BOMBAY METROPOLITAN  
REGIONAL PLANNING BOARD  
*.2311-N7*  
REPORT OF THE  
STUDY GROUP ON  
MOGRAPHY

## I. Constitution of the Study Group

I.1. The Bombay Metropolitan Regional Planning Board in its third meeting held in Bombay on 14th November, 1967 decided to constitute a Study Group to Study the demographic aspects of the Region from point of working out the projected population of the Region over a period of 30 years which would serve as an indicator of the extent of the problem of metropolitan regional planning for the Bombay Metropolitan Region.

I.2. Accordingly the Study Group on Demography was formed with the following three members, namely:-

1. Shri S. V. Desai, Chairman of the Study Group,
2. Shri J. G. Keskar, as Member-Secretary,
3. Dr. S. N. Agarwala, Director, DTRC, Chembur as Member.

The first meeting of the Study Group was held on 16th December, 1967 from which date the Study Group actually started functioning. The Study Group held four meetings upto the end of April, 1969. The Study Group received the valuable assistance from Dr. Vaidyanathan of the Demographic Training & Research Centre (DTRC).

(a) to give on a priority basis within a month of so a tentative forecast of the Region's population at five year intervals upto 1991;

(b) to give more detailed forecasts of population on alternative assumptions;

(c) analyse immigration trends;

(d) give a breakup of projected population by ages and sexes;

(e) study labour participation ratios and project them, study current occupational patterns and project them;

(f) give a breakup of projected population into urban and rural and also to project the population of each urban centre in the region;

(g) suggest measures for controlling the population of Gr. Bombay;

and (h) other important demographic aspects, if any.

I.4. The Study Group referred to the following documents/papers/reports for its deliberations;

(a) District Census Hand Books of the 1951 & 1961 Censuses for Gr. Bombay, Thana and Kolaba Districts.

(b) Migrants in Gr. Bombay 1951-61 by Dr. Zachariah, of DTRC.

(c) Life tables (1951-60) prepared for Western Zone by the Registrar General of India.

(d) Population Projections for Maharashtra State-1951-81 by Shri R.E.Choudhery and Dr.Ramchandran of DTRC.

(e) Gadgil Committee's Report on Bombay and Poona Regions.

(f) "Population Projection needed for planning and policy making" by Dr. K.C. Zachariah.

(g) "Estimating Decade internal Migration in the cities from census data" ....Dr. S.N. Agarwala.

I.5: According to the term of reference stated in para I.3,(a), the Study Group has worked out tentative forecast of the Region's population at five year intervals upto 1991, within a period of four months. These estimates were, however, afterwards revised.

-----

## II. Demographic features of the Region

### II.1. Region and its population in 1961:-

The Bombay Metropolitan Region which is bounded on North by Vaitarna Creek and the taluka boundaries of Bassein and Bhiwandi along the river Tansa on East by Sahyadiri ranges, upto and including Khopoli in the Region, on South by the Patalganga river and on the West by the Arabian Sea is spread over about 3860 sq.km. of land comprising of 940 inhabited villages and 18 Towns besides Gr. Bombay. The Region had a population of 52.8 lakhs in 1961 of which about 46.4 lakhs was urban and 6.4 lakh was rural. The Region though hardly 1.2 percent of the state in Area, has almost 13.4 percent of the State's total population and almost 41.6 percent of urban population of Maharashtra. Whereas in the State the urban population forms only about 28 percent of the total state's population it is about 88 percent (including Gr. Bombay or about 43 percent excluding Gr.Bombay) in the Region thereby indicating the extent of urbanisation reached in the Region.

### II.2 Settlement Pattern in the Region:-

The distribution of the population within the Region is of such an uneven character -- that whereas only 438 sq.km. of Gr. Bombay account for 41.5 lakh persons, the remaining about 342259km. of the Region contain only about 11.3 lakh persons in a hierarchy of big and small towns and villages. Of the 11.3 lakh population in the Region outside Gr.Bombay about 27.4 percent live in small villages of size below 1000 population another about 26 percent live in slightly bigger villages of size between 1000-4999 population; only about 3.2 percent live in villages of size above 5000 population and the remaining 43.3 percent live in 12 towns of size below 20,000 population, 3 towns of size between 20,000 to 49,999 population, 1 town of size 50,000 to 99,999 population and in 2 towns of size of 1,00,000 and above population. The Gadgil Committee on Regional Planning for Bombay and Poona Metropolitan Region observes in its report "The bigger of these Urban Centres namely, Thana, Kalyan and Ulhasnagar are situated in the close proximity of Greater Bombay. The area within the Salsette Island including Thana and Bhayander is in fact a continuous urban agglomeration while the area beyond upto Bassein on the W.Rly, Bhiwandi along Bombay-Agra Road and Ambernath along the C.Rly could be termed the peri-urban zone". "The rest of the Region which would be peripheral or rural zone contains 6 urban centres of population range from 2000 to 8000".

### II.3. Variation in Population Densities in the Region:-

The Regional density of population is 1368 persons per sq.km. as against the State's average density of 129

per sq.km. The densities in all the talukas falling within the limits of the Bombay Metropolitan Region which ranges from 155 persons per sq.km. in Khalapur Taluka to 610 persons per sq.km. in Thana Taluka are much higher than the State's average density of 129 persons per sq.km. The average density in Gr.Bombay is about 9,486 persons per sq.km. which is almost three times the average density in the Region excluding Gr.Bombay. In the urban areas of the Region it varies from 673 persons per sq.km. in Karjat taluka to 5594 persons per sq.km. in Kalyan Taluka and upto 9,486 in Gr.Bombay and 11617 in Bhiwandi taluka. "Even within Gr. Bombay the population densities are again very uneven which vary from 6 persons per acre in 'R' ward to 769 persons per acre in 'C' ward in 1961" as is observed by the Gadgil Committee on Regional Planning in its report.

#### II.4. Growth of population during 1951-61:-

The Bombay Metropolitan Region had a population of about 38.4 lakh in 1951 which increased to 52.3 lakh during the decade 1951-61. The decade rate of growth of population in the Region was about 37.5 percent as against the growth of 23.6 percent in the State's population. The urban population of the Region which was about 87 percent of the Region's total population in 1951 grew by 39.2 percent i.e. faster during 1951-61. The urban areas in the talukas of Thana, Kalyan and Bhiwandi had a faster growth of population than the growth of population in Gr.Bombay during 1951-61. Whereas population in the towns in Bhiwandi, Thana and Kalyan talukas grew by 84.9 percent, 53.1 percent and 41.8 percent respectively in 1951-61, the corresponding growth in the population of Greater Bombay was only 38.7 percent. This trend during the decade 1951-61 exhibits physically expanding urban agglomeration at the doorstep of the Metropolitan City of Bombay along the main trunk routes Bombay-Poona Rly. link and the Bombay-Agra Road. Another significant feature of the 1951-61 growth in the Region's population is that the rates of growth in the urban areas of talukas of Panvel, Karjat and Uran were lower than those in the rural population of the corresponding talukas during the same period. In other words the urban centres in the Kolaba district within the Bombay Metropolitan Region which have the characteristics of almost "Service Towns" have not attracted much growth, during the decade 1951-61 although they were within 30 miles reach from the metropolitan city of Bombay.

#### II.5. Net-migration in the Region during 1951-61:-

The estimates of net migration in urban areas in different parts of the Region during the decade 1951-61 has been worked out by "Census Survival Ratio" method. The 1951 population surviving by 1961 in different age groups is worked out by applying the survival ratios worked out by Shri Shastri of DTBC for Gr.Bombay. The surviving population

so arrived at for a town is then deducted from the actual population enumerated for that town during 1961 Population Census to get the estimates of net-migrants within different age groups during 1951-61. This method is described in detail in the Appendix to this report. The net-migration rates are worked out only in respect of urban area of the Region. The net-migration in the urban areas of the Region is observed to be varying from about - 2.2 percent in towns in Bassein Taluka to 31.5 percent in towns in Kalyan taluka. In Gr.Bombay, the net migration during the decade 1951-61 is observed to be about 14.1 percent. The published work of Dr. S.N. Agarwala on the rates of net migration for three metropolitan cities in India show that the rate was about 30 percent in Gr.Bombay during the decades 1931-41 and 1941-51. In other words the net-migration in the metropolitan city of Bombay declined by almost half during last decade. Dr. Zacheriah in his treatise on the "Migrants in Bombay" has also come to the conclusion that the rate of migration in Gr.Bombay has declined during 1951-61 and he has in his study attributed this fall in rate of migration to reasons such as slowing down in employment opportunities, shift in the industrial structure of the city from the less organised to more organised and capital intensive industries and the Return of the earlier migrants above 35 years of age. He observes in his study " The census showed that the net migration in Bombay decreased from 9,50,000 during 1941-51 to 600,000 in 1951-61. This decrease in the net-migration is probably due to slowing down in employment opportunities. The new industries which came up during 1951-61 were more capital intensive and hence created few employment opportunities. Concomitantly, some of the established factories rationalised their production process and freed workers for other industries. Thus a shift in the industrial structure of the city, from the less organised to more organised and capital intensive industries seems to be major cause of the decrease in net-migration to Bombay. The shift in the industrial structure of the city, from the less organised to more organised and capital intensive industries, seems to be major cause of the decrease in net-migration to Bombay. The decade 1941-1951 was of expansion for Bombay whereas the decade 1951-61 was of consolidation.

Out-migration of earlier migrants from Bombay was heavy, particularly during the first few years of their stay in the city and especially of those above 35 years of age. The rate of outmigration among persons enumerated at Bombay in 1951 was 18 percent for males and about 13 percent for females during 1951-61. This rate was even upto 30 percent per decade among males of 30 years and above. Among the females this rate was relatively higher at ages 15-19 years suggesting importance of marriage factor in the outmigration of females. The rate of net out-migration from Bombay during 1951-61 at ages 35 and over was relatively more than that in the previous decade. Among the recent migrants the rates of reverse migration were higher than among those with long duration of residence. Also the rates of reverse migration were relatively higher for migrants born in the surrounding states of Maharashtra and Gujarat born for these who were

born in more distant states such as U.P. or Andhra Pradesh". Thana and Bhiwandi towns which emerged as major job centres after 1951 have obviously attracted more migrants ( net migration 20.9% ) in Thana and 28.3 percent in Bhiwandi) than any of the other Urban centres in the Region. Also being almost practically a suburb of the great metropolitan city of Bombay, Thana has attracted the migrants who have their work place in Bombay. This town has further potentialities of growing into 'A' class city considering "push" factor from Gr.Bombay and the "pull" factor due to large scale industrialisation taking place on its outskirts and across the creek. Among the other towns, Ulhasnagar which is sandwiched between the industrialisation at Kalyan-Mohone and Ambernath has the potentialities of growing into a big city although the Net-migration to this town during 1951-1961 is observed to be only about 7.0 percent. The declining trends in the net-migration rate are carried forward while projecting the population of different parts of the Region over a period of 30 years i.e. 1961-91. The estimate of projected population in the Region its sex and age group composition and the estimates of potential labour force by 1991 in the Urban areas of the Region are discussed in section III of the Report.

### III. Population Projection

**III.1.** Three sets : low, medium and high-of estimates of projected population of the Region are worked out, based on three different assumptions.

Projected population figures are worked out for 1966-91 with the following three sets of assumptions:

a. 10% reduction in the rates of natural increase and net migration for every subsequent 5th year.

b. 5% reduction in the rates of natural increase and net migration for every subsequent 5th year.

c. 5% reduction in the natural increase with no change in the rate of net-migration, observed during 1951-61 decade.

Results for (a) & (b) are available by age and sex while those for (c) are available for total, figures for rural areas are not changed due to changes in migration.

The first set provides the low estimate, the second set gives the medium while the third set gives the high estimate of the projected population in the Region.

Projections worked out for different parts of the Region:-

---

Considering the present industrialisation and the scope for future industrialisation within the Region, the population projections for urban and rural areas are worked out independently for different parts of the Region such as:

#### Urban Areas

1. Greater Bombay
2. Thana town
3. Kalyan town
4. Ulhasnagar town
5. Urban Thana taluka  
(except Thana town )
6. Urban Kalyan taluka  
(except Kalyan &  
Ulhasnagar)
7. Urban areas in Bassein taluka
8. Urban areas in Bhiwandi taluka
9. Urban areas in Panvel taluka
10. Urban areas in Uran taluka.
11. Urban areas in Karjat taluka.

#### Rural Taluka

12. Rural-Thana taluka
13. Rural-Kalyan taluka
14. Rural-Bassein taluka
15. Rural-Bhiwandi taluka
16. Rural-Uran taluka
17. Rural-Panvel taluka
18. Rural-Karjat taluka
19. Rural-Khalapur taluka

\* for the part included in the region.

Classification of areas is done on the basis of boundaries defined during 1961 census.

Position by 1991:- The Region's population which is about 52.8 lakh in 1961 is expected to reach a formidable figure of 109 lakh (under assumption(a)), 125 lakh (under assumption (b)) and 135 lakh (under assumptions (c)) by 1991. Urban population is expected to increase from 46.4 lakh in 1961, to about 98 lakh (under (a)) and 113 lakh (under (b)) and 123 lakh (under (c)). Rural population, which is 6.4 lakh in 1961, is expected to increase to 10.5 lakh (under (a)) and 11.6 lakh (under (b)). Population of Greater Bombay, which is about 41 lakh in 1961 would reach a threatening figure of 85.6 lakh (under(a)), 98.0 lakh (under (b)) and 106.2 lakh (under(c)) by 1991.

Comparison with projected population by other agencies:-

Population projection figures are previously worked out by Gadgil committee for the Bombay Metropolitan Region and also separately for Gr.Bombay, upto 1991. A set of figures are also worked out for Gr.Bombay by the Demographic Training Research Centre (DTRC) for census Department and on other set of figure are worked out by the Regional Transport Survey Unit (RTS) Finance Deptt. Government of Maharashtra, upto the year 1981. Their figures of projected population of Gr.Bombay and also for the Region are presented below for comparison with those worked out by the Study Group in this note.

Projected Population for Bombay Metropolitan Region & Gr. Bombay 1966-91

(figures in lakhs)

| Year | Bombay Metropolitan Region |        |        | Greater Bombay |             |            |
|------|----------------------------|--------|--------|----------------|-------------|------------|
|      | Study Group                |        |        | Gadgil         | Study Group | Gadgil     |
|      | low                        | high   | medium | ee.            | Low         | high       |
| 1966 | 61.38                      | 62.10  | 61.88  | 61.32          | 48.39       | 48.98      |
| 1971 | 70.38                      | 72.82  | 72.03  | 69.26          | 55.58       | 57.59      |
| 1976 | 79.70                      | 85.17  | 83.32  | 78.25          | 63.00       | 67.45      |
| 1981 | 89.25                      | 99.41  | 95.82  | 88.34          | 70.55       | 78.73      |
| 1986 | 98.91                      | 115.80 | 109.57 | 99.53          | 78.13       | 91.61      |
| 1991 | 108.59                     | 134.70 | 124.61 | 111.83         | 85.68       | 106.26     |
|      |                            |        |        |                |             | 86.44      |
|      |                            |        |        |                |             | 77.48      |
|      |                            |        |        |                |             | Not worked |
|      |                            |        |        |                |             | out.       |

Year in  
which -----1969----- 1966 -----1969----- 1966 1961 1966  
computed

Differences in the estimates are due to the differences in the methods adopted and in the assumptions made in projecting population. The figures of projected population for the Region worked out by the Study Group under assumption (a) are fairly comparable with those worked out by the Gadgil committee, whereas the figures of projected population, worked out by the Study Group for Greater Bombay under assumption (b) are fairly comparable with those worked out by DTBC for Census Deptt.

### III.2 Sex and Age group composition of the Projected Population:

The sexwise breakup of the projected population for the year 1966-1991 is worked out on the following assumption:

i. that the sex ratio for Greater Bombay in terms of no. of females per 1000 males would increase linearly from 663 in 1961 to 700 in 1981 and 720 in 1991.

ii. that in other parts of the Region the sex-ratio would remain more or less the same as in 1961.

Although no definite trend in the figures of sex-ratio for Bombay is observed during the period 1901-1961 the Study Group expects that the sex-ratio would increase linearly from 663 in 1961 to 720 in 1991 in favour of females.

The age composition of the projected population of Gr.Bombay, Rest of Urban areas and of Rural areas in the Region for the year 1966-91 has been obtained on the assumptions that the percentage of population in the three age-groups, namely, 0-14, 15-59 and 60 +, in each of above mentioned Urban or Rural part of the Region would change with the corresponding changes in the percentage of State's population\* in the three age-group during the period 1966-91 at the level of 1961 actuals. In other words if within a age-group 0-14 the ratio of percentage of population in Gr.Bombay to the percentage of State's population is K and if the projected percentage of State's population within age group 0-14 for the year 1966 is  $x_{66}$ , the projected percentage of Gr.Bombay's population within 0-14 age-group for 1966 would be approx. K times  $x_{66}$ . The procedure is repeated to determine projected percentage pattern of population for different age-groups for different years separately sex-wise for Gr.Bombay, Rest of Urban and Rural parts of the Region. The percentage pattern so arrived at is applied to the Region's sex-wise projected population to get the projected population within different age-groups sex-wise, for different parts of the Region and hence for the Region as a whole for the years 1966-1991. The Study Group after taking into consideration the limitation of the method employed by the group for obtaining figures by age for broad areas came to the conclusion that it would not be appropriate to utilise this method for

obtaining similar data for small areas like towns or villages. The projected age-groups structure for the population of different parts of the Region is given in the table no. 3. It will be seen from the table that age-wise population has been worked out and it has been found that during the period 1961-91 changes in the percentage of population belonging to the younger age-groups and working age-groups are minor.

### III.3. Urban Labour force by 1991:-

Labour force or the persons available for work include working persons or the persons in employment plus the persons out of employment but seeking jobs plus the new entrants in the labour force or the persons who are seeking jobs for the first time. According to the Population Census 1961 about 41.8 percent of the total urban population in the region were available for work. In other words the urban Labour force in the Region formed 41.8 percent of the total urban population in the Region. In Gr.Bombay the labour force formed 42.5 percent of the total population in 1961. This percentage of the Potential working force to the total population is termed as a "Labour participation Rate". Censuses are normally the main source of information on population and its demography and economic characteristics. But none of the Population Censuses prior to 1961 give the labour participation rates for any part of the Region owing to defective definition and concepts for compiling the labour force statistics. Only few countries in Asia have data on participation rates. There are two possible approaches for projecting the labour participation rates. In the first approach the past trend in the participation rates is projected using mathematical formula such as an Exponential function. But due to non-availability of the data on participation rates for earlier censuses this approach is not useful. In the second method the future participation rates are not projected. But are only estimated by assessing the probable effects of expected changes in the social and economic setting. This approach is reported to be used in some of the Asian Countries like Ceylon and Phillipines, recently. The study group has adopted this second method for estimating the future participation rates for the urban areas of the Region. The estimates of future labour participation rates within the age groups 0-14, 15-59 and 60 + are worked out separately for Males and Females on the assumptions that:-

- i. The participation of the young people (within age group 0-14) would decline by 30% i.e. at the rate of 1 percent per annum among males and by 50% among females over a period of 30 years from 1961 due to factors such as increase school and college attendance expected due to increased educational facilities in the Urban areas of the Region.

ii. The participation within age group 15-59 is not likely to vary much because the rates for ages between 25-55 are usually remarkably stable in any developing or a developed country where as the rates for the younger and older age group vary with the stage of economic development. In a developing country the participation rate for males in age group 15-59 vary 70% to 90% and hence the Study Group feels that the rate within this age Group which is 89.7% (males) for the Urban population in the Region in 1961 would not go below the 1961 level. Similarly the assumption for estimating the participation rate for females is that it would not decline below or appreciate above its 1961 level, which is 14.6 percent for this age-group.

iii. As there are new entrants in the Labour force in the earlier two age groups there are withdrawals due to retirement, deaths etc. from the labour force in the older age group i.e. 60+. The rate of withdrawal due to death at age corresponds to the probability of death at age X for the general population. Therefore the former i.e. the rate of withdrawal is likely to decline with the increased chances of surviving and with better and increased medical and public health facilities. The prolonged life of a man/woman with the need for the older people to earn their living to help family meet their both end during the days of dearer living if would not appreciate the participation rate beyond it's 1961 level for this age-group it would at least remain stable at the 1961 level. The Study Group has, therefore assumed that the participation rates for males and females in the older age-group would remain stable at their 1961 level i.e. 53.0% for males and 7.4% for females over a period of 30 years from 1961. According to the assumption made separately for males and females in different age groups the labour participation rates for the urban population 1991 are worked out to be 64.3 percent for males and 9.3 percent for females or about 40.5 percent for the total population. The estimates of labour participation rates for the population of Gr. Bombay in 1991 are 64.3 percent for males, 9.2 percent for females and 41.2 percent for the total population. Accordingly the urban labour force in the Region by 1991 would range from 40 to 45 lakh workers. The details are given in Table 10.

### III.4. Occupational and Industrial compositions of the Urban labour force

---

The object of projections of the total labour force is to provide basis for projections of the members of workers in various occupational groups and industrial sectors for the purpose of economic planning. But the analysis involving projection of workers in various occupational groups and industrial sectors is primarily non-demographic in character and depend mostly on non-demographic factors. Therefore the study group feels that projection of workers according to different industry-occupation is beyond its scope and would leave it to its counter part on Industry.

**IV. CONCLUDING REMARK**

IV.1. The Study Group has worked out a set of three population projections for the Region and for Greater Bombay by age and sex for the period 1966-91. These projections have been worked out with considerable care and on the basis of information available with the group. The group, however, wishes to point out that the projected figures should not be considered as absolutely reliable and there would be need for looking into the various assumptions after the results of 1971 census become available.

IV.2. The estimates of future population for different Urban centres including the metropolitan city of Bombay as worked out by the Study Group under different assumptions only indicate the extent to which the growth of population in the respective urban centres would take place in the next 30, years if no measures are taken to disperse this growing population over the Region. However, to give any guidelines for effecting such a dispersal of population over the Region is outside the scope of the Study Group on Demography.

IV.3 The Study Group took into consideration the family planning programme which is being carried out in Gr. Bombay and in Maharashtra State and the new programmes and policies which have been initiated since 1967. The Group does not find it possible to predict with any exactitude the likely trend of birthrate as a consequence of the family planning programmes and policies. But it feels certain that the likely course of future birthrate would be covered by one of the three sets of population projections which the Group has prepared.

IV.4. It may be noted that net-migration was responsible for about 40% of the growth of Gr. Bombay during 1951-61 decade. There is evidence to indicate that there was a substantial decrease in net-immigration during 1951-61 decade as compared to the 1941-51 decade. The future trend of net-immigration remains uncertain and cannot be predicted with great precision. It, however, appears that Gr. Bombay, which is a premier metropolitan city of India will continue to attract migrants. The Group suggests that no measures be taken to limit migration into Gr. Bombay but areas around Bombay should be developed to diversify the population in order to avoid undue concentration of population in Gr. Bombay.

**APPENDIX TO THE REPORT OF THE STUDY GROUP  
ON DEMOGRAPHY**

**Methodology**

**1. Population Projections:-** Bombay Metropolitan Region is first divided into urban and rural parts, urban areas is further divided into eleven parts separating important towns and urban parts in each talukas, Rural area is divided into eight parts, considering separately rural part in each taluka. The whole Region is thus divided into 19 parts as shown in para. III. 1 of the Report.

Population projections are worked out separately for each of the above 19 parts, for every 5th year starting from 1966 to 1991 on the basis of population growth observed during 1951-61 in each part. The method is explained in the following paras.

In case of urban areas growth in population is composed of (i) Natural growth ( i.e. the difference in births and deaths) & (ii) Net migration (i.e. difference in in-migrants and out-migrants). Figures of net-migrants are worked out by applying to the urban population in 1951, the survivorship ratios ( 1950-1961) computed for Gr.Bombay by the Demographic Training & Research Centre, Chembur-Bombay and utilised by Dr. Zachariah in the treatise on the "Migrants in Bombay". Net migrants are obtained by deducting population surviving in 1961 from the actual census population 1961.. Rates for (i) Natural growth and (ii) Net migration are computed separately by compound method.

For rural areas, rate of growth is computed considering the total growth of population during 1951-61. Here the change due to migration is not considered as its magnitude is not significant unlike in urban areas.

By applying these rates to the actual population of 1961 census, projected population figures are worked out for 1966-1991, with the following sets of assumptions of changes in the rates for natural growth and net-migration.

**Assumption:** (b) 5% reduction in the rates for every 5th year. Assumption (a) 10% reduction in the rates for every 5th year. Figures under assumption (a) and (b) are worked out separately for males and females and then totals are obtained.

**Assumption:(c):** 5% in the natural growth every 5th year and no change in the rates of migration.

Figures under assumption are worked out for total population in each part of urban area. As the migration factor is not considered for rural area, figures for rural areas computed under assumption (b) are not changed under assumption(c). These three assumptions provide three sets of figures of population projections. The first set provides the medium estimate, the second gives the low estimate while the third provides the high estimate.

2. Changes assumed in the sex-ratio:- It is presumed that due to development in the near future, such as housing facilities etc, the present sex ratio in Greater Bombay would undergo a change. It is assumed that the sex-ratio for Gr.Bombay in terms of females per 1000 males would increase linearly from 663 in 1961 to 700 in 1981 and to 720 in 1991. While in other parts of the Region it would be the same. The total projected population figures, computed under assumptions (a) and (b) for Gr.Bombay are... therefore split up into males and females in the assumed ratio.

3. Age-group composition:- Population projections for Maharashtra State as a whole for the period 1951-1981, computed by Shri R.E. Choudhari and approved by Dr. Ramchandran of the Demographic Training & Research Centre, Chembur, Bombay, are worked out considering the various factors influencing projections such as future course of fertility, mortality, migration, sex-ratio at birth etc. It is assumed that these factors will affect the population projections of the Bombay Metropolitan Region in a similar manner. Therefore, percentage pattern for the years 1966-1991 for the three broad age-groups 0-14, 15 to 59 & 60 & over is computed on the basis of the projected figures worked out for the State by Shri Choudhari in his booklet mentioned above and it is assumed that the changes in the percentage pattern from 1961 to 1991 in the projected population for Gr.Bombay, Rural area and rest of the urban areas in the Bombay Metropolitan Region would be approximately in the same proportion ( at 1961 level ) as those in the whole state. The actual calculations are done as follows. For example ratios of percentages of population in each age-groups for Bombay to the State are computed. These ratios are then imposed on the respective percentages of population of the State for the years 1966 to 1991, to get the percentage pattern for Gr. Bombay for the corresponding years. These percentage patterns for the years 1966-1991 are then adjusted to add up to 100, by keeping the same trend as observed in the State. A similar procedure is followed for the areas " Rest of the urban in the Region" and " Rural area". The percentage patterns, thus, worked out, are then imposed separately for males and females on the total projected population, to get age-group-wise figures.

4. Labour force: Labour force includes working population, persons seeking employment for the first time and persons employed before but now out of employment and seeking work. Labour participation rates separately for males and females in each broad age-group are worked out for Gr.Bombay and for total urban population in the Region for the year 1961 on the basis of data from 1961 census publications. The rates for 1991 are then estimated on the assumption that labour participation rate would decline by 30% for males and by 50% for females within age-group 15-14 during the period 1961 to 1991, and labour participation ratios would remain unchanged for the age-groups 15-59 and 60 + , for both males and females, during 1961-1991. Imposing these ---- participation rates for 1991 on the projected population for 1991 of Gr.Bombay and Total Urban. The Urban labour force is worked out.
