

NATIONAL PLANNING COMMITTEE SERIES

The National Planning Committee Series will consist of Reports of the various Sub-Committees, each of which deals with the several aspects of the national life. Each Sub-Committee consists of recognised Experts in the subject: and every Report prepared by them considers all the bearings, implications, and consequences of the subject. Together the Series will make a comprehensive outline of an all-embracing National Plan, which, if and when implemented, would revolutionise the conditions of life in this Though most of the country. Reports were prepared in 1939-40, each is prefaced by an Introduction showing the place of the subject in the entire Scheme of National Planning, and ended by a Summary of Developments which brings the matter fairly up to date.

PREFACE

The National Planning Committee, appointed in 1938, began its work early in 1939. After defining the nature of a National Plan, and determining the nature and scope of the work entrusted to them, the Committee issued an elaborate and comprehensive questionnaire which was subsequently supplemented by specific details. Twenty-nine Sub-Committees, formed into eight groups were set up with special terms of reference to deal with all parts and aspects of the national life and work in accordance with a predetermined Plan.

After some unavoidable delay in getting replies to the Questionnaire, the Sub-Committees began their work, and submitted Reports,—some of them Final, some Interim,—which were considered at Plenary Sessions of the parent Committee in 1940. Towards the end of that year the Chairman, Pandit Jawaharlal Nehru, was arrested and sentenced to a long term of imprisonment, during which the work of the Committee had necessarily to be suspended.

On his release a year later, hope revived for an intensive resumption of the Committee's work. But the outbreak of war with Japan, the threat to India's own safety, and hectic march of political events, rendered it impossible to devote any attention to such work at that time. It, therefore, inevitably went into cold storage once again; and remained for the duration of the War.

When at last the War seemed nearing its end. Pandit Jawaharlal Nehru with other leaders was released. The moment seemed again opportune to resume the work of the Planning Committee. Meetings of that Body were held in September and November 1945, when certain more urgent questions, already included in the programme of National Planning were given a special precedence. A Priority Committee was appointed to report upon them. Changes and developments occuring during the War had also to be taken into account; and another Committee was appointed to review the general instructions. given six years earlier to the Sub-Committees. Revised instructions were issued to them following the Report of this Sub-Committee: and the Chairmen and Secretaries of the several Sub-Committees were once again requested to revise and bring. up to date, such of the Reports as had already been submitted -either as final or interim-while those that had not submitted any reports at all were asked to do so at an early date.

As a result, many of the Sub-Committees which had not reported, or had made only an Interim Report, put in their Reports, or finalised them. The parent Committee has had no chance to review them, and pass resolutions on the same. But the documents are, by themselves, of sufficient value, prepared as they are, by experts in each case, to be included in this series.

The following Table shows the condition of the Sub-Committees' work, and the stage to which the Planning Committee had reached in connection with them.

To sum up, fourteen Sub-Committees had made final reports, of which ten have been considered, and Resolutions taken upon them, by the National Planning Committee. Twelve more have presented Interim Reports, of which nine have been considered by the Planning Committee, with Resolutions thereon, while three Sub-Committees have not yet presented any report on the reference made to them.

The idea that all this material, gathered together with the help of some of the best brains in India in the several departments of our national life, should be printed and published was before the Committee from the start. But the interruption caused by the war prevented its realisation. It was once again mooted in 1941; but the moment was not deemed ripe then for such action, partly because the leading spirits in almost every one of the Sub-Committees were unable to devote time and labour to bring their Reports up-todate; and partly also because war-time restrictions or shortages had made scarcer than ever before the statistics and other facts, which particular sub-committees would need, to bring their work up-to-date. The War time needs of Government had attracted several of them to work on Government Bodies, Panels, or Committees. For all these reasons it was seemed undesirable that material of this character-valuable as it must be-should be put out in an incomplete. inchoate, obsolete form, which may reflect unfavourably upon Indian capacity for such tasks.

The four last years of the War were thus a period of suspended animation for the National Planning Committee. Even after the end of the war, it has not been feasible for obvious reasons. for the Planning Committee to resume its work and finalise decisions. Continuous Sessions of that body are indispensable for considering and taking decisions on the Sub-Committee reports presented since 1940, and putting all the material into shape, ready for publication, not to mention making its own Report; but the political situation in the country made it im-Other conditions, however, are somewhat more possible. favourable than in 1938-39, when the Central Government of the country were all but openly hostile to such attempts. Lest, however, the momentary difficulties make for needless further delay, it was thought advisable by the Chairman and the undersigned that no more time should be lost in putting this material before the Public. Following this advice, it is now proposed to bring out a complete Series of the National Planning Committee's Sub-Committee Reports, which will serve as appendices to the Parent Committee's own Report. The Plan of the proposed enterprise is briefly summarised below.

Every Sub-Committee's Report, which is in a final form and on which the National Planning Committee has itself taken resolutions, will be edited and published, with an Introduction assigning their due importance to the suggestions and recommendations contained in that particular report, its proper place in the over-all National Plan; and following it up, wherever necessary, by a kind of Epilogue, summarising the developments that have taken place during the seven years, during which the work of the Planning Committee had been in suspension.

Those Reports, again, which, though in a final form, have not yet been considered, and no resolutions taken thereon, by the Plannings Committee, will also be included in the Series in the form in which they were submitted, with such Introduction and Epilogue to each as may be deemed appropriate. And the same treatment will be applied to Reports which are 'Ad Interim'. whether or not the parent Committee has expressed any opinion on the same. They will be finalised, wherever possible, in the office, with such aid as the Chairman or Secretary of the Sub-Committee may be good enough to render. Sub-Committees finally, which have not submitted any Report at all.—they are very few,—will also find their work similarly dealt with. The essence, in fine, of the scheme is that no avoidable delay will now be suffered to keep the National Planning Committee's work from the public.

Both the Introduction and the Epilogue will be supplied by the undersigned, who would naturally be grateful for such help as he may receive from the personnel of each Sub-Committee concerned. The purpose of these addition is, as already stated, to assign its true place to each such work in the overall Plan; and to bring up the material in each Report to date, wherever possible.

Not every Sub-Committee's Report is sufficiently large to make, more or less, a volume by itself, of uniform size, for this Series. In such cases two or more Reports will be combined, so as to maintain uniformity of size, get-up, and presentation of the material. The various Reports, it may be added, would not be taken in the order of the classification or grouping originally given by the Planning Committee; nor even of what may be called the intrinsic importance of each subject.

In view of the varying stages at which the several Reports are, for reasons of convenience, it has been thought advisable to take up for printing first those which are final, and on which the Planning Committee has pronounced some resolutions. Printing arrangements have been made with more than one Press, so that two or three Reports may be taken simultaneously and published as soon as possible so that the entire series may be completed in the course of the year.

Two other Sub-Committees not included in the list of Sub-Committees given above, were assigned special tasks of (1) preparing the basic ideas of National Planning; and (2) outlining the administrative machinery deemed appropriate for carrying out the Plan. These were unable to function for reasons already explained. The present writer has, however, in his personal capacity, and entirely on his own responsibility, published the "Principles of Planning" which attempts to outline the fundamental aims and ideals of a National Plan which remains to be considered by the Planning Committee. Similarly, he has also attempted to sketch an administrative machinery and arrangements, necessary to give effect to the Plan, when at last it is formulated, and put into execution. Notwithstanding that these two are outside the Scheme outlined in this Preface, they are mentioned to round up the general picture of the arrangements made for publication of the entire work up-to-date of the National Planning Committee and its several Sub-Committees.

The several volumes of Sub-Committee Reports, when published, will be treated as so many appendices to the Report of the parent body, the National Planning Committee. It is impossible to say when that Committee, as a whole, will be able to hold continuous sessions, review and resolve upon Sub-Committee Reports which have not yet been considered, and lay down their basic ideas and governing principles for an all over Plan, applicable to the country, including all the facts of its life, and all items making up the welfare of its people.

The disturbed conditions all over the country, and the Labour unrest that has followed the end of the War has caused unavoidable delays in printing and publishing the several volumes in the series, which, it is hoped, will be excused.

In the end, a word of acknowledgment is necessary to put on record the aid received by the Editor in the preparation and publication of this Series. All those who are associated in the task,—members of the Parent Committee, or as Chairmen, Secretaries or Members of the various Sub-Committees, have laboured wholly, honorarily, and consistently striven to give the best that lay in them for the service of the country. Almost all Provincial Governments and soms States,—the latter twice in some cases,—have made contributions towards the expenses of this office, which have been acknowledged and accounted for in the Handbooks of the Planning Committee, published earlier. Suitable appreciation of these will be expressed when the Parent Committee makes its own Report. At almost the end of its task, the expenditure needed to edit, compile, and otherwise prepare for the Press, the several Reports, has been financed by a Loan by Messrs. Tata Sons Ltd., which, even when repaid, will not diminish the value of the timely aid, nor the sense of gratitude felt by the undersigned.

Bombay, 1st July, 1947. K. T. Shah

INTRODUCTION

The Chemical Industries Sub-Committee, appointed by the National Planning Committee, consisted of :---

Dr. J. C. Ghosh (Chairman)

Shri B. D. Amin Dr. N. R. Damle Dr. K. Venkatraman Dr. Qudrat-i-Khuda Dr. S. S. Bhatnagar Prof. D. Y. Athavle Dr. N. N. Godbole Dr. B. K. Nandi Shri M. L. Dey Dr. Mata Prasad Shri Rajshekhar Bose Dr. K. G. Naik Shri S. G. Shastry Dr. P. C. Guha Dr. B. C. Guha Mr. M. P. Kanga Shri Kapilram H. Vakil Dr. R. L. Datta Prof. R. C. Shah (Secretary)

with the following Terms of Reference :--

- (a) "to make a census of chemicals, including fertilisers, preduced in India, and imported from abroad;
- (b) to survey the potentialities for the manufacture of chemicals in India.
- (c) to form an estimate of the country's requirements in chemicals on a progressive scale for the next ten years.
- (d) to recommend ways and means for developing chemical industries in order to supply the Nation's requirements in the next ten years.
- (e) to recommend such legislation or special concessions as may be necessary for the encouragement or development of these industries.
- (f) to review the possibility of Export Trade in chemicals for the manufacture of which India possesses special advantages."

Soon after its formation, the Sub-Committee met, and devised machinery for collecting information and gathering data. These, however, have not been secured to the extent the Sub-Committee would have desired. Like all other items in such enquiries, the statistical and factual material in this country, officially collected and published, is very poor; while that obtainable from private sources is neither authoritative nor abundant, Dealers and manufacturers are reluctant to answer enquiries of this kind even by such an Organisation as the National Planning Committee; and hence the paucity of the material. The Sub-Committee is thus obliged to complain in almost every section of its Report about the lack of the necessary data; and the Report, necessarily, suffers from want of the requisite material in consequence.

The Report is, as already stated, an Interim document, which would have been finalised, had the National Planning Committee continued to function actively, and the Sub-Committee been given sufficient time to finalise its recommendations. As it is, its conclusions and recommendations cover a goodly ground, and appear to provide sufficient ground for assessing the importance of the Chemical Industry, and recognising its proper place in an allround National Plan.

From the outset, the National Planning Committee had recognised the vital importance of the Chemicals Industry by listing it in the Group of Key Industries, i.e. Industries which are vital to the very existence of the country, or which are the parent or foundation of other important industries.

This importance was also recognised, in all its varied aspects, by the Government of India, when they at last awoke to the necessity of planning, both to meet the urgent war needs and also to provide for post-war development. The Planning and Development Department had set up at least three of its twentynine Panels to consider :—

- 1) The Electro-Chemical Industries;
- 2) The Heavy Chemical Industries; and
- 3) The Dye-stuffs Exploratory Committee;

and some of the leading Members of the National Planning Committee's Sub-Committee were closely associated with these Panels.

In four essential aspects of our national economy, this Industry is of the utmost importance, and fully deserves its description as a Key or Parent Industry on which other industries are dependent.

I. DEFENCE NEEDS

1. In the first place, the Chemicals Industry in its several branches, forms the backbone of the entire provision for the Defence of a country in modern times. This is no longer an age of thews and sinews, nor even of bows and arrows. It is an age where the Atom Bomb is the decisive factor. Wars will be fought and won, not by mere weight of numbers, but by the fullness, variety and up-to-date character of the supplies and armaments, which only a highly industrialised country can provide. All kinds of ammunition, explosives, gases, etc., depend upon a well-developed Chemical Industry to supply the country's needs for Defence. The Sub-Committee in their Report fully recognise it; and the Panels appointed by Government have also realised this aspect, which was intensified during and because of the War.

Defence needs still continue to be paramount in shaping the industrial organisation of the country. Even if the United Nations' Organisation becomes sufficiently strong to outlaw War altogether from the face of the earth, each member of that Organisation would nevertheless have to make its own contribution towards the policing of the world. The result is that much of the material now devoted to a country's own individual Defence would be needed to meet the obligation of a Member of the United Nations, which cannot be fulfilled unless there was an adequate Chemical Industry in each such country.

The ideal, however, of that Organisation, viz. a wholly warless world, does not seem likely to be realised in the immediate future. Not even the leading members, sponsors or parents of the Organisation, have started discontinuing or even diminishing their own Defence Preparation, whether in actual armament or supporting industry. Without, therefore, being an advocate in any sense whatever of war as the only means for settling international differences, one cannot yet overlook altogether the possibility of aggression from outside for a country like India just starting on its path of National Independence, and the consequent necessity for her to be as much prepared for selfdefence as any possible aggressor. Such preparedness would be all but impossible if we have no well-grown Chemical Industry of our own. The Government of India have mainly depended hitherto for such material on foreign imports. The figures collected by the Sub-Committee, and those given elsewhere in this Introduction, are eloquent evidence of that policy of keeping India helplessly dependent on foreign supplies for vital needs CA National Defence, which can no longer be tolerated. And that apart from the consideration that details of imports actually on · account of the Defence Department are not revealed.

NEEDS STATE AID

This Industry has not its importance only in connection with National Defence, though that alone would suffice to make it unperative on a National Planning Authority to take it immediately in hand and develop it with the utmost rapidity possible. It is of vital importance in normal times also, and as such, the Chemical Industry ought to be under the direct ownership and management by the State. For reasons of Defence as well as regional development, it should be dispersed in such parts of the country as are best suited for the purpose from the point of view or raw materials, cheap power, and other necessary condiafter indicates in some detail the different regions where this, clons. The section on the Location of that Industry given hereIndustry has possibilities for a variety of considerations. In the meanwhile, it must be added that no great vested interests of private enterprise exist; and so the field is relatively clear. If this Industry is a nationalised concern from its start, there would be very little difficulty in distributing or allocating it to regions and localities technically appropriate for the purpose. Difficulties of transport, lack of cheap power, distance or uncertainty of markets, which have impeded the progress of the industry, so far, may then all be easily remedied.

Another consideration in regard to this Industry, and its future development as an integral part of the Plan, arises from the relative backwardness of the country in this regard; and the correspondingly strong position of foreign competitors invading our market and capturing it directly or indirectly, so that the Industry has not much prospect of success, unaided by the State. It is, of course, not possible for this country to decide upon a complete prohibition of all imports of Chemicals, and so shut out the foreign interests competing in the Indian market. The latter are so strong, being parts of World Combines, Trusts, or Syndicates, that they have obtained a practical monopoly of the Indian Market. In the face of this competition, and the vital role of Chemicals in peace and war, the Government of India would not be able to adopt and carry out a rigorous protectionist Tariff Policy against such Combines, if the advantage of such protection goes only to the private owner.

FOREIGN CAPITAL IN ALLIANCE WITH INDIAN

Foreseeing possibilities of strong opposition, however, in a resurgent nationalism, the competing Foreign Combines have changed their tactics. Instead of importing their products entirely, they now try to produce them in this country, in alliance with Indian Capitalists, who will give the enterprise a national character in this country, and so secure the benefit of fiscal protection, if that policy is adopted, and secure for them the full benefit of all forms of State aid. Under the Agreements reported between International Chemical Combines and corresponding Indian Enterprise, the problem of policy, direction and management, has, no doubt, been attended to, so that those interested may claim to have safeguarded the national interests in this arrangement to the fullest. They would share all patents and discoveries, all processes and technical advances, so that the necessary pre-requisites for setting up and working the Industry would not be lacking. It is presumed, of course, that this Industry will need full protection and encouragement if it is to be properly built up to make the country as nearly self-sufficient as possible. Such aid and protection, however, would go to private parties at the cost of the community. It must thus be a matter of crucial economic policy for the rulers of this country to decide

if they would admit, in this disguised manner, foreign capital and enterprise, in alliance with Indian enterprise, in such a vital industry necessary for the very existence of the country itself; or whether we should be determined enough to establish a complete State Monopoly in this Industry, owned and managed by the State or its delegate, to be established and built up till all the requirements of the country for Defence and civil needs are met from the country's own production of Chemicals, unalloyed by any foreign association.

As stated in the Interim Report, the country is by no means poor in regard to basic raw materials, technical skill, and other pre-requisites for the successful establishment of this Industry. Advanced scientific research may be lacking, though even in that regard, according to some of the suggestions in the last Sessions of the Science Congress, the scientifically trained man-power in this country, if not of the very highest, at least of sufficiently advanced character, is so large that all the reasonable needs of technical skill may well be met from our own resources. And if a deficit is still left, technical skill of this kind would not be difficult to obtain from the more advanced countries like Germany, America, Russia or Japan.

Lack of electrical energy may be a temporary handicap; but that can be remedied easily when once a comprehensive Plan is set into operation. The problem of suitable market for the products of the industry is a question only of correct location of the industry; and that, as already mentioned, would be no difficulty if the Industry is worked as an integral part of the National Plan, and is owned and managed by the State as a Key cr Defence Industry.

Neither on account of lack of essential raw materials, therefore, nor lack of technical skill, need this Industry by impossible to establish in this country. The capital needed may be considerable; but if the State is running the Industry, that would be no insuperable difficulty.

II. PARENT INDUSTRY FOR OTHERS

2. The second reason why this is regarded as a Key Industry of vital importance to the country, lies in the fact that it is the basic Industry to provide artificial Fertilisers, which are needed for this country's largest single Industry, offering the largest volume of employment to the largest proportion of the people, and producing the major proportion of the wealth of the country, namely, agriculture. It is almost a truism to say that Agriculture in this country is very backward, in point of yield per unit, as also the quality of the yield. This can be very easily rectified by improvements in the accessories of agriculture, such as adequate and regular water-supply by irrigation works where rainfall fails, suitable manure, better implements and seed, and the like. It is unnecessary at this stage to enter into the question of social, organisational and other factors, like the excessive fragmentation of land in this country, which handicap that industry to a very large degree, and reduce and impoverish the yield per unit to much below what it may well be expected.

But even when these factors are reconditioned, the morcellement of agricultural land is stopped, and economic units provided, the inherent qualities of the soil would still require attention and nourishment that organic manure and artificial Fertilisers can afford on a large enough scale to be entirely satisfactory. It has been calculated that Indian Agriculture to be fully rehabilitated, so to say, would require something like a million tons of such Fertilisers. A start has been made by a factory estimated to produce some 350,000 tons; while smaller plants are in operation in Mysore and Travancore which will go some way to meet the deficit. But to make up the full quota, and even to stimulate agriculture still further, a full-sized Chemical Industry, as an integral part of the Plan, is indispensable. Some criticism has, no doubt, been urged upon the newly projected Fertiliser Plant in regard to its production or outturn, as also on the score of its initial financing, pricing of its products, and other analogous, reasons. Whether or not this criticism is well-founded lies in the future. For the moment it is important to add that, quite apart from technical or financial objections that could be urged against these attempts, the fact must be recognised that the success of the Fertilisers Industry depends in a very large measure upon the existence in the country of a fully developed Chemical Industry.

III. INDISPENSABLE ACCESSORY FOR OTHER INDUSTRIES

3. A third reason to classify this as a Key Industry is to be found in its being an indispensable accessory for the finished products of several other industries. The dyes and colours, for example, needed for all the textile goods; the paints and varnishes needed in the household furniture and building materials; glass and plastics; oils, soaps and toilette goods; acids and alkalies of all kinds; and other products which are necessary for several other industries, will not be available in the land if there is no adequate Chemicals Industry in the country.

The Report makes a good survey of these several industries in which chemical products are needed. It indicates the present dependence of this country on foreign imports in these respects, and also the possibility of the country replacing such foreign imports by its own production if only we went about the matter in a thoroughly scientific manner. The Table on page 9 and the following pages makes this evident at a glance.

· IV. NECESSARY FOR PUBLIC HEALTH

4. The last but not the least of the reasons compelling the grading of this as a Key Industry, relates to Public Health. The manufacture of drugs, vaccines of all kinds, sera or medicines is part of the Chemical Industry, which would help combat disease and even to prevent it, and maintain the health of the people at a high level. A section is devoted in the Interim Report to that subject; and the Planning Committee has not failed to recognise its importance in its own Resolutions.

The investigations and reports of the Panels appointed by Government have also emphasised most of these considerations. The case for an early establishment of the Chemical Industry in this country on a scale sufficient to meet all our needs in the several categories is irresistible.

MUST BE STATE MONOPOLY

If the Industry is State-owned and State-managed, its distribution or diffusion in all parts of the country naturally suited for its Location will be automatically attended to. As there will then be no scope for any private individual or corporation profiting at the expense of any other Province, little occasion will be left for inter-provincial jealousies, which make the task of locating industries in really suitable places more than ever difficult and delicate. Provinces on the sea coast, where salt can be made from brine, or in those where salt is available, or where coal is abundant would, other things being the same, be the most suitable locations for this Industry in its several Branches. So far as Drugs and Medicines are concerned, Provinces with good forest wealth would, similarly, be best adapted for that purpose, as also for Essential Oils, Paints and Varnishes.

In the problem of organising this Industry, the economies of large-scale production and facility in manufacturing by-products, makes it desirable, for purely technical reasons, to concentrate, rather than disperse, establishments of this Industry. At the present time there are two groups of regions, namely the 24 Parganas in Bengal, and Okhamandal in the Baroda State on the Arabian Sea Coast, which appear to be the biggest concentrations. The former accounts for 40 per cent and the latter for 26 per cent of the total workers employed in this Industry. The choice of Bengal has been influenced, no doubt, by the near availability of coal, and the presence of a considerable market in jute and other industries taking up the products of the Industry. Likewise in Okhamandal, the presence in a good quantity of the raw material on the spot is the chief reason of the industry being concentrated there. Its principal market is also not far, —the cotton industry in Ahmedabad, Bombay and Sholapur. The products can be sent cheaply to Bombay by sea; and the railway freight to Ahmedabad or Sholapur is by no means prohibitive.

Another Province, with great possibilities for the Chemicals Industry is the Punjab, with its immense salt resources in the Khewra mines. The Imperial Chemicals have got a long lease of 50 years for utilising these raw materials suitable for a large sized Chemical Industry concentrating around the Khewra Salt Mines. The agreement for giving a long-term Monopoly to this Foreign Syndicate is particularly objectionable, because it not only entitles that single Corporation to develop the immense raw materials available there, but allows it to prevent others from doing so, even when it does not choose to develop the appropriate Industry itself. That agreement provides an object lesson to Indian Statesmen, not only in regard to concessions to foreign capitalists at the expense of the country's natural wealth, and future economic development; but also in regard to the danger of Monopolies to private individuals or profit-seeking Corporations. whether Indian or Non-Indian.

Due to reasons of International competition, there has been all the world over a tendency for large sized Industries to gravitate towards a virtual monopoly; and a consequent intensive concentration of the main Industry as well as all subsidiary and connected industries. So long as these are a virtual monopoly in private hands, the economic life of the country will be at the mercy of these private profit-seekers, whether from the point of view of defence or of peace time national self-sufficiency in all Key and vital industries.

Nothing can be more undesirable, in the long-term interests of the country, than such consummation. In view of the vital importance, already stressed and explained, of this Industry, it is to be hoped that none but the State will be allowed to develop this enterprise even as a virtual monopoly, so as to attend justly to all the needs of all the parts of the country.

BEGINNING OF THIS INDUSTRY IN INDIA

The development of the modern, large-scale Chemical Industry in India is relatively of a very recent origin. Except for the Imperial Chemicals and their Associates, there are no great vested interests, nor traditions of private enterprise, which could stand in the way of a sound, scientific, all-round, and well distributed Chemical Industry being established as a Public Monopoly. Its distribution, also in suitable proportions throughout the country, strictly in accordance with appropriate technical considerations, is a relatively easy task. At the time of the first World War, this Industry was almost non-existent in India. Because of the difficulties of Overseas Transport due to submarine menace, lack of shipping, and conversion of that Industry in the supplying countries to munition production at home, stocks of Chemicals were exhausted, and supplies almost disappeared. The war effort of India was hindered in consequence. Wiser by that experience, it was thought desirable to set up wherever possible this Industry.

By 1939 a good beginning had, no doubt, been made, as the figures given in the body of the Interim Report in its several sections will show. Concentration of the Industry in the two named areas, in Okha and Bengal followed, employing between over two-thirds of the total workers engaged in that industry. As already observed, there is very great scope in several other Provinces, like Bihar or the Punjab, still for the intensive growth of this Industry. Technical considerations, however, suggest that for its maximum possible development, it would be best to concentrate these Industries at Centres which are favourably situated in regard to raw materials, communications, power, and markets.

Smaller units, which exist in certain parts of the country at present, are unable to make good their position, because of the high inland cost of transport, particularly on acids. They cannot survive when larger units come into operation as parts of the Plan, and are able to effect a reduction in costs, and market their products at considerably lower rates than prevail today. Whether that section of the Plan, which relates to the Transport Service would determine railway rates or freight charges by road or other forms of more economic tansportation as charges for service, framed on commercial consideration, or as payment for a Public Utility, is a problem for another volume in this Series. Suffice it to add that, however handled, it would have a material bearing on the inception and growth of that Industry.

The Interim Report gives statistics which are almost all obsolete by now. Technical as well as market conditions are radically changed. The cessation of the publication of the two large folio volumes of Detailed Statistics of the Sea-borne Trade of India, makes it even now impossible to bring them more upto-date. The sub-joined Table, however, makes an attempt in that direction, bringing the figures up to 1939-40; while six or seven of the more important items in the Chemical Industries are listed separately, and their figures are brought much nearer to date than in the other case. NATIONAL PLANNING COMMITTEE

IMPORT OF CHEMICALS IN THE YEAR 1939-40

Chemical	Quantities	Value in Rs.
•	in tons	
Sulphuric Acid	265	47,842

RECOMMENDATIONS IN THE REPORT OF THE CHEMICALS SUB-COMMITTEE.

The Interim Report has gone into considerable detail on the specific terms of the Sub-Committee's Reference; and has made definite recommendations on each, which are summarised below for convenience of reference.

INTRODUCTION

1. We recommend that manufacturing concerns in India should be permitted to carry on their work only under a licence from the State, which should inter-alia provide for the compulsory supply of such information as is demanded by the State with such safeguards as are considered necessary and equitable.

HEAVY CHEMICALS

2. Sulphur and Sulphuric Acid. We recommend strongly that a detailed survey of pyrite deposits be made in India at an early date. Failing discovery of suitable deposits of sulphur or pyrites, we recommend that the economic possibility of recovering sulphur or manufacturing sulphuric acid from the following sources be carefully examined:—

(a) Sulphur from Chalcopyrites:—from the sulphur dioxide that goes waste in the process of extraction of copper in Singhbhum District.

- (b) Sulphur from Gypsum:—by utilising Gypsum for cement manufacture and converting the sulphur dioxide evolving therefrom.
- (c) Sulphur from Assam Coal:—which are reported to contain about 4% sulphur.

3. We recommend that synthetic ammonia plants which will yield at least 15,000 tons of anhydrous ammonia, be put up in the neighbourhood of the coal fields where cheap power and cheap coal are available.

4. We recommend that in view of the difficulties in the way of cheap production of sulphuric acid in India, instead of fixing ammonia as ammonium sulphate for use as a fertiliser, ammonia should be largely converted into nitro-chalk, urea, and ammonium phosphate as fertilisers.

We recommend strongly that field experiments on a statistical basis be immediately started in representative localities of India with a view to ascertaining the value of these fertilisers relating to the growth of sugar cane.

5. We recommend that an expert committee be appointed to select a site for the location of a factory for the manufacture of Bichromate from the chrome ore, sulphuric acid, soda and fuel at the cheapest rate. It is probable that an experimental factory will be set up in the Mysore State.

6. We recommend that the hot springs of all the Volcanic regions in India should be examined with a view to finding out their boric acid content, preliminary to any attempt to produce boric acid in the country.

7. We recommend that investigations should be started on Indian bitterns, with a view to the economic recovery of potassium and bromine, both of which are valuable chemicals. If such an enquiry yields promising results, a site for the erection of a factory for the manufacture of potassium salts and bromine, may be selected in a suitable area.

8. We recommend very strongly that a thorough survey of the deposits of apatites in Singhbhum and other parts of India and phosphatic nodules in Trichinopoly be undertaken with a view to finding out their total availability and also ascertaining if representative samples from different localities have similar composition as that given above. If these indigenous supplies are not adequate, the nearest source of high class phosphate rock will be Christmas Island. If we import phosphate rock from abroad, then it will be necessary to start manufacture of superphosphate and triple super at a port town favourably situated in respect of import of raw materials, and nearness to consuming centres.

9. We also recommend that the question of manufacture of ammonium phosphate should be fully investigated when pro-

2

blems relating to the manufacture of synthetic ammonia and phosphoric acid have been successfully tackled.

COAL-TAR DISTILLATION AND DYES

10. We recommend that although the recovery of the byeproducts of coal distillation is not likely to be profitable under the present circumstances, this industry, as a key industry must be started on as wide a scale as possible, with the required State help and protection in a suitable form.

11. We recommend that 3 million tons of coal should be annually converted, in addition to the 2 million at present distilled for coal tar and ammonium sulphate, into soft coke for domestic consumption by the low temperature carbonisation process.

12. We recommend the immediate establishment of a coal tar dyestuff industry as a matter of such urgent necessity that the fullest resources of the state and the individual must be mobilised for the purpose. In the earlier stages, it may be suggested, the intermediates may even be bought from foreign markets, till a coal tar industry is established in the country.

13. We recommend concentration on the production of the sulphonated oils and of the Gardinal and Lissopol types of wetting agents. The factories for the production of textile auxiliary agents would best be situated in the immediate neighbourhood of cotton mills since vegetable oils and sulphuric acid are both available within a reasonable distance.

FINE CHEMICALS

14. We recommend in connection with Plant for the manufacture of fine chemicals, that separate units be set up, probably for every different type of chemicals. Although due to war conditions, it may not be possible to get these plants from abroad, it appears feasible to build up such small plants in many cases with the help of materials and workmanship available in India. In the case of highly specialised and costly synthetic chemicals and drugs which have to be prepared in small quantities, glass utensils and apparatus can even be conveniently and profitably used.

15. Location—the synthetic organic chemical industry may be started in chief port towns like Bombay, Calcutta, and Madras, and also in big scientific research centres like Bangalore.

PHARMACEUTICAL PREPARATIONS

16. We recommend that large factories for the manufacture of alcoholic and pharmaceutical preparations be set up at all big consuming centres, in order to minimise the difficulties of transport. 17. The Universities in India should be required to give training in Pharmaceutical Chemistry and institute a degree in the subject.

18. The quality of crude drugs, both imported and grown in the country, should be strictly controlled.

19. The import duty on manufactured drugs should be increased by 5 per cent.

20. The import duty on crude drugs not available in India should be abolished or appreciably reduced.

21. The imposition of export duty on raw materials obtainable only in India should be considered.

22. Arrangements may be made for the supply of solvents needed for the industry, duty free, or the duties should be considerably reduced.

23. The restrictions upon the free transit of spirituous preparations between the different provinces in India should be removed.

24. The excise regulations should be suitably modified.

25. The drug industry should be encouraged by the Government by the purchase of materials from Indian manufacturers.

26. The proposed Drugs Act of 1940 should be suitably modified, with special reference to the following:

The proposed Drugs Technical Advisory Board should have better representation of chemists and pharmacists.

EXPLOSIVES

27. In order to get over the difficulty of suitable staff for running an Industrial Explosives Factory, it is suggested that, in the beginning, at least half of this may be obtained from a leading explosive manufacturing English Company, which supplies mainly the present demand of India.

28. A central factory for industrial explosives must be situated in a cool place near a flowing river and railway, but at least three miles away from big towns. In order to reduce railway freight the factory should be located near the coal fields of Bengal or Central Provinces.

29. Fireworks factories may be started in different parts of India where there is a large demand near big cities. This industry will thrive better if the present Government restrictions on the storage and transport of sparklers be removed or modified, so as to bring them in line with those operating for safety matches, where the risk of fire and explosion is actually greater.

30. It should be possible to manufacture most of the chemicals for military explosives in this country.

31. It is necessary to organise the fermentation industry so that in addition to alcohol other solvents like fusel oil and glycerol can also be produced from this industry.

32. The National Planning Committee should seriously take up the problem of establishing Petroleum Refineries in India.

PLASTICS

33. We suggest that the Lac Research Institute at Ranchi, which is doing work of great importance on the manufacture of plastics from lac, should be expanded and converted into a central Institute for research work connected with the industry of the manufacture of plastics in general.

GENERAL

34. In cases where skilled technical labour is not available, experts may be brought over from abroad on short term contracts on the definite understanding that they shall fully train up Indians during their term of service. In other cases, young Indians who have received the best available training here, may be sent abroad for training for the particular industries.

35. The Chemical Industry being a Key Industry, must be fostered at all costs. Various Branches of this Industry must be given adequate state protection in one or more of the following ways, as required:

- (i) Prohibition of imports. Imports of finished products should be prohibited for a certain number of years except in special cases, where they may be imported under license from the Government. This would apply to substances like dyes and drugs.
- (ii) Protective import duty for a definite period, e.g. in the case of heavy chemicals.
- (ii) Free import of raw materials and chemicals, which are not available in the country, e.g. in the case of compounds of Arsenic, Lead, Sulphur, Tin, etc.

As stated by themselves, the Sub-Committee had had to work under considerable handicaps, of lack of data from official or authoritative sources or the relevant information from those directly engaged in the industry. They have also not been able to consult with such of the other Sub-Committees,—e.g., Manufacturing Industries, or the Power and Fuel Sub-Committees whose work was interconnected or mutually concerned. This was due to no fault on their side; but solely for want of time, and because the other Sub-Committees concerned had not been able to arrange for mutual consultation.

Despite these handicaps, the Report makes several constructive proposals, which are not, essentially speaking, out of date because of the lapse of time since the Report was first presented. The National Planning Committee have taken their decisions on this Report, which are reproduced in this volume, to indicate the trend of opinion in that body on the subject.

.

Much has, no doubt, happened in recent years in regard to this great industry in its several aspects, which may vitally affect the line of action that may be adopted when a National Plan is being finally given effect to. Many new Chemical inventions have been made; a whole new industry of Plastics has been brought into existence; old materials have been turned to new uses, during and because of the War, which must be taken into account before a proper National Plan can be formulated and carried into effect in this behalf. Several of these developments have been summarised at the end of the Volume in summary form, and based on the reports of some of the Panels appointed by Government during the War, which will provide their own interest to the future planner for all India.

There is, however, an item of the Sub-Committee's reference, which deserves more than a passing mention. The possibilities of developing an Export trade in chemicals made in India cannot be exaggerated, though, for some years to come, while the Industry is being built up, India may herself remain a considerable importer of Chemicals and Drugs. The countries of Asia, who met in conference for the first time at New Delhi last March (1947), have revealed possibilities and directions of co-operation, to mutual benefit, which are hardly yet appreciated or envisaged by those in command of the destinies of these millions upon millions. Some of these countries are much less developed than ours, industrially speaking; and they would offer an immense market for Indian exports, if only India learns the lesson left by European Imperialism, and does not seek to build up her industries solely, or even predominantly, with a view to export, to dump her wares on other countries. The right to national self-sufficiency of each country must be respected; but trade in its natural channels may still be possible.
INTERIM REPORT OF THE CHEMICALS SUB-COMMITTEE

Terms of Reference

1. The Chemicals Sub-Committee was constituted by the National Planning Committee with the following terms of reference:—

- (1) To make a census of chemicals and fertilisers produced in India and imported from abroad.
- (2) To survey the potentialities for the manufacture of chemicals in India. •
- (3) To form an estimate of the country's requirements in chemicals on a progressive scale for the next ten years.
- (4) To recommend ways and means for developing chemical industries in order to supply the Nation's requirements for the next ten years.
- (5) To recommend such legislation or special concessions as may be necessary for the encouragement and development of these industries.
- (6) To review the possibility of export trade in chemicals for the manufacture of which India possesses special advantages.

2. Interim Report

The first meeting of the Sub-Committee was held on the 8th September and the second meeting on the 1st October 1939, in which the plan of work was settled and each member of the committee was assigned, either individually or in groups, the task of preparing a report on the subjects in which he is specially interested. Reports have not yet been received from all the members of the Sub-Committee; but in view of the urgent need to expedite the work of the National Planning Committee, we beg to submit this Interim Report, which embodies only our tentative conclusions.

3. Lack of Reliable Information regarding Indigenous production of chemicals and drugs

It is necessary at the outset to make the distressing observation, that with a few laudable exceptions, our requests for information regarding the amount and value of chemicals produced in India have not been given due consideration by the manufacturers. There is a feeling that such information which may be of considerable value to rivals, may leak out, and in the interest of the manufacturing firm should be withheld from the Sub-Committee. National Planning is obviously impossible if this attitude were to prevail. It is well known that manufacturing concerns in India, when they urge their case for protection before the Tariff Board, are required to submit the fullest information to the Board regarding raw materials, manufacturing processes, cost of production, the quality and value of finished goods. In a system of planned economy, every industry will receive some kind of protection or other, and we therefore recommend that

manufacturing concerns in India should be permitted to carry on their work only under a licence from the State, which should inter-alia provide for the compulsory supply of such information as is demanded by the State with such safeguards as are considered necessary and equitable.

4. Lack of details in the statistics regarding the .sea-borne trade of India

For the reasons stated above, we had to rely often on private information regarding the production of chemicals and drugs in India. We do not therefore claim that statistics relating to these figures, wherever they occur in this report, are very accurate. For collection of information regarding the import of chemicals from abroad we have relied on the "Statistics of the Sea-borne Trade of India." This compilation is very useful, but its usefulness could still further be increased, especially for such surveys in future, if every individual item of import relating to drugs and chemicals, whose value exceeds Rs. 50,000/- a year were included in the Tables. For example, it should be possible to find out immediately from these Tables, the import in value and quantity of a commodity like aspirin, instead of having to rely for such information on the results of enquiry made in the markets of Bombay and Calcutta. It may be noted that while imports of a heavy chemical like soda-ash has increased from 790,000 cwts. in 1923-24 to 1487,000 cwts. in 1937-38: that of magnesium chloride has diminished during this period from 76,000 cwts. to 12,000 cwts., indicating that the country is rapidly becoming self-sufficient regarding the production of magnesium compounds. This kind of indirect evidence has also been used to check the figures of internal production. It is convenient for the purpose of this report to classify the chemicals into groups and devote a section of the report to the major problem of each group.

SECTION I

HEAVY CHEMICALS

5. A bird's eye view of the present position of this industry is given in Table I.

-

Chemicals	Import in	. Year	Price	Manu-	Year	Remarks

6. SULPHUR & SULPHURIC ACID.

Sulphuric acid is one of the most important key chemicals in the industrial world. The present production of 28,000 tons should have to be increased to 90,000 tons a year if the country is to become self-sufficient as regards the manufacture of Sulphates and fertilizers on the present basis of requirements. Even if the present industrial progress is maintained, for self-sufficiency at the end of ter, years, the production should rise to 200,000 Since sulphuric acid is a basic chemical whose cost of tons. production enters into the cost of production of a large number of finished products, attempts should be made to manufacture it as cheaply as possible. Unfortunately in India, we have no large deposit of sulphur. The known deposits of pyrites are often small pockets or are located in inaccessible areas. Sulphur at Rs. 100 a ton would yield sulphuric at Rs. 50 a ton; and if, as at the present time, the price of sulphur rises to the neighbourhood of Rs. 200 per ton, sulphuric acid can be produced at Rs. 85 a ton. This is too high a price and attempts must be made to find alternative sources of sulphur. The technical skill for the manufacture of sulphuric acid by the lead chamber process has long been available in the country; and in recent years the newer method of manufacturing this acid by the contact process has been adopted with success. For example, in the plant of the Mysore Chemicals and Fertilisers Co., about 25 tons of Sulphuric acid can be made every day by the aid of Vanadium Catalysts. Deposits of pyrites have recently been reported from the districts of Simla, Shahabad in Bihar and from Ratnagiri in Bombay. We recommend strongly that a detailed survey of pyrite deposits be made in India at an early date. Failing discovery of suitable deposits of sulphur or pyrites, we recommend that the economic possibility of recovering sulphur or manufacturing sulphuric acid from the following sources be carefully examined:---

(a) Sulphur from Chalcopyrites:

In Singbhum District, the chalcopyrites are being worked by the Indian Copper Corporation for the extraction of copper. It is stated that about 20 tons of sulphur are escaping into the atmosphere every day, during the process of roasting the ore. There are big plants in Canada, Finland and other countries for converting such sulphur-dioxide into sulphur. There is no reason why similar attempts should not be made at the works of the Indian Copper Corporation.

(b) Sulphur from Gypsum.

Gypsum occurs in large quantities in Sind, Rajputana, the Punjab, in the Himalayan Hills, in U.P. and in Madras. In Germany, gypsum has been utilised for the manufacture of cement in place of limestone, the sulphur dioxide evolved being reduced to sulphur or converted into sulphuric acid. Dr. Dubey estimates that a 500 ton cement plant at Dundol near the salt range, can utilise the gypsum deposits in the neighbourhood and produce 80 tons of sulphur every day which can be marketed at Rs. 40|per ton. Sulphur, even at Rs. 50|- a ton will yield sulphuric acid at Rs. 33|- a ton, and will remove the major handicap of India in the development of the heavy chemical industries. We recommend very strongly that this scheme be carefully examined by experts in cement manufacture.

(c) Sulphur from Assam Coal.

Extensive deposits of teritary coals have been found in Assam. They contain on an average 4% sulphur. Experiments should be started immediately to recover sulphur from the coals.

7. AMMONIA, NITRIC ACID, POTASSIUM NITRATE, SODIUM NITRATE.

(a) Nitric acid is produced in India at the present time by the action of sulphuric acid on potassium nitrate. The available sources of potassium nitrate are such that the peace time requirements of nitric acid can be met from this source. Chemical industries are, however, so designed now, that synthetic ammonia which is necessary for fixed-nitrogen fertilisers, can be easily converted to nitric acid for the purposes of war.

Synthetic ammonia. In Mysore, a synthetic ammonia plant has been in operation for some time, which can yield 3,000 tons of anhydrous ammonia. Supposing that it were possible to raise the production of ammonium sulphate by distillation of coal from 18,000 tons to 50,000 tons in the near future, there will still be a gap in the production of ammonium sulphate to the extent of 45,000 tons, which must be secured from the synthetic ammonia industry. We recommend, therefore, that synthetic ammonia plants which will yield at least 15,000 tons of anhydrous ammonia, be put up in the neighbourhood of the coal fields where cheap power and cheap coal are available. Mr. N. G. Chatterjee in Science and Culture (Vol. IV, No. 3, Sept. 1933) has given an account of the estimates of a synthetic ammonia plant. Mr. S. G. Shastry, the Managing Director of the Mysore Chemicals, from his personal experience, states that it will not

be difficult to prepare plans and estimates, if it is definitely settled that a factory with a predetermined output is to be started in any given locality.

(b) Conversion of Ammonia into Nitric acid, Urea and Ammonium phosphate.

In view of the difficulties in the way of cheap production of sulphuric acid in India, we recommend that, instead of fixing ammonia as ammonium sulphate for use as a fertiliser, ammonia should largely be converted into nitro-chalk, urea, and ammonium In many parts of the world, these phosphate as fertilisers. fertilisers are considered at least as valuable as ammonium sulphate. In India, however, the value of these fertilisers has not yet been tested by field experiments. We recommend strongly that field experiments on a statistical basis be immediately started in representative localities of India with a view to ascertain the value of these fertilisers relating to the growth of sugarcane. It need hardly be pointed out that conversion of ammonia into urea not only yields a valuable fertiliser but also a material which is the starting point for the manufacture of synthetic plastics.

8. HYDROCHLORIC ACID, AMMONIUM CHLORIDE, ZINC CHLORIDE, SODIUM SULPHATE, SODIUM SULPHIDE.

The manufacture of hydrochloric acid, ammonium chloride, zinc chloride, sodium sulphate and sodium sulphide are linked together. Sodium sulphate is needed in the paper industry and sodium sulphide is used in the dyeing and tanning industries. Replacement of the import of these chemicals by manufacture in India from sodium chloride and sulphuric acid will vield about 5,000 tons of anhydrous hydrochloric acid as by-product. This hydrochloric acid will be more than sufficient to produce from zinc and from ammonia respectively our present requirements of zinc chloride and ammonium chloride. In this connection, we would draw the attention of the N.P.C. to the following extract from a bulletin by Mr. N. Sengupta (No. 8. Industrial Research Bureau): "The Tatanagar Chemicals Co., Ltd. commenced the manufacture of 85% Zn Cl2 in 1932. The raw materials were the galvanisers' pot skimmings..... The venture was short-lived owing to the fact that an imported grade of 93% purity was offered to the market at the same price as the 85% grade. The manufacturing difficulties involved in raising the purity of the material proved too great for the Company. It is doubtful whether an economical production of Zinc Chloride will be possible in this country, until the conditions become such as substantially to lower the cost of production of sulphuric acid".

We have not yet had an opportunity of discussing with the Manufacturing Industries Sub-Committee their plans for the

NATIONAL PLANNING COMMITTEE

accelerated progress of the paper, dyeing and the tanning industries. We are, therefore, not in a position to form an estimate of the country's requirements of sodium sulphate and sodium sulphide at the end of ten years; this however is a minor problem whose solution will depend on the production of cheap sulphuric acid.

9. SODA ASH AND CAUSTIC SODA.

The value of soda ash, sodium bicarbonate and caustic soda imported into India in 1937-38 exceeded a crore of rupees. This is a key industry which should be fostered in India at all costs. It is, therefore, a matter of great satisfaction, that the Tata Chemicals Ltd. are erecting a plant for the manufacture of these alkalies at Okha where cheap salt and limestone are available. The Imperial Chemical Industries (India) Ltd. are also opening a factory in the neighbourhood of Calcutta for the manufacture of the same compounds. The capital at the disposal of these two great concerns are such that it may be hoped that the initial difficulties will soon be overcome and that India could be assured a regular cheap supply of alkalis from factories within her own borders.

10. MAGNESIUM SALTS.

Magnesium sulphate and magnesium chloride are largely required in the Textile Industries. The import of these chemicals into India is steadily decreasing. The Pioneer Magnesia Works at Kharaghoda and Mithapur are mainly responsible for the production of magnesium chloride. The sulphate is produced from magnesite, obtained mainly from Salem in Madras, and also from the Mysore State. The industry is practically standing on its own legs, and only a little effort is necessary to make the country self-sufficient as regards these commodities.

11. ALUMINIUM SULPHATE, ALUM, ALUMINE-FERRIC.

The grade of aluminium sulphate, alum and alumine-ferric which are now manufactured by Indian concerns is quite suitable for purification of water. The indigenous product is also used in the manufacture of paper; but for use in the dyeing process aluminium sulphate should be absolutely free from iron. So far as is known, the purest variety of aluminium sulphate has not yet been manufactured in this country, and this is largely the variety which is even now imported. Projects are on the way to completion for the erection of plants for the manufacture of aluminium at Asansol, and in Bombay territory adjoining the Jog Falls. If these schemes materialise, aluminium hydroxide absolutely free from iron will have to be produced as intermediate products in these factories. With a cheap supply of pure aluminium hydroxide, the manufacture of pure aluminium sulphate does not present much difficulty.

12. FERROUS SULPHATE, COPPER SULPHATE.

The country is practically self-sufficient as regards ferrous sulphate which is mainly used in the ink-industry. But our imports of copper sulphate which is mainly used as fungicide are rapidly increasing. Its manufacture in India has been retarded by the high cost of scrap copper which is the chief raw material. There is no reason why the trade in scrap copper should not be properly organised in the country at an early date.

13. ELECTRO-CHEMICAL AND ELCTRO-THERMAL INDUSTRIES.

Caustic soda, chlorine, bleaching powder, potassium chlorate and sodium cvanide, calcium-carbide and graphite are the chief chemicals which are produced by electro-chemical and electrothermal processes. A small quantity of chlorine, bleaching powder and caustic soda is manufactured even now in Titagarh Paper Mills, Bengal Chemical & Pharmaceutical Works, and in Mysore Paper Mills. Many cotton mills in India have also put up small plants for the production of chlorine to meet their requirements of bleaching materials. A plant for the electrolytic production of caustic soda and bleaching powder was erected at Mettur about a year ago, with concessions from the Government of Madras regarding the supply of electricity and water. But for reasons, not sufficiently known, this factory, which could have made handsome profits by taking advantage of the present war conditions, has not yet begun work. It is strange that sodium cyanide, more than Rs. 2|- lakhs in value, should be imported into the Kolar Gold Fields, while the Mysore Government is prepared to sell electrical power at 1|8th of an anna per unit. We have not had the advantage of consulting the Power-Sub-Committee regarding the plans for the development of electrical power in India. If proper technical skill and cheap electrical power are available, there should be no difficulty in producing these commodities in the country itself according to our requirements.

14. BICHROMATES.

Sodium and potassium bichromates are largely used in the dyeing and tanning processes, and at the present moment, there is a famine in the Indian market with regard to these commodities. In the State of Mysore, there are very good deposits of chrome ore and a large export trade in this ore has been built up. This ore also occurs in other parts of India, e.g., Chotanagpur, Baluchistan etc. During the last Great War, factories for the manufacture of dichromate were set up, but they went into liquidation shortly after the end of the war. For successful manufacture of dichromate, besides the ore of good quality, it is necessary to have a cheap supply of sulphuric acid, soda, and fuel. It is probable that an experimental plant will soon be set up in the Mysore State for the manufacture of dichromate. We recommend that an expert committee be appointed to select a site for the location of the factory with due regard to the facilities for transport and availability of the ore, sulphuric acid, soda and fuel at the cheapest rate. There are reasons to hope that if these facilities are available, an export trade in dichromate can be built up in place of the crude chrome ore.

15. BORAX.

Practically, the entire requirement of the country in Borax is imported. It is well known that the hot springs of Kashmir and Tibet contain boric acid. We recommend that the hot springs of all the volcanic regions in India should be examined with a view to finding out their boric acid content, preliminary to any attempt to produce boric acid in the country.

16. FERTILISERS : POTASSIUM COMPOUNDS

We have dealt with the problem of fixed nitrogen fertilisers in paragraph 7. The other two principal ingredients of plant food are potassium and phosphorus. Potassium nitrate is even now manufactured in large quantities in India from soil efflorescence in Bihar and other parts. It has been estimated by reliable observers, that more than 100,000 tons each of magnesium sulphate and magnesium chloride, and 15,000 tons of potassium bromide are annually wasted in the Indian bitterns. We, therefore, recommend that investigations should be started on Indian bitterns, with a view to the economic recovery of potassium and bromine, both of which are valuable chemicals. If such an enquiry yields promising results, a site for the erection of a factory for the manufacture of potassium salts and bromine, may be selected in a suitable area.

17. PHOSPHATIC COMPOUNDS

The raw materials for manufacturing the Inorganic phosphatic manures, which are used in large quantities in India, have not yet been thoroughly surveyed. Attempts to prepare super-phosphate from bones are not likely to succeed, and such bones as are available may better be used as bone-meal. There are deposits of apatites in Singhbhum and other parts of India, but the possibility of their economic exploitation has not yet been thoroughly investigated. There are fairly extensive deposits of phosphatic nodules in Trichinopoly District. Preliminary investigation of some samples in the Indian Institute of Science

CHEMICAL INDUSTRIES

appears very promising, as the samples have been found to contain 61 per cent calcium phosphate and only 5 per cent calcium fluoride. We recommend very strongly that a thorough survey of these deposits be undertaken with a view to finding out their total availability and also ascertaining if representative samples from different localities have similar composition as that given above. If these indigenous supplies are not adequate, the nearest source of high class phosphate rock will be Christmas Island. If we import phosphate rock from abroad, then it will be necessary to start manufacture of superphosphate and triple super at a port town favourably situated in respect of import of raw materials, and nearness to consuming centres. We also recommend that the question of manufacture of ammonium phosphate should be fully investigated, when problems relating to the manufacture of synthetic ammonia and phosphoric acid have been successfully tackled.

SECTION II

DISTILLATION OF COAL AND COAL TAR PRODUCTS

18. COAL TAR THE BASIS OF THE DYE AND DRUG INDUSTRY

The manufacture of dyes, drugs, and other synthetic organic chemicals, which are imported annually to the value of over four crores of rupees, is non-existent in the country; and it is to the establishment of this industry that urgent attention must be paid. The national importance of this industry as a key industry cannot be over-emphasised, as it is an industry of vital importance for the well-being of the nation, both in times of peace and war, as the manufacture of explosives and other war-chemicals is also directly connected with this industry. The basic material for this industry is coal tar, only a small fraction of which is at present distilled crudely, for obtaining creosote oil used for manufacture of disinfectants, naphthalene, and pitch used for tarring roads.

19. COAL TAR DISTILLATION

Coal tar as a bye-product of the coking industry is produced in large quantities in India. Coal is mainly carbonised by the high temperature carbonisation process for obtaining metallurgical coke needed in iron and steel works, and to a much smaller extent for producing coal gas in large cities. The bulk of the coal tar at present is obtained from the coke oven plants in the Bengal coal fields, and the surrounding iron and steel works. During the year 1938-39, the production of coal tar, which is obtained in a yield of about 2-3 per cent on the weight of the coal, amounted to about 58,000 tons. The Tata Iron and Steel Works produced over 50 per cent of the tonnage given above. The imports of coal tar and pitch during the year was negligible, viz., 2,800 tons.

The distillation of coal tar to obtain the important coal tar products benzene, toluene, etc., which are the starting materials for the manufacture of dyes and drugs, etc., has so far not been attempted in India on a large scale, although a beginning is just being made at Jamshedpur with the view to supplying toluene to the Government for explosives. Installations for eoal

tar distillation have also been recently made by the Shalimar Tar Products, Ltd., The Beraree Coke Co. Ltd., and Messrs. Bengal Iron Company.

20. ESTIMATED QUANTITIES

Although the recovery of the bye-products of coal distillation is not likely to be profitable under the present circumstances, this industry, as a key industry must be started on as wide a scale as possible, with the required State help and protection in a suitable form. At the present rate, at which the industry of coal tar production progresses, it may be assumed that over the period of the next ten years, approximately 55,000 tons of tar would be available for distillation per year. This quantity on distillation would approximately give the following quantities of the principal finished raw products for dye and drug manufacture :

Product:		Tons/year.
Benzene and toluene	••••	390
Other light oils		145
Phenol	• • • •	165
Cresols	• • • •	165
Naphthalene		2,400
Creosote	• • • •	16,000
Anthracene		165
Pitch	••••	31,500

The approximate quantities of the above products required for the manufacture of dyes are shown in the Appendix No. 1 to the Section on "Dyes and Textile Auxiliary Agents." Dependable figures of the quantities of some of the above, required for the manufacture of drugs, are not available and, therefore, no definite statement is possible regarding the total requirements of the above products. It can be safely presumed, however, that the above quantities would substantially meet the demand except in the case of benzene. Additional quantity of benzene would be available, if the benzene is also recovered from the gaseous products of coal distillation by a benzol-recovering plant. At present 23 million tons of coal are being produced annually in the country, of which 2 million tons are distilled. which yield the coal tar and 20,000 tons of ammonium sulphate. We recommend that 3 million tons of coal should be annually converted, in addition, into soft coke for domestic consumption, by the low temperature carbonisation process. This will do away with the production of smoke, leading to more healthy conditions, and further yield additional quantities of ammonium sulphate and coal-tar, which would be available for distillation. The combined bye-products of ammonium sulphate and coal tar from the

5 million tons of coal carbonised, would, it may be presumed, fully meet the country's requirements of ammonium sulphate and coal tar products.

21. ESTIMATES

The approximate capital outlay required for a coal tar distillation plant, having a capacity of 100 tons a day, would be about 7 lakhs of rupees, while for one with a capacity of 200 tons a day the capital outlay required would be about ten lakhs. The production cost may be roughly estimated at Rs. 5-10 per ton of tar. In addition a Benzol Recovery Plant for the recovery of benzene from the gaseous product of coal carbonisation would be required. The approximate cost of such a plant for the recovery of about $1\frac{1}{2}$ million tons of benzene per year would be Rs. 20 lakhs, and the cost of the benzene refining plant would be about Rs. 8 lakhs. A further outlay of Rs. 2 lakhs would be required for a plant producing 200 tons of naphthalene per year, the production cost being about Rs. 70 per ton of naphthalene.

22. LOCATION

The plants for the carbonisation of coal and for coal tar distillation should be located near the coal fields of Bengal. The separated products of coal tar distillation may then be transferred to a separate factory near by for the manufacture of intermediate products for dyes and drugs. The finished intermediates may then be transported to separate factories for the manufacture of dyes and drugs and other related synthetic organic chemicals, which may be located near big consuming and trade centres like Bombay and Calcutta.

In connection with the carbonisation of coal, attention may finally be drawn to the interesting suggestions of Dr. H. K. Sen (Presidential Address to the Indian Chemical Manufacturers' Association, 1939) that high temperature carbonisation of coal may be profitably supplemented by the low temperature carbonisation process. It may be pointed out, however, that this is a matter, which would require further extensive experimental investigation.

SECTION III

DYES AND TEXTILE AUXILIARY AGENTS

23. STATISTICAL DATA OF CONSUMPTION

As the answers to the enquiries regarding the quantities of various dyes and textile auxiliary agents consumed in India, sent out to various mills and consumers, have been very meagre, the approximate figures arrived at have been arrived at by rough calculations from the scanty answers received, and from private bazar enquiries. The quantities of the different dyes and textile auxiliary agents consumed in India are given in Appendix No. II. Appendix No. III gives the figures for the imports of dyes and textile auxiliary agents during the year 1937-1938, the total value being 4 crores of Rupees.

24. ESTIMATES

Since the production of hundreds of dyes, regarding the chemical nature of many of which no precise information is available, would be utterly impossible in the limits of a 10 year plan, the estimates of requirements have taken into account only the most important dyes in each class. The total number of dyes have thus been reduced to 17 in the case of Direct colours, 10 in Basic colours, 12 in Vat colours, 10 in Naphthols, 8 in Bases, and 11 in Miscellaneous.

Appendix IV gives the estimated yearly requirements for a 10 year plan, together with other relevant information, like the intermediates required and their quantities. Appendix V gives figures for the imports of dyes into India during the years 1935-36, 1936-37, 1937-38. It also contains the figures separately for some of the parts of India. Appendix VI contains the total yearly requirements of the various intermediates, and Appendix VII gives the total requirements of the different raw materials, viz. the coal tar distillation products.

25. A CASE FOR THE INDIAN DYESTUFF INDUSTRY

The history of the British Dyestuff industry is an object lesson to us in our present position. Before the last war, Great Britain did not possess a dystuff industry of any importance,

NATIONAL PLANNING COMMITTEE

over 90 per cent of the dyes used being imported from Germany. As the last Great War progressed, the situation became very serious, and it was realised that the British dependence on Germany for dyes was really tantamount to a much wider and more fundamental weakness of British Chemical industry, as the production of dyes was intimately connected with the production of chemicals, in general. Having realised the vital necessity of the development of a dyestuff industry, the British Government took immediate and far-reaching steps in this direction. Beginning with a direct and large subsidy for the formation of a new company, millions were spent on the rapid development of every branch of the industry, with very special reference to research. Later on, the importation of dyes and even intermediates was prohibitied, except under license for very special reasons. As a result, the British dyestuff factories are now producing over 90 per cent of their home requirements and have in addition a considerable export trade.

With textiles as our primary industry, and the incidence of a host of diseases responsible for the consumption of an immense quantity of medicinal chemicals, the immediate establishment of a coal tar dyestuff industry is a matter of such urgent necessity that the fullest resources of the State and the individual must be mobilised for the purpose. In the earlier stages, it may be suggested, the intermediates may even be bought from foreign markets till a coal tar industry is established in the country.

26. TEXTILE AUXILIARY AGENTS

It has been very difficult to get any reliable data on this subject, and the only recommendation that can be made at this stage is that we should concentrate on the production of the sulphonated oils and of the Gardinol and Lissapol types of wetting agents. Both the classes require vegetable oils as starting material. Among the proprietary wetting agents used, the two outstanding are Igaphan T and Nekal Bx. Although Igaphan T is covered by patents, it should be possible to evolve equally good other substances of a similar nature. The factories for the production of textile auxiliary agents would best be situated in the immediate neighbourhood of cotton mills since vegetable oils and sulphuric acid are both available within a reasonable distance.

SECTION IV

(A) FINE CHEMICALS

FINE CHEMICALS, SYNTHETIC DRUGS, BIOLOGICALS, SYNTHETIC PERFUMES AND ESSENTIAL OILS

27. Statistical Data. Fine chemicals, and Synthetic drugs, synthetic perfumes, production of synthetic organic chemicals, including synthetic drugs and synthetic perfumes, in India, is practically nil. Some costly organic chemicals numbering 300 have been prepared on the laboratory scale in the Preparation Section of the Indian Institute of Science, chiefly for their own research purposes. The import figures for drugs as available in the sea borne trade returns for the last 5 years are as follows:—

1934-1935			Rs.	1,91,90,000
1935-1936			۰,	2,11,17,000
1937-1938			,,	2,06,83,000
1938-1939			"	2,36.17,000
1939-1940	•		"	2,20,53 ,000

These figures would also include other drugs, besides synthetic. Efforts were made to collect the relevant data from Indian Dealers, Custom Officers, Pharmaceutical Works and some Indian Laboratories, but no reliable figures are available. Appendix VIII shows the names of the principal drugs, with the quantitics annually consumed in India and their value, which have been estimately arrived at by appropriate calculation from the little information that has been available.

Raw Materials. It is well known that the raw materials for the production of these synthetic preparations are chiefly derived from coal tar, petroleum, wood distillation and fermentation industries; in some cases other vegetable products and some animal products supply the raw materials. The importance of coal tar as the basis of the drug industry has already been emphasised. Useful products can be obtained from petroleum, besides petroleum used as solvent and for fuel. Attention has been drawn elsewhere to the necessity of establishing petroleum refineries in India, as in other countries, so that these other useful products may be recovered. The chief products of wood distillation are acetic acid and acetone and methyl

NATIONAL PLANNING COMMITTEE

alcohol, which can serve as starting points of other chemicals. Solvents like alcohol, fusel oil, glycerol, and various glycols are the products of the fermentation industries which can be prepared. At present ethyl alcohol is practically the only product obtained by fermentation processes. The various fatty oils abundantly available in the country would also be the starting points for the manufacture of stearic and palmitic acids, etc. and substances derived from them.

Plant. Unlike the heavy chemical industry, the fine chemical industry is not one where a plant can be put up and the products turned out on tonnage basis. In this case, small separate units will have to be set up, probably for every different type of chemicals. Although, due to war conditions, it may not be possible to get these plants and machineries from abroad, it appears feasible to build up such small plants in many cases, with the help of materials and workmanship available in India. In the case of highly specialised and costly synthetic chemicals and drugs, which have to be prepared in small quantities, glass, utensils and apparatus can even be conveniently and profitably used.

The principal processes involved in this subject of synthetic organic chemicals' manufacture consist of the following:—

- 1. Nitration.
- 2. Amination.
- 3. Sulphonation.
- 4. Oxidation.
- 5. Reduction.
- 6. Alkylation.
- 7. Acylation.
- 8. Halogenation.
- 9. Diazotisation.
- 10. Coupling.
- 11. Esterification.

- 12. Saponification or Hydrolysis.
- 13. Decarboxylation.
- 14. Electrolytic Operations.
- 15. Catalytic Processes.
- 16. Different kinds of Condensation.
- 17. Unsaturation.
- 18. Addition of different reagents on 17.
- 19. Ring Closure.
- 20. Ring Opening etc. etc.

Skilled Labour. Skilled labour in the form of well trained chemists, even with considerable research experience, is abundantly available in the country.

Location. The synthetic organic chemical industry may be started in chief port towns like Bombay, Calcutta, and Madras and also in big scientific research centres like Bangalore.

Appendix IX contains a list of the principal synthetic drugs about which the relevant information regarding raw materials, economics of production, etc., has been collected.

(B) BIOLOGICALS

The following products have been dealt with:

- 1. Vitamin B1 Concentrate, 10. Thyroid.
- Vitamin B2 Concentrate. 2.
- Vitamin C. 3.
- Vitamin D. 4.
- 5. Lecithin
- 6. Adrenalin.
- 7. Insulin.
- 8. Pituitary extracts.
- 9. Liver Extracts.

- 11. Papain.
- 12. Pepsin.
- 13. Oestrone.
- 14. Progesterone.
- 15. Synthetic Vitamin B1.
- 16. Synthetic Vitamin B2.
- 17. Fish liver oils (Vitamin A and D).

A sheet has been devoted to each product, indicating, as far as possible. (a) the method of preparation, (b) the units of operation. (c) the materials required for the production of unit quantity of the final product, (d) the present prices of the materials. (e) the sources from which these materials are obtainable, (f) the cost of industrial production of the finished product, (g) the present price of the finished product, (h) reference to the method of preparation. Unfortunately, complete or accurate information under all these heads is not obtainable.

Flant and Machinery. From the standpoint of industry, most of these products, though essential, are not required in very large quantities. The units of operation should indicate which of the larger pieces of apparatus would be required in the production. The cost sheet can only be worked out in relation to the production of other drugs in the same factory and in relation to the cost of the reagents, most of which are obtainable only from heavy industries. The machinery and apparatus required for one of these products can obviously be used for numerous similar products included in the series of drugs and fine chemicals.

Since it is not immediately known how many drugs and fine chemicals and how much of these will be produced in one factory, the following general basis for calculation of the cost of industrial production has been adopted, starting from the cost of materials as the base line. The other costs involved have been calculated as percentages of the cost of materials. This is somewhat arbitrary but seems to correspond roughly to the experience in drug industries in India.

(a) cost of materials.

(b) Depreciation of machinery and interest on blocked capital-15% of (a)

- (c) Power—5% of (a)
- (d) Containers and packing-15% of (a)
- (e) Labour (scientific and ordinary)-20% of (a)
- (f) Overhead—10% of (a)

(g) Literature, etc.—5% of (a)

(h) Sundries and wastage-10% of (a)

In general, therefore, in calculating the cost of industrial production, 80 per cent of the cost of materials has been added to the cost of materials. This excludes freight, propaganda, commission, etc. In planned production and distribution, however, the cost on propaganda and commission, etc. should be small. It should be noted that this costing is only provisional, as it is of a general character and should be revised in future on the basis of more complete and more accurate information, both in relation to each product, and in relation to the number and quantities of products that a particular factory is expected to produce. This factory, considering the nature of the products, should be in liaison with certain heavy chemical industries. The cost of materials and reagents given will also, obviously, be altered in a system of planned production, and, therefore, the cost of production of the finished product will also be correspondingly altered.

Enquiries in Calcutta have not given any exact information regarding the present consumption of these products in India. But it seems that three times the present consumption level can be produced easily, except perhaps with regard to adrenalin and pituitary extracts. This is because they are derived from small glands. Owing to the absence of large-scale slaugther houses, such glands do not seem to be obtainable in sufficient numbers.

Sera and vaccines have not been dealt with, as enquiries show that Indian industries can supply any amount of these that can conceivably be required. Card indices will be furnished later.

(C) ESSENTIAL OILS

Statistics.

(a) As mentioned in the case of synthetic chemicals it is regrettable that in every case we have to mention that no definite statistical data, as far as production in India and importation from abroad are concerned, is available. However, in the following table, the available import and export figures are given:

Import.

	Genuine Turpentine	Turpentine substitute
	Rs.	Rs.
1934-35	1,00,000	48,000
1935-36	70,000	53,000
1936-37	88,000	45,000
1937-38	1,11,000	6,39,000
1938-39	4 4,000	4,58,000

CHEMICAL INDUSTRIES

Export

	2000 00
Essential oil seeds.	
Coriander	8,66,000
Cumin (not black)	5,34,000
Other sorts	1,66,000
Essential oils.	
Sandalwood oil	9,47,000
Lemon grass oil	7,13,000
Palmarosa oil	2,34,000
Other sorts	1,18,000

Raw Materials

(b) Even though full data are not available from the figures given above, it is assured that a major portion of the raw materials for finished essential oils are being exported out of India. That means, the potentialities for organised production of essential oils from Indian raw materials are many indeed.

(c) figures not available.

(d) In the absence of facilities, regarding plants and equipments for large scale distillation of essential oils, it is strongly to be recommended that small units, which can be operated locally in the places where raw materials are available, (viz., in the gardens and fields), should be installed. On the other hand, even if it is desired that large scale plants should be made available, because of the noncorrosive character of most of the essential oils, it should be possible to make even big scale plants in India.

Export Trade.

(f) From the export figures of raw materials and sandalwood and other essential oils, it is clear that there is every possibility of a healthy export trade, for these materials, being established in India.

1038-30

SECTION V

ALCOHOLIC AND PHARMACEUTICAL PREPARATIONS

For the collection of statistical information, an exhaustive list of about 800 to 1,000 pharmaceutical preparations, printed in the form of a booklet, by the kindness of the Alembic Chemical Works Ltd., Baroda, was sent round to various manufacturers of pharmaceutical preparations. The response was, however, extremely poor. A rough estimate of the present position, regarding alcoholic and pharmaceutical preparations has, therefore, been made, which is based on the catalogues of several firms and on the sea-borne trade returns. On this basis the approximate future needs for the next ten years have been put forward. **Present Position**

The major portion, i.e., 7/8th of the alcoholic and pharmaceutical preparations is manufactured, at present, by the Government Medical Stores, the Bengal Chemical and Pharmaceutical Works, the Bengal Immunity Company and the Alembic Chemical Works, Ltd.

The approximate amount of rectified spirit consumed in the country for these preparations is about 100,000 gallons, which is distributed as follows:

Quantity consumed.

The Government Stores at	Bombay	15,000	gallons
53	Madras	20,000	,,
Alembic Chemical Works C	o. Ltd.	20,000	**
The Bengal Chemical and	Pharmaceutical		
Works		15,000	**
The rest of the firms	•	20,000	**
		90,000	"

The latest statistics show that drugs and medicines imported into India are worth about Rs. 2,50,00,000. The approximate value of drugs and medicines used in India, at present, is as under:

CHEMICAL INDUSTRIES

Rs. 2.50.00.000

2.	Drugs manufactured in India		
	(a) Alembic Chem. Works Rs.	15,00,000	
	(b) Bengal Immunity Co.	15,00,000	
	(c) Bengal Chem. & Pharm.	15,00,000	
	(d) Other firms	30,00,000	75,00,000
3.	Drugs manufactured by Gov- ernment Medical Stores at		
	Bombay and Madras		45,00,000

Rs. 3,70,00,000

or roughly Rs. 4,00,00,000

Future Needs

1. Those imported

India could be expected to consume drugs and medicines worth about Rs. 8,00,00,000 by the end of the next ten years. This estimate, of course, excludes the needs so far supplied by the Ayurvedic and Unani medicines used by the public.

Chief Difficulties

To minimise the difficulties of transport, large factories for the manufacture of alcoholic and pharmaceutical preparations will have to be set up at all big consuming centres. The chief hindrances in the development of the drug industry are:—

- 1. Unorganised state of raw materials.
- 2. Question of transport.
- 3. Lack of Drug Control Legislation.
- 4. Unsympathetic excise policy of the Government.

Export Trade

Nearly three-fourths of the drugs mentioned in British and other Pharmacopeas grow in India. Because India possesses all types of climates and variegated soils, acclimatization of seveval drugs would become possible. These natural facilities, togeher with the organisation of a Central Plant Industry Board, would make India an exporting centre for medicinal plants all over the world.

Recommendations

1. The Universities in India should be required to give training in Pharmaceutical Chemistry and institute a degree in the subject.

2. The quality of crude drugs, both imported and grown in the country, should be strictly controlled.

NATIONAL PLANNING COMMITTEE

3. The import duty on manufactured drugs should be increased by 5 per cent.

4. The import duty on crude drugs, not available in India, should be abolished or appreciably reduced.

5. The imposition of export duty on raw materials, obtainable only in India, should be considered.

6. Arrangements may be made for the supply of solvents needed for the industry, duty free, or the duties should be considerably reduced.

7. The restrictions upon the free transit of spirituous preparations between the different provinces in India should be removed.

8. The excise regulations should be suitably modified.

9. The drug industry should be encouraged by the Government, by the purchase of materials from Indian manufacturers.

10. The proposed Drugs Act of 1940 should be suitably modified, with special reference to the following:

The proposed Drugs Technical Advisory Board should have better representation of chemists and pharmacists.

SECTION VI

EXPLOSIVES

Classification. Explosives may be classified as follows, according to the purpose for which they are used in India :--

- (a) · Military explosives.
- (b) Industrial Explosives.

(c) Explosives for sporting purposes.

(d) Fireworks.

(a) Military explosives are used for the manufacture of ammunition required for the Defence and Police Departments of the Government and Ruling Princes. These are either manufactured or imported by the Government of India.

(b) Industrial explosives are used for blasting purposes in various mines and quarries. Powerful modern explosives for such purposes are all imported, mostly from the United Kingdom, mainly under the following trade names:

Blasting gelatine, gelignite, gelatine dynamite, Stonobel, Samsonite.

Blasting gunpowder is manufactured in India near mines and quarries by contractors in sufficient quantities. Blasting fuze and detonators are also imported for firing these blasting charges.

(c) Most of the cartridges required for shot guns and rifles, which are used for hunting, are imported. These are filled with smokeless powder or gunpowder. A small quantity of the latter is manufactured locally for the use of Indian shikaris in their muzzle loaders.

(d) It is not exaggerating to say that, in India, there is no celebration worth the name, be it private or public, in which some fireworks are not let off. There is, therefore, a large demand for such explosives. A part of this is met by the output of local cottage industries, scattered all over India and run mainly by Mahomedans. A large quantity is also imported mainly from China, Japan and Germany.

Statistics.

(a) Military explosives no figures are available.

(b) Industrial explosives—These include blasting gelatine, gelignite and gelatine dynamite, other nitro-compounds, blasting fuse, blasting coils, detonators, etc. The total value in rupecs of industrial explosives imported during the years 1936, 1937, 1938 were approximately 22 lacs, 37 lacs and 26 lacs of rupecs respectively.

The average yearly production in India of blasting gunpowder is of the value of about Rs. $2\frac{1}{2}$ lacs.

(c) Explosives and ammunition for sporting purposes.

The approximate total value of the yearly import of such explosives is about Rs. 10 lacs.

(d) Fireworks.

The value of fireworks imported into India during the year 1938, was about 10 lacs of rupees.

Figures for Indian manufacture cannot be ascertained.

The value of all sorts of explosives manufactured in India may be estimated to be not less than Rs. 5 lacs per year.

Detailed statistics are given in Appendix X.

FUTURE REQUIREMENTS

Industrial Explosives

The development of chemical and metallurgical industries in India during the next few years will create a demand for larger quantities of industrial explosives. Judging from the rate at which the use of these explosives is increasing, it may be estimated that the value may reach 60 lacs of rupees in 10 years' time.

Explosives for Sporting Purposes

The total value of such explosives, used yearly, is 11 lacs of rupees, and this, in 10 years' time, may reach the figure of about 15 lacs.

Fireworks

The total value of fireworks used which may be reached in 10 years may be estimated at Rs. 15 lacs.

POSSIBILITIES OF MANUFACTURE IN INDIA

The main difficulty, at present, to the establishment of a big, explosives factory in India is the want of basic chemicals, none of which is available in India except potassium nitrate and charcoal. If this difficulty is overcome and the permission of the Government be forthcoming, there is no reason why explosives cannot be satisfactorily manufactured in India.

MANUFACTURE OF INDUSTRIAL EXPLOSIVES

Basic chemicals. Appendix XI. shows the quantities of basic enemicals required for the manufacture of Industrial explosives per year. In Appendix XII is given a list of basic chemicals required for the manufacture of fireworks. If an all round development in the manufacture of chemicals takes place as expected, most of these chemicals would be available locally.

Skilled labour. This is not available at present as Indian science graduates have no opportunity of getting the required training in India, as the manufacture of explosives at present in India is in the hands of the Government, who employ mostly European Staff for their superior establishments. The scheme of sending Indian Science graduates abroad for training or importing foreign experts temporarily for training Indian Staff is also not likely to solve the problem. The best solution appears to be that discussed below under "capital".

The capital required for running an Industrial Capital. explosives factory in India may be estimated at Rs. 50 lacs. In order to get over the difficulty of suitable staff for the factory as discussed above, it is suggested that in the beginning at least half of this may be obtained from a leading explosive manufacturing English Company, which supplies mainly the present demand of India. This will serve three purposes:-(1) The English Company which invests the capital will work out its own patents under its own experts; this will ensure a ready sale of the products, which will be put on the market under the same old trade names, which have established a reputation. (2) In consideration of about half the capital to be provided by India. the English Company might be induced to train Indians in variour branches of the industry. (3) There will be a sort of binding on the foreign experts to run the factory efficiently. After a certain number of years, the English Company might be paid off and asked to retire.

Site. A central factory for industrial explosives would need about 200 acres of land, which must be situated in a cool place near a flowing river and railway, but at least 5 miles away from big towns. In order to reduce railway freight the factory should be located near the coal fields of Bengal or Central Provinces.

MANUFACTURE OF FIREWORKS

Fireworks factories may be started in different parts of India where there is a large demand, near big cities. The capital required is comparatively small of the order of Rs. 50,000 or less. Such factories manufacturing sparklers are already running successfully in Western India, and attempts should be made to

49 NATIONAL PLANNING COMMITTEE

start them in other parts of India. This industry will thrive better if the present Government restrictions on the storage and transport of sparklers be removed or modified so as to bring them in line with those operating for safety matches, where the risk of fire and explosion is actually greater.

There is a considerable production of other kinds of fireworks by cottage industries scattered throughout the country.

The main bulk of the imported fireworks consists of squibs and crackers, mainly from China and Japan, where these are made on cottage industry basis. Materials—cheap craft-paper and gunpowder, required for this industry are available in India, and the required machinery which is simple can also be made here. This industry can therefore be very well started in this country.

MILITARY EXPLOSIVES

The Government of India manufactures or imports the whole requirement. A list of the chemicals required is given in Appendix XIII. It would be possible to manufacture most of these chemicals in the country.

SECTION VII.

ORGANIC ACIDS, INDUSTRIAL SOLVENTS, AND PLASTICS

(a) The available import figures for acids are given below:

Acids.	1934-35	35-36	36-37	37-38	38-39
Acetic (Pyroligr	1,68,000 ieous)	1,69,000	1,30,000	1,74,000	1,41,000
Carbolic	35,000	51,000	24,000	30,000	43,000
Citric	1,23,000	1,41,000	84,000	1,39,000	1,79,000
Oxalic	80,000	1,37,000	1,03,000	85,000	1,19,000
Tartaric	1,59,000	2,07,000	1,46,000	89,000	1,53,000
Other sorts	3,39,000	3,58,000	3,50,000	4,43,000	3,95,000

As for production, no organic acids are prepared in India. Regarding solvents, ethyl alcohol is chiefly produced in India. Methyl alcohol, ether, chloroform, acetone and other solvents are produced to a very limited extent.

RAW MATERIALS

(b) Regarding potentialities for the manufacture of organic acids it should be said that plenty of raw materials in the shape of coal tar, oils and fats are available in India. Other solvents can be produced by synthesis.

With the increased development of sugar industries, plenty of raw materials in the shape of molasses for the production of alcohol is available. Now it is only necessary to well organise this fermentation industry so that in addition to alcohol other solvents like fusel oil and glycerol can also be produced from this industry. From the soap the available lye which is being generally wasted at present should be fully utilised for the recovery of glycerine. Organised efforts should be made to win all the hydrocarbons, phenolic and basic solvents, from the tar. Wood distillation industry will form a good source, if well organised, for solvents like methyl alcohol and acetone. Enough plant raw materials are available for the production of furfural and allied solvents.

REFINING OF PETROLEUM

Though the subject does not primarily come within the purview of this sub-committee, we feel that in view of its relation

to industrial solvents, the National Planning Committee should seriously take up the problem of establishing Petroleum Refineries in India. In most free countries in the world, crude petroleum is imported as such and then refined inside the country. The refineries of Italy supply 50 per cent of the country's gasoline requirements by distilling imported crude. In India the Tariff Board has also recommended this :--"It stands to reason that all these countries would not have deliberately established refineries, if it was cheaper to import the refined product....Further two important branches of petroleum business today, namely refining and marketing, are almost entirely in the hands of Companies registered outside India. A substantial part of this business can be converted into a genuine Indian enterprise if refineries are established in India, and oil is marketed by Indian companies with rupee capital. It might be possible to encourage the establishment of refineries in India by Rupee Companies, if the present import duty on crude oil of 2 as. 6 pies per gallon was retained, but was remitted in favour of a genuine Rupee Company subject, of course, to the usual condition on which a bounty is granted and such other control as the Government may impose. No doubt if this business was undertaken by any company outside the big oil Trusts, attempts would be made by inferior competition to bring it to grief, but it should not be impossible for the Government to afford protection against such competition."

PLASTICS

Although this subject also does not fall directly within the purview of this sub-committee, in view of the increasing importance of plastics in industry and the intimate relationship of the plastics industry with the chemical industries, we would like to make the following suggestion. The Lac Research Institute, at Ranchi, which is doing work of great importance on the manufacture of plastics from lac, should be expanded and converted into a Central Institute for research work connected with the industry of the manufacture of plastics in general.

GENERAL

With reference to some of the terms of reference for this subcommittee, we would like to make the following general observations, which apply more or less to all the chemical industries:—

- 1. Labour, skilled and unskilled, required for the various industries.
 - i. Unskilled labour. Unskilled labour is available in the country in plenty. The cheapness of labour is a favourable factor for Indian industry. Besides, the socalled unskilled labour is really intelligent, and is capable of being trained to the required standard.
 - ii. Skilled labour. Highly trained technical men are available for most of the industries. Further, the large number of research chemists turned out by various scientific institutes and colleges would be available for absorption in the various industries. The cheapness of skilled labour is a factor which counter-balances partly in the case of some of the industries, particularly the fine chemical industry. In a few cases, where skilled technical labour is not available, experts may be brought over from abroad for starting the Industry, and running it in the initial stages on short term contracts, on the definite understanding that they shall fully train up Indians for the running of the industry, during their term of service. In other cases, where necessary, young Indians who have received the best available training here, may be sent abroad for training for the particular industries.
- 2. We are in full agreement with the National Planning Committee in the view that Chemical Industry is a key Industry which should be either owned or controlled by the State.
- 3. As the Chemical Industry is a Key Industry, which must be fostered at all costs, the various branches of this Industry should be given adequate state protection in one or more of the following ways, as required :—
 - (i) Prohibition of Imports. Imports of finished products should be prohibited for a certain number of years except in special cases, where they may be imported

NATIONAL PLANNING COMMITTEE

under license from the Government. This would apply to substances like dyes and drugs.

- (ii) Protective import duty for a definite period, e.g., in the case of heavy chemicals.
- (iii) Free import of materials and chemicals, which are not available in the country, e.g., in the case of compounds of Arsenic, Lead, Sulphur, Tin, etc.

APPENDIX. I.

INTERMEDIATES REQUIRED (In tons per annum.)

(Estimates are in excess of calculated figures in order to allow for a margin of expansion).

NITROBENZENE. 1,500 made up as follows:

93 IOF Metanilic acid ((130).
-------------------------	--------

430 Benz i	i dine ' (320)
-------------------	-------------------	------

834 Aniline (630)

1357.

ANILINE. 800 (above mentioned) as follows:

46 for Direct	ts
---------------	----

82	Naphtho	1 AS	(231)
----	---------	------	-------

65 Aniline salt (90)

- 223 Phenyl glycine (362)
- 123 Diphenylamine (127)
- 64 Dimethylaniline (81) plus $Diethylaniline(2\frac{1}{2})$
- 27 Orange II and Crocein M.

630.

DINITROCHLOROBENZENE	700.
m-PHENYLENEDIAMINE	60.
m-NITROANILINE	70.
PHENOL.	55.

(This quantity would be much greater if other requirements, such as salicyclic acid, aspirin, synthetic resins, etc. are taken into consideration).

. . .

B-NAPHTHOL. 500 made up as follows:

- 35 for J and Y acids (32 plus 29)
- 270 Hydroxynaphtholic acid (352)
- 23 B-Naphthylamine (23)
- 16 Directs.
- 40 Acid dyes (this figure is probably very inadequate)

384.

NATIONAL PLANNING COMMITTEE

PHTHALIC ANHYDRIDE. 250 (as in the case of phenols, this figure would be much greater, if other requirements, such as synthetic resins, plasticizers, etc. are taken into account).

ANTHRAQUINONE

500 made up as follows:

208 for Alizarine.

138 Vats.

346.

TOLUIDINE AND TOLUIDINE DERIVATIVES. 300 made up as follows :---

74 for Diaminostilbene disulphonic acid.

64 Toluidine.

- 78 o-Toluidine.
- 8 p-Toluidine.
- 10 Benzaldehyde.
- 234.

CARBAZOL. 30.

APPENDIX IX

SYNTHETIC DRUGS

1 1

Detailed information regarding the following principal drugs, quantities consumed yearly, raw materials, economies of production, has been collected.

Acetyl salinylate acid. Phenacetine. . . Antipyrine. Pyramiline. Methyl salinylate. Aloxyl, salvarsan and Neo Salvarsan. Carbarsan Anaesthesine. Novocaine. B. Euccaine. Atebrin. Plasmoguine. Aristochin and Eu-quinine. Chloral hydrate and chloralore Sulphonal, Trional and Tetronal. Phenolphthalen. Adrenaline (Synthetic) Argyrol, Protoirgol and argonein. Iodoform. Chloromine J, Dichloramine J, Halozene, and Saccharine. Sulphanilamide and derivatives Barbiturates. Yatren or Loretin. Proflavine, Acriflavine and Rivanol. Mercurochrome. Coramine.

APPENDIX X

Statistics. The following figures for import of explosives into British India have been collected from Government publications:—

- (a) Military explosives. No figures are available.
 - (b) Industrial explosives. Import.

	1936		1937		1938

Blasting gunpowder which is made locally has not been considered. The quantity of acids shown in the last column includes recoveries from waste acids.

APPENDIX XII

List of basic chemicals required for the manufacture of Fireworks.

Alum. Aluminium metal powder, coarse and fine Antimony lumps. Antimony sulphide, black, free from grit. Arsenic sulphide, red and yellow, free from grit, Barium chlorate. **Barium** nitrate Borax. Calcium picrate. Charcoal, wood for gun powder Copper carbonates, basic. Copper and potassium chlorate. Copper sulphate. Ethyl alcohol 90% (rectified spirits of wine) Glue. Gum arabic. Iron and steel filings. Lactose. Lead sulphide technical. Magnesium metal powder, coarse and fine. Mercurous chloride. Mercury thiocyanate. Pitch, coaltar. Potassium chlorate, recryst. (free from bromate). Potassium nitrate, free from chloride and sodium salts. Potassium perchlorate. Rosin. Shellac. Silver fulminate. Sodim nitrate, recryst. Sodin oxalate. Starch, maize or potato. Strontium carbonate. Strontium nitrate. Sulphur roll. Talc, fine powder. Wax bees.

NATIONAL PLANNING COMMITTEE

Wax bees Wax paraffin. Zinc metal dust. Printing inks. Cardboard, glaze board, mill board etc. Paper various. Thread cotton, linen, silk etc. Wood for packing, various.

100

APPENDIX. XIII.

List of principal chemicals and other allied stores required by the Government of India for the manufacture of military explosives and stores for defence against gas warfare.

Acetic Acid. Acetone, redistilled. Alum Aluminium metal powder, coarse and fine Ammonia solution, sp. gr. 0.910. Ammonium fluoride. Ammonium nitrate, pure Ammonium perchlorate Ammonium persulphate Ammonium picrate Antimony lump Antimony sulphide, black, free from grit. Arsenic sulphide, red and yellow, free from grit. Barium nitrate, Barium chlorafe, Barium peroxide Bleaching powder, stable Borax. Boric acid n-Butyl alcohol Calcium azide Calcium carbonate, precipitated Calcium silicide Calcium phosphide. Carbon tetrachloride Cesresin white Charcoal, activated for gas masks Charcoal, wood for gun powder Chloropicrin, redistilled

102 Chloro-acetophenone (omega) Collodion Copper carbonate, basic Copper sulphate Cotton waste for gun cotton Diethyl diphenyl urea (sym) Dimethyl aniline for the manufacture of trinitrophenylmethyl nitramine. Diphenylamine. Ether, sp-gr. 730 Ethyl alcohol 90 (rectified spirits of wine) Ethyl alcohol absolute. Glue. Glycerine pure for nitroglycerine. Gum arabic. Hexamine. Hydrochloric acid, technical and pure. Hydrochloric acid, technical and pure. Iron oxide, calcined, for incendiary bombs. Kaolin. Kieselguhr. Lactose. Lead acetate pure. Lead sulphide technical. Litmus, best quality. Magnesium metal powder, coarse and fine. Magnesium oxide, light z Mercurous chloride. Mercury metal pure. Methyl alcohol pure Methyl violet. Mineral jelly. Naphtha, coal tar. Naphthalene. Nickel Ammonium sulphate. · Nitric acid pure.

NATIONAL PLANNING COMMITTEE

Oleic acid, technical.

Phenol crystals Phosgene. Phosphorous, read and yellow. Pitch, coal-tar. Potassium chlorate, recryst, (free from bromate) Potassium nitrate, free from chloride and sodium salts. Potassium perchlorate Pumice stone Pyridine technical Rosin Shellac Silicon, fused lump and powder Sodium carbonate (soda ash) Sodium hydroxide, technical flake. Sodium nitrate, recryst. Sodium oxalate Sodium silicate solution, technical. Sodium thiosulphate Starch, maize or potato Strontium carbonate Sulphur role Sulphuric acid 95-98% and fuming (oleum) Talc, fine powder Toluene rectified Turkey red oil Wax bees Wax carnauba Wax chinese insect Wax paraffin Zinc metal dust Disinfectant (Izal type) Ferrous sulphate Oils, animal, mineral and vegetable, various paints, enamels, lacquers, varnishes. Printing inks. Potassium ferrocyanide. Sweet spirits or nitre. **Tincture** of steel

NATIONAL PLANNING COMMITTEE 104 Aluminium ingot, sheet, wire. Brass bar, sheet, foil Copper bar, sheet, wire. Cupronickel sheet. Gun metal. Iron, various. Iron, various. Lead refined and hard. Nickel ingot (low carbon) Phosphor bronze. Silicon aluminium alloy. Steel various Tinned sheets of copper and iron, and iron wire. Zinc ingot, sheet and galvanised iron sheet. Asbestos goods various Bakelite powder, sheet, varnish etc. Cardboard, glaze board, mill board etc. Celluloid sheet, cement, varnish etc. Cotton wool. Flass safety "triplex", discus. Leather goods various. Paper various Rubber fabrics and goods various. Textiles of cotton, linen, silk etc. Thread cotton, linen, silk etc. Wood for gun carriage and packing, various.

RESOLUTIONS OF THE NATIONAL PLANNING COMMITTEE ON THE INTERIM REPORT OF THE SUB-COMMITTEE ON CHEMICAL INDUSTRIES.

The National Planning Committee having considered the Interim report of the Sub-Committee on Chemical Industries, and pending the consideration of the final report of the Sub-Committee resolve as follows:

(i) In order that Planning may be accurate and effective a census of all forms of production, including cottage industries is necessary, and legislation for this purpose should be undertaken.

(ii) The rapid development of the dye-stuff industry is considered necessary and for this purpose it is recommended that a dye-stuff corporation should be formed as soon as possible. This industry is likely to require state-aid and it may be either subsidised and controlled by the State or owned by it. The Corporation should, in the initial stages, concentrate on the production of particular direct and basic colours, naphthols and bases, as indicated in the appendix to the Report. When the factory or factories under the Corporation start operations and produce dyes etc. of standard quality in sufficient quantity, the importation of dyes and intermediates should be prohibited license for special reasons.

(iii) The immediate establishment of a synthetic ammonia plant is recommended, with a view to making India self-sufficient with regard to synthetic nitrogen fertilisers. Such a factory should produce, at least, 50,000 tons of ammonium sulphate, which is approximately the present deficit in production in India. (iv) The question of the proper use of coal should be considered later along with the recommendations of the Power and Fuel Sub-Committee. The N.P.C., however, agree generally with the recommendations that (a) the use of raw coal for domestic purposes, which involves waste and causes the smoke nuisance should be prohibited; (b) a sufficient quantity (3 million tons) of coal should be distilled to produce the soft coke necessary for this purpose; (c) the tar obtained from this process, as well as from other factories, now in use, should be processed to yield the road tar necessary for improving roads, ammonium sulphate for use as fertilisers, and the chemicals and intermediates essential for the dye and drug industries.

(v) The indigenous synthetic drug industry should be encouraged by a protective duty on synthetic drugs imported from abroad, and by suitable modification of the excise regulations relating to the spirits required for the drugs.

(vi) We recommend that an industry for the manufacture of explosives be started and that this be State-owned.

(vii) Crude petroleum should be imported into the country and subsequently refined in this country, in accordance with the recommendation of the Tariff Board on this subject, and the import of petrol and kerosene be subjected to a heavy duty.

(viii) Scientific research for industrial purposes is necessary for the proper utilisation of many products in manufactures. There should be a State Department for Industrial Research which should establish a National Chemical Laboratory as well as such other laboratories as may be considered necessary, encourage research work in Universities, and give facilities for doing research work in different parts of the country, including grantsin-aid to ccoperative research work. The National Chemical Laboratory should especially investigate the possibilities of using various chemicals as substitutes, of obtaining necessary chemicals from the available resources, and of starting manufactures as suggested in the Interim Report.

(ix) Heavy chemicals should be protected, for a definite period from foreign competition. Such raw materials, and chemicals, which are not available in the country, e.g. sulphur, arsenic, lead, tin, etc., and some of their compounds should be allowed into the country free of import duty.

(x) The Chemical Industries, and more particularly the heavy chemical, and tar and petroleum distillation, and associated industries should be owned or controlled by the State.

106

A NOTE ON THE DYE-STUFFS INDUSTRY

The National Planning Committee, as its session in May 1940, approved of the recommendation of the Chemical Industries Sub-Committee that the rapid development of the dyestuff industry is considered necessary; and for this purpose it is recommended that a dyestuff coropration should be formed as soon as possible. This industry is likely to require State aid, and it may be either subsidised and controlled by the State, or owned by it. The Corporation should, in the initial stages, concentrate on the production of particular direct and basic colours, naphthols, and bases, as indicated in the appendix to the report. When the factory or factories under the Corporation start operations and produce dyes etc. of standard quality in sufficient quantity, the importation of dyes and intermediates should be prohibited under licence for special reasons.

The importance of the dyestuff industry to the economy of the country, in view of its position as a key industry on which the development of other branches of the chemical industry largely depends, is now fully realised in the country. Textiles constitute our premier industry and our annual import of dyes has been of the value of about 4 crores of rupees. This figure can be doubled if we provide for a rise in the standard of living and an increase in the per capita consumption of textiles to double the present figure. A sum of about 8 crores of rupees will probably represent the value of the chemicals and chemical products with which the dyestuff industry will be directly and indirectly concerned.

In 1941 the Government of India, on the recommendation of the Board of Scientific and Industrial Research, appointed an Exploratory Committee to consider ways and means for the manufacture of synthetic dyes. The terms of reference were (i) to make a rough survey of the consumption of the various kinds of dyes in India; (ii) to survey the raw materials and heavy chemicals available for the manufacture of dyestuffs in India; and (iii) to consider the practicability, both technical and economic, for the manufacture of such dyes in India as are capable of production within a period of 15 years.

While the range of dyes employed by our mills and for other purposes runs into hundreds, about 50% of our dye consumption would be represented by a comparately narrow range of 50 dyes. At the instance of the Dyes Committee the necessary raw materials for these 50 dyes, which could be regarded as the basis of a 15-year plan for the establishment of a dye industry, have been examined (J.Sc. Ind. Res., 1942-43 1, 298), and data collected on their production in India. The survey disclosed that the raw material position was on the whole favourable, and further discussion with experts led to the conclusion that, provided certain conditions could be fulfilled, it was practicable to manufacture all the dyes in substantial demand in the country within a period of 15 to 20 years.

There are, however, many problems to be faced and solved. Among the coal tar raw materials, benzene and toluene are already available in quantities considerably larger than those required for the dyestuff plan, and in the case of toluene our production capacity is so large that we might think of additional outlets. The toluene now under production for defence purposes is of the same degree of purity as the dye industry requires. This is not true of benzene, but there is no special difficulty in manufacturing pure benzene. The present supply of naphthalene is inadequate, but it can be increased. The anthracene available is very much less than the needs of the dyestuff industry, but fortunately the anthracene dyes can be conveniently made by the phthalic anhyride route from naphthalene, and the total quantity of naphthalene, taking this additional figure into account, can be isolated from Indian coal tar.

Our coal resources are limited and they have to be conserved very carefully.

The inorganic heavy chemicals, consisting mainly of sulnitric acids, caustic soda and phuric. hydrochloric and over 90 per cent of the total raw seda ash. are Although they are already being material requirements. produced on a considerable scale, they are more or less industries. and it it un full allocated to existing likely that, with the possible exception of sulphuric acid, the dve industry will be able to draw on the present production. Further, the prices are much too high, and it will be necessary for the Indian dyestuff industry to include in its own programme the manufacture of such heavy chemicals as nitric acid by ammonia oxidation and sodium nitrite, as a by-product, oleum, and Except for alcohol, the aliphatic chemical sodium sulphide. industry has been undeveloped, and the manufacture of acetic acid and anhydride, synthetic methanol and formaldehyde must be planned, though the requirements for dyes will not justify their production by the dyestuff industry itself.

The plant requirements represent a serious problem and it will be necessary to import a considerable part of the plant, after taking the fullest advantage of engineering facilities in the country. We will have to develop ultimately a full-fledged chemical engineering industry capable of designing and producing all the machinery and equipment for the chemical industries including the special plant which can withstand the string-

CHEMICAL INDUSTRIES

ent conditions of corrosion, temperature and pressure involved in modern chemical processes; but the time factor is the primary consideration and the early establishment of dye manufacture must be made possible by entering into working arrangements with foreign manufacturers of plant. In view of the difficult and complex nature of the processes of dye manufacture, cooperation with one or more of the large and well-stablished dyestuff organisations in Europe or America will be desirable, so that their technical experience may be available to us. State aid would also be required in many forms and one may recall in this connection the steps taken by the British Government during the last war to safeguard the British dyestuff industry.

Research on synthetic dyes should have ample provision in the national programme of research. The leadership of Germany in the manufacture of dyes and medical chemical was mainly due to he far-sighted encouragement of research. Great Britain and America were not long in learning this lesson, and it has been computed that the American dye manufacturer spends over two million dollars per year on research, devoted not so much to the discovery of new dyes, which must necessarily become less frequent with the passing of time, but to continuous improvement in methods of production and plant design. The expenditure of the Imperial Chemical Industries in 1943 on research and development was over Rs. 3,00,00,000, and it is believed that this figure has now been considerably exceeded.

As a result of the visit of several British and American teams to Germany after the war, extensive and valuable information regarding dyestuff plants and processes in Germany has come to light. These are the subjects of publications issued by the Government of Great Britain and the U.S.A. The Government of India should arrange for copies of the entire set of publications to be supplied free of cost to the major technological institutions in the country, whose duty it will be to make them available to every one interested in the matter in the region concerned.

On account of the very difficult conditions of life in Germany today it is very likely that chemists and chemical engineers, with unique experience in the production of intermediates and dyes, will be prepared to come to India and to assist in the development of the Indian dyestuff industry. The possibilities in this direction must be immediately explored.

According to the reports in the press, Messrs. Tata Sons Ltd. and I.C.I. have arrived at an agreement for organising a dyestuff industry in India. It is understood that the project is proceeding as rapidly as could be expected, considering its vastness and its complexity. The industry will be so organised that it not only makes dyes, but constitute a comprehensive chemical industry, which would stimulate the growth of the entire organic chemical industry in India.

HEAVY CHEMICALS

Statement, summarising the recommendations and possibilities for the development of 'Chemical Industries.'

"REPORT ON THE DEVELOPMENT OF INDUSTRIES FOR WAR SUPPLIES" BY DR. P. J. THOMAS

SULPHURIC ACID

Pre-war Production (1937):—There were 23 factories producing Sulphuric Acid, besides 6 others producing for their own consumption. Total production per annum was 30,000 tons.

Production during war-time (1943):—Production in the existing factories was increased by expansion, and six new factories also were established. Total production reached a figure of 93,000 tons.

Possibilities of Development:—With the all-round development of our industries like textiles, iron and steel etc., demand for the acid will increase. Production of Alum and Epsom salts, can be undertaken if the acid can be produced near the raw material deposits.

Location:—Since the main raw material Sulphur has to be imported, location will have to be fixed by considering the market. Ahmedabad, Bengal, Bihar, and U.P. each requires a tentons a day plant. Production of Alum in C.P. and Mag. Sulphate in Salem can be undertaken if sulphuric acid factories are established there.

Uses:—Sulphuric acid is a vital basic chemical. It is used in the production of auxiliary chemicals like alums, mag. sulphate, and acids like Nitric etc. More than 50% of the total production is consumed by other industries like textiles, steel and iron, etc.

Raw materials used and whether available in the country:— The raw material is Sulphur, supplies of which were met mainly by import. Rediscovery of sulphur deposits in Baluchistan could not ease the position greatly because of the low quality of Sulphur. **Remarks:**—The present method of production by chamber process is antiquated. The more economical 'contact method' will have to be used. 'Contact plants' can be imported from U.S.A. Government can undertake a scheme for producing sulphur from gypsum.

CAUSTIC SODA

Pre-war Production:—Production in pre-war days was negligible and the whole of our demand was met by imports.

Production during war-time:—The 'Tata Chemicals' and 'Mettur Chemicals' have an estimated production of 10,000 tons per annum.

Possibilities of Development:—There are immense possibilities in regard to production of this chemical since the annual offtake of it comes to 50,000 tons. 4 or 5 plants each with a capacity of 10,000 tons per year can be established

Location:—Location of this industry will have to be determined by the (1) availability of cheap electric power, (2) proximity to the market. Caustic Soda plants can be installed in the following places to supply the industrialised area around them: (1) Bombay. (2) Bengal. (3) in the South near Malabar Coast.

Uses:—It is a key chemical used as raw material in the soap, textiles and paper industries. These industries account for 90% of the total consumption of alkali.

Raw materials used and whether available in the country:— The raw material is 'Common Salt' or Sodium Chloride. No dearth of it can be visualised, in India. Rock Salt in Punjab is also a source of this material.

CHLORINE

Pre-war Production:-Nil.

Production during war-time:—Both the factories producing caustic soda by the electrolytic method, get the chlorine as bye-product. 6,000 tons was the annual production in 1943.

Possibilities of Development:—If plants are established for the production of caustic soda, there will be increased availability of chlorine.

Location:—As for the alkali industry, since chlorine is a byeproduct in the electrolytic manufacture of caustic soda.

Uses:-It is used in the manufacture of Bleaching powder and will be of great use in the 'Fine Chemical Industry' if developed. It enters, into the manufacture of D.D.T. and Gammaxene.

BLEACHING POWDER

Pre-war Production:—Production in 1937 came up to 2,800 tons.

Production during war-time:—Bleaching powder is manufactured by both the factories producing caustic soda. Estimated production in 1943 was 4,200 tons.

Possibilities of Development:—Annual consumption of bleaching powder comes to 12,000 tons. With the increased availability of chlorine, indigenous production can be stepped up.

Location:—As for the alkali industry, since chlorine is a byeproduct in the electrolytic manufacture of caustic soda.

Uses:---Used for sanitation purposes and in other industries.

Raw Materials whether available in the country:--Chlorine and slaked lime. Both of them are available in India.

SODIUM CARBONATE

Pre-war Production:--- Nil.

Production during war-time:—There are 3 factories manufacturing Sodium Carbonate with a total estimated production of 74,000 tons per year.

Possibilities of Development:—Present Annual consumption is 100,000 tons and there are good prospects for the Soda Ash industry.

Location:—The location of the industry will be governed by factors such as (1) availability of raw materials, (2) proximity to the market.

Uses:—This chemical is much used in the glass and paper industry.

Raw materials used and whether they are available in India: The raw materials are salt, limestone, ammonia or its salt.

Remarks:—Sind, Bihar, South India, and C.P. each can have a new plant for production of soda ash.

SODIUM BICARBONATE

Pre-war Production:-Nil.

Production during war-time:—As an intermedite product in the soda-ash industry, one of the factories producing sodaash, releases 1,500 tons annually.

Possibilities of Development:—Present annual consumption is 5,000 tons an indigenous production of Bi-carbonate can be stepped up.

Location:—The location of the industry will be governed by factors such (1) availability of raw materials, (2) proximity to the market.

Uses:—It is used in fire-extinguishers and medicinal preparations.

Raw materials used and whether they are available in India: The raw materials are salt, limestone, ammonia or its salt.

112

ALUMINIUM SULPHATE AND 'ALUMS'

Pre-war Production:-7,000 tons.

÷

Production during war-time:—Production could not be increased due to shortage of sulphuric acid.

Possibilities of Development:—Demands for alums would increase with the expansion of our paper industry and textiles. Annual consumption would rise to 20,000 tons. With the possibility of increased production of sulphuric acid, the manufacture of alums in this country has bright prospects.

Location:—If a Sulphuric Acid plant can be established in C.P. or Rewa State, 'Alums' can be manufactured with the Bauxite available there.

Uses:—Mainly used for water-purification and in paper sizing. Potash Alum is used as mordant in dyeing and printing. Chrome Alum is used in chrome-tanning and khaki dyeing.

Raw Materials:—Bauxite and Conc. Sulphuric Acid. Bauxite is available in the Central Provinces and Conc. Sulphuric will have to be indigenously produced.

Remarks:—Pure Aluminium hydroxide, an intermediate product in the manufacture of Aluminium, is necessary for the manufacture of the purest variety of Aluminium sulphate.

POTASSIUM CHLORATE

Pre-war Production (1937):--Nil.

Production during war-time (1943): The Mettur Chemicals installed a plant with a production capacity of 300 tons per annum.

Possibilities of Develoment: Annual consumption being 1,500-1,700 tons, there is possibility for a scheme with the production capacity of 1,500 tons per annum.

Location:-Bombay has been chosen for locating the factory.

Uses:—Largely used in the match industry and to a little extent in blasting powder.

Raw Materials:—Potassium chloride and cheap electric power. Potassium Chloride is got as a bye-product in refining 'salt-petre'.

Remarks:—Both the factories at Bombay and Mettur can meet Indian requirements.

SODIUM SULPHIDE

Pre-war Production (1937):-Nil.

Production during war-time (1943):—A factory was established in Jodhpur with a capacity production of 3,000 tons. Since only two out of the 4 units are working, the production is 1,500 tons per year at present.

Possibilities of Development:—Since there is no great demand for sulphur colours, there is no possibility for an increase $\frac{8}{3}$ in the demand for Sodium Sulphide. Hence the present capacity of the Jodhur factory will be enough.

Location:—Availability of cheap "Scdium Sulphate" is a factor which led to the location of the factory at Jodhpur.

Uses:-It is chiefly used in tanning industry and for developing Sulphur dyes.

Raw Materials:-Sodium Sulphate and coal.

POTASSIUM NITRATE OR SALT PETRE

Pre-war Production (1937):-7,000 tons.

Production during war-time:—The war did not stimulate the industry to any extent.

Possibilities of Development:—There are immense possibilities of development and an annual production of 50,000 tons can be reached.

Location:—The salt petre deposits are found largely in Bengal.

Uses:--Used in gun-powder and also as a 'manure'.

Raw Materials:-India holds the monopoly for Potassium Nitrate.

BICHROMATES

Pre-war Production (1937):—There was no production of bichromates in pre-war days.

Production during war-time:—When imports fell off during the war factories were started in Bihar and Mysore for the production of bichromates. There are now 12 factories producing Sodium Bichromate with a capacity production of 4,800 tons per annum.

Possibilities of Development:—The expansion during wartime is more than enough to meet our demands.

Location:-Good quality chrome ore is available in Bihar and Myscre and the factories have been located there.

Uses:—They are used in chrome-tanning and khaki dyeing. Chromic acid is produced from Bichromates. Potassium Dichromate is used in match industry.

Raw Materials:—Raw materials are quality chrome ore, Scda Ash, lime and Sulphuric Acid. Chrome ore is available in Bihar and Myscre.

Remarks:—Our annual consumption of bichromates in postwar period would come to 2,000 tons. A market can be found in Burma, Australia, and other adjacent countries for the spare capacity of 2,000 tons per year.

ACETIC ACID

Production in Pre-war days:-The wood distillation industry in Mysore was producing 200 tons of acetic acid annually.

114

Production during War-time:-Nil

Possibilities of Development:—There are immense possibilities for manufacture of this acid which is a raw material for the production of white lead, cellulose acetate etc.

Location:—Wood distillation plants can be installed near the source of supply of good wood.

Uses:—Used for the manufacture of lead acetate, white lead, cellulose acetate etc. Also it is used in the rubber industry.

Raw Materials:—One of the bye-products of the wood distillation industry. Ethyl alcohol can be oxidised to produce acetic acid.

Remarks:—Oxidation of alcohol for producing acetic acid can be undertaken in future when alcohol is in surplus.

ACETONE

Production in Pre-war days:-Nil.

Production during War-time:—The Government Cordite Factory was producing 700 tons of acetone from alcohol, to meet the war demands.

Possibilities of Development:-Nil.

Location:—Wood distillation plants can be installed near the source of supply of good wood.

Uses:-It is mainly used in the manufacture of explosives.

Raw Materials:—Acetone is a bye-product of the wood-distillation industry. Butyl alcohol is an important raw-material from which acetone can be produced cheaply.

FORMALDEHYDE

Production in pre-war days:-1937-Nil.

Production during war-time:—1943 — The Kirloskarwadi plant bought out by the Mysore Iron and Steel works is producing 60 tons per annum.

Possibilities of Development:—Being one of the raw materials in the production of Bakelite powder for the Plastic Industry, indigenous production of formaldehyde has good prospects.

Uses:—It is used in the manufacture of Bakelite powder and plastic glue. It is used in the prescriptions for tissue-preservatives.

Raw Materials:—Methyl alcohol which can be produced by distillation of wood or synthetically.

PHOTOGRAPHIC CHEMICALS—SODIUM THIO SULPHATE AND SODIUM SULPHATE

Production in pre-war days:--Nil.

Production during war-time:—Many small factories have started producing these chemicals during war-time. We shall be having a supply of 800 tons of Sodium Thio Sulphate and 300 tons of Sodium Sulphite per annum.

Possibilities of Development:---Nil.

Uses:-These ase photographic chemicals.

Raw Materials:—Soda Ash and Sulphur. Though Sulphur has to be imported, there will be no difficulty in regard to Soda Ash since 3 factories have started indigenous production of Soda Ash.

FERTILISERS

AMMONIUM SULPHATE

Production in pre-war days:-25,000 tons per annum.

Production during war-time:—The importance of fertilisers to step up production of food crops was recognised during the war-period and plans were formulated for the indigenous production of this important fertiliser.

Possibilities of development:—The fertiliser industry has to be developed, if agriculture is be rationalised. Ammonia can be produced synthetically and the other materials gypsum and coke are available in large quantities. An annual target production of 1,000,000 tons should be aimed at.

Location:—Availability of gypsum, good supply of coke and transport facilities, are all factors in determining the location of the factory.

Uses:--The most important manure, fixing-up nitrogen in the soil.

Raw Materials:—Ammonia and Sulphuric Acid. Due to shortage of the acid, the fertiliser can be produced by decomposing gypsum with Ammonia and carbon di-oxide. In this method of manufacture gypsum, coal and Ammonia are the raw materials.

Remarks:—A scheme for manufacture of this important fertiliser has been drawn up and the factory is to be set up at Sindhri in Bihar with an annual capacity of 350,000 tons.

SOAP INDUSTRY

Production in pre-war days:—Estimated production of soap in pre-war time was about 150,000 tons per year.

Production during the war-time:—Due to the difficulty in getting supplies of caustic soda, the industry suffered during war-time and the production fell to the figure 130,000 tons in 1945.

Possibilities of development:—The importance of soap as a consumer article is increasingly felt and the industry has good prospects for expansion.

Location:—Bombay and Calcutta areas have the main concentrations of the industry.

Raw Materials:---Oils, fats and resins and Caustic Soda. Certain Oils have to be imported and on expansion of the alkali industry there will be no great difficulty in obtaining supplies of Caustic Soda.

CEMENT

Production in pre-war days:—In 1939, production came up to 15 lakhs of tons.

Production during war-time:—During war-time the existing factories increased their production which came up to 20,00,000 tons.

Possibilities of development:—Industrialisation of the country, inauguration of irrigation and hydro electric schemes would all require a large amount of cement.

Location ---- The industry is well-dispersed.

Raw Materials:—Limestone is the chief raw material. Coal, gypsum and clay are the other raw-materials of the industry.

Remarks:—The Government decided to have a target production of 6 million tons of cement per annum by 1952. The A.C.C. and Dalmias have plans of expansion and a new factory in Jamnagar with a capacity of 1 lakh of tons per year is contemplated.

INDUSTRIES BASED ON CHEMICALS

DRUGS AND MEDICINES

Production in pre-war days:—Drugs worth about 1,25,00,000 of rupees were produced in India.

Production during war-time:—Production increased and was able to meet the 66% of her annual demands, worth about 4 crores of rupees.

Possibilities of Development:—The industry is only in its infancy and there are immense possibilities of developments if the Heavy Chemical and Fine Chemical industries are developed and well established.

Raw materials:--Raw materials are

- (1) Various inorganic chemicals
- (2) synthetic fine chemicals
- (3) vegetable and animal products
- (4) coal-tar and wood distillation products
- (5) fermentation products etc.

Remarks:—Government assistance and initiative are required in establishing this industry on a sound basis. The country should be made self-sufficient in regard to her requirements of drugs and fine chemicals.

NATIONAL PLANNING COMMITTEE

PAINTS AND VARNISHES

Production in pre-war days:—Production in 1938 was estimated at 24,800 tons.

Production during war-time:—Estimated total production in 1942 was 30,000 tons.

Possibilities of Development:—If Industrialisation of the country is apace, there will be a large demand for paints and varnishes.

Location:—At present Bombay and Calcutta are the main centres of production.

Raw Materials:—The raw materials are various inorganic pigments, oils, resins etc. India is rich in most of the materials.

Remarks—New plants in the Madras Presidency, U.P. and C.P. can be established with a capacity of 25,000 tons per annum.

118

REPORTS OF THE PANELS SET UP BY GOVERNMENT OF INDIA

SUMMARY OF THE FINAL REPORTS OF THE PANELS ON HEAVY CHEMICALS AND ELECTRO-CHEMICALS

A statement is attached summarising the recommendations of the Panels on Heavy Chemicals and Electro-Chemicals regarding targets and locations. The two Panels have throughout worked in close collaboration.

HEAVY CHEMICALS

2. The consumption of Heavy Chemicals depends on the development of the consuming industries, the exact extent of which is difficult to estimate. The Panel are of the opinion that while the targets suggested by them are based on a consideration of the existing conditions, Government may have to modify them suitably when implementing the recommendations, should changed conditions require it.

ELECTRO-CHEMICALS

3. There has been very little development of electro-chemical industries except for one or two areas. The Panel anticipate that with the completion of the hydro-electric projects, abundant power will become available and it will be possible to establish many electro-chemical industries.

GOVERNMENT DECISION

4. Government have decided that it is not necessary to lay down targets of production or to indicate where new units should be located.

The other recommendations are under examination.

Name of Chemical. Present annual production (in tons). Sulphuric Acid 59,000

Present annual consumption (in tons) 55,760 Five-Year Target (in tons) 152,600

PART I-HEAVY CHEMICALS

Recommendations

Fifteen—10 tons per day units and one Govt. experimental plant for producing 35 tons of sulphuric acid and 12 tons of sulphur per day from gypsum should be installed in addition to one 35 ton per day plant in Madras and one 10 ton per day plant in Bihar. Balance of 23,600 tons to be allocated after location of rayon plants is decided. Cost of capital equipment: Rs. 37.5 lakhs without the Govt. plant. Location: New plants to be located in Sind, Bombay, Bihar and C.P.

Foreign experts will be required for Govt. experimental plant. Indian students to go to U.K. and U.S.A. to specialise in Sulphuric Acid industry.

Raw materials available in India. Protection should be given.

to 10,000 tons should be installed near a source of power supply in addition to the two firms in India manufacturing aluminium. Special concessions, such as cheap transport and protection; should be given for the next five years after which the industry may be expected to stand competition.

Government should (i) install a Magnesium. No producnegligible tion small plant of 3-5 tons a day by the Pidgeon process, (ii) purchase and stock 1.000 tons of the metal for supply to Indian manufacturers at cost price. Deposits of Jaipur, Sikkim, etc., 10,000 6.000 Copper should be examined in order to increase production. Copper pyrites should be imported to manufacture copper and sulphuric acid. One 5,000 ton unit for

manufacture of primary metals is from scrap should be establish-
Name of Chemical. Present annual produc- tion (in tons)	- Present annual - consumption) (in tons)	Five-Year Target (in tons)	Recommendations.
			ed at one of the sea port towns —scrap for this purpose should be imported free of duty.
Electro- plating.			Large plants for electro-plating industrial equipment should be installed.
Storage batteries.	75,000 Leatheries (imported)	100,000- 125,000 Leatheries	The existing five factories can supply the requirements if rea- sonable protection is given.
Dry cells			Indigenous raw materials are not being used. This must be done after some processing if necessary. Possibility of manu- facture on a cottage industry basis as in Japan should be exa- mined.

•

SUMMARY OF THE REPORT OF THE PANEL ON FINE CHEMICALS, DRUGS & PHARMACEUTICALS

OBJECTIVE

1. The aim is to make the country self-sufficient in regard to fine chemicals, drugs and pharmaceuticals within the next fifteen years and to make all essential drugs available to the masses.

DEVELOPMENT OF THE INDUSTRY

2. Though the industry developed considerably during the present war, it is still in its infancy. Synthetic drugs produced in this country are mostly made out of imported chemicals and to place the manufacture of drugs and pharmaceuticals on a firm footing, it is of fundamental importance that fine chemicals should be produced in the country in requisite quantities.

RAW MATERIALS

3. The raw materials, from which drugs and fine chemicals are derived, consist of various inorganic chemicals, coal and wood distillation products, fermentation products, petroleum products, animal and vegetable products and synthetic chemicals derived from aliphatic chemicals. The panel consider that it should be possible to produce sufficient quantities of these materials in the country provided that (i) the Heavy Chemical Industry is expanded, especially the manufacture of chloro-sulphuric acid, sodium and chlorides of phosphorus, (ii) the manufacture of intermediates from the distillation products of coal is immediately taken in hand and (iii) the manufacture of adequate quantities of solvents and of crude vegetable drugs of proper quality is well organised.

FUTURE PRODUCTION AND TARGETS

4. The panel has fixed targets of production to be achieved within the next 10 years for about 100 different kinds of Drugs, Vitamins, Hormones, Liver Extracts, Insecticides, Refrigerating Chemicals, Photographic Chemicals, Fine Chemicals, Solvents and other miscellaneous articles. Amongst these, the panel considers that there are some essential items for which the need is very great and urgent and upon the production of which effort should be concentrated during the next five years. In their view a start should be made with the production of these essential drugs and chemicals, utilising the raw materials already available in the country and importing those which are not at present available. In this way the country will be provided with a supply of the essential drugs from the very start at prices which will compare favourably with imported ones, and—what is equally important—a demand will also be created for basic chemicals, and thus an impetus given to their production in this country. The present production of these essential items and the targets to be achieved by the end of ten years are indicated in the table appended.

LOCATION

5. The Panel have made no specific recommendations regarding the location of this industry.

NATURE OF GOVT. ASSISTANCE REQUIRED

6. The Panel consider that the industry will require considerable assistance from Govt. and make a number of recommendations in this regard:—

(i) For the production of certain vital drugs such as Penicillin, Mepacrine and the Sulphanomides, the State should take the initiative and put up pilot plants. The State should also initiate production of coal tar intermediates either directly themselves or through private enterprise.

(ii) Protection should be afforded to this nascent industry; customs duty on raw materials, semi-manufactured goods and capital goods required for the industry should be remitted for 5 years; railway freights on the raw materials and on the finished goods should be reduced; and provincial excise rules should be rationalised so as to facilitate the movement of spirituous preparations from one part of the country to another.

(iii) Research on fundamental problems connected with the manufacture of fine chemicals, drugs and pharmaceuticals should be liberally subsidised.

(iv) Scientists and technicians should be trained for developing the industry in this country. Individuals should not be sent abroad for vague study, but only when some definite project has been decided upon and their specific function in it ascertained.

(v) The development of the fine chemicals, drugs and pharmaceutical industry depends to a great extent on the production of heavy chemicals, coal distillation products, and organic solvents etc., and the production of these materials is linked up not only with the drugs and fine chemicals industry; but also with the dye-stuffs, artificial fibre and plastic industries, etc. A carefully integrated plan is, therefore, required to be drawn

CHEMICAL INDUSTRIES

. . .

on the basis of the reports of several different panels and for this purpose Government should set up a Technical Planning Commission.

(vi) To put the Shark Liver Oil Industry on a firm footing, a Central Board, representing the relevant departments of the Government of India, the departments of Fisheries of the maritime provinces and non-official experts with a whole time executive, should be set up.

ORDERS OF GOVT.

7. The report has not yet been finalised and no orders have yet been passed by Government on it.

Present Production

Target in 10 years

VEGETABLE DRUGS:

Quinine

Pyrothrum

Emetin Strychnine Santonin Ephedrine Caffeine Morphine

SYNTHETIC DRUGS:

Sulpha drugs. Mepacrine Paludrine D.D.T. P-carbamino Phenyl Arsonic acid (carbarsone). Sulpharsphenamine and Neorasphenamine.

VITAMINS.

Vitamin A

35,000 gallons

Vitamin B (group) ,, C ,, D

1,000,000 gallons of shark liver oil of potency 6,000 units per gramme. Targets not fixed. The Techni-

cal and Planning Panels of the Food Dept. are dealing with this question.

SUMMARY OF THE DRAFT REPORT OF THE PANEL ON PLASTICS AND CELLULOID INDUSTRIES

I. PLASTIC INDUSTRY

PRESENT POSITION

1. The present world production of plastic is estimated at about 2,240 million lbs. annually. The per capita consumption in India in 1937 was 0.003 lbs. as compared to lb. 1.500, 1,450 lbs and 1.000 lb in Germany, U.S.A. and England respectively. India possesses the resources necessary for the production of the raw materials required for the synthetic plastic industry and has in addition an abundance of naturally occurring resinous materials. The Panel therefore feel that with the development of the chemical industry and the aid of extensive research and proper standardisation of products, it will be possible to establish a flourishing plastic industry. The consumption of plastic goods is bound to increase rapidly in the post-war period.

2. The industry should be developed on the following lines.

(a) IMMEDIATE EXPANSION OF THE PLASTIC MOULD-ING INDUSTRY.

TARGET OF PRODUCTION

The moulding of plastic articles has been successfully undertaken in India in recent years. There are at present 75 presses capable of handling about 2,000 tons of moulding powders per annum; but most of the presses are manually operated and out of date. The Panel recommend that the moulding industry should be expanded to use about 3,000 tons of moulding powders annually during the next five years and that modern types of automatic presses should be imported. They also give a long list of articles proposed to be manufactured e.g., combs, buttons, trays, etc.

LOCATION

Moulding plants may be located in any part of the country preferably near trade centres. A moulding plant utilising 100 tons of moulding powder per annum is considered a minimum economic unit under Indian conditions. Two Central Die making establishments should be set up, preferably at Bombay and Calcutta.

USE OF IMPORTED MOULDING POWDERS

For the present the industry will have to use imported moulding powders. The Panel recommend (with one dissentient) that the import duty on moulding powders should be reduced to 50% At present duty on finished plastic goods and moulding powders is the same viz: 90% which the Panel consider unsasticfactory.

ORGANISATION OF THE INDUSTRY

The Panel consider that the expansion of the plastic moulding industry can be left to private enterprise; but if private capital is not forthcoming to instal Die-making plants, Government should subsidise the undertaking.

(b) DEVELOPMENT OF THE MOULDING POWDER INDUS-TRY IN INDIA.

TARGETS OF PRODUCTION

The production of the following synthetic plastic moulding powders should be started as soon as the basic chemicals required for their manufacture are available at economic rates and the demand is sufficiently large to justify the erection of an economic unit for each type:

- (i) Phenol-formaldehyde (1500 tons).
- (ii) Cellulose Nitrate (2,000 tons).
- (iii) Urea-formaldehyde (500 tons).
- (iv) Cellulose acetate (1,000 tons).

lene (5) Alkyd (6) Vinyl (7) Acrylate (8) Silicone.

For a long range industrial development plan the production of the following synthetic plastics should be undertaken.

(1) Melamine (2) Furfural-phenol (2) Nylon (4) Polyethy-

(c) DEVELOPMENT OF NATURALLY OCCURRING RESINS FOR USE IN THE PLASTIC INDUSTRY. There are bright prospects of developing the naturally occurring resins for use in the industry. Lac, Bhilawan, Cashew shell liquid, etc. are some of the most promising materials available in the country. Intensification of coordinated research on their utilisation is strongly recommended. A survey regarding the availability of Bhilawan, an important raw material for the plastic industry, should be undertaken.

(d) DEVELOPMENT OF THE FILLER INDUSTRY. A synthetic or a natural resin is very seldom in a condition suitable for direct moulding and requires the addition of filling materials. Wood flour is one of the most important of these. The Panel recommend that its manufacture should be undertaken in India and an annual production of 1,500 tons should be aimed at. (e) RESEARCH.—The plastic industry should be developed in India with the aid of extensive research both of synthetic and naturally occurring materials. It is understood that the proposed National Chemical Laboratories of the Council of Scientific and Industrial Research are going to have a separate division for research on high polymers and plastics. The Panel is of the opinion that all problems of the synthetic plastic industry should be tackled by this section which should be fully equipped with modern apparatus and pilot plants etc. The proposed two cellulose Research Institutes, recommended by the Rayon Panel, should also deal with research problems of the plastic industry using cellulose raw materials.

(f) TECHNICAL TRAINING.—Government should send abroad two Indian technicians every year for training in die designing for the next five years.

II. RAW FILM MANUFACTURE PRESENT POSITION

1. The Indian film industry claims to occupy one of the foremost places among the various industries in the country. The prewar imports of motion picture raw film were about 80 million ft. per year. Consumption is likely to increase rapidly in the next few years.

POST-WAR TARGET

2. The Panel recommend that one factory manufacturing 50 million square feet of raw film of all types should be established during the next five year period.

STAGES OF DEVELOPMENT

3. They recommend that the development of the raw film industry should be in the following stages:---

- (a) coating and processing of imported film base;
- (b) manufacture of film base in the country using imported chemicals;
- (c) manufacture of the necessary chemicals required in the country.

LOCATION

4. The Panel is of the opinion that a site near Poona is likely to be suitable for setting up a raw film factory. It is, however, felt that the actual selection of a site should be left to foreign technical experts.

OTHER IMPORTANT RECOMMENDATIONS

5. (i) FOREIGN COOPERATION:—Since the raw film manufacture is a highly technical and specialised industry and the processes of manufacture employed are patented secrets of a

CHEMICAL INDUSTRIES

selected number of foreign manufacturers, co-operation with some reputed foreign manufacturers is considered essential. The Panel are of the opinion that the Government should take the initiative in this direction and arrange with some foreign firm in the U.S.A., Germany or Belgium for help and assistance in establishing the industry in India. For this purpose it may be necessary to sponsor a joint venture with foreign manufacturers.

(ii) GOVERNMENT ASSISTANCE:--The Panel recommend that the Government should give adequate protection to the industry in the form of subsidy, bounties or by any other means which will not adversely affect the motion picture producing industry. In view of the fact that the industry will use imported chemicals in the initial stages, the Panel feel that the import of the chemicals used specially for raw film manufacture should be allowed duty free. The draw-back rebate system is recommended as suitable for this purpose. The Panel further recommend that concessional railway rates should be fixed for the movement of raw materials required by this industry and its finished products.

(iii) TECHNICAL TRAINING:—The Panel recommend that the Government should arrange to send at least 20 young Indians abroad for specialised training in raw film manufacture. They should be trained for a period of two years in factories manufacturing raw films.

6. The report is being finalised.

SUMMARY OF DRAFT REPORT ON PAINTS AND VARNISHES

There are at present 38 paint factories, of which 15 are large and well established, and 5 pigment and colour manufacturers. The various products of the industry may be classified as under—

- (i) Paints and enamels,
- (ii) Varnishes and lacquers, and
- (iii) Pigments.

The first two constitute finished products, whereas pigments are more in the nature of raw materials both for the paint industry itself and for other industries. Other raw materials employed by the industry, besides pigments, may be grouped as—

- (a) Drying oils and Driers
- (b) Solvents and Thinners
- (c) Resins and synthetic resins.

With the exception of synthetic resins all of these are available in India in the required quantities.

TARGET OF PRODUCTION

2. The existing production and the proposed targets in respect of the various products of the industry are shown in the statement below.

Products	Existing production.	Targets.	Remarks.
(1) Paints & Enamels.	50,000 tons	100,000 tons.	50% of the proposed increase is to meet the increased demands of the internal market & the balance for export.
(2) Varnishes (all types)	25 lakhs gals.	No target proposed.	• • • • • • •
(superior quality) (3) PIGMENTS.	135,000 gals.	300,000 gals.	
(a) ZINC PIGMENTS Lithopone		5,000 tons	Estimated present requirement is 4,000 tons.
Zinc Oxide	4 ,000 tons	6,000 tons	The increased targets of 8,000 tons is recommended if Litho- pone manufacture is not deve- loped.
(b) LEAD PIGMENTS White lead, Red lead, Litharge & Lead chrome.	4,500 tons	8,000 tons	Mainly manufactured from im- ported lead as Indian sources of production of lead are negligi- ble.
(c) TITANIUM WHITES.		3,000 tons	Titanium—containing mineral deposits are available in large quantities in Travancore State.
(d) Carbon Black	Nil.	500 tons	About 400 tons per year are imported for use in paint, rubber and other industries.

3	Products	Existing production.	Tar	gets.	Remarks.
(e)	Aluminium powder	250 tons (requirements not known)	500	tons	_
(f)	Mercuric oxide & cuprous oxide		500	tons	
(g)	(g) OTHER PIGMENTS. Barytes, Whiting, Gypsum, Bauxite, China Clay, Mica, Si- lica, Red Ochres, Iron reds, Ochres & Siennas, Yellow Chromes, Yellow Oxide of Iron, Cadmium yellow, Terre Verte or Green Earth, Chrome Green or Brunswish Green, Chromium Oxide, Ultramarine Blue, Prussian Blue, Gra- phite and Lake Pigments.			These are the other pigments used in the Paint industry. Most of them are available in India in large quantities and hence no targets are suggested by the Panel.	

CHEMICAL INDUSTRIES

LOCATION

3. The Panel recommend that the extra production of 50,000 tons of paints and enamels should be achieved by increasing the capacity of the existing plants by 25,000 tons and by installing new plants of a capacity of 25,000 tons. For the new plants 5 tons per day units are considered suitable. 15 such units are necessary and the Panel have made proposals for the distribution of 12 of these as follows:—

South India including Madras Presidency and the State of Hyderabad, Mysore,

•

Travancore and Cochin etc.15 tons per day.United Provinces15 " " "Central Provinces, Bihar, Assam, Orissa,
Sind and N.W.F.P.5 " " "for each province.5

The Panel have recommended that no new plant should be installed in Bengal, Punjab and Bombay since the industry is already concentrated in these Provinces. There is, however, to be an expansion of existing plants by 25,000 tons and a good portion of this will go to these Provinces.

RECOMMENDATIONS REGARDING GOVT. ASSISTANCE & ORGANISATION

4. The Panel have made the following recommendations for increasing the scope and efficiency of the industry.

(i) A Central Association of all paint manufacturers should be formed to advise Govt. periodically on the development of teh industry and the controls to be exercised. Membership should be made compulsory.

(ii) A Central Paints Laboratory should be started by Government in consultation with the industry. This laboratory should also^{*}be a training centre.

(iii) 10 technicians should be sent abroad annually for specialised studies, and arrangement should be made to import German technicians on a 3 years minimum contract.

(iv) A number of measures should be taken to encourage the production in India of various pigments (more especially Titanium Whites from titanium-containing deposits in Travancore) and synthetic resins. As most of the pigments belong to the class of minerals about which full information is not available, the Geological Survey of India should pay special attention to this matter.

5. The report is being finalised and Government have not yet passed any orders on it.

APPENDIX I

Questionnaire of the N.P.C. report.

List of questions that can be attached to the Report of the 'Chemical Industries Sub-Committee'.

As most of the questions are of a general type, and have been brought under the 'Manufacturing Industries Sub-Committee's Report, no attempt has been made to include them in this list.

LIST OF QUESTIONS.

Hand Book No. 1 Page No. 19 Q. No. 13

Are there any key industries in your province?

N.B.—By "Key Industries" is usually meant industries which are the starting point of the basis of other industries."

Q. No. 14

How far as heavy industries already in existence in your Province, and to what extent do these industries compete with corresponding industries within the country, or outside the country?

N.B.—By "Heavy Industries" is usually meant industries concerned in the manufacture of iron and steel and their products, engineering, chemicals and their like."

Q. No. 15

What room is there for the further development of these Heavy Industries in your Province, and what steps would you suggest for achieving that end?

.. List of Questions that can be attached to the Report of the..

'Chemical Industries Sub-Committee.'

Hand Book No. 1

Page No. 20 (c) Mineral

Q. 23 What are the chief mineral resources available in your **Province**? How far are these resources already being exploited, and developed and by what agency?

Q. 24 What is the room for large-scale mineral, or metallurgical industries in your Province? **Q. 25.** What is the policy of Government in your Province in regard to the grant of concession for the exploitation of mineral wealth in your Province?

Q. 27 What agencies,—local, Indian, or non-Indian—exploit the mineral resources of your Province, under what form of organisation and on what scale of production?

Page No. 22. V. Agriculture (Fertilisers).

Q. 44 What are the handicaps which affect the maximum utilisation of the available agricultural wealth and resources of your Province in regard to:—

(c) Manure

Q. 46 How far does the yield per unit of area cultivated for different crops within your province compare with the corresponding yield per unit of the same crops in

- (a) the other provinces of India
- (b) in the other countries of the world?

What steps would you indicate to improve the quality as well as the quantity of this yield ? Page 39.

SUPPLEMENTARY QUESTIONNAIRE

Q. 1. Has there been ever any attempt to manufacture in this country any of the following articles at present imported?

Table I.

No. 9 Chemicals and chemical preparations

- (a) acids: Acetic Carbolic Citric Hydrochloric Nitric Oxalic Sulphuric Tartaric other sorts.
- (b) Alum
- (c) Aluminous sulphates
- (d) Ammonia and its Salts;
 Anhydrous ammonia
 Ammonium Carbonate and bicarbonate
 Ammonium chloride
 other ammonium salts

- (e) Arsenic and its oxides
- (f) Bleaching materials Bleaching powder other kinds
- (g) Calcium carbide
- (h) Calcium chloride
- (i) Chlorine, liquid
 - (j) Copperas (Ferrous Sulphate)
 - (k) Copper Sulphate
 - (1) Disinfectants: Naphthalene other kinds.
- (m) Glycerine
- (n) Lead compounds: Acetate . Litharge others
- (o) Magnesium compounds Chloride Sulphate Others
- (p) Phosphorus, all kinds
- (q) Potassium compounds Bichromate Chlorate Cyanide others sorts
- (r) sodium compounds Bicarbonate Bichromate Borax Cyanide Carbonate Caustic Soda
 - Hydrosulphite
 - Silicate
 - Sulphate
 - Sulphide
 - other salts
- (s) Sulphur.
- (t) Zinc Compounds: Chlorides Others.
- (u) other sorts of chemicals.
- Page 52.
 - 13) DRUGS AND MEDICINES.
 - a) Camphor
 - b) Cocaine

- c) Cod-Liver Oil
- d) Morphia
- e) Preparations of Opium and Morphia
- f) Quinine salts.
- g) Saccharine.
- h) other sorts of drugs.

14) DYEING SUBSTANCES.

- b) Cochineal.
- c) Cutch and gambiar.
- d) Dyes from coal-tar.
 - A) Alizarine.
 Dry
 Not exceeding 40%
 Exceeding 40%;
 Moist
 Not exceeding 16%
 Exceeding 20%.
 Over 16% but not exceeding 20%.
 - B) Congo red.
 - C) Congo red.

Coupling dyes of the naphthol group Naphthols: Rapid fast colors (rapid salts) Bases;

Other salts,

- D) Vats: Indigo; Carbazole blue; other sorts, Paste; Powder;
- E) Metanil Yellow,
- F) Sulphur Black.
- G) Auramine of Concentration of 15% and less.
- H) Rhodamines (Carthamines) of conc. of 15% and less.
- I) Aniline salts.
- J) Other sorts.
- 26) MANURES:
 - a) Nitrogenous,
 - A) Nitrate of soda
 - B) Sulphate of Ammonia
 - C) Others.
 - b) Potassic
 - A) Muriate of Potash
 - B) Others

- c) Phospatic
 - A) Super Phosphates
 - B) Others
- d) Compounds
 - A) Ammonium phosphates
 - B) Fish Manures
 - C) Others
- Page No. 58
 - 31) PAINTS AND PAINTERS' material (a) Paints & Colours.
 - (A) Barytes.
 - (B) Blue paint or Paris blue
 - (C) Graphite
 - (D) Red Lead Genuine dry; Reduced dry
 - (E) White Lead Genuine dry; Genuine moist
 - (F) LithophoneDryWhite moist
 - (G) Zinc white Genuine dry; Genuine moist
 - (H) Other Sorts White dry; Coloured dry; White moist; Coloured moist.
 - (b) Painters' materials (Other than paints and colours)
 - (A) Turpentine Genuine Substitute
 - (B) Varnishes Enamels Lacquers; other kinds
 - (C) Other kinds of painters' materials.
