16th round as leprosy was then considered as not so much a physical handicap as a disease by itself. In the 28th round mentally affected persons were included.

3. This report is divided into five sections including this introductory section. The important concepts, definitions and procedures adopted for this enquiry are given in section II. The sample designs adopted in the two rounds and the methods of estimation used are respectively given in Sections III and IV. Section V gives the final results obtained.

### II. Concepts, Definitions and Procedures

4. For the socio-economic enquiries of NSS, generally a two-stage design is adopted with the villages in the rural sector and blocks in the urban sector as the first stage units (f.s.u.) and households as second stage units. (A detailed description of the design is given later.) On reaching the sample f.s.u. the investigator goes round the village/block and makes a complete list of all the households living there. This is made in a listing schedule. It was called "General Schedule" in 24th round and "List of Households" in 28th round—Schedule 0-1 for the rural sector and Schedule 0-2 for the urban sector. Now, while visiting the households for the purpose of listing them, he usually collects some additional information on some items from each household. This may be for use in second stage sample selection or may be, on the other hand, purely for the sake of collecting information on such items. Data on the number of physically handicapped persons were thus collected from all the households in the sample f.s.u. and entered in the General Schedule/List of Households by categories. The list of households was prepared in block [6] of the schedules 0-1 and 0-2 and the number of physically handicapped persons normally living in each household was entered in columns (8) through (13) of both these schedules in 24th round. The corresponding column numbers in 28th round were 9 to 15 in schedule 0-1 and 7 to 13 in schedule 0-2. The definitions adopted in the two rounds in this connection are given below.

---

\* The report was submitted as draft report No. 259 in August 1975.

5. A "Household" is defined as a group of persons normally living together and taking food from a common kitchen. Only if a physically handicapped person is normally resident in the household he/she will be counted.

*Blind.*—A person who cannot see for all practical purposes, being blind in both the eyes will be called "blind". Persons with failing eyesight due to old age or those who use spectacles and cannot see without them will not be treated as blind.

*Deaf.*—A person who cannot hear for all practical purposes will be treated as deaf. Those who use hearing aids were considered deaf in 24th round. However, in 28th round, such persons were treated as not deaf.

*Dumb.*—One who cannot talk is dumb.

*Lame.*—One who is disabled or deformed in either of the legs is a lame person.

*Crippled.*—A person who is deformed in any part of the body other than legs and is disabled thereby.

*Mentally affected persons.*—A person who is mentally disordered, as considered by the informant whether or not under psychiatric treatment is considered as a mentally affected person.

While making entries relating to the number of physically handicapped persons, in the total column, no member will be counted more than once; that is to say, one who may be, for example, both blind and deaf will be counted for making entries under blind and deaf columns, but will be counted only once for the total column. Thus the sum of entries against a given household under the individual disability columns may be greater than or equal to the entry in the total column. This applies, naturally, to the final estimates under these heads too.

### III. Sample Design

6. The geographical coverage of NSS was almost the same in 24th and 28th rounds. The survey extended to the whole of the rural and urban areas of Indian Union. However the following tracts had to be excluded from the survey coverage in both the rounds due to operational and other considerations; Ladakh District of Jammu & Kashmir, Mizoram (formerly Mizo Hills district of Assam State); Pal and Samri Tehsils of District Sarguja and Bijapur, Dantewara and Kanta Tehsils of District Bastar of Madhya Pradesh; rural areas of Nagaland; Dadra & Nagar Haveli; Andaman & Nicobar Islands; and Lakshdweep (formerly Laccadives, Minicoy and Amindivi Islands). Further, Mao, Ukhrul and Tamenlong sub-divisions of Manipur, Longai and Kanchanpur in Dharmanagar sub-division of Tripura and Arunachal Pradesh (formerly North-East Frontier Agency) were excluded from the geographical coverage of 24th round. In 28th round, though Manipur was fully covered, some areas of Tripura had to be excluded. Arunachal Pradesh remained excluded from the coverage of NSS in 28th round also though a State Sample was canvassed in Kameng and Subansiri districts. In addition, Narayanpur Tehsil of district Bastar of Madhya Pradesh and tehsils Rajura, Sironcha and Gadchiroli of district Chanda and tehsil Melghat of district Amravati of Maharashtra were outside 28th round coverage.

The sampling designs adopted in NSS 24th round and 28th round as applicable to this enquiry are described in this section. Whereas the design of 24th round followed the earlier patterns, a drastic re-designing was carried out on the recommendation of a Working Group set up by the NSSO Governing Council and the new design became effective from the 28th round. The designs of the two rounds are therefore, very much different from each other and they are discussed here separately.

7. *NSS 24th round : Rural sampling design.*—The sampling frame used for selection of villages was the 1961 census list of villages. The country was divided into 64 "regions" which were formed by grouping contiguous districts having similar population density and crop pattern. Strata were formed within each region by grouping contiguous tehsils similar with respect to density of population and altitude above sea level and having good transport facilities among them. Strata within a State/Union Territory had equal total size. (Each village is assigned a size on the basis of its population and size of a stratum is the sum of the sizes of its constituent villages). The total all-India sample size was 8400 villages. This was allocated to the States on a joint consideration of their rural population, area under cereal crops and the strength of available field staff. This was then modified marginally to make them multiples of 24 and also to ensure a minimum of 360 villages in each State (except Punjab and Haryana where the sample sizes were only 192 and 144 villages respectively). Now, in most States and Union Territories, besides what is called the above mentioned "central sample", in general, a "state sample" of equal size was also selected which were canvassed by the respective State Governments. From each stratum four independent interpenetrating sub samples of 12 villages each (in non-participating States, only 6 villages) were selected circularly systematically with probability proportional to size. The villages with odd order of selection was assigned to the central sample and the rest to the state sample. The survey period of one year was divided

in to six sub-rounds of two months each and in each stratum one village was programmed to be surveyed in each sub-round. Sub-samples 1 and 3 were assigned to one party of field investigators and sub-samples 2 and 4 to another. If any sample village was very large considering the work load for a village, it was divided into a number of parts (the number depending on the population of the village) called "hamlet groups" with approximately equal population content and one of them was selected at random with equal probability for survey for the socio-economic enquiries. All the households in the village or the hamlet group selected for survey were listed in "Schedule 0-1; General Schedule (Rural)". From each household listed, data were collected in block [6] of this schedule, on the number of normally resident members of the household who are afflicted by one of the physical disabilities already mentioned.

8. *NSS 24th round ; Urban sampling design.*—The sampling design in the urban sector was similar to that adopted in the rural sector excepting in one important respect, viz. stratification. Within each State/Union Territory, all towns with population 50,000 and above together formed stratum 1 and all the remaining towns together formed stratum 2. However, the four big metropolitan cities, Bombay, Calcutta, Delhi and Madras each formed a separate stratum. The sampling unit within strata was an urban block. For most towns the frame used was a list of blocks formed by NSS after conducting an Urban Frame Survey. This covers about 90% of the urban population of India. For the rest, the list of Enumerators Blocks of 1961 population census was used as frame. Now, the total number of sample blocks was 4632 (central sample). This was allocated to the States/Union Territories in proportion to their respective 1961 census urban population. This allocation was slightly modified to ensure at least 144 blocks in each State (except Punjab and Haryana) and to make it a multiple of 24. The state-wise allocations were further allocated to the strata in proportion to their total size. (Each urban block is assigned a size based on its population and the total stratum size is the sum of the sizes of the constituent blocks.) Sample blocks from each stratum were selected (as in the rural sector) circular systematically with probability proportional to size in the form of 4 independent interpenetrating sub-samples. Sub-samples 1 and 3 were assigned to one party of investigators and sub-samples 2 and 4 to the other party. As in the rural sector, the central and state samples were selected as linked samples using the same procedure. The phasing of the total annual field work of the round into six sub-rounds of two months each was done in the urban sector also. One-sixth of the total sample size of each sub-sample of each stratum was canvassed in each sub-round. In case a selected block happened to be large, it was divided into areal sub-blocks containing approximately equal population and one of them was selected at random with equal probability for survey. Now, all the households of the sample block (or selected sub-block) were listed in "Schedule 0-2 : General Schedule (Urban)"; and each household was asked how many of their normally resident members suffered from the specified physical handicap and this information was noted against it in block [6] of the schedule.

9. *NSS 28th round ; Rural sampling design.*—The country was divided into a number of "basic strata" as follows. Each district with less than 1.5 million 1971 census rural population formed one basic stratum by itself (except in Gujarat state, where some districts with 1971 census rural population less than 1.5 million have been divided into two basic strata in consideration of concentration of tribal population in some areas and the dry areas of that state). The remaining districts were divided into more than one basic strata, the exact number of strata determined by the district's rural population as given below:—

1971 census rural population of district	number of basic strata
(1)	(2)
less than 1.5 million	1
1.5 million to less than 2.5 million	2
2.5    ,,            ,,            3.5    ,, (and so on)	3

Strata are formed by grouping contiguous tehsils homogeneous as far as practicable with respect to density of rural population and crop pattern. The basic strata are the same for the rural and urban sectors—the rural portion of a basic stratum constituting a stratum for rural sampling and the urban portion of the same forming a stratum for urban sampling. However, there are some basic strata having no urban areas and some with either no rural population or its rural areas outside NSS coverage. In the 356 districts of the Indian Union, which are covered by NSS, 524 basic strata have been formed of which 17 are purely rural strata and 8 are purely urban ones.

The state-wise rural sample sizes were generally the same as in earlier rounds, the total number of sample villages in the Central Sample being 8754. The number of sample villages to be selected from a basic stratum was, within each state, approximately proportional to its 1971 census rural population. The allocations to strata were rounded to multiples of 6 to ensure equal representation to each of 2 sub-samples and 3 sub-rounds. In a few strata with very small population, only 3 villages were selected—each of them repeated for both the sub-samples—and such villages were called "special" villages.

The sample villages allocated to a stratum were selected with probability proportional to population with replacement. The frame used was 1971 census list of villages.

As in 24th round, sample villages with large population content were divided into a number of hamlet-groups one of which was selected for survey.

All the households in the sample village/selected hamlet group were listed in schedule 0.1 and from each household information on the number of physically handicapped and mentally affected persons was collected in block [6] of that schedule.

10. *NSS 28th round : Urban sampling design* : As explained in the previous paragraph, the urban areas of each basic stratum constituted a separate stratum for urban sampling. Each such urban basic stratum was further sub-divided into a number of urban sub-strata as follows :—

all towns with population less than 20,000—urban sub-stratum	1
"          "          20,000 to less than 50,000	2
"          "          50,000 to less than 100,000	"
each town with population 100,000 and above	4,5.....

In general the state-wise allocation of sample blocks adopted in the 27th round was retained in 28th round with the exception of Gujarat and Tamil Nadu where the number of sample blocks were increased at the expense of rural sample size.

The state sample sizes were further allocated to the strata approximately in proportion to their 1971 census urban population. This was rounded to multiples of six, as in the rural sector, to accommodate 2 sub-samples and 3 sub-rounds. However, in about 160 urban basic strata the urban population content was very small and hence the allocation was fixed as 2 blocks—one for each sub-sample. Each of these was repeated in all the three sub-rounds. Such blocks were designated "special" sample blocks.

Except in Tamil Nadu and West Bengal and the "special" basic strata of the remaining states/ U.T.'s, the stratum-wise allocation was further allocated to the constituent urban sub-strata systematically with probability proportional to population.

The frames for selection of sample blocks were the Urban Frame Survey blocks in towns where UFS had been carried out and 1971 census Enumerators' Blocks in other towns as in the 24th round.

The allocated number of sample blocks were selected with probability proportional to size with replacement where "size" of a block is a measure of its population. The total sample of a stratum was divided into 2 sub-samples  $\times$  3 sub-rounds. Sample blocks of each sub-sample was canvassed by an independent party of investigators.

In the case of large sample blocks, they were divided into a number of sub-blocks out of which one was selected for survey at random. The number of such sub-blocks depended on the current population of the block.

All the households in the selected sample blocks/sub-blocks were listed in a schedule 0.2 and the information on the number of physically handicapped and mentally affected persons was collected from each listed household in block 6 of the schedule.

11. As in 24th round, most of the State Governments had participated in NSS in 28th round also. In most such cases they canvassed an equal matching sample. The present report contains data from the central sample only which was canvassed by the central field staff. The sample sizes in terms of villages and blocks are given in Table (O) of the set of tables given at the end of this report.

IV. Estimation Procedure

12. *NSS 24th round.*—In both the rural and urban sectors the usual unbiased estimates of population total for probability proportional to size systematic sampling was used to estimate the total number of physically handicapped persons by categories. The formula is given below :

$$\hat{Y}_s = \frac{Z_s}{n_s} \sum_{i=1}^{n_s} \frac{y_{si}}{z_{si}} \quad \dots(1)$$

where  $\hat{Y}_s$  stand for the estimated total of any variate for the s-th stratum;  $z_{si}$  for the size of the i-th sample village/block of the s-th stratum;  $Z_s$  is the total of the village/block sizes of the s-th stratum;  $n_s$  is the number of sample villages/blocks surveyed in the s-th stratum; and  $y_{si}$  is the value of the variate for the i-th village/block of the s-th stratum. The variates in the present case are the number of physically handicapped persons living in the village/block by categories. Whereas in the rural sector each stratum had a constant number, 24, of sample villages, in the urban sector the number of sample blocks allotted to a stratum varied from stratum to stratum. In case there was hamlet-group/sub-block selection in any sample village or block, the formula was modified as :

$$\hat{Y}_s = \frac{Z_s}{n_s} \sum_{i=1}^{n_s} D_{si} \frac{y_{si}}{Z_{si}} \quad \dots(2)$$

where  $D_{si}$  gives the number of sub-divisions formed in the village/block.

13. The estimates of the aggregates at State, Union Territory or all-India level were obtained by adding the corresponding estimates of aggregates of the constituent strata.

14. *NSS 28th round.*—The estimation procedures adopted in 28th round are discussed below for the rural and urban sectors separately.

15. *Rural sector.*—Let  $Y_s$  stand for the total of a characteristic for the s-th stratum. Then the estimate of  $Y_s$  is obtained as :—

$$\hat{Y}_s = \frac{P_s}{m_s} \sum_{i=1}^{m_s} D_{si} \frac{y_{si}}{P_{si}} \quad \dots(3)$$

where  $P_s$ —total rural population of the stratum s

$m_s$  — number of villages surveyed in the stratum s

$P_{si}$  — the population of the i-th sample village of stratum s

$y_{si}$  — the value of the characteristic for the i-th sample village of stratum s

$D_{si}$  — number of hamlet groups formed in the i-th sample village of stratum s. ( $D_{si} = 1$  for villages where no hamlet group selection was done).

The characteristics in the present context were the number of physically handicapped persons by categories or that of mentally affected persons. The aggregates at State, Union Territory or all-India level were obtained by adding the corresponding estimates of aggregates of the constituent strata.

16. *Urban sector.*—As before let  $Y_s$  stand for the total of a characteristic (e.g. number of physically handicapped persons) for the s-th stratum. The estimate of  $Y_s$  was obtained as follows. For all strata of Tamil Nadu and West-Bengal and for the "Special" strata of the remaining States and U.T.'s,

$$\hat{Y}_s = \frac{Z_s}{m_s} \sum_{i=1}^{m_s} D_{si} Y_{si}/Z_{si} \quad \dots(4)$$

where  $Z_s$  = total size of stratum

$m_s$  = number of blocks surveyed in s-th stratum

$D_{si}$  = number of sub-blocks formed in i-th block of s-th stratum

$Y_{si}$  = value of characteristic of i-th block of s-th stratum

$Z_{si}$  = size of characteristic of i-th block of s-th stratum

For the remaining strata,

$$\hat{Y}_s = \frac{1}{m_s} \sum_r \frac{X_s}{X_{sr}} Z_{si} \sum_{i=1}^{m_{sr}} D_{sri} \frac{Y_{sri}}{Z_{sri}} \quad \dots(5)$$

where,  $m_s$  = number of blocks surveyed in s-th stratum  
 $X_s$  = population of s-th stratum  
 $X_{sr}$  = population of r-th sub-stratum of s-th stratum  
 $Z_{sr}$  = total size of r-th sub-stratum of s-th stratum  
 $D_{sri}$  = number of sub-blocks formed in i-th sample block of r-th sub-stratum of s-th stratum  
 $Z_{sri}$  = size of i-th sample block of r-th sub-stratum of s-th stratum  
 $Y_{sri}$  = value of characteristic of i-th sample block of r-th sub-stratum of s-th-stratum

The aggregates at State/Union Territory or all-India level are estimated by adding the estimated aggregates of the constituent strata.

17. Now, all the estimates presented in this report are in the form of number of physically handicapped (or mentally affected) persons per 1000 population. This was obtained by dividing the estimated number of physically handicapped persons by the estimated population. This denominator was calculated by first obtaining the estimate of total number of households at the State/U.T. level based on the listing schedules following the same procedure as given in the preceding paragraphs and then multiplying it by the average household size obtained from schedule 16 of NSS 24th round for the respective State/U.T. and sector. It is to be noted that the same figures of average household size, obtained from schedule 16 of 24th round were used for both 24th and 28th rounds.

## V. Results

18. The final results on physically handicapped persons and mentally affected persons obtained from the enquiries carried out in NSS 24th and 28th rounds are presented in this section. There are altogether seven tables included in this report. Table (O) gives the sample sizes for both the rounds. Tables (1), (2) and (3) give the estimates of physically handicapped persons per 1000 population for (a) rural sector (b) urban sector and (c) rural and urban sectors pooled obtained from 24th round. Similarly Tables (4), (5) and (6) give the corresponding estimates for 28th round. There are some cells in these tables with entry as "6" and some others having "O". While "—" indicates that there were no reported cases of physical handicap or mental abnormality, "O" means that the rate per 1000 persons was zero upto two decimal places.

19. In addition to the above tables based on data of NSS 24th & 28th rounds Table (7) presents comparative estimates of total number of physically handicapped persons per 1000 persons based on date of 16th, 24th & 28th rounds of NSS. The data relating to 16th round have been taken from "NSS Report No. 117 ; Tables with notes on enquiry on physically handicapped persons ; Sixteenth Round". On that round persons afflicted with leprosy were included among the physically handicapped. Estimates of such persons were, therefore, subtracted from total number of physically handicapped persons for presentation in Table (7).

20. The data given in this report are small in bulk easily comprehensible. The tables speak for themselves. However just one observation may be made here. The incidence of the various physical handicaps is more or less of the same order during the two rounds considered in this report in spite of a change in definition of deafness; and the intensity in urban areas is about half of that in rural areas.

21. A list of the tables (with short titles) included in this report is given below :—

**List of Tables**

Table (0) . . . . .	Distribution of sample size-NSS 24th and 28th rounds.
Table (1) . . . . .	Estimated number of physically handicapped persons per 1000 population in <i>rural</i> areas—NSS 24th round.
Table (2) . . . . .	Do. in <i>urban</i> areas Do.
Table (3) . . . . .	Do. in <i>rural and urban areas pooled</i> NSS 24th round.
Table (4) . . . . .	Estimated number of physically handicapped persons and mentally affected persons per 1000 population in <i>rural</i> areas—NSS 28th round.
Table (5) . . . . .	Do. in <i>urban</i> areas - NSS 28th round.
Table (6) . . . . .	Do. in <i>rural and urban areas pooled</i> NSS 28th round.
Table (7) . . . . .	Comparative estimates of total number of physically handicapped persons per 1000 population for NSS 16th, 24th and 28th rounds separately by <i>rural</i> and <i>urban</i> areas.

TABLE (0) : DISTRIBUTION OF SAMPLE VILLAGES AND URBAN BLOCKS BY STATE/UNION TERRITORY

State/Union Territory	24th round		28th round	
	number of sample villages	number of sample blocks	number of sample villages	number of sample blocks
(1)	(2)	(3)	(4)	(5)
