## FOREWORD

The role and importance of Agricultural Census in providing the basic and valuable information needed for the realistic planning of agricultural development programmes and correct appraisal of the progress achieved, have been widely recognised. Lack of detailed information at the lower administrative levels, especially that relating to the structure and characteristics of agricultural holdings has often proved to be a serious handicap in the formulation of policies and the proper allocation of resources so as to cover all sections of the farming community. With the advent of planning from the bottom and setting up of the District Planning Boards, detailed information about the structure of agricultural holdings and its interrelationship with the characteristics of holdings are not only essential but also a pre-requisite.

Maharashtra has been a deficit State, particularly in foodgrains. Strenuous and sustained efforts are being made to step up the agricultural production in general and the foodgrain production in particular. The adoption of the new strategy in agriculture involving the implementation of the High Yielding Varieties Programme and the multiple cropping schemes for achieving higher yield rates of crops, as also higher monetary return per unit area, represents the State's determination to reach the goal of self-sufficiency in agriculture soon. Since last year, a new experiment in agriculture has been initiated by guaranteeing certain minimum yields of cereal crops per unit area in the Pilot Project Blocks with assured irrigation and/or rainfall. The scheme met with a tremendous success. Again, a planned effort is being made to involve in a big way the landless labourers (to whom surplus lands have been distributed recently), small farmers and weaker sections of the farming population in the implementation of the agricultural development projects. Apparently the success of all such programmes depends to a large extent on the enthusiasm, interest and active participation of the individual operators or tillers who constitute the decision-making units at the field level. It is in this context that the Agricultural Census data pertaining to individual tillers or operators will prove to be of great help in planning farmer-oriented programmes of development.

I am, therefore, very happy that for the first time, the data for individual operational holdings have been collected under the Agricultural Census by the method of complete enumeration in the State and also in the country. The holdingwise information will be of considerable utility, in planning agricultural production programmes and in the proper utilization of the available resources. It is hoped that the information will be helpful in assessing the credit requirements and distribution of production inputs of the right kind, in right quantum, to the right type of people and for the right purpose.

The conduct of the Census proved to be a much more stupendous task than what was originally thought. I am, however, very glad to mention that in spite of the numerous difficulties and the voluminous work involved, the officers, the supervising staff of the various departments and particularly the field staff (v'z., the talathis) carried out the work ungrudgingly, in a spirit of team work and helped in the completion of the project.

I trust that this Report on the Agricultural Census in Maharashtra would be of considerable use not only to the Government departments, but also to research workers, economists and others associated with agricultural planning and development.

Bombay,  
6th September 1976

S. G. PAWAR,  
*Minister for Agriculture,  
Command Area Development and Khar  
Lands, Government of Maharashtra.*

## PREFACE

Maharashtra State, along with other States of the Indian Union participated in the Third World Agricultural Census (1970-71) sponsored by the Government of India at the instance of the Food and Agriculture Organisation of the United Nations. The Census was conducted by complete enumeration of all the land holdings in the State by retabulation of the information available in the basic land records of the villages. The long-felt demand for the detailed information about the structure and characteristics of the operational holdings in the State—the decision-making units—has now been realised and the data of about 50 lakh holdings in the State are available.

As a complete Census of all land holdings in the State was undertaken for the first time, taking into consideration the magnitude and complex nature of the work involved, two organisations were set up, one for the field operations and the other for the processing of data. For the field operations, Deputy Commissioner (Agricultural Census) was appointed in the Directorate of Agriculture. He was assisted by a small census cell and the entire work was planned, organised and controlled by that Officer. The Director of Economics and Statistics was nominated as the Deputy Agricultural Census Commissioner (Mechanical Tabulation) for planning and organising the tabulation of the voluminous data.

The entire burden of the field work involving the collection of basic data under the Census was borne by the talathis of the revenue department, under the supervision of Tahsildars while for training of field staff, providing technical guidance and supervision of the field work, the assistance of various agencies in the districts was taken.

A Study Group consisting of the following members was appointed for drafting the technical report on the results of the Census under Government letter No. Sankhiki/4074/2652-B, dated the 14th August, 1974 :—

1. Director of Economics and Statistics, Bombay.
2. Dr. C. H. Shah,  
Professor of Agricultural Economics, University of Bombay.
3. Shri V. G. Sharma,  
Deputy Commissioner (Agricultural Census) and Chief Statistician,  
Department of Agriculture, Maharashtra State, Pune.

In drafting the report, the Study Group was assisted by Shri N. P. Joshi, Statistician (Agricultural Census) of Agriculture Department and Shri N. V. Mohod, Deputy Director of the Directorate of Economics and Statistics, Bombay.

The results of the Agricultural Census for State and districts are presented in this report. The report is divided into two parts. Part I consists of five chapters dealing with the historical background, organisational arrangements, concepts and definitions. The chapter IV gives the analysis of the Census results and the conclusions derived therefrom. The last chapter (V) deals briefly with the suggestions for future censuses. Part (II) contains the statistical tables giving the summary of these Census data presented in the form of six tables for the State, divisions and each district and according to size class of holdings.

The Census has shown that there were 49·51 lakh operational holdings in the State in 1970-71, with an area of 212 lakh hectares or about 68 per cent of the total State area of 308 lakh hectares. It has clearly brought out the preponderance of the small holdings (i.e. those below 2 hectares or 5 acres), it being to the extent of 43 per cent and that most of them are located in the paddy growing areas of the State; but the area under these holdings was only 9 per cent of the total area under all the land holdings. Further, 37·50 lakh operational holdings or nearly 76 per cent did not possess any irrigation facilities.

Of the total net sown area of 173 lakh hectares in the State, the net area under irrigation was 12·4 lakh hectares (or 7·1 per cent) and the rest (i.e. 92·9 per cent) was dependent exclusively on rainfall. It is of interest to note that about one-seventh (or 30 lakh hectares) of the total operated area in the land holdings comprised land not put to cultivation (i.e. excluding net sown area and area kept fallow during 1970-71).

The conduct of the Census involving the collection of statistical data for each parcel of land covering nearly 5 million land holdings in the State was a colossal task. The talathis, who were entrusted with this responsibility, did a splendid job particularly since they had to attend to this work in addition to their normal duties. The higher revenue Officers right from the Secretary to Government, the Commissioners, Collectors, Deputy Collectors, Tahsildars and down to the level of Revenue Inspectors gave the necessary support in getting the work done properly. The officers and staff of the Statistics Division of the Agriculture Department, Directorate of Economics and Statistics and Land Record Department rendered necessary assistance in the satisfactory conduct of the Census. I would like to express my thanks to all the Officers and staff.

Shri V. G. Sharma, Deputy Commissioner (Agricultural Census) was responsible for the successful planning and organisation of the Census. Shri M. A. Telang, former Director of Economics and Statistics and Deputy Agricultural Census Commissioner (Mechanical Tab.) and Shri V. D. Mahajan, Additional Director of that Directorate, handled the work of planning and organising the tabulation of the voluminous Census data efficiently. Shri N. P. Joshi Statistician (Agricultural Census) put in considerable efforts in rendering the requisite assistance to both the Deputy Commissioners, in the organisation of the Census and subsequently in the processing of the data. I would like to place on record the excellent services rendered by all these officers.

I take this opportunity to express my deep gratitude to Shri I. J. Naidu, Agricultural Census Commissioner (now Secretary, Rural Development Department) Government of India and other officers of that Government for their valuable guidance and help in the conduct of the Census.

I would like to express my thanks to the members of the Study Group for drafting this Report on the Agricultural Census which will be found useful by all those associated with agricultural research and development, directly or indirectly.

Bombay,  
6th September 1976

B. K. CHOUGULE, I.A.S.,  
*Agricultural Census Commissioner  
and Secretary (Agriculture) to  
Government of Maharashtra.*

## PART I

### CHAPTER-I INTRODUCTION

#### Historical Background

1.1. The first attempt to carry out an agricultural census on a global scale was made in 1924 by the International Institute of Agriculture, Rome. The first such census was carried out in 1930. The Food and Agriculture Organisation of the United Nations, which took over the activities of the International Institute of Agriculture in 1945, initiated the First World Agricultural Census in 1950 and the second in 1960. The present i.e. the Third World Agricultural Census was carried out in 1970.

1.2. The basic object of the World Agricultural Census is to provide comprehensive information on agriculture at a global level on a uniform and comparable basis. It is intended to provide a rich source of data for various purposes, chief among them being a comparative study of the experiences of agricultural development in different countries. Further, holdingwise data would be available at the lower levels of the administration. It would also provide the basic frame for carrying out sample surveys involving sizewise stratification. The data may be helpful in formulating plans for future growth and in formulating specific projects for development.

1.3. India participated in the First and the Second World Agricultural Censuses in 1950 and 1960, respectively. In these two Censuses, the required data were collected on the basis of the sample surveys conducted through the National Sample Survey Organisation. The Third World Agricultural Census, 1970, attempted to collect quantitative information on agricultural structure using the agricultural holding as the unit of enumeration and covering the entire country, with one agricultural year as a reference period. The Government of Maharashtra conducted the Agricultural Census in the State as a part of the All-India programme with 1970-71 as the reference year. For the purpose of this Census, it was decided to take an operational holding as a unit of collection of data. For the first time, it was decided to collect data in this Census on essential items by complete enumeration of all land holdings by retabulation of the information contained in the village records.

#### Scope

1.4. As the Census was to cover all the holdings in the State its scope was restricted to the following six items of information :

- (a) Size of each operational holding,
- (b) Individual and joint holdings,
- (c) Tenancy and tenure,
- (d) Land utilization,
- (e) Area under different crops (irrigated and unirrigated),
- (f) Sourcewise irrigated area.

1.5. In order to meet the requirements of the World Agricultural Census, data in respect of certain additional items of information like livestock, farm and non-farm assets and transport equipment, were also to be collected. These data were collected mainly by inquiry with the selected farmers through the 26th round of the National Sample Survey, in which the State Government participated on a matching sample basis. The present report, however, deals with the data collected from the village records.

### Contents of the report

1.6. Part I of the report is divided into five Chapters. In the remainder of this Chapter is given the background information of the State. The Chapter II describes the organisational structure created for the Census. The concepts and definitions are given in the Chapter III and the related Annexure. The Chapter IV gives the analysis of the principal aspects of the Census data. The Chapter V deals with the experiences of the present Census and suggestions for the future ones. The Part II of the report contains the districtwise tables of results of the Agricultural Census.

### Administrative divisions of the State

1.7. Maharashtra consists of 26 districts and is divided into four administrative divisions viz. Bombay, Pune, Nagpur and Aurangabad. The Bombay division comprises seven districts viz. Bombay Suburban, Thane, Kulaba, Ratnagiri, Nasik, Dhule and Jalgaon. The first four districts are the coastal districts and are called the districts of Konkan region. The Pune division consists of six districts viz. Ahmednagar, Pune, Solapur, Satara, Sangli and Kolhapur. The Nagpur division is comprised of eight districts viz., Buldhana, Akola, Amravati, Yavatmal, Wardha, Nagpur, Chandrapur and Bhandara. The first four districts are the Ex-Berar districts, while the remaining four are the Ex-Central Provinces districts of the former Madhya Pradesh State. The Aurangabad division comprises of five districts viz. Aurangabad, Parbhani, Bhir, Nanded and Osmanabad. These districts belonged to the former Hyderabad State.

### Physical features

1.8. The State of Maharashtra, formed on the 1st May, 1960, is the third largest State in India in respect of both area and population. The geographical area of the State is 3·08 lakh sq. km. which is about one-tenth of the area of the Indian Union. The total population of the State according to the 1971 census was 50·41 millions which is about one-eleventh of the country's total population.

1.9. Maharashtra State forms a major portion of the peninsular India, having a sea coast of 720 km. as the Western border of the State. It lies between 16°-4' and 22°-1' North latitudes and between 70° and 18° East longitudes. It is bounded by the Arabian Sea on the West, by Gujarat and part of the Union Territory of Goa viz. Dadra and Nagar Haveli to its North-West, Madhya Pradesh in the East and North, Andhra Pradesh in the South-East and Karnataka and Union Territory of Goa in the South.

1.10. The main features of Maharashtra's topography are the famous North-South ranges of the 'Western Ghat' called the 'Sahyadri' running almost parallel to the sea coast on the West and the East-West ranges of hills called the 'Satpuda' situated on the Northern border of the State. There are also smaller hilly ranges and high lands to the North of Nasik district called the Satmala ranges, with their continuation in the Balaghat range which goes right upto the Eastern boundary of Vidarbha. The Western Ghats divide the State into two distinct natural parts called the Konkan and the Deccan Plateau. The Konkan is a hilly undulating region of 40 km. to 60 km. width, lying between the Arabian Sea and the Western Ghats and located mostly near the sea coast. Over the Eastern side of the Western Ghats, stretch long and broad plains or table lands well recognised as the Deccan plateau, at an elevation ranging from 450 to 610 metres above the sea level. The plateau is intercepted by Satpuda, Balaghat and Mahadev Hills which give rise to three fertile river basins called the Tapi, Godavari and Krishna basins. The names are derived from the major rivers flowing through them. The physiography of the State is shown in the map included in Annexure I.

### Forests

1.11. About 18 per cent of the total area of the State is under forests. Nearly 15 per cent of the 54 lakh hectares of the total forest area of the State is accounted for by one district viz., Chandrapur. The rest of the forest area is mostly spread over 15 districts viz. Thane, Kulaba, Ratnagiri, Pune, Kolhapur, Satara, Sangli, Nasik, Dhule, Jalgaon, Amravati, Bhandara, Nagpur, Nanded and Parbhani.

### Agro-climatic zones

1.12. The climate and soil in Maharashtra vary widely. The annual precipitation varies from less than 500 mm. in parts of Ahmednagar district to more than 3,000 mm. in Ratnagiri district. Soil also varies in structure and content. On the one side, Maharashtra has high rising mountains with thin sheet of loamy soil and on the other the plateau with deep and black soil. Based on the soil and rainfall conditions, the State has been divided into nine broad Agro-Climatic zones. The detailed description of these zones is given in the Research Bulletin-21 of the Department of Agriculture, entitled "Broad Soil Zones of Maharashtra". The demarcation of these zones is shown on the map of the State, along with the district boundaries, which is included in this report as Annexure II. The zones generally cover parts of two or more districts and of even tahsils. As area statistics are maintained according to administrative units only, zone-wise information regarding land use, area under crops, etc., is not readily available.

### Population

1.13. The Population Census 1971 showed that the State population had increased from 395.5 lakh in 1961 to 504.1 lakh in 1971 i.e. by 27 per cent in the decade. The density of population in 1971 worked out at 164 persons per square kilometre as against 178 in the country. Of the total population in 1971, 68.8 per cent lived in rural areas. The proportion of the urban population of the State increased from 28.2 per cent in 1961 to 31.2 per cent in 1971. With the exception of the Greater Bombay district which is entirely urban, urbanisation is found to be comparatively much more in the districts of Thane, Pune and Nagpur with 36 per cent, 42 per cent and 54 per cent urban population respectively. The districtwise figures are given in the Table No. 1 of Annexure III.

1.14. While the rural population of the State had increased by about 22 per cent in the decade ending 1971, the cultivated area (net sown area plus current fallows) remained practically the same. Consequently, the availability of cultivated land per head of rural population decreased from 0.67 ha. to 0.56 ha. The per capita availability of cultivated land was comparatively much low in the rice growing areas of the State viz., Thane, Kulaba, Ratnagiri, Kolhapur, Bhandara and Chandrapur districts. More details are given in the Table No. 2 in Annexure III.

1.15. There were 183.4 lakh workers in Maharashtra in 1971. Of them, 119.3 or 65 per cent were employed in agriculture as cultivators and agricultural labourers. The districtwise statistics are given in the Table No. 3 in Annexure III.

### Contribution of agriculture to the State income

1.16. The State income of Maharashtra at 1960-61 prices increased from Rs. 1,597.4 crore in 1960-61 to Rs. 2,127.1 crore in 1970-71 i.e. by about 33 per cent. However, the income generated in the sector of agriculture and allied activities such as animal husbandry, forestry, fisheries etc., declined from Rs. 664.2 crore to Rs. 578.7 crore i.e. by about 13 per cent. This decline was firstly on account of the fact that 1960-61 was a year of bumper crops in the State and secondly the year 1970-71 was a year of unfavourable season due to which the agricultural production was less than the normal. Thus in 1960-61 agriculture and allied sectors contributed nearly 42 per cent to the State income at constant prices while in 1970-71 the contribution declined considerably to about 27 per cent (for reasons stated earlier). Even then, agriculture continues to be the major source of contribution to the State economy.

### Land use

1.17. The entire land in the State has been cadastrally surveyed and is under the reporting system. The land use pattern under the nine-fold classification adopted in the Annual Season and Crop Report as well as the classification under the six broad groups (I to VI) adopted in the Census is presented in the Table No. 1.1 below for

the country and the State, the area figures being the averages for the years 1966-67 to 1969-70 :

TABLE NO. 1.1

Item of land use	Maharashtra State		Indian Union	
	Area under land use (in lakh)	Proportion of col. 2 to total reporting area	Area under land use (in lakh)	Proportion of col. 4 to total reporting area
1	2	3	4	5
	ha.	%	ha.	%
I. Land not available for cultivation—				
(a) Forests .. .. .	54.1	17.6	637.7	20.8
(b) Area under non-agricultural use ..	6.9	2.2	156.5	5.1
(c) Barren and uncultivable land ..	17.7	5.8	317.8	10.4
Total ..	78.7	25.6	1,112.0	36.3
II. Other uncultivated land excluding fallow land—				
(a) Permanent pastures and other grazing lands.	13.9	4.5	135.8	4.4
(b) Land under miscellaneous tree crops and groves not included in the net area sown.	1.9	0.6	41.3	1.4
Total ..	15.8	5.1	177.1	5.8
III. Other fallows .. .. .	11.4	3.7	91.0	3.0
IV. Culturable waste .. .. .	7.4	2.4	163.6	5.4
V. Current fallows .. .. .	11.0	58.6	1,130.2	44.3
VI. Net sown area .. .. .	183.4	59.6	1,382.8	45.2
Total reporting area ..	307.7	100.0	3,056.7	100.0

The total geographical area of the State is about one-tenth of the corresponding area of the country. The proportions of net sown area in the State and to some extent that of the area not available for cultivation and cultivable waste are markedly different from the corresponding proportions in the country. Thus, the percentage of net sown area to the geographical area is relatively large in the State as compared with that in the country. On the other hand, the percentages of area covered by forests, area under non-agricultural use, barren and cultivable waste land in the State are smaller than those of the corresponding figures of land use in the country.

1.18. The average area under different categories of land utilization in the State during Second and Third Plan periods and the period from 1966-67 to 1969-70 is given in the Table No. 1.2 below which shows that the proportionate area under cultivation has shown a gradual increase during the three periods. The percentage area under forests remained unchanged. The percentage of area under the remaining categories marginally declined.

TABLE No. 1.2

*Land use pattern in Maharashtra*

(area figures in '00' ha.)

Land use	2nd Five Year Plan		3rd Five Year Plan		1966-67 to 1969-70	
	Area	Percentage	Area	Percentage	Area	Percentage
1	2	3	4	5	6	7
1. Total reporting area ..	3,08,514	100.0	3,07,678	100.0	3,07,682	100.0
2. Forests ..	54,197	17.6	54,231	17.6	54,126	17.6
3. Not available for cultivation (i.e. land under non-agricultural use, barren and uncultivable land).	25,649	8.3	24,899	8.1	24,580	8.0
4. Other uncultivated land excluding fallow land :—						
(a) Permanent pastures and other grazing lands, land under misc. tree crops not included in net area sown.	16,516	5.4	15,793	5.1	15,739	5.1
(b) Culturable waste ..	8,831	2.9	8,823	2.9	7,395	2.4
5. Fallow lands—						
(a) Current fallows ..	12,037	3.9	11,333	3.7	11,014	3.6
(b) Other fallows ..	12,829	4.1	11,337	3.7	11,422	3.7
6. Net area sown ..	1,78,455	57.8	1,81,262	58.9	1,83,406	59.6
7. Gross Cropped area ..	1,87,445	60.8	1,90,841	62.0	1,93,112	62.8

Note.—(i) Figures for the 1st Five Year Plan period for the reorganised State are not available.

(ii) Figures for the 2nd Five Year Plan period are based on 4 years' figures i.e. 1957-58 to 1960-61.

**Crop pattern**

1.19. The average areas under principal crops for the Second and the Third Five Year Plans and the period from 1966-67 to 1970-71 are given in the following Table No. 1.3. The gross cropped area in the State increased from 187.5 lakh hectares in the Second Plan period to 193.3 lakh hectares in the period 1966-67 to 1970-71 i.e. by about 1.8 per cent. Generally, the area under rice, bajri, wheat, cotton and sugarcane increased and that under rabi jowar and groundnut declined in the post Third Five Year Plan period as compared to the Second Five Year Plan period. However, no material changes in the proportionate area under different crops over the three periods are observed.

TABLE No. 1.3

*Average area under principal crops in Maharashtra*

Crop	Average area in lakh ha.			Percentage to gross cropped area		
	II Plan	III Plan	1966-67 to 1970-71	II Plan	III Plan	1966-67 to 1970-71
1	2	3	4	5	6	7
1. Rice ..	12.58	13.40	18.40	6.7	7.0	6.9
2. Wheat ..	9.06	8.79	9.45	4.8	4.6	4.9
3. Kharif jowar ..	25.07	25.31	25.37	13.4	13.3	13.1
4. Rabi jowar ..	34.16	35.81	33.16	18.2	18.8	17.2
5. Bajri ..	17.69	17.28	20.26	9.4	9.1	10.5
6. Total cereals ..	103.45	105.22	105.31	55.2	55.1	54.5
7. Total pulses ..	24.43	23.78	25.74	13.0	12.5	13.3
8. Total foodgrains ..	127.88	129.01	131.05	68.2	67.6	67.8
9. Sugarcane ..	1.24	1.51	1.80	0.7	0.8	1.0
10. Cotton ..	25.44	27.39	27.31	13.0	14.4	14.1
11. Groundnut ..	11.28	11.28	9.35	6.0	5.9	4.8
12. Gross cropped area ..	187.45	190.85	193.29	100.0	100.0	100.0

### Productivity of important crops

1.20. Data on productivity of different crops were not collected in the Census. Hence the data on this aspect are not available at the holding level but only at the district level in the Annual Season and Crop Report. The average yields per hectare of principal food and non-food crops for the State are determined on the basis of the data collected through the crop estimation surveys, conducted on random sampling principle. Barring a few minor crops, all the important crops of the State are covered by the crop estimation surveys. The average yields per hectare for different principal food and non-food crops in the State are presented in Table No.1.4. The yield rates of wheat and sugarcane had shown an increasing trend over the period and that of tur and pulses a declining trend. The yields per hectare of other crops did not show any consistent trend in their variation over the four periods.

TABLE No. 1.4

*State average yields of principal crops for the successive Five Year Plan periods*

Crop	Average yield per ha. during				Increase (+) or decrease (-) in col. 3 over col. 2	Increase (+) or decrease (-) in col. 4 over col. 2	Increase (+) or decrease (-) in col. 5 over col. 2
	1st Plan	2nd Plan	3rd Plan	1966-67 to 1970-71			
1	2	3	4	5	6	7	8
	Kg.	Kg.	Kg.	Kg.	(per cent)	(per cent)	(per cent)
Rice ..	939	1,023	989	1,017	+18.9	+5.3	+8.3
Wheat ..	400	406	456	466	+1.5	+9.0	+16.5
Kharif jowar ..	N.A.	663	579	637	....	-12.7**	-3.9**
Rabi jowar ..	N.A.	476	430	451 *	....	-9.7**	-5.3**
				(404)			
Bajri ..	234	273	267	312	+16.7	+14.1	+33.3
Total cereals ..	469	651	517	+530	+17.7	+10.5	+11.1
Tur ..	767	661	572	489	-13.8	-25.4	-36.2
Gram ..	337	319	329	292	-5.3	-2.4	-13.4
Total pulses ..	385	358	341	313	-7.0	-11.4	-18.7
Total foodgrains	451	514	484	491	+14.0	+7.3	+8.9
Sugarcane	7,116	7,562	7,662	9,268	+6.3	+7.7	+30.2
(Average yield in terms of gur)							
Cotton (Average yield in terms of lint)	70	85	77	82*	+21.4	+10.0	+17.1

Note.—N.A. =not available.

\* These are averages of 4 years' annual yields by excluding the average yield of one very unfavourable season while the figure in bracket refer to averages based on all the 5 years' annual yields, i.e. 1966-67 to 1970-71.

\*\* Percentage based on Col. 3

### Irrigation

1.21. The first large scale irrigation work in Maharashtra was the Krishna Canal which was opened in 1870. During the British regime, reservoirs were built at Khadakwasla, Bhatgar, Bhandardara, Chankapur and Darna during the period 1870 to 1920. In the Vidarbha region, irrigation from eight tanks (at Ramtek, Ghorazeri, Asola-Mendha, Nalleshwar, Chandur, Bodalkasa, Khairbandh and Ghormhamara) was started in the first two decades of the current century. In the Marathwada region, no fair sized work was completed till 1954. Hence the well continued to be the major source of irrigation. Taking into account all sources of irrigation, the level of development of irrigation in Maharashtra was far below that of most of the other States in the country and continued to be so even now. While the net irrigated area in Maharashtra was less than 5.3 per cent, it was quite high, ranging from 25 to 46 per cent in other States like the Punjab, U. P., Tamil Nadu, Andhra Pradesh and Bihar (based on the average of 3 years 1956-57 to 1958-59). However, during the period 1960-61 to 1970-71, 45 major and medium irrigation projects and 370 minor irrigation projects were completed in the State.

1.22. In the last 19 years i.e. from 1952 to 1970 the net irrigated area in the State increased by 5·80 lakh hectares. About 73 per cent of this increase in irrigated area is attributed to additional number of wells constructed during the above period. The Table No. 1.5 gives the progress made in the sourcewise irrigated area during the 19 years.

TABLE NO. 1.5  
*Sourcewise irrigated area (figs. in '000' ha)*

Source	1951-52	1969-70	Increase in 1969-70 over 1951-52
1	2	3	4
	ha.	ha.	per cent
Government canals .. .. .	208(24%)	280(20%)	34.6
Private canals .. .. .	23(3%)	32( 2%)	39.1
Tanks .. .. .	179(21%)	225(16%)	25.1
Wells .. .. .	405(48%)	821(57%)	102.6
Other sources .. .. .	36( 4%)	73( 5%)	102.8
Total .. .. .	851(100)	1,431(100)	68.1

1.23. Maharashtra is, thus seen to be largely a dry region with proportionately large area under dry cultivation than in the country as a whole. Due to wide variation in soil and climate, there are as many as nine Agro-Climatic Zones. Consequently there is a wide spectrum of cropping pattern with varying yield rates of crops within the State. It is also seen that the yields per hectare did not generally show consistent increase and the land *per capita* had declined.

## CHAPTER II—CENSUS ORGANISATION

### Structure of Census Organization

2.1. An operation as massive and extensive as an agricultural census requires a special organisation to be created for the purpose. Generally this is done by building up the requisite organisational structure within the government department mostly concerned with it. Since any existing organisation within such a government department is not capable of coping with the responsibility of the census without allowing its normal work to suffer, a horizontal expansion of such an organisation within the concerned department is carried out for the purpose of carrying out the census work. The scale and type of this expansion depends upon the strengthening of the existing organisation that is required to meet the extra quantitative and qualitative demands which the census would make on it. The duration of this incremental organisation created as a result of the expansion is also co-terminus with the duration of the census operation.

2.2. In Maharashtra, however, a different course was adopted. The Census organisation was created by a vertical combination of the two major statistical organisations of (a) the Department of Agriculture, (b) the Directorate of Economics and Statistics in the State. This was done firstly for economising the expenditure and secondly but not less importantly, for utilising, for the two major operations of the Census, the two organisations which had the best expertise and which were best equipped to carry them out. Thus the two major Census operations of (a) the collection of the Census data and (b) the processing of the data, were entrusted to the above two statistical organisations, respectively.

### Central organisation

2.3. The Secretary to Government, Agriculture and Co-operation Department was nominated as the State Agricultural Commissioner with two Deputy Census Commissioners appointed respectively for the two operations in the above two organisations. While the Director of Economics and Statistics was designated as Deputy Agricultural Census Commissioner (Mechanical Tabulation), the post of Deputy Commissioner (Agricultural Census) for Census operations was created in the Directorate of Agriculture and the then Senior Statistician of that office was appointed to that post. He was also entrusted with the responsibility of the last stage of the Census operations namely that of writing the report thereon. The details of the organisations created for (i) Census operations and (ii) processing of the data, are described separately under the paragraphs 2.6 and 2.26, respectively.

### Appointment of State Advisory Committee

2.4. In accordance with the suggestion made by the Agricultural Census Commissioner, Government of India, a State Advisory Committee was set up consisting of the following members to render advice on the various aspects of the Census programme in June, 1971 :

1. State Agricultural Census Commissioner and Secretary to Government of Maharashtra, Agriculture and Co-operation Department. Chairman
2. Shri M. Subramanian (by name), Industries Commissioner .. Member
3. Deputy Secretary to Government, Revenue and Forests Department. Member
4. Deputy Secretary to Government, Agriculture and Co-operation Department. Member
5. Deputy Secretary to Government, Rural Development Department. Member
6. Director of Agriculture, Maharashtra State, Pune .. .. Member
7. Director of Economics and Statistics, Bombay .. .. Member

- |   |    |    |        |
|---|----|----|--------|
| 8. Deputy Commissioner (Agricultural Census), Pune  | .. | .. | Member |
| 9. Deputy Director, Government Printing & Stationery, & Manager, Government Printing-Press, Bombay. |    |    | Member |
| 10. Statistician, Irrigation & Power Department   | .. | .. | Member |
| 11. Deputy Statistician (Agricultural Census), Pune   | .. | .. | Member |
| 12. Assistant Director of Publicity   | .. | .. | Member |

2.5. The Committee met from time to time and took decisions relating to specific allotment of responsibilities to the different agencies concerned and for reviewing the progress of the Census in all its aspects. The bottlenecks in the smooth implementation of the Census scheme and difficulties encountered were also removed promptly as and when they arose. This was particularly helpful in view of the time-bound nature of the Census.

### Organisation for Census Operations

2.6. At the State level, as mentioned earlier, a whole time Statistical Officer, designated as the Deputy Commissioner (Agricultural Census) was appointed in the Directorate of Agriculture, Pune, to plan and organise the Census as also its supervision, give technical guidance to the District Census Officers and others concerned, exercise overall control of the field operations and to draft the report on the Agricultural Census. He was assisted by a Deputy Statistician (Agricultural Census) in the discharge of these responsibilities. The Deputy Statistician (Agricultural Census), Pune, also headed the manual and mechanical tabulation unit created in the Directorate of Economics and Statistics and he was deputed to Bombay for this purpose during the period of the tabulation of data.

2.7. At the State headquarters, one post of Assistant Statistician and two posts of Senior Statistical Assistants were also created for a period of 5 months to provide assistance to the Deputy Commissioner (Agricultural Census) in carrying out the test checking of the Census work, particularly in the problem areas.

2.8. In each district, one (senior) Deputy Collector in the collectorate was designated as the Assistant Agricultural Census Commissioner (Administrative Coordination) and was entrusted with the executive responsibility of getting the Census work done by the talathis in time and coordinating the work of the Census in the district. The District Statistical Officer of the Directorate of Economics and Statistics in each district was allotted the responsibility of looking after the technical aspects of the Census and was designated as the Assistant Agricultural Census Commissioner (Technical Coordination).

In order to help him carry out these functions, especially during the peak period of the Census operations, one post of Senior Statistical Assistant in each district was created under the Census Scheme for a period of five months.

2.9. The present Census was based on the data available in the land records. These land records in the State are maintained by the talathis at the village-level under the supervision of the Revenue Inspectors for a group of villages in the tahsil, by the Tahsildar at the tahsil level and the Collector at the district level. Consistent with this, it was absolutely necessary to involve these agencies in the collection of the basic data of the Census and its supervision. The primary data for agricultural holdings of the village were extracted by the talathi and the prescribed registers and schedules filled in. At the circle level, the Revenue Inspector exercised close control over the work of the talathis, while at the taluka level, the Tahsildar exercised administrative and supervisory control over the work of the Revenue Inspectors. The Block Statistical Assistants carried out the important work of the scrutiny of the final returns and, checking of the aggregations of the Census figures at the village level, under the guidance of the District Statistical Officers.

### Supervision of the Census operations of the fieldwork

2.10. For increasing the scale of supervision, the assistance was taken also of other staff of the technical departments, like the Research Assistants of the District Statistical Officers, the Assistant Statisticians and the Statistical Supervisors of the Agriculture Department, Block Statistical Assistants of the Zilla Parishads, the District Inspectors and the Assistant District Inspectors of the Land Records Department.

2.11. Supervision was divided into two phases. In the first phase, stress was laid on giving a proper and correct start to the field work and was meant to be a rapid check so as to cover as many talathis in the State as possible. It was initiated shortly after the commencement of the Census. The second phase of the supervision programme was organised on a rationalised basis, the emphasis being on assessing the quality of the Census work.

2.12. The first phase supervision was carried out in respect of 4,231 villages and covered 48 per cent of the talathis. The second phase supervision was carried out in respect of 4048 villages or 69 per cent of the villages allotted for supervision. The deficiencies noticed in the Census returns under both the first and second phases of the supervision programme, were brought to the notice of the Revenue Inspectors who arranged to get them rectified not only in respect of the returns of the villages checked, but also those of other villages wherever such or other deficiencies were noticed.

### Decision to undertake the Agricultural Census and methodology adopted for collection of data

2.13. The decision of the Government of India for undertaking an agricultural census on a countrywide scale was received by the State Government in November, 1969. It was desired that the primary unit of collection of data should be an operational holding and information should be collected for essential characteristics of the operational holdings viz., (i) number and size, (ii) land use, (iii) area under crops, (iv) irrigation and (v) tenure and tenancy. The information on these items is already recorded and maintained at the village level by the revenue agency for each parcel of land as a bye-product of revenue administration. Hence, in the States having detailed land records, the methodology adopted for conducting the Census was to collect the data through the retabulation of the same from the revenue records.

### Preparatory work done prior to the Census

2.14. The following preliminaries were completed prior to the commencement of the Census:—

(i) *Updating of land records.*—Action was taken by the Statistics Division of the Department of Agriculture for initiating the preliminaries relating to the Census. Intensive tours in the different parts of the State were undertaken by the then Senior Statistician and his technical officers of Statistics Division to check the completeness of the entries, deficiencies and lapses, if any, in the village land records. The findings of the officers were communicated to the Collectors so as to effect necessary improvements in the land records. Further, Government declared 1970-71 as 'Land Records Year' and issued instructions for—

(a) updating the relevant land records viz. mutation registers, tenancy registers, khata registers, etc.,

(b) carrying out the crop inspection more carefully and in time,

(c) recording the name of actual tiller of the lands with tenurial status of the cultivator in relation to land cultivated,

(d) correct recording of irrigation statistics and the source of irrigation.

(ii) *Orientation meetings.*—Divisional orientation meetings of the Revenue Sub-divisional Officers were held in each division under the Chairmanship of the Revenue Commissioner, in the month of September, 1970, by the then Senior Statistician of the Agriculture Department for explaining—

(a) the methodology to be adopted in the Census and the action to be taken in bringing the records up-to-date,

(b) the special care to be taken in carrying out crop inspection during 1970-71, and

(c) the types of mistakes normally noticed in the crop inspection registers and other relevant records maintained by the talathis.

An all out effort was made with the help of the senior revenue officers to get the mutations regarding tenurial rights carried out in village records and get the crop inspection done during 1970-71 with greater care and accuracy.

(iii) *Pilot Census*.—A Pilot Agricultural Census was carried out in one revenue circle in each of the five regions of the State which had either different land record systems or which had special problems to be studied. The regions considered were (a) Deccan, (b) Konkan, (c) Marathwada, (d) former Berar districts and (e) former C. P. districts of Nagpur Division. The following aspects were studied in the Pilot Census :—

- (1) The operational problems likely to be confronted in the field work,
- (2) The time involved in the conduct of the Census,
- (3) The volume and work-load involved in the processing of the data by manual and mechanical tabulation procedures,
- (4) Finalisation of the schedules and instructions for the main Census.

On the basis of the experience gained in the Pilot Census, the following steps were taken while planning the main Agricultural Census :—

(a) The field work involved in the retabulation of the data of about 5 million holdings with each holding having parcels of land located in the same village or different villages, was a stupendous task. In this process, human errors in posting the entries and in aggregating the figures were likely to occur. Hence, in order to avoid such mistakes, internal checks were provided right at the stage of compilation of individual holdingwise data.

(b) Handling lakhs of holdingwise schedules and keeping an account of the same as well as their storage would have created serious problems, if individual holdingwise schedules were prescribed. Hence in the main Census, registers were prescribed, first for posting the parcelwise details of each holding and aggregating information to give holdingwise data.

(c) The mechanical tabulation of holdingwise data would have been unduly costly and unmanageable. Hence a manual-*cum*-mechanical tabulation procedure was adopted and a separate Census register was prescribed at the village level for posting the holdingwise information in each size-group and aggregating the figures for each size-class manually.

(d) To collect the information for plural holdings, a suitable method was evolved.

#### Schedules prescribed for collecting Census data

2.15. In order to streamline the work of compilation of the Census data, based on the considerations stated in the preceding paragraph, the following three registers and two schedules were prescribed :—

Register/Schedule	Information to be recorded
1. Register A	.. Parcelwise details of each complete holding in the village.
2. Register B	.. Parcelwise details of each incomplete (part) holding in the village.
3. Register C	.. Holdingwise abstract posted in separate pages allotted to each size-group.
4. Green schedule	.. Parcelwise details in respect of individual incomplete holdings (as taken from Register B) for being communicated to the concerned talathi.
5. White schedule	.. The data in respect of each completed (i.e. plural) holding collected on the basis of the complete information obtained for each part holding of the plural holding.

#### Printing of schedules

2.16. The printing of the Census registers/schedules posed a big problem as the requirement of paper and printing material were of such huge proportions that the resources of the Government Printing and Stationery Department were not adequate to meet

the same. Special efforts had therefore to be made to get the schedules printed in time. The volume of printing involved was as follows.

Register/Schedule	No. of copies printed (in lakh)
1. Registers A & B (each) .. .. .	1.87
2. Green and white schedules .. .. .	28.80
3. Register C .. .. .	1.71
4. Booklets of Instructions pertaining to the conduct of the Census, supervision of field work etc. .. .. .	0.69
5. Proformae of supervision reports and progress reports .. .. .	1.00

### Publicity

2.17. As this was the first Agricultural Census being undertaken in the State based on the method of complete enumeration, wide publicity was given through the usual publicity channels with the help of the State Publicity Department. Pamphlets printed in Marathi giving the relevant particulars of the Census were distributed to the extension agencies and also for being kept in the each village revenue office. This was helpful in getting the cooperation of the farmers in ascertaining the information on plural holdings in each village.

### Training

2.18. Detailed and self-explanatory instructions for the conduct of the Census were drawn both in English and Marathi covering every aspect of the Census including concepts and definitions, checks to be applied, procedure for conducting the Census, right from the listing of the holdings to the final stage, with suitable illustrative practical examples. Intensive training was given particularly to avoid incorrect interpretation of the concepts and definitions, incomplete coverage or omission of information and inconsistency of data. Separate instructions relating to the supervision of the Census work were also drafted for the guidance of the supervisory agencies.

2.19. The training of workers at all levels was a major aspect of the Census operation. The organisation of the training of thousands of field workers involved in the Agricultural Census in a short period was a huge task. A two-tier training programme was therefore arranged (i) one at the divisional level for the officers who were to impart training to the field staff along with other higher officers associated with the Census and (ii) the other at the tahsil level for the benefit of the field and supervisory staff at that level.

2.20. The divisional training classes were conducted for two days by the Deputy Commissioner (Agricultural Census) and the Deputy Statistician from the 12th to 30th July 1971 and were inaugurated by the respective Divisional Commissioners. These classes were attended by the concerned Deputy Collectors of the Revenue Department, Assistant Statisticians of the Statistics Division of the Agriculture Department, the Divisional and District Officers of the Directorate of Economics and Statistics and Land Records Department.

2.21. As soon as the training class in one division was over, the training of the field and supervisory staff was arranged in each district of that division immediately thereafter, with the help of the District Statistical Officers and Assistant Statisticians of the Agriculture Department. The entire training programme was thus completed within a month. The exact procedure to be followed in preparing the list of operational holdings, the checks to be applied for ensuring the complete coverage of each village by the Census were explained in detail, in a practical manner with the help of the schedules. Intensive training was given, particularly to avoid incorrect interpretation of the concepts and definitions, incomplete coverage or omission of information and inconsistency of data. Those village officers, who due to unavoidable circumstances, could not attend the training class, were assembled subsequently at the district headquarters and given training.

2.22. The above training classes at the tahsil level were supervised at some places by the Deputy Commissioner (Agricultural Census), Deputy Statistician (Agricultural Census), the then Senior Statistician and the Deputy Statisticians of the Agriculture Department and Deputy Directors of the Directorate of Economics and Statistics.

#### **Date of commencement and completion of the Census enumeration**

2.23. The Census commenced in the State on the 16th August, 1971, in most of the tahsils. In a few tahsils, it commenced a couple of weeks later, as the training itself was delayed in some cases. The compilation of the Census data by the field staff was completed in most of the districts before the end of June, 1972, while only in a few districts namely, Satara, Aurangabad and Ratnagiri, it was prolonged to the end of November, 1972.

#### **Organisation for processing of data**

2.24. The Director of Economics and Statistics was designated as the Deputy Agricultural Census Commissioner (Mechanical Tabulation) as mentioned earlier. He was actively assisted by a senior officer from his office in the discharge of all the duties assigned to the Director as Deputy Commissioner. Both these officers were entrusted with these duties in addition to their normal work. The Directorate was actively associated in all the stages of planning of the Census such as designing the various schedules and drafting the instructions for the field work.

2.25. As mentioned earlier, the procedure adopted for the collection of data in the State had some unique features which facilitated the subsequent mechanical tabulation of the data. It was based on manual-*cum*-mechanical tabulation approach for (a) ensuring fairly good quality of data prior to their mechanical processing and (b) reduction in work involved in mechanical tabulation and making it more manageable. Administratively, the work of tabulation was divided into two sections—(i) Scrutiny section and (ii) Punching section.

2.26. The first section consisted of 60 computers along with the supervisory staff. Since the incumbents to the posts of computers were fresh recruits, they were required to be trained in this work to enable them to handle this voluminous work in the stipulated time of about a year. This section was administratively under the Deputy Statistician (Agricultural Census) who was assisting the Deputy Commissioner (Agricultural Census) at Pune in the Census operations. This arrangement made it possible for the Deputy Statistician (Agricultural Census) and Deputy Commissioner (Agricultural Census) to get the opportunity to know the glaring errors and inconsistencies in the data wherever observed in the broad pre-punch scrutiny organised for this purpose. It also facilitated in taking up speedy measures for removing such deficiencies, etc. before the data were transferred on the punch cards.

2.27. The second section consisted of 30 Punch Operators and supervisory staff mostly drawn from the Tabulation Unit of the Directorate. It was created essentially for transferring the data on to punch cards.

2.28. All the village-wise Census registers (Register C) containing holdingwise details and their aggregates for each size-class were received at a central place in the scrutiny section referred to above. Broad scrutiny of the data in the registers was carried out in that section and corrections made wherever necessary. Thereafter, the aggregated figures for all the holdings together, falling in each of the size-classes of a village were transferred to a specially designed schedule which enabled the supply of clean and legible data to the Punching section. This arrangement helped in considerably reducing the workload in punching and its further processing on the computer. If individual holding-wise-data had been transferred on punch cards, about 80 to 90 lakh cards would have been required. As against this, in the scheme adopted in the State, only about 15 lakh cards were required.

2.29. Apart from scrutiny and transfer of data in the specially designed schedules, the Scrutiny section also carried out other duties viz., checking the receipt of information from all the villages, assigning of code numbers to villages, preparation of dummy data for trial runs on computer, effecting corrections detected in the validation programme of the computer.

2.30. The Officer incharge of the Punching section, in addition to getting the data punched according to time schedule maintained close liaison with the commercial Computer Agency to which the work of computerisation was entrusted on contract basis. The technical requirements for getting the data computerised were decided by the Directorate of Economics and Statistics. The computerised results were presented not only for the State as whole divisions and for the districts but also for each of the tahsils and panchayat samitis. The entire work of tabulation was completed in a period of 15 months.

## CHAPTER III—DEFINITIONS AND DATA SOURCES

### Concepts and definitions

3.1. The concepts and definitions adopted in the Agricultural Census are briefly stated below, while more detailed explanatory notes on some of these are given in the Annexure IV at the end of the report. The sources of data, criteria followed in determining operational holdings and procedure followed in the Census are given in this Chapter.

(i) *Operational holding*.—A holding for the Census purposes was all the land which was used wholly or partly for agricultural production and was operated as one technical unit by one person alone or with others, without regard to title, legal form, size or location.

(ii) *Technical unit*.—A technical unit was the unit which, under the same management, had the same means of production, such as labour force, machinery and animals.

(iii) *Holding*.—The holding might consist of one or more parcels of land, provided all the separate parcels formed a part of the same technical unit and were situated in the same tahsil. If an operator was cultivating lands located in two different tahsils, the lands located in one tahsil taken together comprised one operational holding, while those in the other tahsil formed a second operational holding.

A parcel of land here refers to the smallest cadastral unit viz., a pot-hissa or a survey number itself (in case the survey number had no sub-division) i.e. the smallest piece of land for which particulars of tenurial rights and crop statistics are maintained in the basic village form (village form VII-XII or Khasra register). This definition though differing from that given by the F.A.O. and recommended by the Government of India, has been adopted for convenience, as it afforded easy and quick identification of the components of a holding particularly when the Census was to be done only by retabulation of data.

(iv) *Single, part and plural holdings*.—A single holding was one having all its component parcels of land located in the same village. As against this, holding consisting of parcels of land located in two or more villages was defined as a plural (or multiple) holding and those parcels of land of such a holding in one village together constituted a part (or incomplete) holding for that village.

(v) *Agricultural production*.—Agricultural production for Census purposes included the growing of field crops, fruits, grapes, nuts, seeds, tree nurseries (except those of forest trees), bulbs, vegetables and flowers, production of coffee, tea, cocoa, rubber, jute, oilseeds, fodder, grass, etc.

(vi) *Operator or holder*.—The holder or operator was the person who had the responsibility for the operation of the agricultural holding. He exercised the technical initiative and responsibility for the operation of the holding and might have the full economic responsibility as an owner or shared it with others as a tenant. When two or more persons jointly (as partners) shared the economic and technical responsibility for the operation of an agricultural holding, each was to be considered as the holder if they belonged to different house-holds.

(vii) *Total area of the holding*.—The total area of the holding should include the total of all land forming part of a unit which was under the same technical responsibility and management. It should also comprise the land occupied by the farm buildings, including the house of the holder, provided such buildings were within the operated area. If the farm buildings were located outside the operated area and were covered under 'Abadi' area, then such buildings should not be included in the area of the holding.

(viii) *Type of holding*.—Holdings were classified into two types : individual holdings and joint holdings.

*Individual holdings.*—The concept of holding used in the Census was one of individual as against a family holding. If more than one individual member of the same family held land in their individual names (and were shown in the record as such), their holdings were considered to constitute as many separate holdings. Land might be held by individual persons or by institutions for cultivation. Land held by an institution (like State Farming Corporation, Research Station, Seed Farm, Co-operative Farm and others) and cultivated under its management was included under the category of individual holdings.

*Joint holdings.*—Land held jointly by more than one individual constituted a joint holding. For the purpose of the Census, if the land was held jointly but shares of partners were specified, such land did not constitute a joint holding.

(ix) *Tenure.*—Since an operational holding consisted of land owned and leased in, information was collected for both owned and rented land, indicating the occupancy status of the operator in case of each parcel of land.

An owner was considered to be the owner of a piece of land, if he had the right of permanent heritable possession with or without the right to transfer the title. A plot of land might be leased out to another person by the owner of the plot without losing the right of permanent heritable possession.

Land owned or held in owner-like possession will include—

(a) land held directly from Government under a grant, lease or assignment with rights of (i) permanent heritable and transferable possession and (ii) permanent and heritable possession but without the right of transfer,

(b) land held from persons other than Government with rights of (i) permanent, heritable and transferable possession and (ii) permanent heritable possession but with or without the right of transfer.

(x) *Area rented.*—Area rented in by a tenant (other than those who are treated as owners by virtue of owner-like possession), who has possession of land without the right of ownership, constituted the area rented in, by the tenant.

(xi) *Land utilisation.*—The area under an operational holding was classified into six categories according to the utilisation of land. These categories with definitions are given below :—

*Category I : Net area sown.*—This represented the total area sown with crops or orchards, counting the area sown more than once in the same year only once.

*Category II : Current fallows.*—This represented the cropped area which was kept fallow during the year. For example, if any seedling area was not cropped in the same year, it was treated as current fallow.

*Category III : Other uncultivated land excluding fallow land.*—This included permanent pastures and other grazing lands and land under miscellaneous tree crops, etc within the cultivated holdings.

(a) *Permanent pastures and other grazing lands.*—This included all grazing lands, whether they were permanent pastures and meadows or not.

(b) *Land under miscellaneous tree crops, etc.*—This include all cultivable land which was not included in the net area sown but put to some agricultural use. Lands under casurina trees, thatching grasses, bamboo bushes and other groves used for fuel etc. which were not included under orchards were classed under this category.

*Category IV : Fallow lands other than current fallows.*—This included all lands which were taken up for cultivation but were temporarily out of cultivation for a period of not less than one year and not more than five years. The reasons for keeping such lands fallow might be one or more of the following :—

- (a) poverty of the cultivators,
- (b) inadequate supply of water,
- (c) malarial climate,

- (d) silting of canals and rivers, and
- (e) unremunerative nature of farming.

*Category V : Not available for cultivation.*—This included forests, area under non-agricultural uses and barren and uncultivable land:—

(a) *Forests.*—This included all lands classed as ‘forests’ under any legal enactment dealing with forests or administered as forests, whether State-owned or private and whether wooded or maintained as potential forest land. The area of crops raised in the forests and grazing lands or areas open for grazing within the forests should remain included under the forest area. Only private forests were covered for the purposes of the Agricultural Census.

(b) *Area under non-agricultural use.*—This should include all lands occupied by buildings, roads and railways or under water, canals and land put to uses other than agriculture. However, such lands within the cultivated holdings were covered by the Census.

(c) *Barren and uncultivable land.*—This included all barren and uncultivable land like mountains, desert, etc. Land which cannot be brought under cultivation unless at a high cost, was classed as uncultivable whether such land is in isolated blocks or within cultivated holdings. For the purpose of Agricultural Census, uncultivable land within the cultivated holdings alone were covered.

*Category VI : Culturable waste.*—This included lands available for cultivation or taken up for cultivation once but not cultivated during the reference year and the last five years or more in succession for one reason or the other. Such lands might be either fallow or covered with shrubs and jungles which were not put to any use. Culturable waste land within the holding was alone covered by the Census.

Total of all the six categories as mentioned above comprised the total geographical area of the holding in question.

(xii) *Irrigation.*—A crop receiving water from a source in addition to natural precipitation was classed as irrigated crop, irrespective of the source and number of irrigations given.

(xiii) *Net area irrigated.*—Net area irrigated is the area of land irrigated during a part or the whole year and on which one or more crops are grown during the year. In other words, it is the part of the net sown area that is irrigated.

(xiv) *Gross irrigated area.*—It is the total area under crops grown under irrigation during the year; thus an area of land which has grown two irrigated crops during the year is counted twice and so on.

#### **Land not covered by the Census**

3.2. The basic unit for which the information was collected in the Census, was an operational holding. Consequently, land not belonging to an operational holding was excluded from the coverage of the Census. Thus land under the following categories were excluded from the Census:—

- (a) Government forests and barren lands,
- (b) Government waste land not leased out, allotted or granted to individuals or institutions for cultivation,
- (c) Village common lands, such as those maintained as common pastures or grazing lands and those under the village sites,
- (d) Land under non-agricultural use, such as those covered by buildings, houses and factories and those covered by the public roads, railways, rivers, tanks, etc.

However, lands covered by private forests, pastures or grazing land within the operational holdings and those accounted for, by non-agricultural use within the operational holdings were included in the Census. More details of the lands to be included in an operational holding are given in paragraph 3.4 of this chapter.

### Source of data

3.3. In order to collect the required data for an operational holding, the information under various items covered by the Census, for different parcels of land belonging to the holding was required to be first compiled and consolidated in the forms prescribed. This information for individual parcels was available in various land records maintained at the village level. Since Maharashtra has an excellent land record system and as the entire area of the State is cadastrally surveyed, the details of the land use statistics along with other particulars such as, name of the tiller of the land and mode or status of cultivation with respect to the land are readily available for each parcel. Hence, the basic ownership register, called the Village Form VIII-A or Jamabandi register and the Village Form VII-XII (or khasra) giving the land use statistics and particulars of cultivation, were made use of, in the retabulation of the data for the Census.

### Criteria adopted for determining an operational holding

3.4. With the existing system of land records, a readymade list of operational holdings (i.e. particulars of all the lands cultivated by each farmer) was not available. Moreover, besides the land cultivated by an operator in one village, the lands under his management in other villages and cultivated by him within the same tahsil had to be found out. In order to ensure the correct determination of each operational holding, the field staff was instructed to adopt the following criteria for determining an operational holding :—

(a) Only those parcels of land cultivated (either owned or leased in) by a farmer under one technical unit\* should be treated as an operational holding. If some parcels of lands of a holding were cultivated under one technical unit and others by another technical unit, they should be treated as two operational holdings.

(b) It should include also those parcels of land (in the possession of the operator) occupied by farm house or land put to other non-agricultural purposes, uncultivable lands and pot kharab. However, if the entire area of a holding consisted of non-agricultural lands only, such a holding should be excluded under the Census.

(c) Where some parcels of land of a holding were fallow, they should also be included in the operational holding. However, in case the entire holding consisted of fallow land only (other than current fallows), the holding should be excluded. In case the entire holding consisted of 'current fallows' (i.e. land kept fallow during 1970-71 only), it should be included in the Census.

(d) Government waste lands given out for cultivation should be covered by the Census.

(e) Land belonging to a temple, but cultivated by a farmer as a trustee without incurring any cost of his own and merely as a manager, should be treated as a separate operational holding belonging to the temple and reported as 'cultivation managed by the trustee'. Any land, owned or cultivated by the trustee on his own (reaping the benefits of the cultivation therefrom), would form a separate operational holding and the trustee treated as the operator.

(f) In some villages where consolidation of holdings had been done, the previous cultivators might in a few cases continue to cultivate the lands, although in the records the name of the owner of the consolidated holding was shown. In such cases, the de-jure position (i.e. the one shown in the records) should be taken as the criterion for determining the operational holding.

(g) Where a farmer had raised a loan by mortgaging his lands to an institution like the Land Mortgage Bank, the Record of Rights might show the Bank as the owner till the loan was repaid. But for all practical purposes, the farmer should be treated as the de-facto cultivator. The lands mortgaged should be treated as owned and self-cultivated, if the farmer was actually cultivating his lands.

(h) Grass when naturally and bestowed economic benefits to the cultivator was treated as a crop and included in the net area sown in some districts of the State, while in other districts it was shown as fallow area. The classification of the land utilisation in this respect as recorded in the khasra (V.F. VII-XII) should be taken as the basis for the Census.

(\* Definition given in paragraph 3.1 (ii) of this chapters)

### Joint holdings

3.5. The joint holdings were determined on the basis of following considerations:—

(a) *Land cultivated jointly by members of a family.*—When two or more persons jointly (as partners) shared the economic and technical responsibility for the operation of an agricultural holding, each should be considered as the holder if they belonged to different house-holds. In such cases, the names of all the partners should be entered under the item 'Name of holder'. However, if the persons jointly operating the holding were members of the same house-hold, one of them, say the head, should be considered as the holder.

(b) *Joint holdings with shares specified.*—In some cases, two or more farmers were shown in the Record of Rights as joint holders. Further, their exact shares were also indicated in terms of 'anna'; but the total area of each parcel of land thus cultivated was not split up according to the area operated by each sharer though, on the spot, such separate cultivation existed. In such cases, the land cultivated by each farmer should be treated as belonging to a separate operational holding and all other lands, if any, cultivated by him elsewhere (either in that village or in anyother village in the same tahsil) should be included in that operational holding.

### Procedure adopted for listing operational holdings

3.6. The first task in the Census was the preparation of the complete and correct list of operational holdings, taking necessary care to avoid any omission and duplication of entries. Similarly, a single holding had to be differentiated from a plural holding. To avoid such likely omissions and mistakes and to ensure that the Census covered all the lands cultivated by each operator, when scattered in two or more villages, the talathi used his local knowledge fully and also consulted the knowledgeable farmers, sarpanch, kotwal etc. of the village at a meeting of all such persons concerned, for this purpose.

3.7. The rest of the procedure depended on the land records system prevalent in the districts in the different regions of the State and hence the same is described below separately for each region :—

(i) *Western Maharashtra (Pune and Bombay Divisions).*—The information on ownership holdings with particulars of parcels of land (in each holding) and the names of the owners arranged in the alphabetical order was readily available in the Village Form VIII-A. Since it was reported that over 90 per cent of the farmers in Maharashtra were owner-cultivators, the above village Form was taken as the starting point for preparing the list of operational holdings. However, in order to know as to who was the actual cultivator in respect of each parcel, necessary verification had to be made with reference to the Record of Rights, namely Village Form VII-XII (or *khasra*). To avoid any omission or lapses in this process, the following procedure was followed for listing the operational holdings :

Firstly, a primary list of names of owners in the alphabetical order (as given in the Village Form VIII-A) was prepared and against each name the survey numbers with *pot-hissa* owned by each owner was listed.

Then starting with the first cultivator in the list, verification was made parcel by parcel of land, as to whether it was being cultivated by the owner by reference to the Village Form VII-XII (or *khasra*). The parcels thus cultivated by the owner were ticked off in the list. For those parcels which were not cultivated by the owner, a cross mark was made against them and the name of the actual cultivator for each such parcel was entered in a supplementary list in the alphabetical order along with the particulars of that parcel. In this process, care was taken to see whether the name of the cultivator thus entered in the supplementary list, had not already occurred (being an owner-cultivator) in the primary list; if his name had already occurred, the particulars of land (not owned but) cultivated by him were also shown against his name in the primary list. Again, for each parcel of land for which verification had thus been completed, a tick mark was made at the top of the concerned page of the Village Form VII-XII.

Proceeding in the above manner, the primary list of owner cultivators and the supplementary list of farmers cultivating the lands taken on lease or rent was completed. Thereafter, verification of the all pages of the Village Form VII-XII was made to see whether any particular parcel had remained to be included in one holding or the other. Parcels left out, if any, were included in the respective operational holdings to which they belonged. If a parcel did not belong to any of the holdings already listed, a new holding was formed. In this manner, complete count of all parcels of land in the operated area was ensured.

(ii) *Aurangabad Division*.—In this division, the information regarding the *khatedars* was obtained from the Village Form No. V (or “*Khatawani*”). Using this and the Village Form VII-XII, the primary list of cultivators was obtained and then the procedure as described above was followed for determining and listing the operational holdings in each village.

(iii) *Ex-Berar districts\* of Nagpur Division*.—In these districts, using the ‘*Jamabandi*’ Form and the Crop Inspection Register (“*Pere-patrak*”) the procedure under (i) was followed for listing the operational holdings.

(iv) *Ex-C. P. districts\* of Nagpur Division*.—In these districts, the ‘*Kistabandi Khatawani*’ Form and ‘*Khasra*’ register were used for preparing the list of operational holdings.

### Complete and incomplete (or part) holdings

3.8. Having completed the list of operational holdings of a village, they were classified as ‘complete’ and ‘incomplete’ (single i.e. and par) holdings by a suitable symbol in red ink against each holding of the latter category. Where all the parcels of a holding were situated in one village only, it was termed as a ‘complete’ (i.e. single) holding and where distributed in two or more villages, it was called an ‘incomplete’ (or part) holding for the village and a ‘plural’ holding in the tahsil. The Census data for the complete holdings in a village were recorded in Register-A and for the incomplete holdings in Register-B. The relevant extract of Register-B for each incomplete holding was posted in the Green Schedule.

3.9. As stated in the earlier paragraph, for each part (or incomplete) holding, the talathi ascertained by local inquiry, the names of villages and sazas in which the different components of the corresponding plural holding were located. Where the components of a plural holding were located in the villages within the jurisdiction of the talathi, he pooled the data of the Green Schedules for the plural holding. In case, some of the part holdings were located in villages outside his jurisdiction, the Green Schedules in such cases were sent to his Revenue Inspector for co-ordination. The Revenue Inspector in turn, on receipt of all the relevant Green Schedules, assembled the talathis under him and arranged for getting the plural holdings formed by matching the concerned Green Schedules. In cases of the plural holdings, the parts of which were scattered over 2 more revenue circles, the co-ordination and formation of plural holdings were done at the tahsil level under the supervision of the Tahsildar. The complete data of a plural holding thus formed were posted in the White Schedule.

3.10. The plural holding was included in that village where the operator resided and had part of his holding too. In case, however, the operator had no land in the village of his residence, the plural holding was included in that village where major part of his holding was located.

### Posting the Census data in the final return

3.11. After compiling the holding-wise Census data in Register-A (for the single holdings) and White Schedules (for the plural holdings), the holdings were classified according to size (depending on their area) into 12 size classes as specified under the Census. The holding-wise data were then posted according to size class (to which they belonged) in Register-C which contained separate pages for each size class. From the data thus compiled, size class-wise aggregates under each item were obtained for each village.

(\* Their names are given in paragraph 1.7)

### Units for reporting area statistics

3.12. Instructions were given to report the area statistics in the above registers and schedules in the original units as contained in the village records without making any conversions. The conversion into metric units was done finally at the stage of the computerisation of the data.

### Scrutiny and despatch of returns

3.13. The Census returns (preliminary and final Census Registers) were deposited at the tahsil office by the talathis after the completion of the Census, village by village. Immediately thereafter, the scrutiny of the returns and checking of the village level aggregates for each size class were organised in each tahsil. The Block Statistical Assistant in each panchayat samiti carried out the scrutiny under the guidance of the District Statistical Officers for all the villages. Detailed instructions were given for this purpose. They were specifically instructed to verify among other points, whether all the Census returns had been completely received for all the villages, canvassing had been done for all the holdings in each village, the data showed internal consistency and to check the correctness of village level aggregation for each size class of holdings.

3.14. The records were checked in the presence of the talathis and the concerned Revenue Inspectors who were specially called for this purpose. With their help the defects and deficiencies noticed, if any, in the census returns were removed.

3.15. The final Census returns were then transported to the district collectorate alongwith the list of villages covered by the Census.

3.16. The District Statistical Officer with the help of the technical staff viz., one Senior Statistical Assistant and Research Assistant carried out the scrutiny of the Census Registers in respect of 25 per cent of the villages of each tahsil at the district level. In particular, the completeness of coverage of all the villages in each tahsil was verified using the list of revenue villages sent by the Tahsildar. After a proper verification of the records, scrutiny and reconciliation of discrepancies noticed at the district level, the returns were despatched with a special messenger of the collectorate to the Census Tabulation Unit in the Directorate of Economics and Statistics, Bombay.

### Number of villages covered by the Census

3.17. On receipt of the Census returns in the Tabulation Unit, the list of villages covered by the Census was tallied with that of the Population Census 1971. The number of villages covered by the Agricultural Census was 38,374. The Population Census list 1971 contained 685 villages more. The Agricultural Census did not cover these villages on account of the following reasons :—

- (i) 281 villages had no agricultural holdings at all,
- (ii) 15 villages were merged with other revenue villages,
- (iii) 389 villages were forest villages for which no village revenue records were maintained.

### Proportion of plural holdings

3.18. While collecting the basic data for the Census, information was also obtained regarding the number of complete (i.e. single) and part holdings as also plural holdings in each village and the same is summarised in the Table No. 3.1 below. Out of the total number of 49.51 lakh operational holdings in the State, 91.4 per cent (45.24 lakhs) were single holdings. Hence the State had 4.27 lakh plural holdings (i.e. 8.6 per cent of the total number) which had their components scattered in two or more villages in the same tahsils.

3.19. The proportionate number of plural holdings was higher in all the districts of Nagpur division being 10 to 20 per cent. In Pune and Aurangabad divisions, it varied from 4 to 7 per cent and from 6 to 9 per cent respectively, while in Bombay division it was 11 to 13 per cent in Kulaba, Dhule and Jalgaon districts and 2 to 8 per cent in the remaining districts of that division.

3.20. The total number of incomplete (i.e. part) holdings in the State was 9.96 lakhs. It was relatively large in Jalgaon, Amravati and Chandrapur districts being 0.72, 0.73 and 0.86 lakh, respectively. On an average, a plural holding comprised of 2 to 3 incomplete holdings. The above information will be useful in organising Agricultural Census in future.

TABLE NO. 3.1

Statement showing the number of single and plural holdings as also the part holdings in each district.

District	Complete or Single holdings	Incomplete or Part holdings	Plural holdings	Total number of operational holdings	Proportion of

## CHAPTER IV—ANALYSIS OF CENSUS RESULTS

### Introduction

4.1. The present Census was the first of the type which was based on complete enumeration giving data on the structure of holdings, use of land, crops grown, irrigation and tenancy etc. Through the data carefully collected from the records of over 38,000 villages spread over 26 districts of the State, it is possible not only to provide an account of land uses, based on the analysis of the data but also to study the inter-relationship between the size of holding, tenancy, land use and irrigation.

4.2. The operational holdings were grouped into 12 classes on the basis of their size, the lowest class being 0.5 ha. and below and the highest class 50 ha. and above. Such a grouping serves as a basic classificatory character also for relating other aspects such as tenancy, land use, crop pattern and irrigation to the size of holding.

### Contents of the Census tables

4.3. In order to understand the nature and type of analysis, a brief account of the contents of the tables of Census results is given below:—

Table-I gives the distribution of holdings according to size and their classification according to individual and joint holdings. Table-II gives the size class-wise information regarding irrigation i.e. holdings were grouped according to whether they were wholly irrigated, partly irrigated or wholly unirrigated. Table-III presents distribution of holdings according to whether they were entirely owned, entirely leased in or partly owned and partly leased in. Table-IV furnishes the details of land according to seven different types of land use viz., (i) net sown area, (ii) current fallows, (iii) net cultivated area, (iv) uncultivated area, (v) other fallows, (vi) cultivable waste and (vii) area not available for cultivation. Table-V contains details of area irrigated according to sources of irrigation, such as wells, canals, tanks and others. Lastly Table-VI gives irrigated and total area under different crops.

Tables-I and III taken together provide information on the pattern of land holdings, tenancy and ownership. Tables II, V and part of VI together provide details regarding irrigation. Tables IV and VI taken together provide details of land use. Table VI contains information regarding area under crops.

Since the Census information was collected from the village records which did not contain data on the per hectare yield of crops and their total production, the same could not be covered in the Census.

The six tables containing the Census results are given in Part-II of the report for the State as a whole, for the administrative divisions and for the 26 districts of the State. The description of the contents of the tables is given in the Appendix-I to this report.

### Discussion of results

4.4. The results of the Census are discussed in three sections. Section-I deals with the coverage of the Census and the salient results of the Census in an overview. In Section-II are discussed the district-wise results of the Census, while in section-III are given the results of the Census related to the size class of holdings.

## SECTION I

### Coverage

4.5. By definition, the Census covered land within the operational holdings, leaving out land under occupation by the State and also in certain cases not in agricultural use. The total area covered by the Census was, therefore, less than that of the official statistics namely, those published in the Annual Season and Crop report. Thus, as against the State total geographical area of 308 lakh hectares of land according to official statistics,

the Census covered only 212 lakh hectares of operated land i.e. 68.8 per cent as is seen from the Table No. 4.1 below:

TABLE NO. 4.1

*Census coverage and land use*

(area in lakh ha.)

Land use	Area based on	
	Official Statistics	Census data
1	2	3
1. Land not available for cultivation—

(b) Land put to non-agricultural use .. .. .	9	*
(c) Barren and uncultivable land .. .. .	18	*
Total .. .. .	81	11
2. Uncultivated land—		
(a) Pastures .. .. .	17	*
(b) Land covered by miscellaneous tree crops etc... .. .	2	*
Total .. .. .	19	6
3. Cultivable waste land .. .. .	15	8
4. Other fallows (fallows other than current fallows) .. .. .	8	5
5. Current fallows .. .. .	8	8
6. Net sown area .. .. .	177	173
Grand Total .. .. .	308	212

\* Separate figures not available.

(Note—The figures in the last column do not add up to the total due to rounding.

4.6. The net sown area covered by the Census was 173 lakh ha. and is close to that of the official statistics of the State. Land not covered by the Census consisted mainly of two categories (i) land not available for cultivation and (ii) other uncultivated land. Part of cultivable waste-land and fallow land (other than current fallows) was also not included in the Census. It is note-worthy that operators held more than half (i.e. 8 lakh ha. out of the total 15 lakh has.) of cultivable waste land, as also of the other fallow land. However, in respect of uncultivated land, operators held less than one-third of the uncultivated land in the State i.e. 6 lakh ha. out of 19 lakh ha.

4.7. The land not put to cultivation in the operated area (i.e. excluding the net sown area and current fallows) was 30 lakh hectares or nearly 14 per cent of the total operated area. Out of the former land, nearly 27 per cent was cultivable waste and 20 per cent was uncultivated land (i.e. pastures and land covered by miscellaneous tree crops, etc.). However, the ratio of cultivable waste land to the total cultivated land (i.e. net sown area and current fallows taken together) was only 4.4 per cent. In planning the programme of reclamation of land, these statistics will be found useful.

**An overview**

4.8. In 1970-71, Maharashtra had 49.51 lakh operational holdings with a total area of 211.79 lakh ha. giving an average area of 4.28 ha. per holding. Most (i.e. 97.3 per cent) of the holdings were individually operated and 1.36 lakhs or (2.7 per cent of the total) were joint holdings. The area of land under joint holdings was 7.15 lakh ha. or 3.4 per cent of the total operated area. The average size of joint holdings worked out at 5.27 ha. as against 4.25 ha. for the individually operated holdings.

4.9. In Maharashtra, agricultural land tenancy was legally abolished in 1957 and is permitted only in a few specific cases. Hence, cultivation of land is done mostly by peasants who owned lands. Thus in 1970-71, 95 per cent of the total operated land was owned, the rest being rented as revealed by the Census data. In fact, the total number of operational holdings can be classified into 3 categories as below.

- (i) Owner operated (i.e. farmers owned the entire land they operated).
- (ii) Partly owned and partly rented (i.e. the operator leased in some land in addition to his own).
- (iii) All the land operated was taken on lease.

92 per cent of the holdings were of the first category, while 5 per cent and 3 per cent were of the last two categories, respectively. The average sizes of holdings in the 3 categories were 4.17, 6.87 and 3.24 ha. respectively. Pure tenants had the smallest average size of holdings.

4.10. Of the total area, the cultivated land formed 85.3 per cent, consisting of net sown area (81.7 per cent) and current fallows (3.6 per cent). Fallow land (including cultivable waste and other fallows but excluding current fallows) accounted for 6.2 per cent of the total operated area. The rest of the operated area under the two categories, (a) uncultivated land and (b) land not available for cultivation, was 8.2 per cent.

4.11. As shown by the Census, gross irrigated area under crops was proportionately small being 7.4 per cent of the total cropped area. Of the 49.51 lakh operational holdings in the State, 11.91 lakh or 24 per cent were irrigated either partly or wholly, the number of wholly irrigated holdings being 1.73 lakh.

4.12. Maharashtra is mainly a foodgrain growing State with nearly seven-tenth of its cropped area under foodgrains. Cereals occupied 55 per cent of the cropped area and pulses 13 per cent. Among cereals, jowar was the leading crop occupying about 31 per cent of the gross cropped area, followed by bajri (11 per cent) and rice (7 per cent). Cotton was the leading cash crop of the State grown in most of the districts accounting for 15 per cent of the cropped area. Groundnut was also grown in several districts, its area being about 5 per cent. Sugarcane, though a minor crop in the State occupying only 1 per cent of the cropped area and grown in pockets of a few districts having irrigation facilities, is still a commercially very important crop in view of its high yield rates and high recovery percentage besides its growing importance from the export angle.

## SECTION II

### Districtwise findings

4.13. The districtwise summary of the Census data, relating to number of holdings, area operated, average size of holdings along with the percentage of small holdings and area, is given in the Table No. 4.2. While discussing the Census results, in both Sections II and III, those pertaining to the Bombay Suburban District have been excluded since it consists mostly of urban area; but the Census figures have been presented for the district, wherever possible.

### Number of operational holdings and area operated

4.14. The total number of operational holdings in the State was 49.51 lakh with a total operated area of 211.79 lakh hectares. The number of holdings in individual district varied from 0.81 lakh (1.6 per cent) in Wardha district to 3.88 lakh (7.8 per cent) in Ratnagiri district. The distribution of the operated area among the different districts ranged from 3.78 lakh hectares (1.8 per cent) in Kulaba district to 13.4 lakh hectares (6.3 per cent) in each of Aurangabad and Ahmednagar districts.

TABLE NO. 4.2

*Districtwise number of operational holdings and area operated*

District	Operational holdings		Area of holdings		Districtwise percentage —small holdings		Average size of holdings (ha.)
	Number	Percentage	Hectares	Per- centage	No.	Area

**Average size of holdings**

4.15. The average size of the holdings in the State was 4.28 hectares. Among the divisions, it varied from 3.40 ha. in Bombay Division to 6.05 hectares in Aurangabad Division. Among the districts, the smallest value of 2.01 ha. was recorded in Kolhapur district and the largest 7.11 ha. in Yavatmal district. An examination of the district-wise average size of holdings reveals that the districts could be broadly grouped into four categories as indicated in Table No. 4.3 below, according to very small, small medium and large average size of holdings.

TABLE NO. 4.3

Average size of holdings	Names of districts
Below 3.0 ha.	.. Thane, Kulaba, Ratnagiri, Satara, Kolhapur and Bhandara.
Between 3 and 4 ha.	.. Jalgaon, Sangli and Chandrapur.
Between 4 and 6 ha.	.. Buldhana, Akola, Amravati, Wardha, Nagpur, Nanded, Ahmednagar, Pune, Dhule, Solapur and Nasik.
Above 6 ha.	.. Aurangabad, Parbhani, Bhil, Osmanabad and Yavatmal.

The analysis of cropping pattern which is discussed later, if related to the average size of holdings indicates that the paddy growing districts had a smaller average size of holdings, their share in the number of holdings also being relatively large compared to their share in the area.

#### Joint holdings

4.16. From a perusal of Table No. 2 in Appendix II it is seen that in 13 districts, the number of joint holdings was less than 1 per cent of the total number of holdings. Nagpur district had the highest number of joint holdings, to the extent of 18 per cent. In five more districts of Nagpur division viz. Chandrapur, Akola, Buldhana, Bhandara and Wardha, the percentage of joint holdings was between 6 and 10. In the remaining 7 districts, it was between 1 and 5.

#### Proportion of small holdings

4.17. The number of small holders (i.e. those having holdings of size below 2.0 ha. or 5.0 acres) was appreciable in the State being 43 per cent. But the area operated by them was quite small, being only 9 per cent of the total operated area in the State. The relative proportion of small holders was found to be large in the paddy growing districts of the State. Thus it was above 60 per cent and above in Thane, Kulaba, Ratnagiri, Satara, Kolhapur and Bhandara districts. Consequently the average size of holdings in these districts was quite low being 2 to 2.8 hectares. The proportion of small holdings was generally relatively low in the predominantly millet and cotton growing districts viz. Dhule, Nasik, Ahmednagar, Solapur, Nagpur, Wardha, Buldhana, Akola, Yavatmal and all the five districts of Marathwada, it being below 40 per cent.

#### Land use

4.18. The share of the individual districts in the area and number of holdings convey the situation about the spatial distribution of land operated in the State. The analysis of land use brings out the extent of utilization of land for different purposes. Table No. 4 in Appendix II gives the percentage area under different categories of land use.

4.19. The extent of utilization of land for agriculture i.e. the proportion of net sown area to the total occupied area varied very widely, from 28 per cent in Ratnagiri district to as high as 93 per cent in Aurangabad district. But in several districts i.e. in 18 out of 25, the percentage of net sown area exceeded 80 while in 3 more districts it was between 70 and 80. Only in the districts of the Konkan region (i.e. Thane, Kulaba and Ratnagiri), the percentage of net sown area was relatively very low ranging from 28 to 53.

4.20. The proportion of uncultivated land was very small in most of the districts except in the districts of Konkan region, where it ranged from 10.5 per cent in Kulaba to 28.9 per cent in Thane district.

4.21. The proportion of lands classified as "other fallows" was also very small in most of the districts except in the districts of Kolhapur, Kulaba and Ratnagiri where it was between 7 and 11 per cent.

4.22. The proportion of area under culturable waste was generally less than 4 per cent. The districts of Kulaba, Ratnagiri and Satara, however, recorded higher proportions of 14 per cent, 21 per cent and 10 per cent respectively. This is attributed to the fact that the land not put to agricultural use was comparatively large in these districts, they being situated in or around the mountainous area of the Sahyadri.

## Irrigation

4.23. The Census data collected on the different aspects of irrigation, such as the number of irrigated holdings, area irrigated, sources of irrigation, crop-wise utilisation and categories of beneficiaries are summarised in the following paragraphs.

### Irrigated holdings and area irrigated

4.24. The Census data show that the State is very poorly placed in the Indian Union in respect of the the availability of irrigation facilities to farming. Thus, out of 173.03 lakh hectares of net sown area in the State, only 12.37 lakh hectares i.e. 7.1 per cent received irrigation from some source or the other. However, the benefit of irrigation was available to about 24 per cent of the total number of operational holdings, as 11.91 lakh out of 49.51 lakh operational holdings in the State were irrigated either wholly or partly in 1970-71. Still the fact that 92.9 per cent of the net sown area and 76 per cent of the total operational holdings in the State did not have any irrigation is noteworthy. Of the 11.91 lakh irrigated holdings, only 1.73 lakh holdings were wholly irrigated and the remaining 10.18 lakh holdings were partly irrigated. Thus the wholly irrigated holdings formed 14.5 per cent of the total number of irrigated holdings accounting for roughly the same proportion i.e. 16 per cent of the total net area irrigated. The average net sown area per holding in case of wholly irrigated holdings, wholly unirrigated holdings and partly irrigated holdings was 1.15, 3.17 and 5.10 ha. respectively. Hence the average net sown area of a partly irrigated holding was higher by nearly 2 ha. than that of a wholly unirrigated holding. The over all average irrigated area per irrigated holding (taking together the first and third categories of holdings referred above) was 1.04 ha. as seen from Table No. 8 of Appendix-II.

### Distribution of irrigation

4.25. The information on the districtwise distribution of irrigation is summarised below in respect of—

- (i) Area irrigated,
- (ii) Number of irrigated holdings,
- (iii) Source-wise area irrigated.

(i) *Area irrigated*—Even though the percentage net irrigated area for the State as a whole was low (7.1 per cent) yet, some districts are better placed having appreciably higher percentage of area irrigated while other districts have practically no irrigation as will be clear from the Table No. 4.4 below

TABLE NO. 4.4

Class intervals in percentages (net irrigated area)						
15 to 35	10 to 15	7 to 10	5 to 7	3 to 5	1 to 3	Less than 1
Bhandara (33.3)	Jalgaon (10.5) Pune (12.2)	Dhule (9.3)	Nagpur (6.9)	Aurangabad (4.1)	Usmanabad (2.9) Parbhani (1.1)	Akola (0.5)
Chandrapur (16.6)	Ahmadnagar (13.2) Satara (13.5) Kolhapur (11.5) Solapur (10.3) Nashik (10.0)	Sangli (9.4)		Bhir (4.6)	Nanded (1.3) Buldhana (1.5) Amravati (1.8) Wardha (2.2) Ratnagiri (1.6) Kulaba (2.2) Thane (1.3)	Yavatmal (0.6)
			Maharashtra (7.1)			

Note.—Figures in brackets refer to percentage net irrigated area.

The districts of the State can be divided in fact into three categories according to those having (i) percentage irrigated area above the State level percentage irrigated area (of 7 per cent), (ii) equal to the State level percentage and (iii) below the State level percentage irrigated area. The first category, comprising 11 districts, had nearly 79 per cent of the total irrigated holdings in the State with over 81 per cent of the State irrigated area. If Nagpur district, which had practically the same percentage irrigated area as for the State, is added, almost half the number of districts in the State would account for about 81 per cent of the total irrigated holdings in the State and 84 per cent of the State net irrigated area.

(ii) *Number of Irrigated holdings.*—The number of holdings according to the three categories (1) wholly irrigated, (2) wholly unirrigated and (3) partly irrigated, expressed as percentage of the total number of holdings in each district is shown in Table No.7 of Appendix II. The percentage of net irrigated area under the first and third categories of holdings is also given in the same table. In the 12 districts where the percentage of irrigated area is of the order of the State level figure or above it, the proportionate number of holdings having irrigation facilities varied from about 25 per cent in Nagpur district to about 45 per cent in Bhandara district. Thus nearly one fourth to one-half of the holdings in these districts had irrigation facilities. The proportionate number of wholly irrigated holdings ranged from about 2 per cent in Jalgaon and Nagpur districts to 12 per cent in Chandrapur district while that of the partly irrigated holdings varied from 22 per cent in Nagpur district to 36 per cent in Bhandara district.

(iii) *Sources of Irrigation.*—The districtwise percentage of area irrigated by different sources is shown in Table No. 9 in Appendix II. Well was the important source of irrigation accounting for about 60 per cent of the total irrigated area in the State. Of the 7.39 lakh hectares of area irrigated by wells, 80 per cent was located in the 9 districts viz. Ahmednagar, Solapur, Nasik, Pune, Jalgaon, Dhule, Aurangabad, Sangli and Satara.

Canal was the second important source of irrigation in the State contributing about 18 per cent to the total irrigated area. Canal irrigation was concentrated in 10 districts viz., Pune, Ahmednagar, Solapur, Satara, Jalgaon, Nasik, Dhule, Nagpur, Bhandara and Chandrapur. They covered in all 2.01 lakh ha. or about 91 per cent of the total area irrigated by canals.

Tank irrigation was a localised source of irrigation. Bhandara and Chandrapur districts alone accounted for about 87 per cent of the total area irrigated by tanks, while the rest of this area was mostly located in the districts of Nagpur, Bhir, Solapur and Pune.

Other sources of irrigation primarily include lift irrigation. This source of irrigation was predominantly prevalent in the districts of Kolhapur, Satara, Sangli, Chandrapur and Pune together accounting for about 82 per cent of the total area irrigated by other sources.

### Cropping pattern

4.26. Statistics of area for over sixty crops were collected in the Census. A broad indication of the cropping pattern that emerged from the analysis of the data is summarised in the Table No. 4.5 given below :

TABLE NO. 4.5

Crop	Area in '000' ha.		Cropwise Percentage area to the gross cropped area	Cropwise percentage of irrigated area to its total area
	Irrigated	Total		
1	2	3	4	5
Rice	286	1,352	7.4	21.15
Jowar (Kharif)	12	2,503	13.7	0.47
Jowar Rabi)	216	3,115	17.1	6.93
Jowar (Kharif+Rabi)	228	5,618	30.8	4.05

TABLE NO. 4.5

Crop	Area in '000' ha.		Cropwise Percentage area to the gross cropped area	Cropwise percentage of irrigated area to its total area
	Irrigated	Total		
1	2	3	4	5
Bajri	44	1,996	11.0	2.20
Wheat	217	739	4.1	27.36
Total cereals	793	10,083	55.5	7.86
Tur	1	603	3.3	0.16
Total pulses	36	2,407	13.2	1.49
Total foodgrains	829	12,489	68.7	6.63
Sugarcane	190	191	1.0	99.47
Total food crops	1,217	13,009	71.4	9.35
Total oilseeds	19	1,665	9.1	1.14
Cotton	69	2,696	14.8	2.55
Total fodder crops	19	590	3.2	2.75
Total non-food crops	112	5,019	27.5	2.23
Total gross cropped area	1,357	18,223	100.0	7.44
Area cropped more than once.	120	920	.....	13.04
Net sown area	1,237	17,303	.....	7.14

Note.—The percentages in col. (4) do not add upto 100 due to rounding.

It would be seen from the column No. 5 of Table No. 4.5 that the percentage of gross irrigated area to the total gross cropped area is only 7.4. Practically 99.5 per cent of area under sugarcane was brought under irrigation. Amongst the cereal crops, about 27 per cent of the area under wheat was irrigated while that under paddy was to the extent of 21 per cent. Very negligible area, i.e. 3 per cent of under irrigated cotton.

4.27. A large part of the cropped area was devoted to foodcrops accounting for 71 per cent of the cropped area. Among food-crops, foodgrains covered nearly 69 per cent of the cropped area comprising 56 per cent under cereals and 13 per cent under pulses. Non-food crops occupied about 28 per cent of the cropped area. The leading single crop of Maharashtra was jowar—a cereal which is grown both in the kharif and rabi seasons. It occupied about 31 per cent of the gross cropped area of the State. In the order of importance among cereals, next to jowar was bajri followed by rice covering 11 per cent and 7 per cent of the total cropped area, respectively. Among non-food crops, more than half the area was devoted to cotton. On the whole, the total area covered by oilseeds was about 1/10th of the gross cropped area and about 1/3rd of the area under the non-food crops. The leading oilseed crop was groundnut as it occupied more than half of the area under oilseeds. Thus on the whole, kharif and rabi jowar, cotton, bajri and rice were the principal crops of the State as they covered 64 per cent of the total cropped area. Two more crops viz., groundnut and wheat accounted for about 9 per cent of the cropped area. Thus out of over 60 crops, these seven crops accounted for practically 3/4th of the State total cropped area.

4.28. Pulses, as a group, were also important and they covered about 13 per cent of the cropped area. Among pulses, tur, gram and mung were relatively important crops. Thus all the 10 important crops together make up a total of 85 per cent of the gross cropped area of the State. Evidently a little less than 1/6th of the cropped area was distributed among the rest of the 50 crops. Among them were such of the commercial crops like sugarcane, banana, chillies, onion, fruits and vegetables.

#### Cropping pattern in the districts

4.29. The principal crops grown in the individual districts and the area thereunder expressed as percentage of the gross cropped area in the respective districts are given in Table No. 5 of Appendix II. In Table No. 6, the area contributed (in terms of percentage) by each district to the State total area under the individual principal crops has been given. The findings on the basis of these two tables are summarised below :

Jowar was relatively important in Ahmednagar, Pune, Satara, Sangli, Solapur, Aurangabad, Parbhani, Nanded, Bhir, Osmanabad and Nagpur districts. These 11

districts together accounted for 72 per cent of the total area under jowar in the State. Amongst them, Solapur district has the largest area under jowar being 1/9th of the State total area. If 7 more districts—namely Buldhana, Akola, Yavatmal, Chandrapur, Wardha, Amravati and Jalgaon were added, the total jowar area contributed by these 18 districts out of 22 jowar growing districts, would be 96 per cent of the total area under jowar in the State.

4.30. Bajri is the next important cereal crop grown to an appreciable extent in 10 districts viz. Nasik, Dhule, Jalgaon, Ahmednagar, Pune, Satara, Sangli, Solapur, Aurangabad and Bhir, covering 95 per cent of the total bajri area. In fact, the three districts of Nasik, Ahmednagar and Aurangabad together accounted for more than 50 per cent of the bajri area in the State. It is seen that the cultivation of bajri was concentrated in fewer districts (than in case of jowar), despite the fact bajri was the second important crop in the State. It was only in Nasik and Dhule districts that the crop was grown relatively to a large extent. Though it was grown on adequately large scale in the other districts also, the area under jowar exceeded that under bajri.

4.31. Paddy occupied the third place in the order of importance among the principal crops of the State. Paddy was extensively grown in the three coastal districts viz. Thane, Kulaba, Ratnagiri and among the interior districts of Chandrapur and Bhandara on the eastern border of the State. The latter two districts of Nagpur division have dependable irrigation facilities. These five districts together accounted for about 70 per cent of the area under paddy. In seven more districts viz. Nagpur, Kolhapur, Pune, Nasik, Satara, Osmanabad and Nanded, paddy was grown to an appreciable extent. Thus the above 12 districts covered 91 per cent of the paddy area. However, in the former five districts, the crop occupied overwhelmingly large area than any other crop. In Thane and Kulaba districts, paddy covered more than 60 and 75 per cent of the cropped area in the respective districts, while in Bhandara district, more than half the cropped area was covered by paddy.

4.32. Wheat, although a principal crop occupied less than 5 per cent of the gross cropped area in the State. The cultivation of wheat was spread over in 21 districts, excluding the three paddy growing coastal districts and Kolhapur district. The three districts viz. Nasik, Nagpur and Aurangabad together covered nearly 1/4 of the State area under the crop. In the remaining districts the extent of area covered by the crop ranged from 2 to 6 per cent.

4.33. Cotton is the main cash crop of the State. It occupied a proportionately higher percentage of the total gross cropped area than any other crop in Wardha, the four Berar districts of Nagpur division and Jalgaon district of Bombay division. In the cropping pattern of these six districts, the proportion of area devoted to this crop ranged from 27 per cent in Jalgaon to 51 per cent in Amravati and exceeded that of any other crop including jowar which was also an important crop in the districts. Of the total area of 27 lakh ha. in the State, nearly 2/3rd was contributed by these districts alone. Parbhani, Nanded and Aurangabad districts of Aurangabad division also grew the crop on a fairly wide scale accounting for respectively about 10 per cent, 7 per cent and 7 per cent of the State area under the crop. Thus these nine districts accounted for nearly 87 per cent of the State cotton area.

4.34. The proportion of the area occupied by cotton was relatively small in the districts of Pune Division, viz. Satara, Ahmednagar, Sangli and Solapur. However, the crop in these districts is mostly irrigated and being long staple variety is an important cash crop in these districts.

4.35. Among the non-food crops, next in importance to cotton as a cash crop was groundnut, which accounted for about 5 per cent of the total cropped area of the State. The share of its area in the cropping pattern was more than 10 per cent in five districts viz. Dhule, Sangli, Satara, Kolhapur and Osmanabad. The crop was also grown on an appreciable scale in four more districts viz. Jalgaon, Solapur, Yavatmal and

Amravati to the extent of 5 to 7 per cent. These nine districts thus accounted for about 70 per cent of the State area under groundnut.

4.36. Among the commercial crops, sugarcane was important due to its high yield rates and relatively high recovery rate although its share in the total cropped area was only 1 per cent. It was grown on a comparatively large scale in the six districts of Pune division, viz. Ahmednagar, Sangli, Kolhapur, Pune, Satara and Solapur, which accounted for more than 3/4th of the State area under the crop. Aurangabad and Osmanabad districts of Aurangabad division contributed nearly 9 per cent and Nasik district of Bombay division 7 per cent of the sugarcane area of the State.

4.37. Fodder crop occupied a prominent place in the cropping pattern of the State, particularly in the three coastal districts of Bombay division and in two more districts viz. Pune and Kolhapur of Pune division. The proportion of the area devoted to fodder in these districts ranged from 12 per cent in Kulaba district to 26 per cent in Ratnagiri district.

#### Tenure and tenancy

4.38. As already mentioned earlier, 92 per cent of the holdings in the State were entirely owned by the farmers. However, in the three districts of Kulaba, Kolhapur and Chandrapur, the percentage of such holdings was lower being 82 to 85, as would be seen from Table No. 3 in Appendix II, while in three more districts of Thane, Parbhani and Yavatmal it was between 85 and 90. Further in the four districts of Dhule, Jalgaon, Sangli and Solapur, it was between 95 and 97 per cent, while in Bhandara district it was as high as 99 per cent i.e. practically all the holdings were entirely owned. In the remaining 15 districts, 90 to 95 per cent of the holdings were entirely owned.

4.39. In 13 districts, the percentage of wholly rented holdings was very low being less than 3 per cent. Even among the remaining 12 districts, it was relatively appreciable only in case of Thane, Kulaba, Parbhani, Yavatmal and Chandrapur where it was between 5 and 9.

4.40. Only in 3 districts viz. Kulaba, Kolhapur and Chandrapur, the number of partly rented and partly owned holdings was 10 to 11 per cent of the total number of holdings, while in the remaining districts it was less than 8 per cent.

4.41. In terms of area of the operated land, the rented area varied from 0.7 per cent in Bhandara district to 12 per cent in Kolhapur district. In fact, the percentage of rented area was 7 or more only in the six districts of Thane, Kulaba, Kolhapur, Amravati, Yavatmal and Chandrapur. The rented area was less than the State level over-all percentage rented area viz. 5, in 14 districts of the State.

### SECTION III

#### Analysis of Census data according to size of holdings

4.42. The main purpose of the Census was to study the structure of land holdings—the basic unit of enumeration—in relation to the essential agricultural characteristics such as land use, cropping pattern, irrigation, tenancy, type of holdings viz. joint and individual holdings, etc. To facilitate such a study the original 12 size classes have been further combined into six broad size groups of holdings viz. upto 2 ha. 2-5, 5-10, 10-20, 20-50 and 50 ha. and above. Those of size upto 2.0 ha. were considered as small holdings, while those of 20 ha. and above as large holdings. The results obtained according to the broad size groups are presented in the Table No. 10 to 24 in Appendix II and the findings in regard to the major characteristics of the land holdings are summarised below.

4.43. (i) *Proportion of number of small holdings.*—The districts with different proportion (per cent) of small holdings have been grouped and shown in Table No. 4.6

below, while the percentage of area covered by them is given in the subsequent Table No. 4.7

TABLE NO. 4.6  
*Distribution of districts according to different percentage of small holdings*

Class interval in percentage						
70 and more	60 to 70	50 to 60	40 to 50	30 to 40	20 to 30	Less than 20
Kulaba (72)	Bhandara (67)	Sangli (54)	Pune (46)	Buldhana (37)	Solapur (29)	Osmanabad (19)
Kolhapur (70)	Ratnagiri (64)		Chandrapur (44)	Akola (34)	Dhule (28)	Yavatmal (15)
	Thane (64)		Amravati (44)	Nasik (34)	Nanded (27)	
	Satara (60)		Jalgaon (42)	Ahmednagar (33)	Wardha (26)	
				Nagpur (30)	Bhir (24)	
			Maharashtra (43)		Aurangabad (22)	
					Parbhani (20)	

(Note.—Figures in brackets denote the percentage of small holdings in the respective districts).

The proportionate number of small holdings was as high as 72 per cent in Kulaba district, while it was less than 20 per cent in the case of Osmanabad and Yavatmal districts. Preponderance of small holdings was noticed in the four more important rice growing districts, viz., Kolhapur, Bhandara, Ratnagiri and Thane and also in Satara, the proportion of such holdings there being 60 to 70 per cent.

TABLE NO. 4.7  
*Distribution of districts according to percentage of area covered by small holdings*

Class interval in percentage				
20 to 25	15 to 20	10 to 15	5 to 10	Less than 10
Kulaba (25)	Satara (17)	Ratnagiri (14)	Pune (10)	Aurangabad (4)
Bhandara (25)	Thane (16)	Sangli (13)	Buldhana (8)	Parbhani (4)
Kolhapur (24)		Jalgaon (12)	Akola (8)	Bhir (4)
		Amravati (11)	Nasik (7)	Osmanabad (3)
		Chandrapur (11)	Dhule (6)	Yavatmal (3)
		Nanded (6)	Ahmednagar (6)	
		Nagpur (6)		
		Solapur (5)	Maharashtra (9)	
		Wardha (5)		

Area covered by small holdings was about 25 per cent in the three districts of Kulaba, Bhandara and Kolhapur, while it was less than 5 per cent in the five districts of Aurangabad, Parbhani, Bhir, Osmanabad and Yavatmal.

4.44. (ii) The distribution of district according to different proportions of large holdings expressed in percent is given in the Table No. 4.8.

TABLE NO. 4.8

*Distribution of districts according to proportion (per cent) of large holdings*

Percentage of large holdings					
5	4	3	2	1	Less than 1
Yavatmal	Osmanabad	Buldhana Akola Bhir Wardha Ahmednagar	Nasik Dhule Jalgaon Pune Sangli Solapur Aurangabad Parbhani Nanded Nagpur Chandrapur Maharashtra	Thane Kulaba Ratnagiri Satara Amravati Bhandara	Kolhapur

As can be seen from Table No. 4.8 above nearly 5 per cent of the holdings were large in Yavatmal district while their proportion was 1 per cent in six districts viz. Thane, Kulaba, Ratnagiri, Satara, Amravati and Bhandara, and less than one per cent in Kolhapur district.

The districts with different proportion of area covered by large holdings are given in Table No. 4.9.

TABLE NO. 4.9

*Distribution of districts according to percentage of operated area in large holdings*

Class interval in percentages			
20 to 30	15 to 20	10 to 15	5 to 10
Yavatmal (22)	Ahmednagar (16) Buldhana (19) Solapur (18) Osmanabad (17) Wardha (19) Bhir (16) Akola (17) Nagpur (15) Thane (15) Ratnagiri (16)	Sangli (14) Parbhani (13) Amravati (14) Aurangabad (12) Pune (12) Nasik (11) Chandrapur (10) Kulaba (13) Maharashtra (13)	Jalgaon (8) Dhule (7) Satara (8) Nanded (6) Kolhaur (7) Bhandara (6)

Area covered by large holdings, as seen from the Table No. 4.9 above varied from 22 per cent in Yavatmal district to 6 per cent in the two districts of Nanded and Bhandara. In the remaining districts, the area under such holdings was between 7 and 19 per cent.

4.45. The districtwise number of operational holdings and area covered expressed as percentage are given in Table No. 10 and 11 for different size classes, in Appendix II.

4.46. *Measure of the inequality in the distribution of land in holdings.*—The inequality in the distribution of land among the different farmers can be studied in terms of 'concentration ratio,' which is a measure of the degree of the inequality of such distribution. The concept of concentration ratio is illustrated below.

If all the holdings were of equal size the concentration ratio would be zero. In contrast, if, in an extreme situation, all land was in possession of one operator, the concentration ratio would be equal to one. The Agricultural Census pertains to only operators of agricultural land. It does not take into account the landless labourers. Hence for the data obtaining from the Agricultural Census, in the second hypothetical case when almost the entire land was in the possession of one operator and the rest of the operators had negligible land, the concentration ratio would be close to one. Thus where the distribution of land is more equitable (i.e. inequality is low), the concentration ratio will be low and when the distribution of land is very uneven, the concentration ratio will be high.

4.47. Concentration ratios for operational holdings calculated for the different districts in the State ranged between 0.42 for Aurangabad and 0.68 for Ratnagiri. Within this range, if the values of the concentration ratio are divided into four groups namely—(1) low inequality, between 0.42 and 0.50 (2) medium, between 0.51 and 0.55 (3) high, between 0.56 and 0.60 and (4) very high, more than 0.60 then the distribution of the districts according to these ranges of concentration ratios would be as given in Table No. 4.10.

TABLE NO. 4.10.

*Distribution of districts according to concentration ratios*

Concentration ratio							
Low		Medium		High		Very high	
Aurangabad	(.42)	Akola	(.51)	Bhandara	(.56)	Thane	(.64)
Nanded	(.43)	Ahmednagar	(.51)	Pune	(.56)	Ratnagiri	(.68)
Parbhani	(.43)	Nasik	(.51)	Sangli	(.58)		
Osmanabad	(.44)	Chandrapur	(.52)	Satara	(.58)		
Dhule	(.44)	Amravati	(.53)	Kolhapur	(.60)		
Yavatmal	(.45)	Buldhana	(.53)				
Wardha	(.48)	Bhir	(.54)				
Solapur	(.49)	Kulaba	(.54)				
Jalgaon	(.49)						

It is seen that distribution of land was much more unequal in the two districts of Thane and Ratnagiri, for which the concentration ratios were as high as 0.64 and 0.68 respectively. In contrast, in ten districts of the State the concentration ratio was low indicating relatively equitable distribution of land. In the remaining 13 districts, the concentration ratio was between 0.51 and 0.60.

4.48. The rather widely varying range of concentration ratios as above, can be attributed partly to the fact that land in the possession of the individual operators, included in some districts, a fairly high proportion of cultivable waste land, particularly in the districts located in the hilly regions. It was observed that a much higher proportion of land in the possession of the bigger cultivators was either culturable waste or land not available for cultivation, particularly in Thane and Ratnagiri districts. A more refined measure of the concentration ratio can be had by excluding the area under such items of land use. Hence the concentration ratios were worked out again taking into account only the land under cultivation (i.e. net sown area + current fallows). Table No. 12 in Appendix II gives a comparison of the concentration ratios worked out on the basis of operated area and the cultivated area. With this approach, the concentration ratios of Ratnagiri and Thane districts diminished appreciably to 0.55 and 0.57, as against the previous values of 0.68 and 0.64 respectively which is according to expectation. If a few extreme cases like those of Ratnagiri, Bhir, Thane and Kolhapur are ignored, the two sets of concentration ratios bore a close resemblance. Thus the districts with high concentration ratios on the basis of total area had also high

concentration ratios worked out on the basis of the cultivated area. Hence the relative position of the inequality of distribution of land among the operators in different districts remained more or less unchanged whether the concentration ratio was measured on the basis of operated area or the cultivated area.

4.49. (iv) *Association of concentration ratio with certain characteristics of holdings.*—It would be interesting to study whether the district-wise variation in the values of the concentration ratio is associated with some of the relevant known characteristics of the distribution of holdings. For this study, two characteristics viz. (a) average size of holdings and (b) irrigation have been selected and the findings thereof are briefly discussed below.

4.50. (a) *Average size of holdings.*—The Table No. 4.11 below gives the distribution of the districts according to different ranges of average size of holdings on the one hand and the values of concentration ratio (based on operated area) on the other.

TABLE NO. 4.11

*Distribution of district (number) according to concentration ratio (on the basis of operated area) and the average size of holdings.*

Average size of holdings (ha).	Concentration ratio (with operated area)					Total number of districts.
	0.41 0.45	0.46 0.50	0.51 0.55	0.56 0.60	0.61 and above	
below 3 .. ..	...	...	...	4	2	6
3-4 .. ..	...	1	1	1	...	3
4-5 .. ..	2	...	3	1	...	6
5-6 .. ..	...	3	2	...	...	5
6-8 .. ..	4	...	1	...	...	5
Total No. of districts ..	6	4	7	6	2	25

Most of the entries in the above table are found to be in the upper right hand corner cells and the lower left hand corner cells, indicating an inverse relationship between the averages size of the holdings and the values of concentration ratio. In other words, where the average size of holdings is low, the concentration ratio may be expected to be high and *vice versa*.

4.51. If the value of concentration ratio is calculated by restricting to the cultivated area, the inverse relationship becomes sharper, as is seen from Table No. 4.12 below:—

TABLE NO. 4.12

*Distribution of district (number) according to concentration ratio (on the basis of cultivated area) and average size of operational holdings.*

Average size of holdings (ha).	Concentration ratio (with cultivated area)					Total No. of districts
	0.41 0.45	0.46 0.50	0.51 0.55	0.56 0.60	0.61 and above	
below 3 .. ..	...	...	6	1	...	7
3-4 .. ..	...	1	...	1	...	2
4-5 .. ..	2	1	3	...	...	6
5-6 .. ..	...	5	...	...	...	5
6 and above ..	4	1	...	...	...	5
Total No. of districts ..	6	8	9	2	..	25

4.52. (b) *Irrigation.*—The association of concentration ratio with the extent of irrigation in different districts is brought out in the Table No. 4.13 below : It gives the distribution of districts according to percentage of irrigated area on the one hand and concentration ratio on the other.

TABLE NO. 4.13

*Distribution of district (number) according to concentration ratios and net irrigated area as percentage of net sown area.*

Net irrigated area (ha).	Concentration Ratio					Total No of districts.
	0.41 0.45	0.46 0.50	0.51 0.55	0.56 0.60	0.61 and above	
Below 1 .. ..	1	...	1*	...	...	2
1 to 4 .. ..	3	1	3	...	2**	9
4 to 8 .. ..	1	1	1	...	...	3
8 to 12 .. ..	1	2	1	2	...	6
12 to 16 .. ..	...	...	1	2	...	3
16 and above .. ..	...	...	1	1	...	2
Total No. of districts ..	6	4	8	5	2	25

(\* refers to Kulaba district)

\*\* refers to Ratnagiri and Thane districts)

If Thane, Ratnagiri and Kulaba the three coastal districts, where the rainfall is assured and irrigation is low are excluded, it is observed that there are no entries in the table in the upper cells in the lower left hand corner and in the upper right hand corner. The entries are concentrated along the diagonal cells which indicate a positive relationship between the concentration ratio and the percentage of the area irrigated.

4.53. *Joint holdings.*—For the State as a whole, the proportionate number of joint holdings was not significant, being only 2.7 per cent. However, the percentage of joint holdings was relatively appreciable in the districts of Nagpur division, particularly in Nagpur, Wardha, Buldhana, Bhandara and Chandrapur as can be seen from Table No. 2 in Appendix II. The proportion of joint holdings in these districts was 2 to 5 times that for the State as a whole. It may be worthwhile to investigate whether in these districts, joint holdings were concentrated among certain class of farmers or whether the phenomenon was common among all classes. The Table No. 4.14 below gives the proportion of joint holdings to the total number of holdings, according to size classes, for the above districts.

TABLE NO. 4.14

*Percentage of joint holdings according to size classes in selected districts*

District	Size class of holdings in hectares						
	Up to 2	2-5	5-10	10-20	20-50	50 and above	All classes
1. Buldhana ..	5.5	8.1	11.2	12.8	19.6	32.4	8.4
2. Wardha ..	7.3	9.0	11.7	14.0	16.2	17.0	10.5
3. Nagpur ..	12.9	16.6	20.4	24.8	32.1	41.2	17.5
4. Bhandara ..	7.2	7.9	11.4	12.7	12.2	13.8	8.3
5. Chandrapur ..	4.3	7.1	8.9	10.0	12.0	4.5	6.4
State ..	2.6	2.8	3.0	3.1	5.0	9.0	2.7

It would be seen from the above table that the percentage of joint holdings generally increased with the size of the holdings in each of the above five districts.

4.54. *Tenancy.*—In 1970-71, 5.1 per cent of the total area under the holdings was rented. Proportion of (wholly and partly) rented holdings to the total number of holdings was about 8 per cent, suggesting that only a relatively small number of farmers leased in some land for cultivation. The districts, where the extent of area rented was higher than the State level percentage (of rented area) were Thane, Kulaba, Kolhapur, Aurangabad, Parbhani, Bhir, Osmanabad, Akola, Amravati, Yavatmal and Chandrapur, the total rented area varying from 5.6 per cent to 12 per cent, as seen from the Table No. 3 in Appendix II. Kolhapur district had the highest rented area of 12 per cent. The proportion of rented area in different size classes of holdings in these eleven districts is shown in Table No. 4.15.

TABLE NO. 4.15

*Rented area as percentage of total operated area in selected districts according to size class of holdings.*

District	Size class of holdings in hectares							All classes
	Up to 2	2-5	5-10	10-20	20-50	50 and above		
1. Thane ..	9.7	9.5	7.5	5.8	5.3	2.5	7.7	
2. Kulaba ..	9.2	8.2	5.6	5.2	4.1	2.4	7.0	
3. Kolhapur ..	8.1	10.6	13.5	15.7	18.4	23.5	12.0	
4. Aurangabad ..	6.2	5.6	5.0	5.6	7.1	7.1	5.6	
5. Parbhani ..	8.4	7.1	6.5	6.5	7.3	8.4	5.8	
6. Bhir ..	4.6	4.6	4.9	5.7	8.2	7.7	5.6	
7. Osmanabad ..	5.9	5.0	5.0	5.5	6.6	13.9	5.6	
8. Akola ..	2.8	4.2	6.2	7.5	6.8	18.2	6.2	
9. Amravati ..	4.6	6.1	8.6	8.8	7.0	3.8	7.5	
10. Yavatmal ..	6.4	10.4	13.1	12.9	7.8	5.8	11.1	
11. Chandrapur ..	12.4	10.0	7.0	5.2	3.4	3.2	7.8	
State ..	4.7	4.7	4.9	5.2	5.6	9.8	5.1	

The individual districts showed different trends in the degree of association of the extent of tenancy with the size of land holdings and no definite relationship emerged between the two characteristics of holdings.

4.55. *Irrigation.*—As was seen earlier (under paragraph 4.25 of Section II) the percentage of net irrigated area was of the same order as or higher than the State percentage (7.1 per cent) in 12 districts. Hence an attempt was made to study the relationship between the extent of irrigation and the size of holdings, in case of these twelve districts. The Table No. 4.16 below gives the proportion of irrigated area to the net sown area according to the different size classes of holdings in these districts.

TABLE NO. 4.16

*Irrigated area as percentage of the net sown area according to size class of holdings*

District	Size class of holding in hectares							All classes
	Up to 2	2-5	5-10	10-20	20-50	50 and above.		
1. Nasik ..	16	11	10	8	6	17	10	
2. Dhule ..	12	9	9	11	9	5	10	
3. Jalgaon ..	10	10	11	11	11	6	11	
4. Ahmednagar ..	20	15	13	11	10	33	13	
5. Pune ..	19	15	12	9	6	4	13	
6. Satara ..	15	13	13	12	11	55	14	
7. Sangli ..	12	11	9	8	6	4	9	
8. Solapur ..	20	12	10	8	7	28	10	
9. Kolhapur ..	14	12	10	8	8	7	12	
10. Nagpur ..	8	5	6	8	9	12	7	
11. Bhandara ..	34	33	32	34	4	42	33	
12. Chandrapur ..	32	18	13	12	14	16	17	
State ..	12	8	7	6	5	10	7	

In the four districts viz. Dhule, Jalgaon, Nagpur and Bhandara the percentage of irrigated area practically remained the same in the holdings with different sizes. On the other hand, in the remaining eight districts viz., Nasik, Ahmednagar, Pune, Satara, Sangli, Solapur, Kolhapur and Chandrapur, the percentage irrigated area showed a declining trend with the increase in size of holdings. However, in the case of Ahmednagar, Satara, Solapur and Bhandara districts, a definitely higher percentage of irrigated area was noticed in the case of large holdings of size 50 ha. and above. This can be attributed to the occurrence of holdings with larger irrigation facilities of the State Farming Corporation in the Deccan districts and on account of Malguzari tanks in Bhandara district.

4.56. A study of the relationship, if any, between the percentage of irrigated area in different size classes of holdings and the source of irrigation was carried out. The findings are summarised in the following paragraphs.

4.57. (a) *Irrigation by canals.*—Water supplied by canal is an external source which is expected to be independent of the size of holdings and canal water would be available on the basis of location of the farm in the command area, rather than on the size of the farm. Against this background, a study of the percentage (net) area irrigated by canal (with respect to the net sown area) according to different size classes of holdings has been carried out with the help of the Table No. 4.17 below.

TABLE NO. 4.17

*Net area irrigated by canal as percentage of net sown area by size class of holdings*

District	Size class of holdings in hectares						
	Upto 2	2-5	5-10	10-20	20-50	50 and above.	All classes
1. Nasik ..	3.76	1.69	1.25	0.84	2.06	12.92	1.50
2. Dhule ..	3.91	1.61	1.24	1.27	1.00	0.63	1.50
3. Jalgaon ..	2.88	2.33	2.22	1.94	2.05	0.97	2.25
4. Ahmednagar ..	3.78	2.98	2.22	1.66	4.86	25.03	2.61
5. Pune ..	7.21	4.98	3.50	1.35	1.00	0.30	3.56
6. Satara ..	5.14	4.14	3.28	2.20	11.14	49.88	4.11
7. Sangli ..	0.48	0.29	0.23	0.18	0.23	0.41	0.28
8. Solapur ..	4.11	2.49	1.65	0.88	2.55	15.56	1.75
9. Nagpur ..	2.67	1.69	1.85	2.09	2.16	2.04	1.93
10. Bhandara ..	10.48	8.05	6.77	5.96	5.21	3.46	7.96
11. Chandrapur ..	7.9	3.41	1.09	1.45	1.13	0.47	2.89
State ..	2.79	1.65	1.11	0.72	0.53	5.36	1.27

In the districts of Dhule, Jalgaon, Pune, and Bhandara, the percentage area irrigated by canals to the net sown area showed a declining trend with the increase in the size of holdings. The same trend was observed in the remaining districts of Nasik, Ahmednagar, Satara and Solapur also, for the size classes of holdings upto 20 ha. In case of the higher size classes of 20 to 50 ha. and 50 ha. and above in these four districts, the sudden increase in the percentage of canal irrigated area is attributed to the possible inclusion of the lands with larger canal irrigation facilities belonging to the State Farming Corporation causing distortions in the trend mentioned earlier.

**Irrigation by wells**

4.58. (b) In Table No. 4.18, the area irrigated by wells as percentage of the net sown area has been presented for the different size classes of holdings for the districts where the percentage area irrigated by wells was relatively appreciable.

TABLE NO. 4.18

*Area irrigated by wells as percentage of net sown area size classe of holdings*

District	Size class of holdings in hectares						
	Upto 2	2-5	5-10	10-20	20-50	50 and above	All classes
1. Nasik ..	12.04	9.71	8.21	7.40	6.03	3.92	8.42
2. Dhule ..	8.27	7.51	7.90	9.19	8.25	3.86	8.14
3. Jalgaon ..	6.98	7.49	8.62	8.94	9.25	4.94	8.13
4. Ahmednagar ..	15.85	12.11	10.49	9.03	9.15	6.66	10.43
5. Pune ..	10.64	8.94	7.68	6.70	5.10	2.39	7.71
6. Satara ..	6.54	7.02	7.56	8.04	8.52	3.97	7.22
7. Sangli ..	7.79	7.95	7.60	6.99	6.29	3.42	7.40
8. Solapur ..	15.04	9.26	7.63	7.09	8.08	12.15	8.08
9. Aurangabad ..	7.35	4.39	3.70	3.45	3.30	4.44	3.84
State .....	5.10	4.56	4.29	4.04	3.55	3.59	4.27

In the case of well irrigation, it would be seen that the percentage of irrigated area showed a declining trend as the size of holdings increased in the districts of Nasik, Ahmednagar and Pune, but upto 50 ha. in Aurangabad and upto 20 ha. in case of Solapur. On the other hand, it showed a slight upward trend in Jalgaon and Satara districts while there was no definite trend in either direction in Dhule district.

### Irrigation by tank

4.59. (c) In Bhandara and Chandrapur districts tank is the important source of irrigation. The percentage area irrigated by tank in different size classes of holdings for these districts is given in Table No. 4.19.

TABLE NO. 4.19.

*Area irrigated by tank as percentage of net sown area by size class of holdings*

District	Size class of holdings in hectares						All classes
	Upto 2	2-5	5-10	10-20	20-50	50 and above.	
Bhandara .. ..	22.65	23.28	23.28	26.10	31.19	34.56	23.77
Chandrapur .. ..	21.58	13.13	10.29	9.23	12.24	12.43	12.29
State .. ..	2.60	1.52	0.93	0.67	0.70	0.85	1.13

In Chandrapur district, the percentage of irrigated area declined with the increase in size of holdings upto 20 ha. while it practically remained the same in different size classes of holdings in Bhandara district.

### Irrigation by other sources

4.60. (d) The percentage area irrigated by other sources was appreciable only in the three districts of Satara, Sangli and Kolhapur and the same is presented in the Table No. 4.20 below. In Kolhapur district, lift irrigation was the major source of irrigation.

TABLE NO. 4.20

*Area irrigated by other sources as percentage of net sown area by size class of holdings*

Districts	Size class of of holdings in hectares						All classes
	Upto to	2-5	5-10	10-20	20-50	59 and above.	
Satara .. ..	3.00	2.16	1.54	1.19	0.83	0.73	1.95
Sangli .. ..	3.42	2.55	1.44	0.50	0.20	0.12	1.73
Kolhapur .. ..	10.37	8.07	7.10	5.41	7.63	4.40	8.16
State .. ..	1.37	0.64	0.53	0.21	0.20	0.47	0.46

It is seen that the percentage of area irrigated by other sources generally declined as the size of holdings increased in all the three districts.

4.61. *Relative importance of different sources of irrigation.*—In order to study the relative importance of the different sources of irrigation and to see whether that was related to the size of holdings also, Table No. 4.21 is presented giving the proportion (percentage) of canal irrigated area, based on the total net irrigated area due to all sources taken together, in the selected districts.

TABLE NO. 4.21

*Area irrigated by canals as percentage of net irrigated area according to size class of holdings.*

District	Size class of holdings in hectares							All classes
	Upto 2	2-5	5-10	10-20	20-50	50 and above		
1. Nasik ..	24	15	13	10	8	77	15	
2. Jalgaon ..	29	24	20	18	18	16	22	
3. Dhule ..	32	17	13	18	10	13	15	
4. Ahmednagar ..	19	20	17	15	15	75	20	
5. Pune ..	37	33	29	20	15	8	29	
6. Satara ..	34	31	26	8	19	91	31	
7. Solapur ..	20	20	17	11	10	56	17	
8. Nagpur ..	32	31	29	28	22	17	28	
7. Bhandara ..	31	25	21	18	13	8	24	
10. Chandrapur ..	25	19	14	12	9	3	17	
State ..	23	20	17	13	11	54	18	

The above table reveals a distinct trend of declining importance of the canal as a source of irrigation as the size of holdings increased. The decline was fairly steep except in Nagpur district (where it was slight). The downward trend was continuous for all the size classes of holdings in six districts i.e. excluding four districts of Nasik, Ahmednagar, Satara and Solapur, where it was noticed upto 50 ha. only. The data imply that for the farmers with smaller holdings, canal was more important source of irrigation than for those with larger holdings. Again, though the number of holdings of size 50 ha. and above was very few, yet they stand apart from the observed pattern. In four of the ten districts (*viz.* Nasik, Ahmednagar, Satara and Solapur), the very big holdings, as a group, had canal as the most important source of irrigation, with about 56 to 91 per cent of the irrigated area being due to canal.

4.62. One common feature is noteworthy. Barring big holdings of size 50 ha. and above in the four districts referred to in the preceding paragraph, the holdings in none of the size groups received irrigation water predominantly from canals; in most cases, canals supplied water to only one-third or even less of the irrigated area. If a table similar to that of Table No. 4.21 is prepared for wells, it will be evident that in most districts and in most cases except very big holdings, well was the major source of irrigation. In Chandrapur and Bhandara districts, however, the trend similar to one stated for well irrigation, can be seen in respect of tank irrigation from Table No. 4.22 below.

TABLE NO. 4.22

*Area irrigated by tank as percentage of total net irrigated area by size class of holdings*

District	Size class of holdings in hectares							All classes
	Upto 2	2-5	5-10	10-20	20-50	50 and above		
Bhandara ..	66	71	74	77	78	82	72	
Chandrapur ..	69	74	77	76	79	80	74	
State ..	22	18	14	12	14	9	16	

In both these districts, tanks irrigated 72 per cent and 74 per cent of the irrigated area of holdings in all the size groups, the general trend being one of increasing importance of tank as a source of irrigation as the size of holdings increased.

4.63. In Kolhapur district, the 'other sources' of irrigation were predominant in all the size classes as seen from the Table No. 4.23 below.

TABLE NO. 4.23

*Area irrigated by 'other sources' as percentage of the total net irrigated area by size class of holdings*

District	Size class of holdings in hectares						
	Upto 2	2-5	5-10	10-20	20-50	50 and above	All classes
Kolhapur .. ..	74	69	69	69	73	50	71
State .. ..	12	8	5	4	4	5	6

The share of the area irrigated by other sources in the total net irrigated was 69 to 74 per cent in different size-classes and it showed a general declining trend as the size of holdings increased in Kolhapur district.

4.64. *Intensity of irrigated cropping according to size class of holdings.*—

The intensity of cropping in the irrigated area depends on the amount of water available for irrigation and the period for which it is available. But multiple cropping depends upon the cropping pattern also, particularly on the duration of each successive crop. As already mentioned earlier, the extent of irrigation was different for different size classes of holdings and generally it tended to decline with the increase in the size of holdings. Further, the importance of different sources of irrigation also differed for the different size groups of holdings, canal being more important for smaller holdings with the exception of a few districts. Based on these considerations, a study of the relationship between the intensity of cropping in the irrigated area and size of holdings has been attempted on the basis of Table No. 4.23 below.

The intensity of irrigated cropping is measured by the ratio of the gross irrigated area to the net irrigated area.

TABLE NO. 4.23

*Intensity of irrigated cropping according to size class of holdings*

District	Size class of holdings in hectares						
	Upto 2	2-5	5-10	10-20	20-50	50 and above	All classes
1. Nasik .. ..	120	117	117	116	113	102	117
2. Dhule .. ..	112	108	108	107	104	102	108
3. Jalgaon .. ..	118	117	115	114	114	114	116
4. Ahmednagar .. ..	110	108	109	109	109	103	109
5. Pune .. ..	124	120	117	117	117	126	119
6. Satara .. ..	124	122	122	125	124	109	123
7. Sangli .. ..	110	108	109	111	113	110	109
8. Solapur .. ..	124	118	117	117	117	109	118
9. Kolhapur .. ..	102	102	102	102	101	100	102
10. Aurangabad .. ..	104	103	103	103	105	100	103
11. Nagpur .. ..	104	104	103	104	103	102	103
12. Bhandara .. ..	101	101	101	101	101	101	101
13. Chandrapur .. ..	101	101	101	101	101	102	101
State .. ..	110	110	110	110	109	105	110

It is seen that the intensity of cropping for these districts varied from 101 in Chandrapur and Bhandara to 123 in Satara. A noteworthy feature of the above data is that except in a few districts like Pune, Dhule, Nasik, Jalgaon and Solapur there was practically no variation in the intensity of cropping in the different size classes. An implication of this observation is that only a small portion of the irrigated area was cropped more than once and that its proportion to the net irrigated area was nearly the same for bigger and smaller farmers.

### Crop pattern according to size of holdings

4.65. In the context of subsistence agriculture, the proportionate area devoted to foodgrains is generally expected to be higher in smaller holdings than in the larger holdings. Against this background, the relationship between the actual cropping pattern and the size of holdings was studied and the findings are summarised below.

As already seen, the percentage area under foodgrain crops considerably varied from district to district. In order to examine whether the proportion of gross cropped area devoted to foodgrains varied with the size class of holdings Table No. 16 is presented in Appendix II. For the purpose of this study, the districts can be conveniently grouped into 3 categories as below :

TABLE NO. 4.24

#### *Distribution of districts according to different percentage area under foodgrains*

Predominantly cotton growing districts	Predominantly paddy growing districts	Predominantly millet growing districts
Jalgaon	Thane	Nasik
Buldhana	Kulaba	Dhule
Akola	Ratnagiri	Ahmadnagar
Yavatmal	Chandrapur	Pune
Wardha	Bhandara	Satara
Amravati	Kolhapur	Sangli
		Solapur
		Nagpur
		Aurangabad
		Parbhani
		Bhir
		Nanded
		Osmanabad

It is seen that in the first category of districts the percentage area under foodgrains showed a narrow range of variation among the different size classes, particularly in the four Berar districts. In the paddy growing districts, with the exception of Bhandara, it showed a declining trend with the increase in the size of holdings, the decline being sharp in the 3 Konkan districts. In Bhandara district the proportionate area under foodgrains remained practically the same in all the size classes. In the millet growing districts, the pattern of variation was of two types : whereas the proportionate area under the foodgrains in the districts of Ahmadnagar, Pune and Solapur showed little variation among the different size classes, in the remaining districts it showed a slight declining trend with the increase in the size of holdings except in Satara and Sangli where the trend was in the reverse direction i.e. it increased as the size of holdings increased (upto 50 ha.).

It can, therefore, be concluded that on the whole no consistent trend is noticed to confirm or reject completely the expectation stated earlier. On the other hand, different types of phenomenon were noticed in the different categories of districts mentioned above. Thus, an evidence, somewhat unusual, has been obtained which suggests that in districts where cash crops were grown on a relatively large scale, the proportion of the area, devoted to foodgrains did not seem to differ for the different size classes significantly. But in the districts in which foodgrains predominated, the small holders devoted relatively large proportion of area to foodgrains than the big farmers.

4.66. An analysis of the above type carried out for the individual main crops is discussed below :—

*Jowar.*—In case of jowar in almost all the districts in Nagpur division and to certain extent in the districts in Aurangabad division the proportion of its area to the total area under crops showed only a small variation in the different size

classes as will be seen from Table No. 17 of Appendix II. In the districts of Buldhana, Nagpur, Dhule, Jalgaon and Solapur the proportionate area under jowar declined with the increase of the size of the holdings. On the other hand, in Pune district it showed an increasing trend upto the size 20 ha. In Aurangabad division the holdings falling in the lowest size group did devote relatively larger area to jowar compared to those in other size classes.

*Rice.*—The districts of Thane, Kulaba, Ratnagiri, Bhandara and Chandrapur and to some extent Kolhapur district are important rice growing districts. In these six districts a declining trend was observed in the proportionate area under rice crop. The range of variation of percentage area under rice in the different size classes was remarkably wide (except Bhandara) the highest and the lowest being 87 per cent and 15 per cent in Thane, the range was 89 per cent to 20 per cent in Kulaba, 65 per cent to 26 per cent in Ratnagiri. Even in Chandrapur and Kolhapur districts the area under rice varied between 56 per cent to 21 per cent and 31 per cent to 6 per cent respectively, as can be seen from a perusal of Table No. 18 of Appendix II.

*Nagli.*—In the three Konkan districts, nagli an inferior cereal crop was grown mostly on inferior lands. Analysis of Census data showed that the small farmers devoted lower area to nagli while bigger farmers, particularly in Ratnagiri district devoted proportionately much larger area of the total cropped area to nagli, as seen from the Table No. 19 in Appendix II.

It may be worth observing that in these three Konkan districts, the other major competing crop was fodder as indicated in Table No. 20. Its proportion to the total cropped area showed a steep increasing trend as the size of holdings increased in Thane and Kulaba districts while in Ratnagiri district the trend was slight. Fodder as a crop occupied an important position among the big farmers in Pune and Kolhapur districts also, as they devoted more than half the area under crops to fodder alone.

*Bajri.*—The size classwise percentage of area under bajri for the 10 districts in which the crop is grown on relatively large scale is presented in Table No. 21 in Appendix-II. The distribution indicates that in Nasik district, which grows the crop predominantly, the percentage area decreased with the increase in size class of holdings. On the contrary in Sangli and Solapur districts and to certain extent in Satara district, a slight increasing trend in the proportionate area under bajri with the increase in size class of holdings is noticed. In the rest of the districts, the percentage area practically remained the same in the different size class of holdings. In Dhule district very large holdings of size 50 ha. and above devoted substantially larger proportion of area to bajri.

*Wheat.*—The size classwise percentage area under wheat is shown in Table No. 22 of Appendix II for 13 districts where the crop is grown on comparatively large scale. Of these, in six districts viz. Dhule, Jalgaon, Aurangabad, Parbhani, Bhir and Osmanabad, the proportionate area under the crop practically remained the same in different size classes. In Nasik district, where the crop is grown on a large scale, the small holdings devoted proportionately larger area to this crop than larger holdings. In the remaining districts, particularly those in Nagpur division, showed a mild increasing trend in the proportionate area under this crop, with the increase in size of holdings.

*Cotton.*—Maharashtra's most important commercial crop is cotton. At the State level, 15 per cent of the total cropped area was devoted to cotton. Within the individual districts cotton occupied 36 to 51 per cent of the cropped area in the 5 districts of Nagpur division namely, Buldhana, Akola, Amravati, Yavatmal and Wardha, as can be seen from Table No. 23 in Appendix II. Three more districts, where cotton was similarly important accounting for over 1/4th of the cropped area, were Jalgaon, Parbhani and Nanded.

In all the five districts of Nagpur division mentioned above, the proportionate area under cotton did not vary much in the different size groups of holdings, though there was a slight downward trend in Amravati and Wardha districts. The percentage of area devoted to cotton tended to increase with the increase in the size of the holdings, rather sharply in Nanded district. In Parbhani district no trend was observed in the inter-size class variations of the proportionate area devoted to cotton. Thus, on the whole, the percentage area under cotton did not vary with the size of the holdings.

*Groundnut.*—Groundnut is another important commercial crop grown in Maharashtra occupying 4.8 per cent of the gross-cropped area in the State. Among the districts, in Dhule, Satara, Sangli, Kolhapur and Osmanabad the share of groundnut in the total cropped area in the respective districts exceeded 10 per cent. The area under groundnut expressed as percentage of the total cropped area in different size classes of holdings is shown in Table No. 24 of the Appendix II for the 14 important groundnut growing districts. From a perusal of the same, it is seen that the proportionate area under groundnut declined with the increase in the size of holdings in the three districts of Satara, Sangli and Kolhapur, while in the remaining districts, practically no variation was observed in the different size classes of holdings.

4.67. From the foregoing discussion, an inescapable conclusion emerges that generally for most of the districts especially in the dry region of the State, the size of the holdings seems to have little effect on the allocation of area to crops grown for family consumption or those grown for market. The above detailed analysis shows that, by and large, the cropping pattern, at least in the case of major crops, was not influenced by the size of holdings.

#### **Comparison of official statistics with those of Census in respect of important crops**

4.68. As stated earlier in Chapter I, the data for the Agricultural Census were collected for the first time by the method of complete enumeration covering all agricultural holdings in the State. The information on land use and area under crops was compiled from the basic village records, viz., Khasra (i.e. village form VII-XII) which also formed the basis for the preparation of the official statistics, published in the Annual Season and Crop Report. Hence the Census data afforded a unique opportunity for the first time, to compare certain important comparable items of area statistics published in the Annual Season and Crop Report, independently compiled by the different procedures viz., one by the aggregation of holdingwise data under the Census and the other by the aggregation of parcelwise data from the village records.

4.69. To enable such a comparative study, the Census and official statistics pertaining to the State total net sown area and gross-cropped area together with that of certain important crops and group of crops under the two heads viz., irrigated and total (i.e. irrigated + unirrigated) are given in the Table No. 4.25. A comparison of the figures of area in columns 2 and 3 of the table reveals that the Census figures were lower than the corresponding official statistics in the case of individual crops and for a group of crops, viz., cereals, pulses, etc. ; but the margin of difference was quite small in the case of individual crops. In the case of cereals, foodgrains, as also the net sown area and gross-cropped area, the difference was between 2 and 3 per cent. In the case of other group of minor crops such as pulses, oilseeds, horticultural crops (vegetable and fruits), condiments and spices, the margin of difference was rather wide.

In case of the irrigated area under individual and group of crops, the disparity in the two sets of area figures was much wider, with the Census figure being generally on the lower side.

Though it is not possible to give any rational explanation for the difference between the two sets of figures, there appears to be a need for a careful and detailed examination of the factors responsible for the same.

TABLE No. 4.25

*Area under different crops (1970-71) of Maharashtra, based on the Census and Official statistics*

Item	Total area* (i.e. irrigated+unirrigated)			Irrigated area*		
	Census	Official statistics	Per cent difference (-) OR(+) over S & CR	Census	Official statistics	Per cent difference (-)OR(+) over S & CR
(1)	(2)	(3)	(4)	(5)	(6)	(7)
Net sown area ..	1,73,030	1,76,682	-2.1	12,367	13,469	-8.2
Gross-cropped area ..	1,82,229	1,87,369	-2.7	13,573	15,703	-13.5
Rice .. ..	13,518	13,524	-0.0	2,863	3,138	-8.0
Kharif jowar ..	25,029	25,370	-1.3	121	207	-41.0

Total fodder ..	5,897	6,737	-12.5	194	284	-31.0
Total non-food crops	50,192	52,445	-4.3	1,115	1,358	-17.0

(\*Area in "oo" hectares)

## CHAPTER V—SUGGESTION FOR FUTURE CENSUS

The following suggestions are made for making the Census data more useful for formulating policies on related issues :—

(i) *Improvement in the content of basic area records.*—The present village revenue records particularly Village Form No. VIII-A (Khatavani) and Village Form No. VII-XII (Khasra) both need to be suitably modified to furnish the basic data required for the census as below :

(a) Particulars of lands owned by each khatedar in other villages also, if any, giving details of plural holding.

(b) Whether he is resident cultivator of the village; if not, the name of the place where he resides.

(c) Net sown area (irrigated and unirrigated separately) for each parcel of land.

(d) Classification of fallow land.

(ii) *Improvement in the reliability of basic statistics.*—Provision may be made to check the nature and extent of errors, if any, in the basic area records.

(iii) *Collection of data on a few additional items.*—The scope of the Census (1970-71) was limited to five items mentioned in Chapter I. Apart from these, information on other important selected items is also available in the basic village records, such as land revenue. Further, under the source of irrigation, information about the wells (energised/non-energised) is also recorded. It would be useful, if holdingwise information is collected on :—

(a) the number of wells (energised/non-energised),

(b) land revenue.

(iv) *Tabulation of additional information collected in the Census.*—(a) The data collected in the Season and Crop Report regarding the sourcewise irrigated area under crops, are not adequate to provide information to the planners. For example it would be quite useful to know the number of irrigated holdings under each source and so also the sourcewise and cropwise area irrigated.

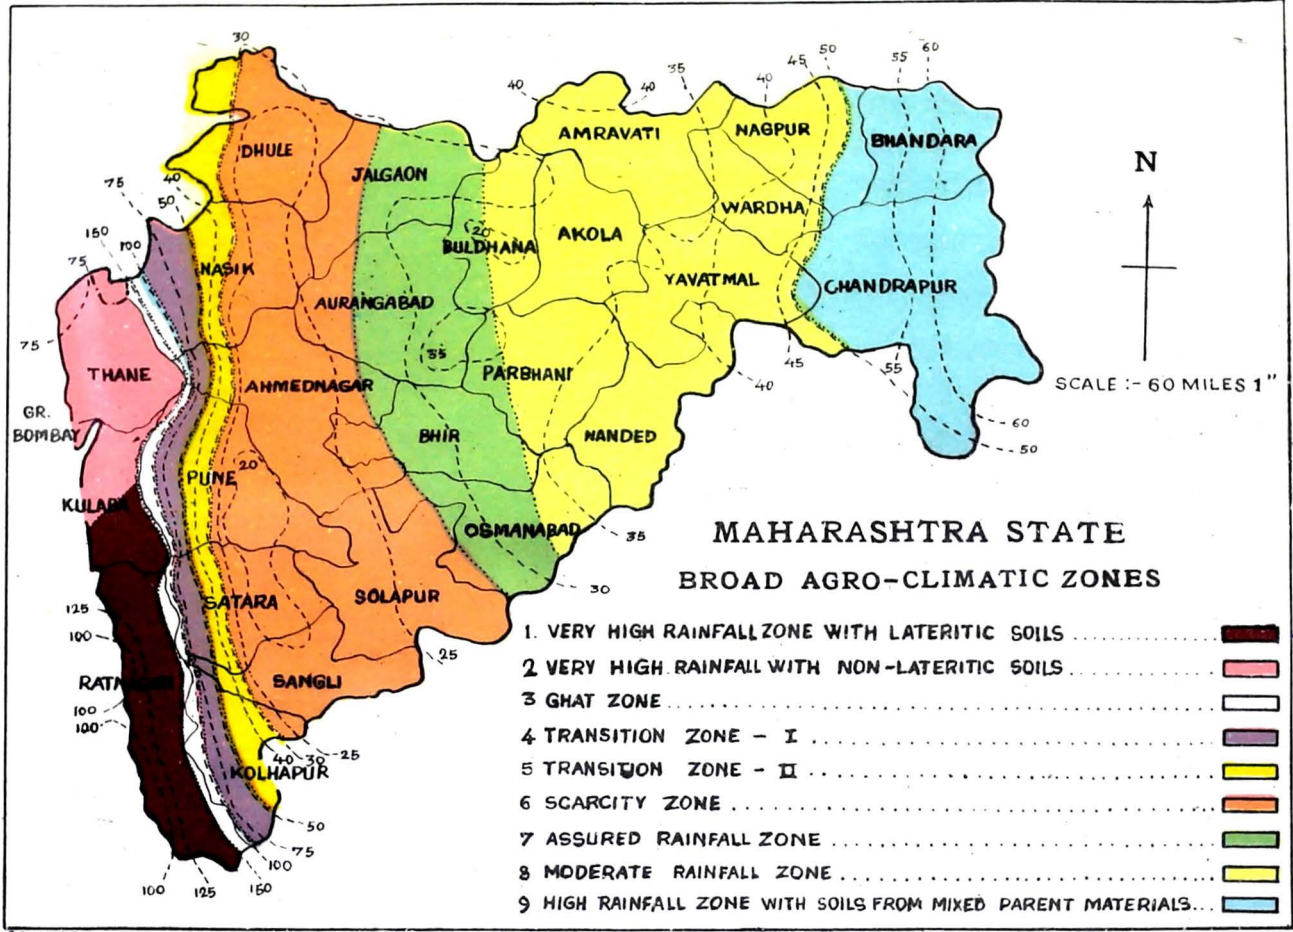

(b) The information about the number of holdings growing a particular crop will be quite useful. Hence the tabulation programme may be so planned as to get the number of holdings growing each of a few selected crops.

(c) The data collected under the Census for large size holdings cannot be properly analysed unless these holdings are categorised into individual and institutional holdings. This may be included in the tabulation programme.

ANNEXURE - II

47(b)

## ANNEXURE III

TABLE NO. 1

*Distribution of population*

District	Year 1961					Year 1971				
	Population					Population				
	Total	Urban	Per cent to the total population	Rural	Per cent to the total population	Total	Urban	Per cent to the total population	Rural	Per cent to the total population

## ANNEXURE IV

## EXPLANATORY NOTES ON CONCEPTS AND DEFINITIONS

Some of the concepts and definitions mentioned in Chapter III are further explained below in this Annexure.

Agricultural Census in its present form attempted to collect information for each agricultural holding on three aspects (i) size (ii) ownership and occupancy of land, and (iii) land use. The first two give an account of the structure of land holdings, together with the extent of tenancy and other details of relationship like the cultivator's tenurial rights to land, while the last gives details of the extent of productive uses of land mainly for growing crops, with or without the use of irrigation. The manner in which the operated holdings were distinguished from ownership holdings is explained below as also the problems faced in the determination of individual and joint holdings under certain situations.

(a) *Holdings*.—There are two types of holdings : (i) owned and (ii) operational. An owned holding consists of land owned and land held in ownership like possession, irrespective of whether it is actually operated by the owner or by others. It gives an account of land as an asset. An operational holding consists of (i) that part of owned land which is operated by owner himself i.e. self-operated owned land and (ii) land taken on lease or on mortgage or under any similar contract, which passes the possession of land to one who operates it. Thus the operational holding gives an account of land as the basis of farming enterprise. Of the two types of holdings, the concept of operational holding was used to define the unit of enumeration in the Census.

(b) *Operational holding*.—The definition of an operational holding hinges on the definition of operation of land for the purpose of the Census. An operational holding was defined to consist of all the land used wholly or partly for agricultural production and operated as one technical unit, by one person alone, or with others, without regard to title, legal form, size or location. A technical unit was defined as one, which, under the same management, had the same means of production, such as labour force, machinery and animals. In practice, the concept had to be liberally interpreted as explained below :—

An operational holding may consist of one or more parcels of land which need not be located at one place or in one village. Whether different parcels belonged to one operational holding was decided by using the criterion relating to self-cultivation by the operator i.e. the farmer. The operator may be cultivating the piece of land himself with the help of his family members or may be cultivating it entirely or partly with the help of hired labour. He may as well be operating the land through an agent. Despite this wide variety of arrangements for cultivation of land, the pieces of land so operated constituted one operational holding. In all these arrangements, the operator had direct interest in the produce of the land, since he took decisions regarding the land use. In case the manager or the agent took the decisions regarding land uses, in lieu of the operator of the land, he did so with the explicit understanding and the authority given to him by the operator. Thus the holder or the operator took the initiative and was willing to take the economic and financial responsibility implied in this decision. On account of this direct stake in the production, the pieces of land cultivated under the arrangements mentioned above were considered as land self-cultivated and as such constituted one technical unit of operation, a farming enterprise and hence an operational holding. The distance between any two pieces of land operated by the person was therefore not taken into account while deciding an operational holding. This definition, it may be mentioned, is analogous to that given in the existing laws pertaining to the operation of land in the Bombay Tenancy and Agricultural Lands Act, 1948.

(c) *Tenure and Tenancy*.—Since an operational holding consisted of land owned and leased in, information was collected for both owned and rented land, indicating the occupancy status of the operator in case of each parcel of land.

(d) *Problems in the determination of individual and joint operational holdings*.—A holding may be operated entirely by a farmer alone or jointly along with others. Again, while a few parcels might have been operated singly (i.e. alone), some other parcels might have been operated by him jointly with others. Further, there were cases where a land was shared for cultivation by two or more cultivators with their shares specified but each farming his portion separately. In such a case, the area of the land held jointly was divided among the cultivators in the proportion of the shares of the different cultivators and the share of each of the cultivators was added to the other corresponding area operated by him in the village or other villages individually, to get the total area of the operational holding of the concerned cultivator.

A further complex situation arose particularly where the land thus shared was too small as in Ratnagiri district to permit different cultivators to carry out farming operations separately according to their shares. In cases of this type, it was a normal practice that such a parcel of land was cultivated entirely by one co-sharer by rotation during each year. In the second case, the parcel of land held jointly was grouped with the other land in the villages (or any other village) of that cultivator, who operated the parcel of land during the Census year. The procedure adopted for determining a part-joint-part single holding is illustrated below :—

An operator, say 'X', operates a piece of land, say parcel 'A', entirely belonging to him. He also operates another piece of land say 'B' jointly with another operator 'Y'. The operator 'Y' operates a piece of land "C" independently. They do not operate any other land in the tahsil. If the shares of the two operators X and Y in parcel 'B' are one-half each and their shares are specified in the record, then there will be two operational holdings consisting of  $A + \frac{1}{2}B$  and  $C + \frac{1}{2}B$ . If the shares of 'X' and 'Y' in parcel 'B' are not specified

in the record, there would obtain three operational holdings, A,B and C (B being a joint holding) though there are only two operators or farmers. This procedure gives larger number of operators. It is likely that there may be more cases of unspecified shares than of specified shares. In the above case, if the operator 'X' had a share in a parcel of land 'D' with share not specified, along with other operators W and Z, then that would constitute yet another operational holding.

There were situations in which a farmer had his own land or land leased in by him, as well as he managed lands belonging to owners who were either individuals or institutions like temples, etc. In all such cases, the land under each individual's possession was treated to constitute one holding and land managed by him belonging to others constituted a separate holding. In case the owner of land had distributed several parcels of land among different managers, they were brought together to constitute one holding. Temple land, for instance, if cultivated by more than one person as managers not getting financial benefit of the produce, was treated as one holding. In case the owner of the holding which was managed by an agent, had other parcels of land which he directly managed or operated, the area of the parcels managed by others and those parcels operated by him directly were added up to constitute one holding. Besides temples, there were other institutions like Co-operative-Farming Societies, State Farming Corporation, Seed Farms and Agricultural Research Stations which held lands that were managed by other farmers or paid managers. Land tilled by each such institution within the boundary of one tahsil was counted as one operational holding and treated as an individual holding.

## APPENDIX I

Sr. No. of the Table and its title

Contents and Clarification of the table

The tables in Part II give the results according 12 size classes of holdings as below :—

- (i) — 0.5 hectares.
- (ii) 0.5— 1.0 hectares.
- (iii) 1.0— 2.0 hectares.
- (iv) 2.0— 3.0 hectares.
- (v) 3.0— 4.0 hectares.
- (vi) 4.0— 5.0 hectares.
- (vii) 5.0—10.0 hectares.
- (viii) 10.0—20.0 hectares.
- (ix) 20.0—30.0 hectares.
- (x) 30.0—40.0 hectares.
- (xi) 40.0—50.0 hectares.
- (xii) 50.0—and above.

*Table No. I*

Number of operational holdings and the area operated by size class of holdings. This table gives the number of operational holdings and their area in each of the 12 size classes. It shows also the split up of the holdings into individual and joint holdings and the area thereunder.

*Table No. II*

Number of operational holdings reporting irrigation and the net area irrigated by size class of holdings. The table gives for each size class the classification of the holdings according to irrigation, viz., wholly irrigated holdings, wholly unirrigated holdings and partly irrigated and partly unirrigated holdings. A wholly irrigated holding is one, the net sown area in which was entirely irrigated. When all the net sown area of a holding was unirrigated, it has been termed as a wholly unirrigated holding. If the land under crop in a holding was only partly irrigated and the rest unirrigated, it has been classified as a partly irrigated and partly unirrigated holding.

*Table No. III*

Number and area of operational holding by tenure and by size class of holdings. It gives the classification of holdings according to tenure and tenancy in each size class. A holding whose entire area was owned by the operator is classified as wholly owned holding. A holding taken entirely on lease or on rent is classified as wholly rented holding. If a part of the holding was taken on lease and the rest was owned, it is classified as partly owned and partly rented holding.

*Table No. IV*

Area under different land uses by size class of operational holdings. This table shows the distribution of the area under the following seven items of land use in each of the 12 size classes:—

- (i) Net sown area,
- (ii) Current fallow,
- (iii) Net cultivated area,
- (iv) Uncultivated land,
- (v) Other fallows,
- (vi) Cultivable waste, and
- (vii) Not available for cultivation.

*Table No. V*

Source-wise net area irrigated by size class of holdings. The table gives for each size group the net irrigated area of the operational holdings classified according to different sources of irrigation.

*Table No. VI*

Area under principal crops by size class of holdings. The table gives the irrigated and the total area under 14 important crops and that under categorised aggregates like cereals, pulses, total foodgrains and others.

## APPENDIX II

TABLE NO. 1

*Percentage of operational holdings and area operated in each district.*

District	Percentage of holdings	Percentage of area operated	Average size of holdings

**PART II**

---

---

**PART II**  
**WORLD AGRICULTURAL CENSUS 1970 MAHARASHTRA STATE**

**I. EXPLANATORY NOTE ON THE AGRICULTURAL CENSUS TABLES**

The data collected under the Agricultural Census have been summarised in six tables for each district, division and the State in accordance with the format finalised in consultation with the Government of India. A brief description of the contents of each table is given below :

**TABLE I**

This table gives the number of operational holdings and their area in each of 12 size classes. It shows also the split-up of the holdings into individual and joint holdings and the area thereunder.

**TABLE II**

The table gives for each size class, the number and area of operational holdings classified as 'wholly irrigated', 'wholly unirrigated' and 'partly irrigated' and partly 'unirrigated holdings'. Wholly irrigated holding is one whose net sown area was entirely irrigated. When the net sown area of a holding was all unirrigated, it has been termed as a 'wholly unirrigated holding'. If the land under crop in a holding was only partly irrigated and the rest unirrigated, it has been classified as a 'partly irrigated and partly unirrigated' holding.

**TABLE III**

It gives the classification of holdings according to tenure and tenancy in each size class. A holding whose entire area was owned by the operator is classified as 'wholly owned' holding. A holding taken entirely on lease or on rent is classified as 'wholly rented' holding. If part of a holding was taken on lease and the rest was owned, it is classified as 'partly owned and partly rented' holding.

**TABLE IV**

This table shows the distribution of the area under different items of land use, in each of the 12 size classes, classified as follows :

(i) Net sown area, (ii) Current fallows, (iii) Net cultivated area, (iv) Un-cultivated land, (v) Other fallows, (vi) Cultivable waste, (vii) Not available for cultivation.

**TABLE V**

The table gives for each size group the net irrigated area of the operational holdings classified according to different sources of irrigation.

**TABLE VI**

The table gives the irrigated and total area under different crops (of relative importance in the State).

**II. CLARIFICATION REGARDING CERTAIN FIGURES APPEARING IN THE TABLES.**

**A. Limits of size class of holdings**

The value of the upper limit of each size-class belongs to the next higher size class. But due to rounding, the area under a particular item in a size group may be of the same magnitude as that of the upper limit of the size class.

**B. Cases of 'nil' area figures**

In a few cases (such as in the first 2 size classes of Tables II and III of Bombay Suburban District, Yavatmal and Wardha districts) even though a few holdings are reported, the corresponding area may appear as 'nil'. This is due to the fact that the area in such cases is less than 0.5 ha. and hence not shown.

**C. Totals of area may not add up due to rounding**

The total operated area given in Col. (4) of the census Tables is classified according to certain categories in Tables III and IV. The categorywise areas may not add up to the aggregate in Col. (4) on account of the following reasons :

(i) While tabulating the primary data of the census relating to area, the last digit (i.e. the figure in the unit's place) of the total area for each size group in a village, was ignored to facilitate tabulation programme.

(ii) The area figures have been rounded to the nearest hectare at the final stage and then presented in the Tables.

For similar reasons, the cropwise area figures given in Table VI may not add up to the corresponding total gross-cropped area given in Cols. 5 and 6 of that Table. The disparity may be more pronounced in case of the very small holdings, due to the above two reasons.

**AGRICULTURAL CENSUS—1970—MAHARASHTRA STATE**
