We ourselves think that the compulsory establishment of such councils will be for the benefit of all concerned. Of course, as far as the workmen's representatives are concerned it would be best if it is insisted upon that outsiders should not represent them but that only wage earning units should be returned on such councils. The actual proportion in which they should be represented is a question on which there may be some difference of opinion. The Whitley Committee of 1916, recommended 50 per cent. representation on either side and we believe that that would be a proper data of representation in order to inspire confidence in the working classes as to the efficacy of their representation. Of course, the function of the council will be more or less of a consultative nature and if conducted sympathetically might promote good relations between the employers and the employees. They may be consulted for example (i) on the working rules of a factory as well as those (ii) in connection with dismissals. In this connection special rules if created in consultation on both these heads, particularly the latter would tend to avoid ill-feeling which is the chief cause of many industrial troubles. Dismissals may be due to either inefficiency insubordination, or slackness at the factory and in either of these cases a council such as the one we are suggesting will be of great assistance tending as it is sure to do towards smoothness in place of unpleasantness. In connection with welfare work also these joint councils connected with each factory will also be of great help. In this connection it is advantageous to quote here a passage from the excellent book published only this year (1929), of Prof. Henry Clay of the University of Manchester, entitled, the "Problems of Industrial Relations" where the working of the industrial councils as recommended by the report of the Whitley Committee for the past ten years comes in for close criticism.

The author has to admit that "The experience of the industries that did adopt the Whitley scheme points to the same conclusion, that the continuous contact and co-operation over non-controversial business, which an industrial council involves, are an aid to the peaceful settlement of differences, even if they cannot offer a complete guarantee of peace."

### Hours of Work.

The reduction from 12 hours to a 10 hours shift has not materially reduced production as is admitted on all hands. This encourages us to recommend the experiment of a further reduction by at least half-an-hour which ultimately may lead to a "nine hours' shift." We agree with the recommendation of the Fawcett Committee on this question, as given in para. No. 42 of their report, on the "extreme desirability of extra recess" through the reduction of working hours. In our opinion it may be given a fair trial and if the experiment succeeds in "reducing loitering and absenteeism and results in no material loss of production" it may be converted into a permanent arrangement. We of course realize that much will depend on the co-operation of the workmen here with the management, but as the above recommendation of the Fawcett Committee was due to the earnest pleading on the part of labour leaders themselves, who assured the committee that the same would be successful on the footing we have stated above, we are inclined to suggest the experiment.

### Industrial Disputes.

*Trade Disputes Act.*—We are strongly of the opinion that the Act should be amended so as to prohibit picketing. Any one who is familiar with the recent events in connection with industrial disputes in the country, especially in Bombay, will agree that this amendment is absolutely necessary. Para. 88 of the report of the Court of Enquiry recently appointed by the Government of Bombay under the Trade Disputes Act shows that picketing and intimidation by the strikers and acts of violence committed by them on those who declined to go on strike, resulted, among other causes, in the prolongation of the April, 1929, strike in Bombay. In para. 77 of its report, the Court has held, on the evidence of the Commissioner of Police, that intimidation had been carried on by the strikers to a considerable extent both in the chawls and on the roads and that picketting was by no means peaceful. The Court also refers to a statement made by Mr. Bakhale, a well-known labour leader, that the members of his union working in the Madanpura mills had complained to him that they were afraid of going to the mills, because they would be assaulted. Para. 72 of the report of the Percival Committee recently appointed by the Government of Bombay, also refers to intimidation of loyal workers and their families; in view of these findings there is no course open but to stop picketting; It has been argued that the right to strike being the birth right of every worker and being the essence of the Trade Union Movement, it follows that the right to persuade another peacefully to withhold service is equally legitimate. This argument overlooks the fact that those who are willing to work have a right to be protected from those on strike. This was the principal point made by the Hon. Member in charge of the Trade Disputes Bill while speaking in the Assembly in connection with an amendment prohibiting picketting. He actually quoted a passage from a book entitled "Freedom of Associations" Vol. I which stated that "the right to work, however implies that those willing to work have the right to be protected against strikers and that picketting is prohibited." (See Legislative Assembly Debates dated 6th April, 1929, Vol. I page 2,950). We should further point out that under the present industrial conditions in force in India, peaceful picketting is only a vision. This is due to the fact that an illiterate labourer can seldom be expected to act peacefully in times of excitement. This aspect of the question also came in for careful consideration at the conference convened by H.E. the Governor of Bombay in June last, in connection with the strike situation which resulted in His Excellency's decision to introduce a Bill in the Local Legislative Council for prohibiting picketting. The idea had unfortunately to be dropped for causes beyond the control of the Local Government, but we take this opportunity to quote from the speech of His Excellency at the time of the opening of the local Legislative Council in July, 1929.

"In addition it was found to be the general opinion of the bodies represented at the conference that picketting as now practised is often only another work for terrorization of the workers, especially at their homes and that a measure to control picketting during industrial disputes was necessary. As I indicated in my announcement to the conference in Bombay it was originally intended to frame such a measure on the lines of the English Act as it then stood, but as it is understood that this Act is now being reviewed, Government have decided not to introduce a Government measure on the subject for the present."

We trust we have made out a sufficiently strong case for anti-picketing legislation in India; we hope therefore that the Royal Commission will make recommendations on the subject bearing in mind that Indian Legislation should proceed along the lines of special Indian Conditions.

*Industrial Disputes (Causes).*—One of the causes of industrial disputes is the lack of contact between the employers and employed which tells heavily on their relations. In this matter the most important factor is the human factor. The healthy development of this factor depends, among other things, on the frequency with which employers come into direct personal touch with the workmen. With our illiterate labour, the problem of labour presents special difficulties of our own in India. This makes it all the more necessary for employers that personal contact should be brought about as far as possible between them. We have already suggested works councils as a remedial measure in this direction. The managing agency system, as it is being worked at present, is also responsible for this want of contact. Under it, a managing agent can go on adding company after company to its list in addition to carrying on various businesses in as many lines as it pleases. The heads of the firms concerned are thus too busy; their energies are directed towards so many channels that there is scarcely any time for them to come into contact with the workmen; that work is often left to inexperienced and unsympathetic assistants. A kind word, a sympathetic pat from the agent which goes a long way towards bringing about an atmosphere for loyalty and respect is thus conspicuously absent. In this view it is interesting to note that this question of the lack of contact was raised at the conference of representatives of the Indian Merchants' Chamber, The Bombay Chamber of Commerce and the European Association which the Millowners' Association had called on the 12th June, 1929, to consider the strike situation when Mr. H. P. Mody, the chairman of the association, observed as follows:—(See "Times of India" of 12th June, 1929).

"Coming to the question of the want of touch between the employers and the workers, I will not deny it; all I will say is that there have been excuses for it. The ignorance and illiteracy of the men and the classes from whom they have been drawn have not made it possible for employers of labour to get into the skins of the workpeople but whether something or other should be done in the near future is a matter which must engage the earnest attention of all employers of labour. My Association would observe that the excuse suggested is hardly convincing. The truth of the matter is that our mill agents have neither the time nor the inclination to establish personal contact with their workmen with the result that wrong impressions and distrust of the management exists among the workmen."

In view, therefore, of the importance of the point we hope that the Commission will be good enough to investigate to what extent the managing agency system as it is being worked at present is capable of bringing about personal contact between employers and workmen as a system or how far it is possible under the system to bring about this most essential factor for industrial peace and well being.

### Trade Combinations.

*Trade Unions Act, 1926—Possible amendments.*—That the imperfections of the Trade Unions Act have left the door open to a number of abuses is illustrated by the reports of the Court of Enquiry and the Percival Committee. The court has held that some of the leaders of the Girmi Kamgar Union took an unfair advantage of the conditions prevailing in October, 1928, and adopted the unconstitutional method of converting mill committees from advisory into executive bodies; that their policy was to encourage individual actions among the officers of a mill committee even to the extent of declaring a strike although such procedure was against the rules. The court has further held that these leaders encouraged antagonism between the workers and millowners and caused several lightning strikes without just cause, that the officials of the union unjustifiably broke off the negotiations with the millowners then pending, and took the extreme step of declaring a general strike, that the dispute which resulted in the general strike did not exist between the workers as a body and the millowners, but between the officials of the union on the one hand, and the millowners on the other. As to the main causes of the prolongation of the strike, the court has held that they were due to (a) the aggressive and mischievous propaganda of the officials of the union and inflammatory appeals made by them to the workers, and to (b) picketing and intimidation by the strikers and acts of violence committed by them on non-strikers. The court also found that the officers of the union did not act according to recognised rules of trade unionism, and that important documentary evidence bearing on the strike was not available.

The Riots Enquiry Committee (Percival Committee) has held that the union was the basic cause of the riots and that the intention of the leaders was to get the whole industry under their control, not merely to obtain pecuniary advantage for the,

labourers. These findings and conclusions show that there is an urgent necessity for a drastic amendment of the Indian Trade Unions Act, if the labour movement in this country is to be saved from going into the hands of undesirable persons. It will be seen that there is no provision in the Act prohibiting sudden or lightning strikes without notice, in countries where trade unionism has advanced on sound lines, strikes are a last resort. In India they have become a normal feature. This we submit is most unsatisfactory. It will be also seen that the Act does not provide for any machinery whereby those who are not genuine friends of labour can be prevented from being honorary officers of a union under Section 22. Similarly, the Act does not contain any provision whereby any honorary officer can be turned out if found to be indulging in excesses or working contrary to the constitution of the union. The select committee to which the Trade Union Act, 1926, was referred observed in Clause 6 (e) "we propose the admission of honorary and temporary members as the assistance of experienced labour leaders will be of considerable value to trade unions, while the movement is in its infancy." The facts disclosed show that this right has been grossly abused and that safeguards are needed as regards the qualifications and appointments of honorary or temporary members. The Act also does not provide a procedure to be followed in connection with the calling and the conducting of a strike or for dealing with a strike which is called and conducted in violation of the rules of the union; it is submitted that in such cases the certificate of registration should be cancelled. The Act is also silent about many matters, e.g., the nature of the books to be kept, inspection of accounts by inspectors appointed by the Government on requisition of members or those interested, the manner in which the alterations, variations or modifications in the rules are to be carried out, the appointment and removal of officers, the number of such officers, the minimum number of members required for a trade union, and the minimum subscription payable. In short, there is considerable need for control and supervision on the working of a Registered Trade Union. An enquiry should also be made as to how far the power to admit honorary members under Section 22 of the Act is being abused by multiplication of trade unions in the same industry and in the same area. Under regulation 22 of the Bombay Trade Unions Regulations, 1927, the right of the public to take inspection extends only to the register kept in accordance with regulation 5, but it is submitted that this right should be extended to all documents filed before the Registrar.

## GIRNI KAMGAR MAHAMANDAL.

### I. Recruitment.

1. 20 per cent. of the Textile labourers are local; the rest come from outside. Out of these  $\frac{1}{4}$  are Mahomedans and the rest are Hindus, Christians, Jews and others. Most of the Mahomedans are working in the weaving department and the Hindus in drawing department, mechanical line of the weaving department and carpentry. The Marathas, men and women, come from Poona, Sholapur, Satara, Belgaon, Nasik, Ahmednagr, Kolaba and Ratnagiri district and their distribution on work in several mills is as follows :—

Men from the southern part of the Ratnagiri district and from Poona and Satara district work chiefly in the weaving department, those from the Kolaba and other districts in the spinning department, men from Ratnagiri district work also in framing and roving departments. Women from the southern part of Ratnagiri district work in winding, dyeing and reeling and the Ghati (Kokan) women work in Safet (white) winding, frame ring and carding departments. Mahomedan women work in colourwinding department. The Bhayyas from northern India work in the blow-room and carding departments, the low caste people such as Mahars, Mangs and others work in the sweeping department and in roving, carding, framing and ring departments also. The pardeshis and Bayyhas who come from U. P. are included in the  $\frac{1}{4}$  part of the Hindu community. In the bleaching and dyeing departments men from Ratnagiri district and the Mahomedans work equally together.

2. In proportion of service in the city of Bombay the number of labourers coming from abroad and adjacent villages and that of men out of employment is far greater than the requirements, such unemployed staff of people get work only in the absence of leave of the permanent incumbents on account of sickness, performance of marriage ceremonies, and affairs of their landed properties at home. Some of the men from Konkan and southern India (Deccan) who work in Bombay mills go to their native places to look after their fields there, soon after the setting in of the monsoons, and return to their duties in summer every year but those from northern India go to their native places once in three or four years as their motherland is far away from Bombay and going so far is most expensive.

After all the Hindusthani Bhayyas work in the departments of little importance such as carding and blow-room while men from Konkan work in the much more important department of weaving and they are found fully experienced and expert in that art.

3. As stated in the para. above, men from Konkan Deccan and other adjacent villages, come for service in Bombay being compelled to do so by their inability to pay off the Government assessment of their own lands which produce nothing on account of shortage of timely rainfall and get themselves employed in the absence of men on leave. Such men are found at hand when necessity for additional hands is felt by the millowners.

7. In Bombay many men are seen without employment.

The reasons are :—(a) Men of profession such as ironsmiths, carpenters and others, who used to supply landowners in their own villages, with ploughs and other implements of peasantry which now have been supplied ready-made by foreign countries, have lost their own profession and have therefore been compelled to come to cities like Bombay in search of employment in some of the firms. (b) In view of curtailment of expenses particularly reduction of low paid working hands has lately been taken in hand by the employees. (c) Five or 6 mills in Bombay have lately been closed and 10,000 or 12,000 workpeople have been thereby left without employment.

In this way the number of unemployed has been increasing day by day.

8 (ii) It seems that there is no system of engaging temporary hands. Had there been permanency in the employment of the working staff, the temporary employment could have found its way in that system. The men employed here are not sure that they will have to serve for life, getting higher ranks of proficiency nor could they entertain hopes of promotions in pay with the increase of members in their families, are not willing to work on the same pay and post through the long run of their future life and in cases when a new officer resumes duties, several changes recur and under such a transitory system of employment one can scarcely find labourers (work-people) of long-standing. Hence temporary system of employment might not have been introduced.

9. The benefit of the Apprentices' Act of 1850, although it is very important, has been enjoyed only by men in authority or by men highly favoured by the agents and the superintendents, their relations or people of their own caste. The Act is not in the least beneficial to any other working hand.

## II.—Staff Organisation.

10. The agents' duties are :—To purchase raw materials, to sell ready made cloth and keep accounts of the profits and loss of the mills and his subordinate officer, the manager has to look after the management of the mill.

11. The manager and the superintendent have power to appoint departmental supervising subordinate staff, while the agent alone is empowered to appoint chief superintending superior staff of several departments in the mill.

12. The system of recruitment is already mentioned above. No mill has managed to give preliminary education of processes and machines. Those who have been raised to the rank of jobbers and head jobbers have tried their best to pick out knowledge of their own duties only through their long standing experience in the department.

There is a technical institute in Bombay but only men who know English are admitted into it. No benefit of the institute has been derived by many others who know not English, as the education there is not imparted in Marathi or other native language. No steps have been taken by the millowners as regards preliminary education. In some of the mills, schools were opened to educate half-time boys, but that was only a farce and no more importance could be given to it, but now half-time system has been put a stop to and consequently the so-called schools have been closed.

The Bombay Municipal Corporation have started compulsory Primary education, but the boys are not able enough to take the benefit of that education as their guardians have no stability of their professional services and that the wages they receive are too small to meet their own wants.

In many of the mills, the vacancies of jobbers and head jobbers are filled up by outsiders under favour or recommendation of men in high repute setting aside the claims of the qualified lower subordinates already working in the department.

13 (i) Generally the work-people and their supervising head officers are on friendly terms with each other, but now for a year or two there is a friction between

them because the leaders of the working staff are outsiders and quite ignorant of the mill matters and in fact vagabonds, and through the teachings of the newspapers of selfish attitude.

(ii) *Jobbers* bring men for work. They know how to repair machines and supervise the working staff and their work. Hence it is quite necessary to keep jobbers. In the absence of jobbers the work will suffer.

(iii) *Work Committees*.—Nothing can be said more satisfactorily about the unity of the labour party in the mill area of Bombay because of the opposition of the supervising head officers. Notwithstanding all such opposition, the Girni Kamgar Maha Mandal—a union of the workpeople—has alone survived for 4 years past.

(iv) *Work Councils and Industrial Councils*.—No such councils are in existence here.

14 (i) In every mill, a timekeeper is appointed to keep attendance of the work-people and accounts of their pay. The clerk in the department prepares accounts of the workers on piece-work and sends them to the timekeeper who checks them and enters them in the muster roll. The timekeeper prepares pay-tickets and distributes them amongst the work-people one day previous to the pay-day and the pay is distributed the next day after the distribution of pay-tickets.

The system of keeping attendance is as under :—There are tin and punched tickets provided for all the departments except the weaving. A box is kept at the entrance door of the mill, wherein given tickets are to be put in, and the ticket boy takes them out from the box and puts them on the Board kept for the purpose. The timekeeper then checks the tickets on the board with the report of the present working hands from each department, and fills in the attendance register of those that are present on work and prepares the accounts of pay at the end of each month. Besides the timekeeper has to submit reports of the occurrences of accidents, injuries or any mishap to any of the working hands. Thus the timekeeper has to work very hard. He has to look after the welfare of about 1,000 work-people.

(ii) Cashiers or pay-masters come from the agents' office to distribute pay to workers. The pay is distributed in the presence of the timekeeper and in accordance with the entry made in the muster roll against each and every worker. Gangs after gangs of workers come from several departments of the mill, to receive their pay.

15. *Contractors and Intermediators*.—There is no system of contractors in the Bombay mills.

### III.—Housing.

16 (i) Owners of some of the mills have erected chawls for housing the workers as also the development and improvement trust department have erected chawls for housing them into rooms of 10 ft. by 10 ft. Accommodation for free ventilation and water has not been properly attended to but all rent charge there is very high.

(ii) Government and wealthy people have built chawls for work-people. Rents of rooms in the Government chawls erected by the development department vary from Rs. 5 to Rs. 9-8 annas according to the area of the unoccupied rooms in different parts of the building.

(iii) Workers have no chawls of their own.

18 (i) The present and most urgent demands of the workers are, education and housing with suitable accommodations with tolerable rents.

19. According to the present style of building a house, the millowners have built houses of a common nature for the millhands and the rents charged thereupon are also considerably less than other buildings of the same standing and structure but the accommodation for free ventilation and light is not properly attended to in erecting them. In all they are like other buildings of the same style.

The development department of Government have also built several chawls in various parts of the mill-area, but they are as if they were pigeon-holes and the tenants living there generally suffer from malarious fever still there is no cheapness in the rate of rents charged and almost all of these chawls are therefore, left unoccupied.

20. Caste distinction is given particular attention to in the living of the work-people in the mills and the rates of rent are generally the same throughout the whole area.

### IV.—Health.

23. The health of the millhands is very bad owing to the thick population in the city, want of free ventilation and the nasty air they have to inhale in the mill compounds and in the occurrence of any epidemic, the first of its attack is on the workers in the mills and on account of various inconveniences they are not able to face the danger of the epidemic.

(ii) Average death-proportion amongst children of the workpeople is far greater than any other country in the world. The municipal report itself proves that the average is more than half of the average death proportion of children in any other country.

(iii) No precaution has been taken about the unhealthy condition of the workpeople in the mills.

The owners of houses always look after the recovery of monthly rents from the tenants. They do not care at all for the inconveniences of the tenants nor do they get the dirt removed from the different quarters in the chawl, they do not look to white washing and colouring, get the gutters drains and privies cleaned. Not only this, but even the municipality here is quite careless about cleaning gutters and roads in the habitation of the workpeople.

(iv) The workpeople have to buy articles of very poor food owing to their scanty means of subsistence allowance.

24. (i) The owners have opened dispensaries for giving medicines to workpeople, but it is a mere show. The workpeople have no confidence in the treatment and medicines given there, because they fully well believe that there will be very little or no improvement at all.

(ii) Government hospitals have been opened, but how far the patients going there have improved is a most serious question to be solved.

(iii) Charitable dispensaries have been opened, but they require much more improvement in them.

(iv) Female doctors, passed nurses and midwives have now-a-days come forward to prescribe their medicines, but the workpeople cannot take the benefit of their medical help as the fees charged by these female doctors are abnormally very high.

26. (i) Latrines are provided for workpeople, but they are extremely dirty at either of the places.

(ii) Provision of drinking water is not sufficient at all.

(iii) Where there is not sufficient provision of drinking water it is not difficult to ascertain what arrangements could be there for bathing and washing purposes.

27. There is no management or supervision in the mill.

29. Cold and malarious fevers are generally harbouring at the doors of the millhands, besides cholera and other epidemics prevail oft-times, and seriously endanger the lives of the millhands.

30. *Sickness Insurance*.—No such course has up to now been followed by any of the mills.

31. *Maternity Benefits*.—Millowners have now begun to bring into force this practice for the last two or three months because of the arrival of the Whitley Commission here, but not otherwise.

#### V.—Welfare.

32. Tennis-grounds have been prepared and are ready for the enjoyment of officers but no arrangements of the nature have been made for the millhands.

34 (i) Tea shops on contract have been maintained in the mills for the supply of refreshments to the millhands as also sheltered accommodation is provided for the workpeople to take their meals and creches for children.

(ii) There is no necessity of any physical exercise as the workpeople are so much tired of the laborious work of the day that they need only rest after such horrible work of 10 continuous hours.

35. These above provisions of welfare if available, are beneficial to the millhands.

36. The practice of providing schools for half-time boys has long since been discontinued by the millowners. Now there is not such educational facility in existence.

37. In some mills grants or pensions, not as a right, are received by certain numbers of old employees, but in almost all the mills even when the workers do not receive their pays for the work done, how could they expect to get the pension scheme introduced?

38. Nature of co-operation could not be understood. It will be better if the peculiarity for co-operation be explained in a wider sense of its application.

#### VI.—Education.

40. No facilities of education have been given by the millowners but there are some municipal schools in the industrial areas which serve the purpose for the time being.

41. The millowners have done nothing in respect of industrial and vocational training.

42. As the millowners have not devoted their attention to the training of the millhands nothing can be said about its good or bad effects upon the millworkers.

#### VII.—Safety.

44. There is no register kept for the purpose to find the number and nature of accidents occurring in the mills but some of the workers who suffered from serious injuries in the accidents, got small amounts as compensation.

#### VIII.—Workmen's Compensation.

51. It is better if the compulsory insurance comes in force.

52. Possibility of providing against insolvency of employers who might be so covered.

No action has been taken in this respect by the millowners.

#### IX.—Hours.

55. The hours of work in Bombay mills are 10 per day and 60 per week. These 10 hours are split up into two periods of 5 hours each with a break of 1 hour from 12 to 1.

56. In Bombay mills a week of six days is adopted.

60. The present system of allowing recess hour at mid-day from 12 to 1 is agreeable as the workpeople take their meals and amuse themselves awhile in the interval.

61. In Bombay it is a practice to give a holiday on Sunday but when a holiday falls on any other day in the week, Sunday stands as a working day.

#### X.—Women, Young Adults and Children.

81. *Effect of 1922 Act on Employment.*—This act has reduced the number of half-time operatives, the number of working hands employed on overtime and the work on Sundays.

82. Infants are not admitted to the mills in Bombay, but in mills where creches (rooms) have been provided for, their mothers are allowed to take the infants with them and keep them in creches. In some mills the infants in the creches are provided with milk and biscuits free of charge.

83. Women are compelled to work 10 hours a day. It is better if the working hours in the case of women be changed from 10 to 8 hours a day.

85. The system of double employment of children does not exist in Bombay mills.

87. Children are not allowed to work in the mill soon after the introduction of 1922 Act which reduced the number of half-time operatives but when a newcomer comes in for work in the mills, he is promoted from lower grade to the higher according to his proficiency in the execution of work done.

88. Women and children are not allowed to work at night, because such a system is not agreeable to workpeople.

#### XII.—Wages.

96. Prevailing rates of wages are from 28 to 35 Rs. per month but they are quite insufficient. It is true that rates of pay have been increased by 70 per cent. to 80 per cent. but rates of food grains and other articles of family requirements have an increase of 150 per cent.

97. After much debate about the present pay, the millowners have submitted to the Fawcett Committee, a statement showing average rate of pay from which it appears that there is an increase in the pay of the workpeople in some of the departments of the mill establishment, but there is a reduction at the same time of one quarter of the staff of working hands in those departments and consequently the work there has increased 33 per cent.

99. Seventy-seven per cent. to timeworkers and 80 per cent. to pieceworkers are paid in excess of their present pays to cover the rise in the cost of living, and although the rates of staple food grains have been reduced a little for the last four years, the excessive dearness in the rates of rents of hired rooms and still further increase in the rates of articles of food and other requirements in the family, the so-called apparent increase in pay is not even sufficient to cover the expenses and make the two ends meet.

101. Wages have been fixed according to the nature of work done, with due regard to the wages paid in the neighbouring mills.

No contracts or agreements are entered into with individual workers, but the wages are fixed by the heads of departments according to their own choice.

102. As the system of employing persons on overtime has been discontinued by the enactment of 1922 Act, there seems no necessity now to think of the average scale of wages paid to workers.

103. In the year 1928, an attempt was made to standardize wages throughout the mill industry but the same has not come in force up to now and that the principle of standardization was not properly understood by the workpeople.

104. There is no source to know what effect changes in wages was on labour supply.

105. If the minimum standard of wages be fixed at Rs. 40 in the case of males and at Rs. 30 in the case of females, the workers can pull on precariously in the present days of scarcity and want.

106. (i) The maximum limit of fining should be 2 per cent. of the pay received.

(ii) When the heads of departments are displeased with any worker, they get him dismissed without any reason. It is desirable that they should make proper inquiries into the matter before issuing order for dismissal.

107. Payments of wages are made monthly and the millworkers approve of the system now in force.

108. When a workman comes from his native place to Bombay for work, he owes nothing to anyone in Bombay, but he is after some time found fully engrossed with debts.

109. In Bombay there is no system of giving bonus or profit share to millhands.

110. Leave on full pay is not at all granted to any worker because of his sudden illness or any other emergency. They get leave without pay and it is granted by the head of the department to which he belongs.

#### XIII.—Efficiency of Workers.

112 and 113. The Rt. Hon. Thomas Shaw has fairly admitted in 1925 that the Indian mill operative has a very interesting comparison with any other workers in the efficiency of work.

114. Almost all the workers come from villages. They, therefore, require time to commence with the work on machines as they require necessary instructions in the use of machinery. The Bombay millhand has to work through unsuitable state of circumstances such as inefficiency of plant and management, physique, health, education, standard of living and climate and he, not minding the unsuitability of circumstances, tries to improve himself in the conduct of his business matters, but he has to keep his proficiency in work confined to himself as he entertains no hope of getting higher posts of rank or increment in pay.

115. (i) By changes in working hours there is a slight increase in the piecework.

(iv) When a working man lives in the chawls erected by the owner of the mill in which he works, is discharged from his duties he has to submit to the oppression of the millowner to vacate the rented rooms occupied by him.

#### XIV.—Trade Combinations.

119. (i) The intention of forming a trade union is to try to give requisite compensation to any of the workers found in a serious and sudden accident, to make provision for unemployed, to help the sick with medical help and the old, with money.

(ii) They have to look after health, education, economy in expenditure industrial education, improvement in the construction of buildings and persuasion of millhands to build houses of their own by economical means through co-operation.

120. (i) The Girmi Kamgar Mahamandal is a union conducted by the millworkers themselves. It is the first union established in Bombay. It also stands first of all other unions in India. Outsiders, ignorant of the mill matters, are not allowed to take part in it. The reason is that although there are many learned men in Bombay, they are not conversant with mill affairs and therefore not able enough to deal with the manners of behaviour between the millowners and the millworkers. They do not know the system of work in the mills and do not understand what the difficulties are nor do they try to understand them. They give their advice one way or the other, whether right or wrong, as they like in order to make much ado about nothing and make their name famous in the public by hook or by crook. It has long been experienced that their advice of the nature mentioned above is not at all beneficial to the millworkers but on the contrary it is worthless. It ruins the interests of the workpeople. Hence such men did not find their way in this union.

While the union was in progress, the millowners proposed a cut of 11½ per cent. in the wages of the workpeople but this union did not move an inch from strike, but kept it on. The result was that it proved very successful in the end. The workers got their full wages without the slightest cut. Leaders from outside such as Messrs. Joshi, Bakhle and others who had come with a view to help the Mahamandal, but as the whole work of the union was taken in hand by the workers themselves, they did not succeed in their attempts and the union worked on uninterruptedly. In 1928, another strike was proclaimed, but as it was untimely and without any cause the Mahamandal was not for it. But Messrs. Bakhle, Joshi and other leaders of the communist party commenced a general strike and kept it on through the help of rich people in the foreign countries such as England and Russia and others. The Mahamandal, finding that the interests of the workpeople are ruined in the general strike, kept aloof from the general strike. The leaders of the communist party understood that they are going a wrong way, but they, instead of coming to the right, path of virtue, tried to crush down the Mahamandal altogether, but as it was consisted of workpeople alone, they could not do so. The Mahamandal fully well believed from the beginning that these outsiders will certainly spread disaffection amongst the workpeople and ruin their interests and their belief was fully well confirmed by the decision of the Court of Enquiry and that of the Riot Enquiry Committee in 1929.

(ii) The union can exercise control over its members in the execution of its business matters.

(iii) The union can increase the extent of co-operation between the master and the servant and confirm their relations with each other.

122. (i) *Methods of negotiations between Employers and Employed.*—It is possible to observe such a method.

(ii) The co-operation between employers and employed can increase the production.

#### XV.—Industrial Disputes.

123. In order to bring the strikers to terms, the millowners closed the mills altogether.

(i) The millhands do not get requisite compensation in return for their efficiency in work, the oppressive policy of the head officers towards the workpeople, and unusual cut in their wages.

(ii) Every strike lasts longer than its previous one. The second strike lasted for six months but there was no fighting in any other strike than that of 1928.

There was fighting in the strike of 1928, not because it lasted for a long time, but because the speeches made by the leaders of the red flag union were of an inflammatory and intimidating character producing discontent in the minds of the workpeople.

(iii) Settlement can easily be made on such conditions as are approved by the employees.

(iv) It cannot be understood to what extent the machines have been kept without use and thereby have become useless as also the workers extremely suffer in the strike.

124. (i) We do not know what are the results of the investigation.

(ii) There is no objection to appoint conciliators.

(iii) The Act of 1860 is beneficial to the millowners.

(iv) There is no joint standing machinery.

(v) His Excellency the late Governor Sir Lealie Wilson had paid a visit to the Mahamandal in 1924. No other opportunity was afforded to the workpeople to represent their cause.

(vi) No representative of workers association has been admitted in any council assembly, trade board or joint industrial association.

The representatives that have now come forth and appointed as leaders are qualified, but they know nothing of the mill work nor have they any knowledge of other mill affairs. The reason why they are appointed is that the millworkers do not know English.

125. *Trade Disputes Act.*—The act has just come in force but from its apparent attitude it seems to be very troublesome to the workpeople.

126. The Government always keeps itself neutral.

## XVII.—Administration.

133. *Central and Provincial Legislatures. Action and attitude on labour question.*—Please refer to reply to 124 (vi).

The qualified solve the question as they think better. No opinion of the work-people has been taken into consideration up to now.

134. By the movement of international organization some points have been referred to legislative councils and action has been taken to bring them in force but by slow degrees.

136. The Government have opened a Labour office and it has some concern with the labour party.

146. There are so many developments sought for and they can be brought into effect but the millowners are quite against the development scheme.

## BOMBAY PORT TRUST.

## I.—Recruitment.

1. The bulk of the labour, skilled or unskilled, employed in the Bombay Port Trust Docks and Workshops comes from villages and coast towns in the Bombay Presidency. Most of the casual labour in the docks comes from the districts of Ahmednagar, Nasik, Poona and Satara. A fair number of semi-skilled employees in the workshops such as firemen, greasers, etc., come from the United Provinces and a small number of Pathans are also employed. About 60 per cent. of the labour employed on the Port Trust Railway comes from outside the Presidency.

The majority of employees recruited from outside Bombay visit their homes once a year.

*Engineering Department.*—Many of the Workshops hands leave during or before the monsoon to attend to cultivation of their fields or repairs to their homes in their native villages and rejoin afresh on their return to Bombay after an absence of two to three months. Besides the practice of leaving work during the monsoon the staff also avail themselves of the 14 days' leave on full pay allowed them per year.

2. The average number of workmen employed in the chief engineer's department is 6,600 per month and this figure does not vary appreciably. Of these, approximately 2,700 men have been admitted to the Provident Fund after 3 years' continuous service and may therefore be considered permanent.

*Docks Department.*—The labour force employed in the docks by the Port Trust averages some 3,500 daily with minima and maxima on ordinary working days of 1,800 and 5,000 respectively. Of this number, about 80 per cent. are casual and the remaining 20 per cent. are "permanent" in so much as the latter are paid monthly at daily rates and enjoy the privilege of contributing to the Trustees' Provident Fund and of being granted annual leave.

*Railway Department.*—The permanent labour force is 470, or 512 including locomotive drivers and firemen.

3. *Engineering Department.*—It used to be the practice some years ago to send Muccadams to the villages to recruit labour but there is now no necessity for this as men offer themselves for employment at the works in sufficient numbers. When new men are required they are selected according to their experience and general suitability.

The supply of labour is generally greater than the demand and no improvements can be suggested. The need for public employment agencies does not exist as far as this department is concerned.

*Docks Department.*—About 80 per cent. of the labour employed in the docks are engaged in gangs through headmen called "Toliwallas" who recruit a standing nucleus from their villages and secure the balance in the City as required from day to day. The toliwallas or gangmen are not necessarily headmen in their villages in early life, but are frequently enterprising and intelligent coolies who have become gang leaders by common consent of their fellow-workers. These toliwallas function as bankers to their regular gangs and generally care for their well-being. Payment of wages is made through the toliwallas who may be considered as small agents or contractors with the advantage of having a personal interest in and some measure of the confidence of the men. When disputes arise, the Port Trust Officer in charge of labour is usually called upon by both parties to adjudicate, and his advice is generally accepted. As these toliwallas and their permanent nucleus of labourers serve for many years in the docks, the relations between employer and employed are

generally speaking of a more intimate nature than would be possible if labour were recruited through Employment Agencies. At present the dock labourers are no members of any union; should they become so, it is possible that the present relations will undergo considerable change. Under existing labour conditions in India it is considered that the substitution of employment agencies for the present system of recruiting through *toliwallas* would be disadvantageous to all concerned.

*Railway Department.*—There is always an ample supply of applicants on the spot to meet all demands.

The need for public employment agencies is not felt nor are they considered to be a very reliable source of recruitment.

7. *Engineering Department.*—In the case of coolies and the less skilled men the question of unemployment in the true sense does not arise as they can generally return to their villages and maintain themselves and their families by working on the land.

In the case of men in more regular employment, such as crane drivers, etc., an effort is made to mitigate the hardship of temporary unemployment owing to slackness of work by a system of compulsory leave without pay, apportioned as equitably as possible among the staff.

8. (i) Workmen in the shops and on general maintenance work are allowed to work up to an age limit of 65 years provided they continue physically fit, and many workmen who have done good service in the past are retained on light work to an advanced age.

*Docks Department.*—Owing to the method of recruitment and employment through *toliwallas*, muster rolls of individual casual labourers are not maintained. The average duration of service as coolies in the docks is about ten years and is about the same for the permanent or monthly-paid hands, the majority of whom are in the Conservancy Establishment. When age prohibits heavy manual labour, the majority retire to their village holdings giving way to younger men who take their places. Their old age is therefore automatically provided for by the custom of the country.

*Railway Department.*—Since the Bombay Port Trust Railway was opened 14½ years ago, the duration of employment among inferior grades has been as follows:—8 per cent. over 10 years, 34 per cent. over 5 years, 58 per cent. under 5 years.

Among the drivers and firemen the figures are:—61 per cent. over 10 years, 31 per cent. over 5 years, 8 per cent. under 5 years.

(ii) *Engineering Department.*—In the case of construction works men are generally engaged temporarily for the duration of the work. In the case of maintenance work employment is generally regular and permanent. In the workshops the number of men employed naturally varies according to the amount of work in hand but to mitigate the hardship of unemployment among the regular workers, a certain proportion are placed on compulsory leave at intervals when the work is slack. This system is however resorted to as little as possible.

*Docks Department.*—Casual employment in its application to the docks is taken to mean daily engagements as required. About 80 per cent. or say an average of 2,000 men are casual.

*Railway Department.*—During the busy season, November to April, 12½ per cent. additional staff are employed on casual basis.

(iii) *Engineering Department.*—The average of absenteeism is about 7 per cent. during the year.

*Docks Department.*—The percentage of absenteeism among the permanent monthly-paid labourers consisting of conservancy branch, water lascars and general purposes coolies, is about 11 per cent. which increases to about 14 per cent. during the two months of seasonal exodus just before till just after the monsoon. Regarding casual labour no figures are available but during these same two months some shortage of docks labour is liable to occur. The causes in both cases are: (a) the marriage season, and (b) the demands of village agriculture. It is to be noted that these seasonal migrations are common to domestic servants and most classes of labour in Bombay.

*Railway Department.*—The extent of absenteeism, i.e., absence without leave amounts to about 6,000 days per annum among 470 men, the causes being chiefly due to temporary sickness and family affairs. Absenteeism in this Department cannot be said to be seasonal as absences due to seasonal occupations are generally covered by sanctioned leave. About 50 per cent. of the above 6,000 days are without pay involving a loss of about 2·1 per cent. on the total annual wages bill.

## II.—Staff Organisation.

The central administration of the Port Trust is vested in a Chairman and a Board of 20 Trustees, under whom are the Deputy Chairman and the Heads of the various Departments of the Trust.

10. *Engineering Department.*—There is one head of the department and under him are 1 deputy, 3 executive and 6 assistant engineers, a number of sub-engineers, a mechanical superintendent and 4 assistant superintendents, foremen, chargemen, supervisors, overseers, muccadams, etc.

*Docks Department.*—The docks are under the constant personal supervision and inspection of the trustees' docks manager and his deputy and assistant managers. They are also frequently inspected by the chairman of the board of trustees. Each of the three docks has a deputy manager in immediate control and each dock is subdivided into sections under an assistant manager. Each of the transit sheds has a superintendent; the gate checks are supervised by gate inspectors and gatekeepers. The "Hamallage" or labour branch of the docks is controlled by a deputy manager with an assistant manager under him. This branch controls (under the docks manager's orders) the daily engagement, allocation and payment of the dock labour employed for Port Trust purposes and the allotment of staff duties generally.

*Railway Department.*—The railway department is controlled by a manager under whom are 2 deputy and 3 assistant managers. The operative work at the various yards and depots is under the immediate supervision of yard foremen and the commercial or clerical work at the yards is supervised by goods foremen of various grades. The engineering branch of the railway comes under the chief engineer and is immediately supervised by an assistant engineer under whom are 5 inspectors and sub-inspectors.

11. The managing staff in all departments are selected in accordance with their qualifications, experience and general ability. As far as possible vacancies are filled by promotion within the service. When this is not possible vacancies are advertised and the selection is made by the board or the chairman in accordance with the provisions of the Act. The appointment of the deputy chairman and heads of departments is subject to the sanction of Government.

12. The staff qualify for advancement by experience and by acting from time to time in higher appointments in temporary vacancies caused by leave or sickness.

*Engineering Department.*—Skilled workmen in the shops are promoted — as opportunities occur—according to the merit and ability shown by them in their particular class of work. By this means they can in time rise to such appointments as head fitter, chargeman, etc.

13. The relations between staff and rank and file are generally cordial and satisfactory. Subordinates always have access to their superior officers and through them to the head of the department and through him to the chairman if they have any complaint to make or grievance to represent.

The provision of such amenities as living quarters, schools for employees' children, infant welfare and maternity centres, the Co-operative Credit Society and other schemes connected with employees' welfare and referred to elsewhere in this report has done much to increase the contentment of the workpeople in the Trustees' employ.

14. (i) Registers of attendance are maintained by timekeepers in each department. At works directed from one centre but spread over outlying areas "Check timekeepers" go round and check the men at the site of their particular job. The accounts department also maintains an independent test check by means of its outside audit branch.

Piecework and contract works are checked by the departments responsible for the work, i.e., for engineering work by the chief engineer's staff and for docks labour by the docks manager's staff. A secondary check is also maintained by the chief accountant's outside and revenue audit staff as follows:—

For engineering works quantities are checked and for docks labour the tonnage or number of packages handled is verified from the import general manifest and returns submitted by the steamer agents and the docks shed staff.

(ii) Payments are made in cash monthly in arrears except for labour at the outlying quarry works at Anik and for casual labour at the docks. At Anik the payments are made half-monthly in arrears owing to the isolated nature of the work. Where the number of workmen to be paid is large payment boxes are filled in compartments in the cash office and taken to the works by cashiers for distribution on the spot. Payments are made in the presence of a responsible departmental officer by the cash staff of the chief accountant's department in the majority of works and in a few cases by the cashier of the controlling department concerned.

In the case of the docks labour, the docks department cashier makes the payments. Daily paid labour is paid the following day while payment for piecework is made soon after the completion of the ship's discharge or loading.

15. (i) *Engineering Department*.—Building and construction work is frequently entrusted to suitable contractors.

*Docks Department*.—As stated in above replies, recruitment and engagement of the casual labour, which comprises the majority of the Port Trust dock employees, is effected through the *toliwallas*. The procedure is the outcome of years of custom, and though there are no specific contracts these *toliwallas* may be considered as petty contractors. Since 1925 piecework has been adopted as much as possible as the basis for labour payments in the Trustees' Docks. Practically all quay portage, sorting, stacking and warehousing is paid for by the ton or, when more convenient, on the basis of a numerical unit. Conservancy, water supply, certain loading contracts and odd jobs are carried out by the monthly-paid staff.

*Railway Department*.—The work of loading and unloading approximately 3 million bales of cotton per annum is let out on contract.

(ii) So far as is known, sub-contracting is not resorted to.

(iii) and (iv) *Engineering Department*.—The contractors' work is in all cases supervised by Port Trust engineers which leaves no scope for unsatisfactory work.

*Docks Department*.—The working conditions in the docks are controlled by the Port Trust through its docks department, that is to say the *toliwalla* supplies his men as required and directed by the labour branch of that department. Briefly the shipowner requisitions for his requirements day by day, and subject to practical considerations such as cargo congestion, religious holidays, etc.—the docks department meets these demands by instructing the *toliwallas* to produce suitable labour gangs and perform the tasks specified. The *toliwalla* has no powers to negotiate with the shipowner or any party other than the Trust.

*Railway Department*.—No direct control is exercised over working conditions as between the contractor and his workmen, the effect of which has been found satisfactory.

### III.—Housing.

16. About 36 per cent. of the normal number of labourers engaged are housed in accommodation provided by the trustees. The number at present housed is slightly over 3,000.

17. Three plans showing the type of the quarters provided at Antop village, and two plans showing the type of quarters at Wadala for railway staff are attached\* together with a brief description of the accommodation at the Wadi Bunder chawls, *vide* Appendix A.\*

1,725 units and 11 dormitories are provided for the occupation of manual labour employed by the Trust. The various types of accommodation provided are: (a) single, double or three-roomed tenements, according to the class of workmen; (b) semi-detached, single-storied two-room cottages at Antop village; and (c) single room quarters in the Wadi Bunder chawls.

Lighting is provided in passage-ways; conservancy is carried out departmentally. Water supply is free.

19. The accommodation provided is popular among the men and is utilized to the full letting capacity.

20. The quarters are either rent-free or allotted at concessional rents up to Rs. 7—8 annas per mensem per unit, according to the class of the quarters provided and the workers occupying them.

In the case of the docks coolies (who form the largest proportion of the labour housed), the rents charged represent between 13 to 15 per cent. of the man's average wages. No allowance has been made for overtime wages or the fact that practically all the tenants have lodgers who are also mostly dock employees.

The maximum rental of Rs. 7—8 annas per mensem per unit charged at the Wadi Bunder chawls is half the economic rent.

21. *Engineering Department*.—Tenements are not rented except to persons employed in the Trust. Single men belonging to one department are sometimes allowed to share a room but sub-letting is not allowed. When a tenant leaves the service, he is required to vacate his room, failing which legal action is taken. Such cases are now practically non-existent.

*Docks Department*.—The infiltration of outsiders is a continual source of trouble to the Port Trust; the labourers themselves appear to have no objection to indiscriminate overcrowding in exchange for any unauthorized rents they are able to collect from "outsiders." From time to time the trustees take legal steps to secure evictions if disciplinary action is ineffective.

## IV.—Health.

24. (i) The trustees have provided dispensaries at the following places on their estates where cases of sickness and injury are attended to and ordinary medicines are supplied to the staff free of charge: Prince's dock; Wadala; Grain depot; Antop village.

Serious cases of accident, etc., which cannot be attended to at the trustees' dispensaries, are sent to one of the public hospitals to which the trustees are regular contributors.

In addition to the above, temporary dispensaries are maintained in localities where works involving the engagement of labour on a large scale are in progress.

All employees of the Trust (including casual labourers) are further entitled to the supply of ordinary medicines for their families on payment in cash according to a scale of charges which represent as nearly as possible the cost price of the medicine. At Antop village dispensary medicines are supplied free to the residents.

(iv) No women doctors are engaged as the number of women employees is insignificant.

25. Full advantage is taken of the medical facilities provided. No separate statistics of the attendance of the labourers is available; the total number of patients attended and cases of injuries treated during the official year ended 31st March, 1929, at the Port Trust dispensaries were as under:—

	No. of patients attended.	Cases of injuries treated.
Prince's dock dispensary ..	23,107	1,109
Wadala dispensary .. ..	5,020	599
Grain depot dispensary ..	6,714	1,759
Antop village .. .. .	10,344	60

During the last small-pox epidemic 3,381 persons (including family members of the staff) were vaccinated.

26. Adequate sanitary arrangements and water supply at work places and in Port Trust quarters are provided. Washing places are provided at quarters.

31. The first work financed out of the recently constituted employees' welfare fund was the erection of a maternity home and infant welfare centre at the Port Trust dock labourers chawls at Wadi Bunder at a cost of Rs. 22,570. The maternity home, which was opened by Her Excellency Lady Wilson on 16th November, 1928, has accommodation for six cases at a time with provision for future extension, and is equipped on the most modern lines. The management of the home and centre is undertaken by the Bombay Presidency Infant Welfare Society who provide the medical staff, medicines and milk for distribution; the Port Trust contributes Rs. 500 a month towards the expenses in addition to paying for the electricity and gas, water charges, telephone rental and maintenance of the building. The home has proved extremely popular and during the first six months of its existence 70 patients have been accommodated. Owing to the increasing demand a scheme for extension is now being prepared.

## V.—Welfare (other than Health and Housing, but including Education).

32 and 34. In addition to the opening of the maternity home and infant welfare centre referred to above, the trustees have in contemplation schemes for the benefit of their labourers such as laying out playgrounds with equipment for indigenous and other sports and games; also affording monetary assistance to the social service branch of the Y.M.C.A. to organise periodical cinema shows, musical entertainments, night lectures, etc.

An employees' co-operative credit society was instituted two years ago, the membership of which is open to all classes of employees (including workmen) who are members of the trustees' provident fund. The objects of the society are to encourage thrift by enabling members to save and invest part of their income in a safe and remunerative manner and to prevent indebtedness to money lenders by making loans available for approved purposes on reasonable terms as regards interest and repayment. The present number of members is 2,503; the issued share capital is Rs. 2,36,470 and the loans outstanding amount Rs. 2,90,773.

36. (i) and (iii) *Docks Department*.—For the dock labourers' children a free primary vernacular school is provided by the trustees in the compound of the labourers' chawls. The three teachers and one lady teacher are selected on the recommendation of the municipal school authorities.

*Railway Department*.—Three grades of education are provided free for workers' children : (a) Kindergarten ; (b) Marathi vernacular standards I–IV ; and (c) Anglo-vernacular I–III.

*Note*.—Standards I to III in the Anglo-vernacular school rank "pari passu" with standards V to VII of the Marathi School plus tuition in English.

These schools are administered by the Bombay Port Trust and financed by Government, the Bombay Municipality and the Bombay Port Trust.

(iv) *Docks Department*.—The average attendance of children is about 120 or just under 50 per cent. of the total child population of the chawls. Making allowances for infants and language difficulties, the percentage is considered satisfactory.

*Railway Department*.—The schools are used to the fullest extent by the workers' children between the ages of 5 and 12. Educational authorities do not admit children under the age of 5 and parents as a rule remove children on their attaining the age of 12 with a view to their seeking employment. The average attendance of pupils is about 170.

37. Owing to the joint family system prevailing in most parts of India, the earning members are as a rule burdened with the support of those members of the family who are unable to work. A retiring provision for labourers incapacitated by age would obviously alleviate the burden.

In the Bombay Port Trust, workmen—after having put in a qualifying period of 3 years continuous service—are admitted to the benefits of a provident fund, the terms and conditions of which are considered to make adequate provision for retirement in normal cases. The employee contributes  $8\frac{1}{4}$  per cent. of his earnings and the Trust contributes a similar amount plus interest on the accumulated balance at the rate fixed by the trustees from time to time according to the interest earned on the investments of the fund—generally the rate is 5 per cent. per annum or slightly under.

## VI.—Education.

41. The Trustees have a scheme for training apprentices in their workshops. On completion of their course these apprentices are eligible to apply for appointments such as chagemen in such vacancies as may occur.

## VII.—Safety.

43 and 46. *Docks Department*.—The Trustees' views on these questions and the conditions in the Bombay docks, as compared with those in British ports, are stated in letters addressed to the Government of Bombay (Marine Department) in 1928, which are quoted below :—

(Dated 26th September, 1928).

While acquiescing in the principle of protection of dock workers against accidents, the trustees are of opinion that, as far as the Port of Bombay is concerned, there is no actual need for legislation on the subject. The Port authorities already take all reasonable precautions in their own interests for the safety of their workers and it may be pointed out that, apart from humanitarian motives, the Indian Workmen's Compensation Act provides a strong incentive to safety measures. The precautions already adopted in the Port Trust docks have been compared with the regulations detailed in the section of the English Factory Act which is applicable to dock workers and it is found that, with the exception of (1) compulsory chain sling testing and (2) the provision of first-aid outfits at various centres in the docks, this administration is observing the English rules in all essentials. As regards exception (1), the adoption of suitable rules is now under consideration and as regards (2) municipal ambulances are obtainable within 15 minutes of the occurrence of any accident in the docks.

The trustees are, on principle, opposed to any fresh legislation which would tend to add to the financial burden on port administrations or shipowners. If, however, the International Labour Conference, after considering the opinions of the various Governments, comes to the conclusion that the existing provisions for the protection of dock workers are insufficient and that it is necessary to frame an International Convention on the subject, the trustees are of opinion that the terms of that Convention should be on the lines adopted in Great Britain, as specified in the relative section of the English Factory Act. They consider it most important however,

that the terms should allow port administrations considerable latitude in the matter of framing rules as it would be essential to practical working that such rules should be based on experience and known conditions at the various ports. In Bombay, for example, the rules for workers in the docks would require to differ considerably in certain respects from those for workers at the bunders (open wharves for small craft) as the working conditions are totally different. The trustees also consider it most desirable to avoid any risk of the work of port administration being hampered by interference from subordinate outside officials and they would therefore urge that in framing regulations to give effect to the object under reference, the major ports, like the principal railways, should be vested with responsibility for carrying out such regulations with a minimum of outside interference.

As regards the suggestion of setting up Safety First Committees on which the workers would collaborate, the trustees are of opinion that, under present conditions and having regard to the fact that Indian dock labour as a class is still illiterate, the adoption of this proposal would not serve any useful purpose.

(Dated 26th October, 1928).

I have the honour to acknowledge receipt of your memorandum No. 1016/1808-M, dated the 24th September, 1928, and enclosures which has crossed with my No. 4319 of the 26th ultimo. To the general views expressed therein the Trustees have nothing further to add, and this reply is therefore confined to some amplification of the statements made regarding safety precautions observed in the Trustees' docks.

There are no specific rules and regulations akin to the British "Docks Regulations, 1925" framed under Section 79 of the British Factory and Workshop Act, 1901.

Under Section 73 of the Bombay Port Trust Act of 1879, however, the Board is empowered to make by-laws for *inter alia*.—(a) "The guidance of persons employed by them"; (b) "The safe and convenient use of the wharves, docks, piers, warehouses, tramways and other works constructed or acquired by them under this Act"; (c) "for the use of the public landing-places constructed by or belonging to them"; (d) "for the reception and removal of goods brought within the premises of the Board"; (e) "for keeping clean the harbour and basins and the works of the Board, and for preventing filth or rubbish being thrown therein or thereon"; (g) "for regulating, declaring and defining the wharves, docks and piers vested in the Board on which goods shall be landed from, and shipped on board, vessels."

In the attached statement a comparison is made between the requirements of the British regulations and the measures taken or by-laws in force in the Bombay Port Trust Docks from which it will be observed that the Port Trustees as distinct from "Ship" and "Merchant" operating in the docks are already observing practically all the more important safety precautions.

It will also be observed that in respect of certain processes, principally those connected with the handling of cargo, the Trustees through the medium of their by-laws have powers and exercise those powers to ensure a reasonable factor of safety.

It is trusted that the above remarks and the comparative statement will provide Government with the information they require.

In conclusion it is desired to emphasize the Trustees' views that should the introduction of legislation be decided upon, ample latitude must be allowed to enable the varying conditions at different ports and at different parts of the same port to be observed without hindrance; also that the controlling bodies of major ports should be vested with responsibility for carrying out statutory regulations with a minimum of outside interference.

The statement referred to in the latter (copy enclosed, *vide* Appendix C) shows clearly the safety precautions in force.

**Railway Department.**—The existing regulations are laid down in the General Rules for Open Lines of Indian railways. Copies are published in English and the various vernaculars and issued to all staff concerned. In addition to the General Rules, local rules are laid down for the safety of employees and it is the duty of the supervising staff to see that such orders are understood and carried out.

44 and 45. **Engineering Department.**—Accidents incidental to the nature of the work occur from time to time and are usually due to the carelessness of the workmen themselves. The average number of trivial accidents per annum is about 500, serious accidents about 3 and fatal accidents about 2.

**Docks Department.**—Examination of Police returns show that the majority of fatal accidents occur on board vessels and are caused by falling into open holds. As regards the sheds and quays, fatal accidents are usually due to goods falling out of crane slings and by persons being run over by vehicles. The fundamental cause

of the majority of such accidents is the labourer's own carelessness and disregard of ordinary safety precautions. The following statement summarizes the accidents that occurred in 1928-29 :—

Causes of accidents.	Slight.	Serious.	Fatal.	Total.
<i>On Board Vessels.</i>				
Falling into holds or lighters .. .. .	9	4	3	16
Falling in dry docks .. .. .	—	1	2	3

*Railway Department.*—The incidence and causes of accidents are enquired into and reported annually to the Railway Board on their standard form. This form gives full information as regards both incidence and cause and actual figures for all railways are obtainable therefrom.

48. Doctors and dispensaries are provided in the docks and other centres and are immediately available when required.

City ambulances are obtainable within 15 minutes of the occurrence of accidents in the docks, while the trustees have under consideration the provision of first-aid boxes in the docks. Up to the present, no steps have been taken to train the staff in first-aid treatment.

### VIII.—Workmen's Compensation.

52 and 53. This matter was referred to the trustees by the Director, Labour Office, and Registrar of Trade Unions under cover of a questionnaire submitted along with Government Resolution, General Department, No. 264 of 18th December, 1928. The reply of the trustees (in May, 1929) is quoted below :—

With reference to Government Resolution (General Department) No. 264 dated 18th December, 1928, I have the honour to submit the following statement of opinion, approved by the Board of Trustees, on the questions referred to in the letter from the Government of India, Department of Industries and Labour, No. L-1125 dated 30th November, 1928 :—

1. As regards ports it is considered that the scope of the Act should be extended so as to make it applicable to such of the following classes as are not already included, subject to the prescribed limit of pay :—(a) all port employees working within dock areas, including dry docks ; (b) persons employed on dredgers, tugs, barges, launches, or any other vessels owned or operated by a port authority ; (c) persons engaged in submarine diving operations in connection with the service of a port authority ; (d) persons employed in the service of any electrical supply or distribution company or attending upon any machinery connected therewith.

3. From the employers' point of view, as far as organized industries are concerned, lump sum payments are decidedly preferable to any general system of monthly disbursements which would involve heavy clerical work and resulting expense to the employer. From the employee's standpoint it is considered that on the whole the lump sum payment is also preferable for the following reasons :—(a) in many industrial centres, especially ports, the bulk of the working population is not indigenous and periodical visits from their villages in order to collect payments or, alternatively, the uncertainty of accurate delivery of remittances through the post to out of the way addresses offer grave objections; (b) in the case of permanent disablement a lump sum payment enables the recipient to set up a shop or purchase land or otherwise invest his capital in such a way as to support himself. A hopelessly improvident person or one who is in the hands of unscrupulous relatives will derive little or no benefit from his compensation in whatever form it is paid to him. It is, however, considered that some reasonable discretion should be given to the Commissioners as regards the form of payment.

4. The scales of compensation laid down in the case of death, permanent total disablement or permanent partial disablement are considered reasonable and adequate except that the minimum monthly " assumed wages " under Schedule IV of the Act might be raised to Rs. 15. The compensation allowed for temporary disablement, *vide* Section 4 (1) D (i), is considered inadequate for employees whose pay is over Rs. 60 per mensem, e.g., a coolie earning Rs. 30 a month is eligible for compensation at the rate of Rs. 15 a month while an employee on Rs. 300 is limited to Rs. 30 only. To rectify this inequality it is suggested that the limit of compensation be raised to Rs. 75 per half month or one-fourth of the monthly wages which ever is less.

5. It is not considered that the waiting period should be reduced as this course would encourage malingering over trifling injuries. While appreciating the loophole for abuse it is considered that " dating back " provisions to say the fourth day might suitably be introduced as it is undoubtedly a hardship for men whose injuries incapacitate them for some weeks to lose ten days' compensation.

6. It is considered that the inclusion of widowed sisters and widowed daughters would sufficiently enlarge the present list of dependents but the commissioners are in the best position to offer an opinion on this matter.

7. Submission of proof of dependence is desirable but insistence on this in all cases would undoubtedly complicate the administration of the Act. It is suggested that such proof should be demanded in the case of a parent or paternal grandparent. The commissioners are in the best position to offer an opinion on this question.

8.

It is considered that the party who employs and pays the workman should be responsible for the payment of compensation, but the workman should be allowed to claim against the principal, leaving the latter to recover from the contractors. The Act should therefore be suitably amended so as to permit of liability being passed on in every case to the party directly employing the workman.

## IX.—Hours.

### A.—Factories.

55. *Engineering Department.*—Working hours on week days except Saturday :—8 a.m. to 5.30 p.m. with interval for meals from 12.30 to 1.30 p.m., 8½ hours. Working hours for Saturday :—8 a.m. to 1 p.m., 5 hours. The limit in the workshops and quarry is 60 hours per week including overtime.

56. Six days per week.

60. (i) All workmen are allowed one hour for meals.

(iv) Apart from Sundays there are 26 holidays on which the works are closed, Besides this, there are certain " sectional " holidays.

61. Sunday is observed as a day of rest.

### B.—Mines.

63. The Port Trust " mines " consist of two open quarries for trapstone and moorum. The same working hours as stated above are observed.

### C.—Railways.

73. (i) *Railway Department.*—The normal hours worked are 8 per day and 56 hours per week.

(ii) The actual hours worked are in accordance with the normal except in certain cases where duties are of light or intermittent nature. The following percentages show this :—

On 8 hours duty equal 76 per cent. of total staff.						
" 9 " " " "	5	"	"	"	"	"
" 10 " " " "	12	"	"	"	"	"
" 12 " " " "	6	"	"	"	"	"
" 14 " " " "	1	"	"	"	"	"

(iii) Workers are normally not on call after doing the above hours of duty until their turn again falls due.

74. Seven days are normally worked per week.

76. (i) No intervals are actually laid down but the intermittent nature of railway work provides sufficient opportunity for occasional rest.

(ii) Staff whose spells of duty exceed eight hours are allowed one hour off for meals.

(iii) No holidays are given except under the leave rules dealt with in paragraph 110 of this questionnaire.

#### D.—Other Establishments.

78 and 79. *Docks Department.*—The hours of work in the docks are :—Daywork, 8 a.m. to 12.30 p.m., 1.30 p.m. to 6 p.m. Nightwork, 7.30 p.m. to midnight (half night), 7.30 p.m. to 3.30 a.m. (whole night). Ordinarily the docks are closed on Sundays, Christmas Day, New Year's Day, Good Friday and the King's birthday, though vessels are permitted to work on payment of additional charges. Labourers employed upon these days are paid at standard rates. The many religious holidays are recognized to the extent of allowing as many members of the community concerned as can be spared to absent themselves from work. Actually the crises of most festivals enjoyed by the working classes are reached at night so that the men are willing to work by day during most of such festivals. The average number of hours per week worked by the toliwalla's men, i.e., the casual labourers, cannot be stated with any pretence to accuracy. Endeavours are being made to extract some information from the men; this will not be available in time for this report but may be referred to in the oral evidence. The monthly-paid men average six days per week and in addition work about the same number of nights on overtime per month.

80. Dock labour has been contented and stable for some years, and the men are generally sufficiently clannish to support one another in disputes. In the absence of unsettling propaganda and agitation therefore, it is not considered that regulation by legislative means is necessary or desirable. To go further, it is probable that such regulation would be resented by the men and without necessarily benefiting them, would hamper the mercantile interests of the country.

#### XI.—Special Questions Relating to Seamen and Workers in Inland Navigation.

93. *Engineering Department.*—The ordinary working hours on dredging craft aggregate 50 per week. The working day is from 8 a.m. to 5.30 p.m. with an interval of  $\frac{1}{2}$  hour for meals. On Saturdays the hours are from 8 a.m. to 1 p.m. without interval. For work done beyond the ordinary working hours the crews are paid overtime.

*Port Department.*—There are no fixed hours of work for the crews of the vessels comprised in the Port Department flotilla. They are called for duty at any time during the day or night as required but in the ordinary course their working hours in the aggregate do not exceed 8 hours per diem.

94. *Engineering Department.*—Suitable accommodation is provided as necessary on dredging craft. Rations are not provided, but cooks, cooking utensils, stoves and fuel for cooking are provided.

*Port Department.*—No rations are supplied to the crews of the vessels comprised in the Port Department flotilla.

The majority of the crews of the Port Department flotilla live on board their vessels. The lascars of the Prince's, Victoria and Alexandra Docks are provided with free quarters at the docks for their own use only but not for their families.

The crews of the vessels comprised in the Port Department flotilla do not serve under articles of agreement.

95. The Indian Merchant Shipping Act does not apply to vessels of the Port Department flotilla which are classed as "inland vessels."

## XII.—Wages.

96. *Docks Department.*—The prevailing rates for labour at the present time are :—

- A.—Boy or truck coolies (casual)—14 annas per diem.
- B.—Boy or truck coolies (monthly-paid)—14–15 annas per diem.
- C.—Scavengers (monthly-paid)—14 annas per diem.
- D.—Bag coolies (casual)—Re. 1–8 annas per diem.
- E.—Muccadums who generally supervise groups A, B and C, draw an average of Re. 1–8 annas per diem.

From inspection of some of the toliwallas' wages accounts, it appears that the dock labourers' earnings (including overtime) are about Rs. 32 per man. The men employ clerks who check the amounts paid them by the toliwallas.

97 and 100. *Engineering Department.*—On a representation last year from the Port Trust Employees' Union that the pay of workshops hands had not kept pace with the increased cost of living and that increments were rarely given, a thorough investigation was made into the rate of wages of all workmen in the engineering department. Copies of the following two statements prepared at that time are attached for information, vide Appendices\* E. and F. :—(a) Comparative details of number and pay of various classes of Port Trust workmen employed in 1914 and 1928 ; (b) Average percentage increase of pay in each class as compared with 1914.

*Docks Department.*—The rates of wages ruling in 1914 in regard to the classes of labourers mentioned in reply to questionnaire No. 96 were as follows :—

- A.—Annas 7 per diem.
- B.—Annas 7–8 per diem.
- C.—Same as A probably.
- D.—Annas 12–14 per diem.
- E.—Annas 10–12 per diem.

Prior to 1925 the Port Trust paid the toliwallas at daily rates per man supplied. Since 1925 the Trust has paid them at piecework rates on tonnage handled. The men are paid by the toliwallas according to both methods. Broadly speaking the toliwallas pay their regular hands steady rates with small bonuses for extra rapid work. The rate of wages of extra men that the toliwallas engage from day to day in the city are governed by supply and demand, in connection with which there are two controlling factors : (a) seasonal variation occasioned by the annual migration during the rainy season and (b) daily variation caused by greater or less number of vessels working in the docks.

There are no formal agreements or contracts as between the Trust and the toliwallas or between the toliwallas and their men. As will be seen from the paragraph on prevailing wages, the increases in rates have generally speaking corresponded with the increased cost of living.

102. *Engineering Department.*—Basis of 8 hours, whether night or day, equals a day : 4 hours half a day and so on, except :—(a) Tide work dredging, where fixed allowance is sanctioned ; (b) continuous night dredging, where the first six hours count as one day ; (c) divers, who are paid by shifts of 4 hours.

Overtime is calculated on the same basis as ordinary pay. Pay for the purposes of overtime is :—(a) In the case of daily-rated staff, the daily rate of pay, and (b) in the case of monthly-rated staff, the monthly rate of pay divided by 30.

Sundays are paid for on the same basis as ordinary overtime.

*Docks Department.*—Payment is made by the day, half day, etc., at the ordinary day rate, plus a small bonus which varies with the different classes of labourers from 1 anna to 4 annas.

*Railway Department.*—No extra payment is made for Sunday work. Overtime to drivers and firemen is paid at the ordinary rate of wages.

105. It is considered that until labour organization in India has reached a higher stage of development it would not be practicable, except perhaps in the case of certain organized industries, to lay down a statutory minimum wage for labourers.

Conditions and cost of living vary so widely in the different provinces and cities of a vast country like India that it would be difficult, if not impossible, to lay down statutory minima applicable to the whole country.

Labour such as that employed in docks in Bombay is almost entirely casual and subject to seasonal variations, the reasons for which are explained elsewhere. The present conditions and the haphazard system of recruiting such labour would

not lend themselves to the establishment of a statutory minimum wage nor is it thought that legislation in this direction would be popular among the labourers themselves.

It would no doubt be advantageous in certain respects to lay down statutory minima in the case of skilled and semi-skilled labour employed in organized industries, factories, workshops, etc., subject to due allowance being made for the territorial variations in cost of living referred to above. As regards the Bombay Port Trust Workshops, the wages of the various classes of skilled and semi-skilled workmen are regulated within certain minima and maxima which, although not statutory, are determined by prevailing rates in similar works in the locality and do not vary to any extent except in so far as any applicable change in the cost of living may justify.

**106. Docks Department.**—Fining is seldom resorted to, but the toliwallas are sometimes fined for unsatisfactory work. Fines are not recoverable from the labourers unless under the definite orders of the Port Trust Officer in charge. All fines are allocated to the Trust Welfare Fund, which is utilized for the promotion of welfare work for the benefit of the employees.

**Railway Department.**—Fines are limited to a maximum of 10 per cent. of the employee's monthly pay. The extent of fining amounts, on the figures of the preceding 12 months, to 15 per cent. of the total wages bill.

Other deductions are made on account of debits for avoidable loss or damage to Port Trust property for which the employee is responsible. Such debits are included in the limit and the percentage recoveries mentioned above.

Fines are utilized in the promotion of welfare work on behalf of the employees

Legislation for the levying of fines and their limitation is provided for in the Indian Railway Act No. IX of 1890.

**107. (i)** Monthly, half-monthly and daily. Monthly payment is the general rule except for the workmen at Anik Quarry who are paid half-monthly, and casual labour at the Docks which is paid daily or on completion of the ship's discharge or loading.

(ii) Maximum of 15 days.

(iii) This subject was fully enquired into by the Government in the year 1926. Copy of the chairman's reply No. 4284, dated 20th October, 1926, to the enquiry is attached for reference (Appendix H).

(iv) Unclaimed wages are after a reasonable period (generally about 2 years) transferred to a welfare fund for the benefit of the employees, but any claims submitted and substantiated thereafter are met from this fund. For all practical purposes it may, therefore, be stated that unclaimed wages are always recoverable, subject to authentic proof of the validity of the claim.

**108.** Money lending on usurious terms is a curse that is prevalent throughout India. The Port Trust has taken various steps to protect its employees from the pernicious effects of this custom, e.g., money is advanced from the employee's provident fund in cases of certificated illness of the employee or his family and there is also a Co-operative Credit Society of the Port Trust employees which is increasingly patronized and has as its objects the encouragement of thrift and the granting of loans for reasonable purposes on easy terms as regards interest and repayment.

**110.** Fourteen days' leave on full pay is ordinarily allowed to workmen (except casual labour at the docks who are engaged from day to day, as required, through toliwallas).

Workmen on the establishment who are injured on duty are allowed 1 month's leave on full pay and 3 months' leave on half pay.

The above rules do not apply to the line staff of the Bombay Port Trust Railway who are governed by the railway service rules. They are allowed 15 days on full pay in one year and, if injured on duty, are allowed up to 6 months' leave on full pay. They are also allowed leave on full pay not exceeding 30 days if they have to proceed for treatment to a Pasteur Institute and, if residing in Port Trust quarters, if they or any of their family contract a contagious or infectious disease.

#### XIV.—Trade Combinations.

**120. (i)** Three unions have so far been constituted in the Port Trust, i.e.—(1) Bombay Port Trust Employees' Union; (2) Bombay Port Trust Railwaymen's Union; (3) Bombay Port Trust Docks Staff Union.

The first two have been officially recognized by the Port Trust; the third will be officially recognized as soon as it is registered under the Indian Trades Unions Act. The conditions of recognition are detailed in Appendix I.\*

The Employees' Union is open to all employees in the chief engineer's department. It chiefly represents the workshops employees. The membership (1,458) represents about 40 per cent. of the total number of workmen employed in the department.

The Railwaymen's Union is open to all employees on the Bombay Port Trust Railway, superior and inferior, but mostly represents clerical staff. The membership (304) is about 41 per cent. of the total number of employees.

The Docks Staff Union is open to all employees of the docks department, but so far it has not been patronized by the dock labourers and represents chiefly the clerical staff, permanent and temporary. The dock labourers have so far held aloof from the Union, though efforts have been made to enlist their support. Although not *unionised* this class of labour is extremely clanlike, and would readily combine in the event of any dispute with their employers.

(ii and iii) The attitude of unions towards the administration is in the main correct and generally speaking the conditions of recognition are observed without friction. In common with other unions the management is largely in the hands of outside labour leaders, one result of which is that representations are frequently made to the employers which are vitiated by incorrect knowledge of facts and ignorance of service and working conditions. Trades union organization in India is in its infancy and the demands submitted are frequently entirely impracticable and put forward without any regard to common sense or equity as between the worker and the employer. An insistent and recurring demand is that all workers should receive periodical increases of pay irrespective of their skill or efficiency or the nature of the work on which they are employed; another frequent demand is that once a worker has been engaged he should be retained indefinitely, irrespective of whether there is work for him or not.

The administration observes strict impartiality in its dealings with union and non-union employees and generally speaking the relations between the administration and the Unions are quite amicable, though instances have arisen when a union has had to be warned for vilification of non-union employees in the union periodical. The administration has consistently impressed on the unions the desirability of managing their own concerns without interference from outside labour leaders and agitators and to some extent the unions are showing a disposition to follow this advice, although a few prominent labour leaders still function as office bearers and exercise a strong influence on the policy of the unions.

121. (i) Two of the Port Trust Unions have registered and the third is in process of registration. The unions appear to have no objection to accepting the provisions of the Act.

(iii) Under the existing provisions of the Act it is possible for all the office bearers to be non-employees. Article 22 of the Act lays down that not less than one-half of the total number of officers shall be persons actually engaged or employed in the industry; as, however, the term " officer " includes the managing committee, it is possible for all the principal office holders, i.e., president, vice-president, secretary, treasurer, etc., to be outsiders. The Trustees consider it very desirable that the office bearers should, as far as possible, be selected from among the employees and they are of opinion that in this respect the Act is defective and should be suitably amended. It also seems desirable to lay down that before a union can be officially registered it must show that its membership constitutes an adequate proportion of the class of workers whom it purports to represent.

122 (i) Reference is invited to the Port Trust conditions of recognition (Appendix I).<sup>\*</sup> Representations from the unions are submitted in writing to the chairman or the secretary of the Port Trust and are fully investigated with the head of the department concerned. The result of the investigation is then submitted to a staff committee of the Trustees and, in cases where the unions ask for deputations to be received, these requests are always acceded to by the chairman and the staff committee.

#### XV.—Industrial Disputes.

125. The Trustees have expressed to the Government the opinion that the Major Port Administrations should be included in the category of Public Utility Services for the reason that ports are as much an essential link in the chain of transportation and supply as railways, and it has been abundantly proved in other countries that trade and industry can be disorganized, and public welfare seriously affected, by sudden stoppages of work in ports. In the present illiterate and unorganized condition of labour in India it is very necessary that—as regards all essential services—the law should provide prompt and adequate means of restraining the activities of irresponsible and extreme labour leaders.

As the Bill stands, it would allow of ports being notified as Public Utility Services after three months' prior notice in the *Gazette of India*, but this delay in enforcing the provisions of the law might easily prove disastrous to trade and industry.

## APPENDIX C.

Comparison of requirements laid down in British Regulations, 1925, with actual measures taken and Bye-laws enforced in the Bombay Port Trust Docks.

(Referred to in reply to Question No. (46) ).

British Regulations	If observed in Bombay.	Relevant Docks' Bye-laws, if any.	Extracts from Bye-laws and Remarks.
<i>Part I.</i>			
1 (a) ..	Observed .. ..	<i>Nil.</i>	
(b) ..	Observed in Prince's and Victoria Docks. Similar arrangements for Alexandra Dock in hand.	<i>Nil.</i>	
2 (a) ..	Observed .. ..	<i>Nil.</i>	Consisting of life-belts hung on open hooks attached to transit shed walls.
(b) ..	Do. .. ..	<i>Nil.</i>	Consisting of recessed ladders and stairs on quay walls.
3 ..	Do. .. ..	<i>Nil.</i>	As certain classes of goods are stored in the open, and night work is regularly carried on, the standard of lighting is high.
4 to 6 ..	Not observed .. ..	<i>Nil.</i>	It is proposed to adopt these measures.
7 ..	Observed .. ..	<i>Nil.</i>	A Municipal Motor Ambulance stationed near the centre of the dock system is reserved for accidents in the docks and can be obtained in less than 15 minutes. Should more than one ambulance be required three more are available from a distance of about 2 miles. The Port Trust also maintains an emergency hospital and dispensary with an assistant surgeon in whole-time charge near the centre of the dock system.
8 ..	Not observed .. ..	<i>Nil.</i>	Would follow with the adoption of sections 4 to 6 above.
9 (a) ..	Observed .. ..	27, 43	Substantial gangways are supplied free. "Ship" responsible for attachment, adjustment and illumination. Illumination compulsory for foreign going ships in compliance with precautions against ingress of rats and their plague fleas.
(b) ..	Concerns the master of vessel.	<i>Nil.</i>	
10 ..	Do. do. ..	<i>Nil.</i>	
11 ..	Do. do. ..	<i>Nil.</i>	
12 ..	Do. do. (also) ..	69	"Masters and owners. . . are responsible for the proper provision of lights in all those parts of vessels where work is being carried on in any way connected with the use of the Trustees' cranes . . and other property." The Trustees therefore exercise some control.
13 to 17	Do. do. ..	<i>Nil.</i>	

APPENDIX C—continued.

British Regulations	If observed in Bombay.	Relevant Docks' Bye-laws, if any.	Extracts from Bye-laws and Remarks.
<i>Part III.</i>			
18 ..	Observed in respect of Port Trust plant.	<i>Nil.</i>	
19 ..	Observed in respect of Port Trust gear.	<i>Nil.</i>	
20 to 22 ..	Observed in respect of Port Trust gear.	<i>Nil.</i>	The Trustees have a chain testing house at which Stevedores' chains and slings are tested for a small charge. An enlarged testing house and compulsory testing of Stevedores' gear is under consideration.
		67 & 68	Stevedoring Firms work under licenses granted by the Trustees, who are thus able to exercise a measure of control over their operations.
23 24 ..	Do. do. ..	67 & 68	See remarks on 20 to 22 above.
25, 26 & 27	Do. do. ..	<i>Nil.</i>	
28 ..	Not observed ..	<i>Nil.</i>	Adoption of these measures is in hand.
29 ..	Observed in respect of Port Trust plant.	41	" Exhaust steam or water from winches or other machines or engines on board vessels in dock shall be led down the side of the vessel to below coping by a hose or other effective appliance."
30 (a) ..	Do. do. ..	70	This Bye-law holds the "ship" responsible for loading the Trustees' quayside cranes with slings not exceeding in weight their designed lifting powers.
31 (b) ..	Do. do. ..	<i>Nil.</i>	
31 ..	Do. do. ..	<i>Nil.</i>	Bye-law No. 67 requires competence in Hatch foremen.
32 ..	Observed ..	<i>Nil.</i>	There is no age limit however. The docks quays are from 30 feet upwards in width and are not used for storing cargo which is taken into or behind the transit sheds.
33 ..	Concerns Master of vessel	<i>Nil.</i>	In practice not used in the Docks.
34 ..	Do. do. ..	<i>Nil.</i>	
35 ..	Do. do. ..	67	This bye-law almost covers this regulation, viz. . . . "one foreman in the hold, who . . . whenever a vessel is loading cargo in the between decks . . . shall that see between-deck hatches . . . are properly put on before commencing work."
36 ..	Do. do. ..	67 & 68	The dock officials refuse to allow dangerous or negligent slinging and if need be stop work on the vessel.
37, 38 & 39	Do. do.	67	Almost covered by this bye-law

## APPENDIX C—continued.

British Regulations	If observed in Bombay.	Relevant Docks' Bye-laws, if any.	Extracts from Bye-laws and Remarks.
<i>Part III.</i> <i>contd.</i>			
40 ..	Observed in respect of Port Trust gear.	127	" Any person who shall cut, deface or injure any . . . (Port Trust property) within the dock shall in addition to the prescribed penalty (a fine) be required to pay the amount of damage, etc. . . ."
41 ..	Do. do. ..	<i>Nil.</i>	
42 ..	No regulations ..	<i>Nil.</i>	
43 ..	Concerns master of vessel	<i>Nil.</i>	
44 ..	No regulations ..	<i>Nil.</i>	
45 ..	Do. ..	<i>Nil.</i>	Under the terms of bye-law No. 117 the power to enforce the docks bye-laws and generally manage operations within his jurisdiction in the docks is vested in the docks manager.
46 ..	Do. ..	<i>Nil.</i>	

## APPENDIX F.

Statement showing average percentage increase of pay in each class of workmen in the Bombay Port Trust Engineering Department as compared with 1914 (referred to in reply to Question No. (97) ).

Designation.	1914.	1920.	1928.	Percentage of increase over 1914.
	Rs. a. p.	Rs. a. p.	Rs. a. p.	
Fitters .. .. .	2 0 10	2 9 7	3 0 6	48
Turners .. .. .	2 2 6	2 11 1	2 15 6	42
Greasers .. .. .	0 12 0	1 4 0	1 10 0	116
Asst. Fitters or Fitters Coolies ..	0 12 3	1 5 0	1 6 10	86
Carpenters .. .. .	1 6 9	2 3 0	2 13 0	98
Mochees .. .. .	1 8 0	2 1 0	2 0 0	33

## APPENDIX H.

Copy of letter No. 4284, dated 20th October, 1926, from the Deputy Chairman, Bombay Port Trust, to the Director of Information and Labour Intelligence (Labour Office), Bombay (referred to in reply to Question No. (107)).

2. It is agreed that, for the reasons given a delay of a fortnight or more in payment of monthly wages inflicts some hardship on employees and that legislation is desirable to check the abuses referred to. It is considered necessary that powers should be reserved to Local Governments to exempt such administrations and concerns as can satisfy the Local Government that their system of payment of wages is regular and involves no hardships to their employees. It will also be necessary that employers should be allowed to fix the date on which for purposes of calculation of wages the month should commence and end. This will be most necessary in the case of employers whose staff is divided into a number of departments or sections spread over a large area and have to be paid on separate pay sheets. In administrations such as the Port Trust this necessitates the continuous payment of wages from the 1st to the 15th of each month, according to a fixed programme. It would be impracticable to prepare and disburse all the pay sheets within a week without considerably augmenting the clerical and cash staff, but the difficulty can be overcome by fixing different dates for the commencement and end of the official month for the different classes and sections of employees. This would be merely a matter of internal organization and would not affect the employees and it, therefore, appears unnecessary to provide that the sanction of Government should be obtained to such arrangements.

3. It is not considered that the enforcement by law of a shorter period of payment than monthly would be either desirable or practicable.

4. The proposal to fix one week as the time limit within which the payment of wages due must be made, is considered reasonable. It should be laid down that wages shall be paid within six days after the close of the period for which they are due and that Sundays and holidays under the Negotiable Instruments Act should be reckoned as *dies non* in computing the statutory period of six days, otherwise it will not be practicable to comply with the requirements of the law if a succession of holidays should intervene immediately after the close of the period. It is not considered that, in respect of the time limit, any distinction should be drawn between monthly wages and wages for a shorter period. In the great majority of cases wages are calculated and paid on a monthly basis, but if, for any special reason, payment is to be made fortnightly or weekly, the preparation of the paysheets and other formalities connected with the disbursement necessitate just as much time and labour as in the case of monthly wages and the margin allowed for payment should, therefore, be the same, otherwise employers would be put to unnecessary expense for additional clerical staff. It should also be made clear that, for the purposes of this legislation, daily-rated staff in regular employ who are paid by the month shall be regarded as on the same footing as monthly-rated employees. Workshops employees, for example, are usually engaged on a daily rate of pay but their wages are disbursed monthly as long as they are in regular employ. The services of such employees in the Port Trust is recorded in service registers and they are entitled to certain of the privileges of the permanent staff, e.g., provident fund and casual leave. It would be impossible to grant such privileges if their wages were not disbursed monthly and any change in the present system would undoubtedly be resented by the employees themselves as likely to prejudice the security of tenure of their employment.

5. It is considered desirable that provision should be made on the lines suggested in paragraph 6 of Mr. Ley's letter under reference for payment within the statutory period of a percentage (75 per cent. appears reasonable) of the wages earned, in cases where intricate calculations or evaluations are involved. Special pay of the nature of bonuses, overtime, etc., should be excluded from the operation of the proposed legislation, or, if considered preferable, the Local Government should be given authority to grant exemption in such cases.

6. The proposed enforcement of the legislation by the infliction of fines, regulated in the manner suggested in paragraph 7 of Mr. Ley's letter, is agreed to, but the suggestion that a portion of the fines might be allocated to the workmen injured, should certainly not be adopted as the division of the money among the workmen affected, in proportion to the degree of injury would probably be so difficult as to render the proposal unworkable. In any case, injuries to workmen are covered by the Workmen's Compensation Act and no steps should be taken to interfere with its operation.

7. The chairman is in agreement with the proposal that the power to prosecute should be vested in some independent authority, such as an inspecting staff, but it is considered that the procedure to be adopted in regard to inspections should be very

carefully defined, it being clearly desirable to avoid all unnecessary interference with the internal management of the concerns affected. It would probably be sufficient in most cases if the employers were required to furnish periodical certified returns showing the period and date of disbursement of their staff wages.

8. Finally, it is agreed that the abuses which the proposed legislation is designed to check are particularly associated with the larger industrial concerns, and that, for this reason and having regard to the difficulty of extending the operations of the measure to smaller establishments, the legislation should be restricted in its operation to those concerns to which the provisions of the Factories or the Mines Act are applicable.

Messrs. E. D. SASSOON & Co. Ltd.

### Housing.

The housing of mill operatives in Bombay is a problem which has engaged the attention of Government and mill companies for some years.

In seeking accommodation, the workers first consideration is the charge for same, and they seek the cheapest available without thought of sanitation or healthy surroundings. The workers further considerations are for accommodation with friends or relations and as near as possible to their place of employment.

The Development Department constructed numerous blocks of chawls some years ago, but they have not been taken up to the extent originally anticipated for various reasons and there still remain areas in the city which are overcrowded and unhealthy.

Along with other mill companies, we have chawls of our own, but in the past they were not taken advantage of by the operatives to any large extent as they felt they had not the same latitude in regard to arrears of rent as they would have with a landlord of privately owned chawls who had no control over their wages. We also found that we were housing numbers of workers belonging to other mills and factories who were sub-tenants of our own operatives who had engaged the rooms.

We consider there are advantages, to the operatives and to ourselves, in providing clean sanitary accommodation close to the mills and we have given this matter our serious attention. Steps were taken recently to remove all outsiders from our own chawls and we have reduced the rents considerably in an endeavour to fill the rooms with our own employees. We further allowed considerable latitude in regard to the payment of arrears of rent. The result has been satisfactory and to-day our chawls are practically full, all occupied by our own work-people and their families.

As already stated, we employ approximately 22,000 operatives. In considering housing schemes however, this figure requires adjustment.

There are a large number of men who will always live with their friends or relatives at a distance from the mill, and it is estimated that not more than 50 per cent. of our permanent operatives can be induced to take advantage of housing facilities provided by our mill companies.

To-day, we have 23 blocks of chawls, containing in all 775 rooms. The average size of the rooms is 166 sq. ft. and the average rent is Rs. 4-2 annas per month. This rent compares favourably with that charged by the Development Department and private landlords, it being 15 per cent. and 40 per cent. cheaper respectively. All rooms have been let and there are approximately 1,200 operatives and their families in occupation.

Taking the most up-to-date and recently constructed chawls as an example, i.e., those connected with the David Mills Co., it is a matter of interest to note the following figures:—

The capital cost to the mills company amounts to Rs. 10,45,518 whereas the return on this outlay amounts to about Rs. 1156 per-month net, not allowing for depreciation, or 1.3 per cent. return on capital outlay.

### Welfare.

*Medical.*—There are three full time doctors on the mills staff, one being a lady doctor whose special duty is the care of female operatives; all of the doctors visit the mills daily. We maintain nine dispensaries, each in charge of a full time compounder under the supervision of the medical officers.

Two whole time welfare workers are employed, chiefly for the benefit of the co-operative societies in the mills, at an annual charge of Rs. 4,140. They also supervise the night-school, co-operative restaurant, reading rooms and baby creches.

*Restaurant.*—Some of the clerks of the Alexandra and E. D. Sassoon mills started a restaurant in April, 1923. It is not a registered co-operative society, but 36 shareholders subscribed for 99 shares at Rs. 5 per share.

The managing board consists of 8 members and the mills paid a sum of Rs. 250 for the initial expenses for providing cooking vessels. The mills also pay the salaries of the cook and servants and give the rooms occupied rent free. The expenses of the food are divided amongst the members at the end of the month. This restaurant has not functioned too well and the care of same is now being taken over by the welfare officers.

*Reading Room and Library.*—From the profits of the restaurant, a reading room and library is conducted for members only. There are 425 books in the library, both in English and vernacular, and newspapers and periodicals are regularly purchased.

This society also granted a sum towards the purchase of a cricket kit for the use of employees of the mills.

*Tea Shop.*—The Alexandra and E. D. Sassoon mills also maintain a tea shop towards the expenses of which, the mill sanctioned the sum of Rs. 500. In the beginning this shop was managed by the members of the mills co-operative society, but it turned out a failure and after one year's trial, the contract was given to an outsider for the supply of food on fixed rates at a monthly rental of Rs. 145.

*Crèches.*—There are two baby crèches, one at the Jacob Sassoon mill and the other at the Rachel Sassoon mill, each capable of providing for about 50 babies. The daily average attendance prior to the strike was 30. The infants are daily bathed and dressed in clean clothes provided by the mills. All except those entirely breast-fed, are given milk and biscuits.

Each crèche is in charge of a whole time matron assisted by two or three ayahs. The lady doctor visits both the crèches every day. Further extensions to crèches to our mills were under organization, but have been delayed owing to the recent mill strike.

In connection with the crèches, we wish to acknowledge the assistance we have received from the Factory Inspection Department of the Bombay Government, mentioning Dr. Miss Cama in particular.

*Anti-Malarial Work.*—An anti-malarial staff is employed in charge of an inspector to prevent the breeding of malarial mosquitoes in mill compounds and chawls.

*Accidents.*—Full wages are paid by the mills for the first ten days of disablement, although the Workmen's Compensation Act does not provide for any payment for this period. The total amount thus paid in advance of statutory requirements in the year 1927 was Rs. 2,940-11-6 pies.

*Cheap Grain Shops.*—Nine grain shops are maintained. Grain, cereals, sugar and jaggery are sold at these shops to the operatives of the respective mills at cost, and on credit against earned wages. The annual aggregate turn-over is Rs. 1,25,000. The shop expenses amounting to Rs. 12,000 annually are paid by the mills.

*Employees' Benefit Fund.*—All unclaimed wages are credited to this fund and grants are made from it to employees retiring after long service and to dependants of deceased employees. Financial distress caused by illness is also relieved. The total disbursements thus made in the year 1927 were Rs. 25,460-2-9 pies.

*Hawalla.*—This is a system whereby operatives leaving the firm's service (either temporarily or permanently) are enabled to draw their wages before the stipulated pay-day. About Rs. 1,75,000 is annually advanced at an interest of 3 to 6 pies per rupee. The funds for this system are provided free of interest by the mills and the interest of 3 to 6 pies per rupee above mentioned, is utilized solely for welfare work.

*A Night-school.*—(for adults as well as children) is conducted at the Jacob Sassoon mill, where elementary English, Marathi and Arithmetic are taught. The average attendance in normal times is about 50.

*Co-operative Credit Societies.*—All mills, except the Manchester and Elphinstone mills, have 19 co-operative credit societies between them. The David mill has seven departmental societies, and the Jacob Sassoon mill has six. Membership of one of the latter societies is entirely restricted to women workers.

The recent strikes affected these societies adversely to a considerable degree, and vigorous efforts of the welfare workers appointed by the company have been necessary to keep the societies in existence.

Whereas, the aggregate membership in 1928 shows a fall of 19 per cent. from that of the previous year, and the share capital a corresponding fall of 20·7 per cent., the aggregate amount of members' deposits is now up by 15·8 per cent. and outstanding loans have been reduced by 15·5 per cent. Three societies which were in the "C" class in 1927, were brought up to the "B" class in 1928. A statement showing the comparative position of the societies at the end of 1927 and 1928, respectively, is attached hereto.

Till the end of 1927, the policy of the firm was one of non-intervention in the management of the societies. It was however, discovered that several societies had passed into the hands of cliques consisting of jobbers and clerks and that the rank and file kept away from the societies. The aggregate membership in 1927, was 1,907, which is only 8½ per cent. of the total employees of the mills concerned. Misappropriation to the extent of Rs. 4,400 was detected in the Alexandra and E. D. Sassoon mills co-operative credit society. The firm therefore directed its welfare workers to control the working of the societies generally. This change of policy is having very salutary results, as will be seen from the progress made by the societies recorded in the statement attached. It has to be remembered that these improvements were brought about in a year which was full of strikes.

By way of encouragement, the firm grants an annual bonus of Rs. 100 to the secretary of each society standing in the "A" class. Loans free of interest are frequently advanced by the firm to the societies. The aggregate amount of loans thus advanced in 1927 was Rs. 6,440.

### Wages.

Wages are paid monthly on a day between the 10th and 15th of the month following that in which the wages are earned. This system has been criticised and suggestions have been put forward from time to time for the payment of wages fortnightly, and even weekly. In 1912, we made an experiment of paying wages fortnightly, but after three months the system had to be dropped. In 1924, the Secretary of State for India raised the question again, and the millowners' association went into the matter exhaustively, but the scheme had to be dropped in deference to the wishes of the workpeople. Mr. Chamanlal introduced a Bill in the Legislative Assembly in September, 1924, under which the payment of weekly wages to workmen, domestic servants and other employees was to be made compulsory. The Bill was dropped and the system of monthly payments was continued.

When we introduced the system of paying fortnightly wages in 1912, a deputation of workpeople approached us and intimated their intention to strike if the system was not dropped. Their argument was that their rents were paid monthly and that they ran monthly accounts with grain shopkeepers, provision shops, etc., and that these accounts were settled monthly. They further pointed out that they relied on receiving a full month's pay when they wished to return to their villages periodically. We did not proceed with the matter and the system of paying monthly was reverted to.

When the Secretary of State for India, raised the question of fortnightly payments in 1924, the Governor of Bombay approached the millowners' association who appointed a special advisory sub-committee to draw up a practical scheme. The scheme put forward was on the following basis :—

Wages should be paid on the 15th and 30th of each month.

On the 30th of each month, wages earned from the 1st to the 15th of that month should be paid, and on the 15th, wages earned from the 16th to 30th of the preceding month should be paid. The system to come into force in August, 1924.

The scheme as prepared by the sub-committee was referred to individual members of the association who were asked to consult their operatives in the matter. It was found that the workpeople were universally opposed to the change and the arguments advanced were the same as those placed before us in 1912. Several mill companies were opposed to the scheme, unless other large employers of labour, such as the tramway company, municipality, etc., could also introduce it. The scheme was finally dropped in June, 1924.

In regard to the criticism made at various times of the delayed payment of wages, i.e., 10 to 15 days after they have been earned, we consider the workpeople have no real grievance on this point. It must be remembered that the calculation of the wages due to piece workers is a lengthy process in a large factory and 10 days is not an unreasonable time for the preparation of the pay rolls. We are of opinion that this could be expedited and payment made on the 6th day of the following month, but this would necessitate a few adjustments to make the work easier, such as the consolidation of the dear food allowance.

The pay-days are fixed by the millowners' association annually and a day before a mill holiday is invariably chosen; for instance, if there is a religious festival on the 12th of the month and the mill is to be closed on that day, wages would be paid on the 11th. Further, if there is no festival and the mill is to be stopped on a Sunday the 14th, wages would be paid on Saturday the 13th. It has been suggested that a fixed pay day would be more suitable to the workers. In our opinion this would cause dissatisfaction, as the men would always want their wages to be paid before their holiday, and as long as we continue to be elastic in this matter, there will be no real grievance.

Operatives leaving service, at irregular dates are paid their earned wages on pay-day, but if they ask for earlier payment, they are paid under the Hawalla system, i.e., at a discount of 3 to 6 pies in the rupee. When a whole section is stopped, operatives are paid their full earned wages within two or three days.

Prior to the recent strike, operatives gave the mill officials one month's notice from the 1st of the month of their desire to resign at the end of that month and wherever sufficient reasons were advanced for immediate leave, such leave was given by the granting of a discharge pass.

Since the strike, workmen rarely give notice of their intention to resign. They ask for an immediate discharge which is generally granted and the operative is paid his full earned wages on pay-day, or earlier under the Hawalla system should he so desire.

The operative leaving service without notice should, under the mill rules, forfeit his wages. As pointed out above, however, an immediate discharge is usually granted and his wages paid on pay-day. We can trace one instance of wages of an operative being forfeited through leaving the mill without notice. In this instance, the operative filed a suit in the Small Causes Court for the recovery of his wages, but the Court upheld the argument of the defence that as he had left service without notice, he was not entitled to draw his wages and the suit was dismissed.

*Fines.*—Order No. 18 of the standing orders as presented by the Millowners' Association to the Fawcett Committee, provides for offences for which operatives are liable to be fined. Section (b) of this order provides for fining in cases of negligence in work or neglect of work.

The Fawcett Committee's report deals with this subject at considerable length and makes reference to the practice of handing over damaged cloth to weavers, debiting their wages with the full cost of such damaged cloth. The Fawcett Committee disapproved of this practice although they appreciated the necessity for strict disciplinary action in cases where faulty cloth was produced as a result of negligence. In November, 1926, we abolished the system of handing over damaged cloth to weavers and our mills were instructed to deal with all such cases by fining the individual concerned. This change resulted in an inordinate increase in the quantity of fents produced and within a year it was found necessary to revert to the old practice of handing damaged cloth back to the weavers.

The incidence of fines (all mills) during the 8 months January to August, 1925, was .14 per cent. of the wages bill. During the period January to October, 1927, when fines were imposed on those weavers producing faulty cloth, the incidence rose to .23 per cent. On reverting to the old practice of handing over damaged cloth to the weaver, at the end of 1927, the incidence dropped and during the period January to April, 1928, it was .15 per cent. of the wages bill.

The value of damaged cloth handed over to weavers during the period January to September, 1925, averaged Rs. 260 per month per mill (under our control), and during the period January to September, 1926, Rs. 380. per month per mill. As pointed out above the system was abolished towards the end of 1926, and revived in November 1927. Since the end of 1927, the mills have not worked normally and we are not in a position to give figures of damaged cloth values for the last two years.

A certain percentage of the cloth, varying with the type of cloth manufactured by a particular mill, may be considered as difficult to sell as the styles and qualities may vary from those used by the class to which the weaver belongs. Where the cloth is an easily saleable one, as the price recovered from the weaver is the wholesale contract rate, he will lose nothing at all in disposing of the cloth. There may be some hardship where the cloth is not easy to sell and adjustments might be made in the price at which such cloth is debited to the weaver. We feel that the principle of debiting cloth to a weaver should be maintained in view of our experience during the period this system was abolished.

It is, however, essential that the operative should have protection to prevent him being saddled with cloth, the basic fault of which was caused by matters outside his control.

Prior to the strike we were negotiating with the local union with a view to providing a joint examination with a union official and the operative concerned, before cloth was finally booked to the operative in order to protect the latter, but the strike stopped all negotiations.

Some system of examination is necessary and in the absence of efficient trade unions, it might be made a duty of the local factory inspectors although we are afraid they are already overworked and with the present staff will not be able to cope with this.

While on the subject of wages, we wish to refer to what is known as the efficiency system of working which was introduced by us and which has been referred to at length in the Fawcett Report of 1928.

The Tarriff Board in its report, states that "the only alternative to a reduction in wages is increased efficiency and it is in this direction that in our view, the true line of advance lies." This question of increased efficiency has been the subject of serious consideration by us for some time and in 1926, we introduced what is now known as our "Efficiency System." This scheme was explained in detail in our written statement to the Fawcett Committee submitted through the Millowners' Association, and we attach hereto a copy of it. (Marked appendix X with supplementary appendices).

It is an accepted fact that the competition which the Bombay mills have to face is keenest on qualities imported from Japan. The textile industry in Japan is well organized and the report on it recently published by Mr. A. S. Pearse, the general secretary of the International Federation of Master Cotton Spinners and Manufacturers Association, is illuminating.

From a perusal of this report it will be seen that the weaving section is the department in which India is terribly backward. It is reported one girl attends 5 ordinary looms without difficulty as against 2 which is the common practice for a male weaver to attend in Bombay.

Our "Efficiency System" provides for advancement on these lines and although it will be some years before we attain the state reached by Japanese operatives, we are of the opinion we shall maintain steady improvement in this direction.

Co-operation from labour is however a vital necessity if much advance is to be made and if successful, means that labour will benefit by the expansion of the industry, due to our attaining competitive costs with higher wages to the individual operative.

In addition to the improvement in the efficiency of workers, it will also be necessary for mills to instal more modern plant.

Post war developments in the textile industry have been such that more progress has been made during the last 5 years than was made in the previous 50 years in the development of improved textile machinery.

In the spinning side, combined blowing room machinery, high drafting and other minor methods have made much machinery redundant and reduced the work of the operative.

On the weaving side improved methods of winding, high speed warping, automatic drawing-in and twisting and automatic looms have completely revolutionized existing methods of working. New problems have entered the industry in relation to these new methods and the existence of sound trade unions, on the lines of the textile trades unions existing in England, have become an imperative necessity.

If the industry in Bombay is to continue, changes of equipment and methods of working to enable us to keep abreast of our competitors are absolutely essential.

The operative in Bombay is conservative to a degree and unless handled by a strong trade union, will resist the changes and the upheavals which the installation of improved machinery will necessitate.

Criticism against the efficiency system has been most intensive on account of the fear of consequential unemployment by its adoption. It is evident that unless the efficiency of the workers and the machinery is brought up to date, the industry in Bombay will totally pass out with a great deal more unemployment than will be incurred in the adoption of efficiency schemes. Such schemes however, will enable the industry to meet foreign competition and lead to the expansion of the industry to an extent which will not only absorb any unemployed, but will lead to further expansion.

#### Trade Unions.

We have already criticised the absolute necessity in Bombay for the establishment of trade unions functioning on lines similar to the textile trade unions in England. Our firm have realized this for a very long period and in 1922 endeavoured to form a trade union amongst the operatives of the Rachel Sassoon mill by giving covert assistance. The services of Mr. Peter Baptista were called in and he was requested to organize a trade union to which we promised every possible help that lay in our power in so far as it is possible for an employer to assist in the formation of a trade union amongst his own employees.

A union was formed, but unfortunately fell into bad odour very rapidly owing to lack of trained and experienced officials. Mr. Baptista was unfortunately not able to afford us much assistance at that time owing to pressure of work in other trade unions he was connected with. Since that date, we have always endeavoured to deal with any trade union that has brought up any matter for discussion before us and at no period have we refused to meet the authorized representatives of trade unions.

The necessity of soundly organized unions is such that we consider that in the absence of other means, Government should take the matter in hand at once and, if necessary, bring out experts from England to organize and train trade union officials from the ranks of the workers.

The above figures are compiled on the actual wages paid and not on rates, i.e., they are largely affected by absenteeism, and the present unsettled state of the industry.

## APPENDIX No. X.

A careful survey of the international textile situation made in 1923 brought to light the fact that Japan and China were easily able to undersell their competitors in every line of textiles in which they had specialized. Investigations showed that the principal advantages possessed by Japan were :—(1) The advantage accruing by the employment of women and children on night shifts, which the Textile Tariff Board of 1926 have found to be "unfair" competition; (2) lower costs of production with, in many cases, individually higher wages than paid in India; (3) absolute vertical specialization on certain qualities, enabling them to practically control the market in these styles.

Other minor advantages were found, such as cheaper power, etc., but as these do not come within the scope of a statement on the "New" system, they need not be dealt with here. Every advantage that Japan possesses has been carefully scrutinized by the Bombay millowners as a body and by individual members, and attempts made with varying success to reduce our charges to the same or less than similar charges existing in Japan.

*Labour* is the highest charge of all (excepting raw materials), but any attempt to reduce the rate of wages of labour in the past, has resulted in strikes to the disadvantage of all parties concerned.

We considered the possibility of increasing the wage of the operative by asking him to tend more machines; at the same time assisting the operative by introducing better methods of working. Tests were made in several of our mills as to the feasibility of what may be termed "Fordizing" the industry. By this we mean the allocation to each operative of enough work to keep him healthily employed throughout the working day and paying him the maximum rate of pay that the work he is doing will permit of.

With the idea of reducing costs and increasing wages, it was essential that we should make a complete survey of the industry with a view to providing every means in our power to make the work lighter for the operative, our aim always being that there should be the same or less real work for the operative under any new system we might establish than was done formerly under the old system, except in cases where the operative was formerly employed on real work for a ridiculously low period of the working day.

Our survey convinced us that in many sections of the industry, operatives were not doing from more than three to four hours actual work, and the actual amount of work that could be done in these particular departments could easily be doubled without unduly taxing the worker.

Before proceeding with the installation of the scheme, small experiments were made in various directions and we decided to proceed on the following lines :—(1) Fix standards of production and quality for each machine in the mill; (2) arrange systematic checking so that these standards are maintained; (3) fix a standard of cotton for each mixing, below which we were not permitted to go and arrange the quality of mixing to suit quality of fabrics we manufactured.

These standards to be fixed so that the maintenance of the standards fixed for quality, production and machine should not be made difficult for the operative.

(4). Adjust each machine in process so that it will work at (a) maximum efficiency, (b) permit of good wages to the worker, (c) reduce the cost by making each worker handle a very much increased outturn without being overworked.

As a preliminary it was decided to pay the worker 33 per cent. to 50 per cent. more than the previous wage for twice the number of machines attended, but conditions were adjusted so that in spite of attending more machines less than twice the work was done.

In this connection we would point out that in the English list (Oldham Masters' Cotton Association) it will be noticed that the rates for two frames are only about 30 per cent. more than the rates provided for one frame, and from such information as has been obtained from Japan and America, the total increase wage to the worker has only been from 10 per cent. to 20 per cent. in spite of much greater multiplication of the machines tended.

We have referred to the intense vertical specialization adopted by the Japanese and to make the position clear an explanation is perhaps necessary.

All cotton manufacturing countries use one of the two methods of manufacturing or a combination of both in varying degrees, viz. :—(1) Horizontal specialization linked up by different classes of middlemen, which permits of small units; (2) vertical specialization in which all processes are concentrated in one hand from the raw material to the finished product, necessitating large units and limitation of style.

The latter is the system developed by the Bombay mill industry and is the ideal system for the production of cloth and yarn required in huge quantities, but fails where small quantities of varied products are required, or where flexibility and ability to meet rapid changes of styles are necessary.

Lancashire has almost entirely built up its huge business on horizontal system, while our Japanese competitors have carried vertical specialization to an extent unknown elsewhere in the textile countries of the world. Germany and Italy also have the vertical system, but more approaching the Bombay development of the same; in fact, Bombay, Italy and Germany may be said to be of the same vertical type which gives more flexibility than with the out and out vertical style of the Japanese, but which suffers in the intense competition for the manufacture and sale of bulk products.

Lancashire, America and India have lost trade to China and Japan in grey goods of types suitable for bulk production and it is worthy of note that it is only in this class of goods in which Japanese and Sino-Japanese mills have been enormously successful.

Bombay mills are arranged for vertical specialization and are better placed, particularly on the lower counts, than the Lancashire mills, from this point of view, to meet the intense Japanese competition. The difficulty as far as the general run of Bombay mills is concerned, is that while organized vertically, there is too much variety in the equipment to permit of intensive competition with the Japanese. This is due to the requirements of the internal trade for which the mills were designed and which requires varying widths and styles of cloth for different periods of the year. It cannot be laid at the door of the individual millowner who, in the majority of cases, put in looms to replace trade lost in yarn for China, and naturally put in the style and width of loom to suit his home trade and its seasonal variations.

We decided to try and work a mill on this intensified vertical specialization and for this purpose endeavoured to compete with the Japanese 10 lb. sheeting or cabot and grey drills. We purchased the Hongkong mills and renamed it the Manchester mills with a two-fold object. The first was to ascertain if the vertical system of production could be intensified on Japanese lines, and the second was to ascertain if the Manchester or rather Lancashire method of allocating work and payment could be adopted in a rational form suited to the conditions prevailing in Bombay.

We have been able to dispose of our production, but in the export market we were compelled to sell at a loss in spite of realizing slightly higher prices than our competitors. In India a very small profit was possible and we are satisfied that more intense specialization can be made a success if the whole-hearted co-operation of labour can be secured.

It is essential here to point out that no attempt has been made or is intended to be made to establish the new system where the conditions we have laid down for success are not at present possible. Under this head we place the spinning of coarse counts 10's and below and the old system continues where these counts are spun. In the weaving departments the only sections in the whole of our group where the three and four-loom systems have been attempted has been on plain or drill cloth on an easy class of work. On fancy and more difficult cloth the old system is prevailing, and will prevail until we can find means to fulfil the conditions laid down for the success of any new scheme. On certain qualities and styles we have moved in the other direction by placing *one* loom per weaver, and it is certain that for some time to come there will be very little displacement of labour in the weaving section unless we are driven by the continuance of non-co-operation from labour to instal automatic looms with which we are experimenting with some measure of success.

Appendix I gives the dates in which the new system was introduced into the various departments in each of our mills.

Dealing first of all with the spinning section of the industry it will be noticed that all sections of the spinning department of the Manchester mills (except the weft frames) commenced work on the new system from the re-opening of the mill in May, 1926, and very little difficulty was experienced at the commencement in this mill due probably to the fact that it was a mill that had been stopped for a long period and there was therefore increased employment and not a displacement of labour.

The Manchester mill is one of the oldest mills in Bombay dating back to 1874 and has changed hands several times. On taking the mill over, we spent over six months repairing the plant and buildings. Old and out of date machinery was scrapped and machinery not suitable for the manufacture of standard sheeting was transferred to sister mills and replaced by suitable machinery either new or from sister mills. Full details of the system and personnel as compared with the previously existing system are given below department by department :—

**Mixing Room.**—The old system of hand mixing was done away with and a completely new pneumatic mixing plant installed. This results in a much better opening and blending of the cotton and a saving of labour (see Appendix 3).

**Blow Room.**—The old plant was scrapped and replaced by two exhaust and four finisher scutchers, the number of machines being reduced and the cotton handled automatically by the machines except for removing the laps. On the scutchers we have one man to two machines the wage being increased from Rs. 25—8 annas to Rs. 35—7 annas. For many years the David mills had been running a section of their blow room on this system without extra pay. The system has been in existence in a mill in Delhi since the inception of the mill at a wage at present of Rs. 25. The system was so successful that this was the first portion of the new scheme to be put into work at sister mills in our group.

**Cards.**—The cards in the mill were completely overhauled and where any case of doubt of the quality of the card fillet occurred the card was entirely reclothed. Additional cards were installed and the weight of cotton treated per card reduced.

A team system as near as possible to the English system was introduced splitting the cards into sections of 30 cards or 3 preparations.

Each team consists of :—

1 Front jobber	..	..	..	..	..	Rs. 44-2.
1 Back jobber	..	..	..	..	..	Rs. 44-2.
1 Lap carrier and fly gatherer combined	..	..	..	..	..	Rs. 27-2.
2 Can minders	..	..	..	..	..	Rs. 23-8.

For settings and general supervision of cards, one head jobber and one assistant jobber are employed and no other men are employed. Oiling is done by the front and back jobbers and the sweeping is done by the men.

**Drawing Frames.**—Three preparations of old machines were scrapped and replaced by new machines, the balance of the old machines being thoroughly overhauled.

Instead of one man to each head, two men were put on three heads. The old wage was about Rs. 33 and the new wage is Rs. 41.

**Slubbing-Inter Frames.**—The old system was continued but all the machines in this department were completely overhauled and old machines scrapped.

**Roving Frames.**—All machines were overhauled and old machines scrapped. One man tended two machines instead of the usual Bombay practice of one machine. No additional assistance was given other than the existing doffer boys. The wage was increased by 50 per cent. although the difference in the same system in the English list is 30 per cent. In all cases, the increases given were in our opinion too high but were given to encourage the adoption of the system.

**Ring Spinning.**—The alteration in this section was to place a side boy in charge of two sides instead of one side as formerly, the number of tarwallas and doffer boys being the normal number employed in sister mills on similar counts. Wages were increased from Rs. 25—8 annas to Rs. 39 and with the quality of work there is no reason why a side boy should not mind up to 600 spindles, which Mr. Sasakura maintains is done in Japan.

One feature of post war development in the cotton trade has been the rapid increase in the use of high-draft system which eliminates at least one and possibly two processes in the spinning department. Yard production is speeded up and roving frames eliminated, saving floor space and power which can be utilized for more ring frames. For some years we have been experimenting with the various types of high drafting systems on the market and have now decided on their respective merits for the type of yard we spin.

The Manchester mills and a portion of the Jacob Sassoon mills have been converted to one of these systems. As a result the former does not now require roving frames and therefore operatives, power, stores or space for same. In addition, the quality of the yarn is improved and the bobbins in the creels of the ring frames last four times as long as before and so reduces the work of the side boy.

### Weaving Section.

**Warp.**—The existing grey winding machines were completely renovated and in addition a Schlafhorst "M" pattern high speed winding machine was installed. Our experiment with this machine showed that on coarse counts the Indian operative was unable to keep pace with the speed of the machine and we transferred this machine to a sister mill where the results are entirely satisfactory on finer counts. The old system of grey winding therefore continues and also the old rate of wages and conditions of employment.

**Weft.**—(Re-winding). Universal winding machines No. 90 type and Schlafhorst high speed winding machines "S" type were installed to re-wind all the weft on to special large size bobbins, so that the amount of yarn wound on a pirn was increased

from 540 yards to from 1,500/1,750 yards depending on the size of universal pirn used. Rates were exactly as paid in our sister mills on similar machines and no change was made in the rates of pay or condition of employment. The employees on these machines are an addition to the number of employees previously engaged, i.e., the working staff of the mill is increased by the total number of workers employed in this department.

*Warping Department.*—No alteration has been made in this department and the rate of pay and conditions of work are the same as existed formerly in sister mills.

*Sizing.*—The entire department was completely overhauled and a much simpler and easier system of working established. The number of operatives employed remain the same as in our sister mills. This department in particular is grossly overpaid when compared with other countries. A sizer in Japan looks after one machine and is paid Rs. 55 per month whereas in Bombay he is paid over Rs. 90 and requires the assistance of a back sizer on Rs. 45. There is no reason with the class of yarn working at this mill why one sizer should not look after one machine with one back sizer to six machines.

*Drawing-in.*—The conditions here are exactly as before but a reduction in the number of men employed has been made by the installations of two automatic warp twisting machines in which the old set of healds from the weaving shed are twisted to the new beam reducing the number of drawers by two-thirds to three-fourths according to the life of a set of healds. This is to some extent counterbalanced by the employment of a team of higher paid men on the warp twisting machines.

*Weaving Shed.*—As previously pointed out this shed is now re-planned for vertical specialization and only two qualities of grey cloth are made—the plain looms making three yard sheeting and the drill looms 13½ lb. drills. Only one count of weft is used in the whole shed, and headings are practically non-existent. Trouble for the jobber and weaver is saved; there is no change of pick wheel to be made and no need for a weaver to worry as to the correct count of weft he has to use—any weft at the looms goes into any of the three or four looms he has to tend. For the line jobber the whole process of gaitting up is simplified—all the work is straightforward and it should not take more than 15 minutes for the jobber to have a new beam working after the old beam is completed.

The weaver is employed purely as a weaver in that the warp beam is brought to the loom by a coolie, it is gaitted up by the jobber and handed over to the weaver in a working condition. Weft is brought to the weaver by special weft coolies and woven cloth is taken to the cloth warehouse for him. His work is reduced to reshuttling the loom on the breakage of weft and drawing in broken ends. The former is reduced by the fact that the length of yarn in a shuttle is increased from 540 yards to 1,500 yards, that is, he has less shuttling to do on three or four looms than he formerly did on two looms.

A much better class of warp is supplied to him and the cloth is of low reed and pick so that his work in this direction is also reduced, apart from the additional help given by supplying him with weft at the looms and taking his cloth from him. Further help is given in that the mill provides a spare weaver for each double section, to help any weaver who has a smash or is in any difficulty. This man also helps to tend the looms of weavers who have left their looms as they occasionally must with five hour runs. On the quality of work supplied, the nature of the cloth and the assistance given, we feel confident that any weaver of average ability could mind six and not three or four looms.

It is interesting to note from Mr Sasakura that mills in Japan are discontinuing the use of universal winding on account of the cost of same, although they are increasing the number of looms per weaver, whereas in Bombay, Trades Unions are resisting any increase on the number of looms per weaver in spite of the expense of this additional process and the assistance given.

Speaking in England, as recently as September 26th, this year, Mr. Frank Nasmyth makes the following comment:—

" Throughout the Continent an effort is being made to-day to reduce the cost of production by installing improved machinery and methods. The rewinding of weft is being very seriously and closely considered. By increasing the filling supply in the shuttle, the weaver can attend to more looms from four to six being the increase in the majority of cases. Less wages per loom are paid to the weaver who has no more work to do, often less, and who earns weekly a higher wage than previously. The rewinding of weft makes an ordinary loom semi-automatic and in the Valley Field mill, at Montreal, the automatic weft replenishing mechanism previously applied to the looms has been removed and reworded weft used. Weavers are looking after

16 looms in this shed, being provided with assistants such as weft and cloth carriers, who are, however, not on the same high rate of wages as the weaver. Making the spinner or weaver a full time producer is most essential." (Textile Weekly October 5th, 1928, page 119.)

*Line Jobbers.*—Instead of an average of 40 looms per section a line jobber is asked to look after 60 looms in view of the straightforward nature of the work.

*Head Jobbers.*—The conditions of work for head jobber are the same as existed previously in sister mills and there is no alteration in rates or conditions of work.

*Cloth Warehouse.*—No alteration is made in the cloth warehouse except that a few men such as piece sorters are not necessary in view of the mill only making two styles of cloth-drill and sheetings, which cannot possibly be mistaken.

The chief inspector of factories, Mr. T. W. Johnstone, took a keen interest in the Manchester mill experiment and had many opportunities of studying same as he regularly visited the mill in connection with some special experiments we were conducting on ventilation and humidification under his guidance. As a result the following comment was made on page 9 of the annual factory report of the Presidency of Bombay, 1927:—

"Wages generally remained steady throughout the year. The most important strikes occurred in two Bombay mills controlled by a large firm of managing agents. An attempt was made to introduce the recommendations of the tariff board respecting an increase in efficiency as an alternative to a reduction in wages. In at least one of the mills every effort was made by the management to secure efficiency. Machinery was reorganized and to a great extent replaced. Its lay-out was also improved. Weavers were required to work three looms instead of two, but every facility was given them. Larger pirns provided for the shuttles to cut down the labour involved in shuttling. Improved methods of handling the cloth and giving out work were adopted and it is doubtful whether the weavers had, owing to the improvements effected, actually more work to do on three looms than on two under former conditions. The arrangements benefited the employer and the employee alike. Working costs were reduced but the employee received better wages. The strikes, which lasted throughout August, ended in favour of the employers. The system was extended to other mills under the same agents but was followed in the early part of this year by a strike in all their mills to be again followed by the surrender of the employees."

The system was slowly extended to our other mills, the order being:—

Manchester Mills (4 looms), January, 1927. Part sections.  
(3 and 4 looms), August, 1927. Complete shed.

Apollo Mills, Ltd. (3 and 4 looms), August, 1927.

Meyer Sassoon Mills (4 looms), March, 1928. Part section.

The introduction of the system at the Apollo mills led to a strike on August 1st, 1927, at that mill in the weaving department. These weavers brought the workers at the Manchester mills on strike on August 5th, 1927. The strikers resumed work at the Manchester mills on August 27th, 1927, and at the Apollo mills on September 1st, 1927, and the system has continued there since.

Shortly before the end of December, another group of mills in Bombay issued a notice making the system optional in their mills from January 1st, 1928, and we decided to issue a notice to the operatives in our mills that the spinning departments would go on the new system from February 1st. Trade was in a terrible condition. Huge stocks of cloth were held by many mills and offers for goods were at prices which showed such a loss as to make it worth consideration whether the mills would not do better to close down rather than accept such prices.

If the operatives were not prepared to co-operate in reducing costs it was certainly not advisable for the mills to continue running and adding to the heavy existing stocks or selling forward at a huge loss. A strike occurred; the dates of striking and resuming being in Appendix 4. A feature of this strike was that the strike commenced at mills in our group with the lowest number of spindles per frame, viz., 240 to 252.

The next strike was the last general strike which commenced in the middle of April at the Currimbhoy mills and Appendix 5 gives the dates each mill stopped work. It will be noticed that it was some days afterwards that these mills were brought out on strike and in more than one case actual physical resistance was put up by the operatives against strikers from other mills before the mills were compelled to close down. Although our decision to adopt this system was arrived at before the tariff board sat and was in progress at the Manchester mills during the sitting of the tariff board, the latter body arrived at a decision which we maintain advocates the system we have adopted as a means of saving the industry in Bombay without reducing wages. Mr. Sasakura has given evidence showing the rapid strides Japan has made in this direction and we attach Appendices Nos. 6 and 7\* showing a comparison with Bombay on the basis of information supplied by him as well as from official sources.

The objections made against the system by labour on various occasions have been (1) physically impossible to work the system without detriment to health; (2) fullest economic benefit not given to workers; (3) unemployment; (4) standard of efficiency of jobbers not improved; (5) provision should be made for greater facility for technical education; (6) provision of proper raw materials.

1. It is very difficult to counter this allegation as the mills have never been able to settle down to a steady run through strikes. In addition, it is the experience of most Bombay mills to date that higher wages mean a higher percentage of absenteeism. Certain operatives prefer a lower scale of wages to increased pay for more work and these men have, in some cases been weeded out. Appendix 8† shows the attendance on the new system as compared with the old, where comparisons have been possible. We maintain that operatives can do the work we have asked them to do without danger to health, in fact, in many cases much more work than the tasks allotted could easily be done.

2. We have erred in the liberal side in giving the operatives 50 per cent. increased wage for the increased work. The tariff board have commented on this point and we have already drawn attention to the fact that the proportion given is much less in other countries. The 50 per cent. is not all saving to the mills, in fact, the amount of saving is far less than would be warranted by the position of the industry, bearing in mind that the major portion of this saving goes in the provision of additional plant and labour.

3. Unemployment is a national problem and a question that cannot be handled by individual mills. This system is a means of maintaining present employment for the majority of the workers in the industry and if successful may lead to the re-starting of many mills now closed down or the partial adoption of double-shift working.

4. The millowners' association have dealt with this problem but individual millowners have contributed plant to the school started by the social service league, which to date has not been successful.

5. Facilities are given for technical education. Appendix 9 shows the number of employees from our mills attending the apprentice classes at the Victoria Jubilee Technical Institute.

6. We maintain that better cotton has been given at all our mills for the spinning of all counts above 10s., the latter not being on the new system.

\* Appendix No. 7 not printed.

† Not printed.

Mr. M. S. BHUMGARA, SOLDIER BAZAAR, KARACHI.

I.—Recruitment.

1. (i) The total number of workpeople employed in Bombay mills, under normal conditions, is about 153,000. Of these there are about 22,000 Mahomedan weavers, who are not agriculturists in any sense of the word. They have no land of their own to cultivate, and are practically domiciled in Bombay for more than two generations with their wives and children. Then, there are Kamathis, numbering about 9,000, who are also domiciled in Bombay for many generations past. Thus out of about 36,600 weavers working in Bombay mills, nearly 31,000 are domiciled Bombay citizens and have nothing to do with agriculture. Then again, there are those amongst spinners and others coming from Ratnagiri and adjoining districts. As a matter of fact, these people who number about 30,000 have lost all connections with their native country during last fifty years. It is a fact which every millowner in Bombay knows that when there are labour troubles in Bombay of the nature of a general strike, it is on these Ratnagiri men that the millowners generally depend to break the strike, as these people have no home to return to and hence they are the worst sufferers at such times.

We thus see that about 40 per cent. of the whole labour complement of the Bombay mills has nothing to do with agriculture and that they are mill operatives pure and simple. Of those that remain, thousands from several other districts have made Bombay their home and though they retain their connections with their native towns, most of them have ceased to be agriculturists themselves. They may have their homes in the country, they may have their family land which may be cultivated by their relations at home, and hence they may be going to their *masals* occasionally for a change. But that does not mean at all that they will very easily revert to agriculture. Necessity has no law, and when they are starving in Bombay during a general strike, they have to return to their country, partly because there the living is much cheaper than what it is in Bombay and partly because of what small chance they may have to work on the fields.

If these facts are properly understood both by the millowners and the union leaders, most of the present difficulties, in providing for the Bombay cotton mill operatives a humane treatment, will disappear.

(ii) *Causes of particular Streams of Migration.*—These causes are of a varied nature, the chief amongst them being traced as under:—(a) Misrepresentations regarding their prospects in Bombay mills by jobbers who, in old days, visited the agricultural parts of the country as recruiting officers on behalf of their mills. Those that migrated had little idea of the cost of living in Bombay as compared with that in their own country. (b) Insufficient scope for agricultural pursuits. (c) Vicious temptations of the city life in Bombay as reported in the country from those who had already migrated into Bombay. (d) Hand-loom weavers, who before their migration into Bombay, were working on hand-looms gave up the latter in favour of power-looms. It may be stated here that most of the weavers in Bombay mills have been in this profession for many generations past. The only change, so far as they are concerned, is that they have reverted from the hand-loom to the power-loom.

(iii) *Changes in recent Times.*—As I have stated above, a very large number of workpeople have now made Bombay their domicile and hence the practice of having to send jobbers as recruiting officers up in the country has now ceased. Nowadays, instead of the jobbers going out in search for men, there is a fairly large and free flow of workpeople from up-country into Bombay in search for employment.

3. (i) *Methods of Recruitment.*—The workpeople, as a rule, offer themselves at the mill gates for vacancies. They are generally introduced to the head-jobber of the department concerned by the line jobbers working under him. Sometimes the head-jobber brings his own men. The qualifications or the antecedents of the new men, barring the spinners, are never inquired into. Very often some of these men are quite new but manage to get an entrance. As a rule, money makes the mare go.

The Indian Tariff Board had an occasion to go into this question and their conclusions on this subject are to be found in paragraphs 63 of their Report, Volume I, pages 138 and 139.

It appears that the millowners had to admit that the system of engaging men through jobbers furnished openings for corruption. Their attempt, however, to explain the situation by saying that "it is the only possible system in Bombay conditions, as the jobber is in touch with labour to an extent that no official of the mill can possibly be, and that it does not necessarily follow that because a jobber produces men, they are engaged by the mill," shows that the millowners have not before them the correct facts. There is no objection to a jobber producing his men. The objection is regarding the final selection of his men by himself. And to this, the millowners say that it does not necessarily follow that because a jobber produces men, they must be engaged. With all due deference, I beg to submit that this is not correct. The statement is entirely wrong. As a rule, the departmental heads and in several cases their assistants, are never at the mills until about an hour and a half or two hours after the mills start working, and if they are not on the spot when the men are recruited, it does not necessarily follow that because a jobber produces men they must be accepted for engagement. This is my personal experience as a mill manager.

The millowner's further contention that "it is not always possible for all vacancies to be filled from the applicants waiting at the mill gates for employment, and that, when this is the case, the only course open is to send out jobbers to the homes of the operatives to collect men" applies not to the present times but to the latter part of the nineteenth century. I am in a position to assert most definitely that the state of things to which the millowners refer does not at present exist, except perhaps in case of a couple of mills which may be geographically unfavourably situated. Even in the latter case, I have made personal inquiries from the manager of a mill which was at one time similarly affected on account of its unfavourable situation and my information is that during the last seven years, when all mills in Bombay were working under normal conditions, there was not a single occasion to send a jobber in search for men.

(ii) *Possible Improvement.*—The Tariff Board's condemnation of the practice and their recommendation that "all labour should be engaged directly by the officer of the mill in charge of the department which requires it or by a reasonable assistant" seems to me to be the only rational method which needs to be adopted. If the millowners desired to make a change in this direction, all that they have got to do is to make the presence of their departmental heads and of their assistants compulsory a little before the starting of the mills.

(iii) *Public or Private Employment Agencies.*—These do not, as a rule, exist. Even if they did they would be useless. Such agencies, at the same time, would be a menace to the workpeople, who would be exploited every time. There are at present a number of service securing agencies throughout the country which claim to secure jobs for the unemployed amongst artisans and clerks. Some of these agencies are an open scandal and ought to be suppressed or allowed to exist only under a licence from the local Government, which should satisfy itself as to the resources of these employment agencies to secure jobs for the unemployed.

7. *Unemployment.*—(i) The extent of employment depends upon the engagement by the mills of their required complement from day to day. Unemployment in the Bombay cotton mills, as a rule, falls under two different and distinct classes. Some of the mills work only a part of their machinery, leaving the other part stopped for some time. Unemployment thus caused necessarily tells on the workpeople who

are thrown out. A very large percentage of men who offer themselves for employment at different mill gates every morning belong to this particular class of unemployed workpeople. There are other mills which are very erratic in this matter and stop their spindles and looms at any moment, sometimes at the very last moment, thus turping out a part of the workpeople who, having left their homes early in the morning, wended their long way towards their mills in the hope of earning their daily bread. This unexpected driving out of the men cuts them both ways. They cannot get a job in the mill where they think they are permanently engaged; at the same time, they are deprived of their chance to look out for a job elsewhere, due to their being late for this purpose. Such sudden dismissals may mean nothing to the mills concerned, but they do tend to create disaffection amongst the workpeople. It is necessary that the men who are not required the next day should be given a notice to that effect the previous evening. This is the least that the mills could do. Failing this, the workpeople should be paid their wages for that day. Barring the two cases above mentioned, generally speaking, unemployment in Bombay cotton mills cannot be called of a very cruel nature.

(ii) (a) Retrenchment in itself is not so calamitous in its effects. It is, however, necessary that those who are the newest on the staff should only be axed. The turning out of old hands under the pretext of retrenchment does work a hardship on them. Such instances of dismissal often happen due to the petty jealousies between the jobbers and their men and the jobbers should not be permitted to have their last say in the matter. The same thing may be said of other cases of dismissal where it has no object but that the man does not suit the jobber or that the jobber refuses to let himself suit the man. Retrenchments and dismissals cause a great disaffection particularly when they are uncalled for. When I was manager of the Khatau Makanji mills, I had myself to send away for good a very large number of superfluous persons from almost all departments. There was then no disaffection at all, as each one of the cases I had personally investigated in consultation with the departmental heads and their jobbers.

I may here append a note to explain what an unfair dismissal generally means and how it tells on the workpeople. I do it, because I find that during the last mill strike an attempt was made to show that the once dismissed workpeople were offered a job elsewhere, but it was alleged against them that they were so obstinate and unreasonable that they would not accept the millowners' offer to reinstate them in other mills.

The man who, by dint of his steady application to his machine for a number of years, has thoroughly mastered it, knows it and understands it perfectly well. In a way, he has learnt to understand his machine's many and odd eccentricities and knows how to get the most and the best work out of it. To ask a man, therefore, to give up his own machine and work on another is to punish him for his past diligence. By working on a machine other than his own, he stands in no better position, so far as wages are concerned, than the man who has been all his life a rolling stone and who owns no machine which he can, by any possible pretence, claim to know and understand thoroughly.

(b) As a rule voluntary retirement takes place when the man becomes physically unfit for further work or when he decides to give up mill life and return to his country.

Among other causes leading to unemployment may be reckoned the spread of an epidemic, strikes and lock-outs.

(iii) *Methods of alleviating and remedying distress.*—There was a time when the millowners could have taken steps to introduce a system of unemployment insurance for those thrown out of employment due to retrenchment or those who were wrongly dismissed. Benefits of such insurance could have been extended to those unable to attend to their work on account of illness. As for those dismissed, something more should be done than giving full credence to the statement of the jobber concerned. It is not unoften that a jobber brings a new man because he gets his *baksisk* from him. The result is that an otherwise innocent man has to make room for his brother who has been found more generous to the jobber. In a very large number of cases, jobbers are supported by their departmental heads, partly because the latter are sometimes entirely on the mercy of their jobbers for a smooth running of their departments and partly because they have their own share in the poor man's *baksisk*.

(iv) Subject to what I have said above, unemployment insurance, as a rule, will not very much help the workpeople in Bombay cotton mills. So far, there is not that healthy atmosphere within and without the mills and it is possible that any scheme of general insurance may be abused by a section of the workpeople. However, any compensation paid as suggested above would make the millowners a little more concerned about their own affairs which they have now totally left to the charge of a set of irresponsible persons.

8. *Labour Turnover*—(i) *Average duration of employment*.—For spinners, this is most uncertain and nothing definite can be said. There are those who spend their whole lives in the mills, then there are others who work for a few years and then go away to their villages. It often happens that a change of jobbers necessitates a change of the entire batch of men working under them. . . It is remarkable that weavers, as a rule, are very reluctant to leave a mill where they may have worked for a number of years in spite of a change of their jobbers. This is because, being paid on production, they fully appreciate and understand that their earnings for some time to come will be considerably affected in the new place. I know a large number of weavers who have put in twenty to thirty years' service in one place.

(iii) *Absenteeism*.—This is a subject to which the Bombay millowners have given their much thought and time, but without success. I have, however, noticed one thing that in a mill where the chances of absenteeism being forced on the workpeople by a stoppage of machinery are few, the complaint in this direction is almost insignificant. When a mill stops a number of its men from time to time in a most erratic way, the latter naturally try to find out a more permanent place. Even then, when some of the mills have stopped a part of their machinery for some time, there is a surplus of labour available, and the effects of absenteeism are not always quite patent. But when all mills are working under normal conditions, and there is no surplus, the mills of the type I have just described are the worst sufferers. In that case, they have no choice of their own and the departmental jobbers are compelled to accept for engagement any and all who offer themselves for vacancies. It must be said, however, that such occasions are but few and rare, and in my experience I have never felt a shortage of workpeople in spinning departments.

The Tariff Board has evidently said three things in the matter of absenteeism. Properly analysed, they stand as follows :—

- (1) It is difficult to suggest a way by which absenteeism can be reduced.
- (2) A mill in Bombay has reduced its absenteeism from 15 to 1 per cent.
- (3) The best way is to engage a ten per cent. bigger staff.

To be candid, I cannot see any logic in the above suggestions. They have before them a mill which has successfully reduced absenteeism from 15 to 1 per cent. by bringing to its aid a most rational method, and yet the Tariff Board cannot see the wood for the trees. Their own suggestion of engaging a 10 per cent. larger staff is, to say the least, most unbusinesslike and not at all in the general interests of the industry. It is a pity that they could not see that the suggestion, if honestly put into practice, is open to grave abuse. What the mills, at present engaging this larger staff, have gained in efficiency, I do not yet know. My own experience is that after getting rid of most of this so called "reserve staff," I was in a position to improve efficiency to a very considerable extent.

I may say what generally happens when this extra "reserve" staff is engaged by a mill. Truly and really speaking, spare hands do not at all spare the trouble which is, without them, involved. On the other hand, they add to the existing troubles. Once the spare hands are taken up, they remain as a permanent fixture to the existing labour staff. If this, in itself, is not an evil, the practice makes room for greater corruption while it exists and in spite of gaining in efficiency, as imagined by the Tariff Board, there is a decided check on its improvement. The idea is to put in the spare hands in place of absentees. In experience, I have found that this is never done to the fullest extent. If A is absent, B comes in and earns his wage *in the name of A* and when A receives his wages, B is paid out of it through the jobber concerned. An additional man is thus provided for reasons which are not far to seek. I have known of mills taking substitutes even for these very spare hands if any of them remained absent. And where, through a strict supervision, the full number of spare hands are made use of, one sees in the departments a criminal waste of materials. And what is the excuse? All spare hands are engaged! As if they were brought inside the mills to be disengaged.

Now, I may show the effect of this practice on departmental efficiency. Where a department is accustomed to receive a number of extra hands, that department never makes any progress. It remains progress-proof. I ask a mill agent to apply this rule to his own office. He has an accountant. Supposing every time he goes on leave there is a man reserve to take his place. What happens? The rest of the office staff remain where they are. Their instinct for progress is killed. They are made ambitionless. The office efficiency remains at its lowest ebb. And at the top of all that when for some reason or another, the accountant and his substitute both disappear, the office is in a state of chaos and disorder. Similarly, by engaging an extra set of men in a mill, the workpeople are deprived of their most elementary lessons in efficiency. At the same time, it encourages the departmental heads in their present attitude to let the departments

take care of themselves. A better and stricter supervision with a more rational method of organizing the departments ought to help the management not only to do away with the additional staff but to add also to the workpeople's efficiency. The practice of engaging spare hands is, therefore, not only rotten in its principles but highly objectionable to the healthy growth of departmental efficiency in a cotton mill.

## II.—Staff Organization.

10. Administrative organization generally depends on the extent of the powers exercised by a particular manager. There are mills where managers are invested with full powers so far as administrative affairs are concerned. There are others where his powers are generally defined. There is yet a third class in which managers have to place the smallest possible matters before the agents for their final approval and sanction. Needless to say, the administrative affairs in mills falling under the first class are most satisfactory, if the managers concerned are intelligent, conscientious men. They being on the spot, they know best what to do under certain circumstances. The managers who have their powers defined have a very limited scope for their activities. The mills which suffer most in matters of administration are those falling under the last group. I know of instances where a number of useful suggestions were withheld from being brought to the notice of the agents simply because, in spite of their own very firm belief in their suggestions, the managers did not know what was going to be their fate and they generally preferred to let the things take their usual course.

In some mills, agents do not understand the difference between administrative and departmental organization. The result is that often the administrative head remains a mere figure-head and he thus learns to shirk his own responsibilities.

As a rule, departmental organization is left to the care of jobbers. There are exceptions, but they are very few. Why such things exist only the millowners can say. It is impossible to write on the subject of departmental organization in all its aspects. The subject is so comprehensive that it may call for the writing of an elaborate thesis to do it a full measure of justice.

11. There are no fixed rules for the selection of staff. All over the world, various agencies are made use of in their selection and the millowners cannot be an exception. Personal acquaintance, introduction through one or another source, past obligations, friendship, etc., are questions which are generally considered in the matter of staff selection. In some cases, applications are independently invited through the agency of the press. In that case, the best recommendations are generally on paper. It has been the experience of a large number of millowners that the men who have the best certificates are often the most rotten.

12. The selection of subordinate staff is, as a rule, the chief concern of the departmental heads. The practice is much abused and an idea of its abuse can only be gathered from the fact that in one particular instance a man who had never seen a cotton mill during all his life was appointed a head-jobber in one of the Bombay mills. Such instances may be exceptional, but the practice is not sound in its principles. In some cases, nowadays there is a tendency to encourage students who have passed out from the Victoria Jubilee Technical School to go in for these jobs. My own knowledge is confined to only a very few of them, but the general complaint about the technically trained young men is that they are a bit too much conceited for their having in their pocket a diploma of their proficiency. Though their knowledge of departmental practice is often nil, they claim to be better trained all round. This complaint, from what little experience I had of this class of men, I have no hesitation to endorse.

The jobbers who belong to the subordinate staff are mostly untrained. The result is that in several mills where the departments are left entirely in charge of their jobbers by the departmental heads, they necessarily run jobber-like. Efficiency is at its lowest, waste production is absolutely unchecked, production is manufactured both in the processes and on paper, and, in short, the departments are in a most disorganized state. So long as the present method of engaging jobbers exists without any attempt being made to train them, there is little chance of being any improvement in labour efficiency in Bombay cotton mills. Facilities for training them are few and far between. I have discussed this question further in paragraphs 40 and 41 below.

13. Relations between staff and rank and file are of the most unpleasant nature. Had these relations been what they should be, Bombay would have acquitted itself honourably during the last great strikes in cotton mills. One great difficulty of the whole thing is that the senior staff has done little to place before the agents the workpeople's case truly and honestly. I have discussed this question with several managers and departmental heads, when almost in each case I was told that if they attempted to place the workpeople's case before the agents, they themselves would incur the latter's displeasure. I feel that their fears are not at all well founded.

In any case this is the situation as I can see it. The agents not having a direct touch with their workpeople, the workpeople's grievances are not brought to their notice in proper light. In many cases the agents consult their managers as to what they should do. This is a very wise course which any mill agent can safely adopt as it gives the manager an opportunity to place before the agent all the facts pertaining to a particular case. But I find that the facts are often distorted, as some managers like to give the agents an impression that the mills are in a helpless state due to the workpeople's vagaries. Thus the workpeople are between the two stools. There is no love lost between themselves and their officers. At the same time, these officers are the only people to whom the agents can refer in matters affecting labour, and if their representations are not honest and straightforward before the agents, the workpeople must necessarily suffer.

14. Every mill in Bombay has an efficient timekeeping department. . . . The only possible chance of a fraud being played on the mills is in the case of spare hands and "budlis" (substitutes), but with proper supervision this can be eliminated.

The system of making wages payment in a large number of mills is entirely out of date. It entails not only a great hardship on the workpeople, though they themselves may not regard it as such in view of their getting a chance for a frolic, to leave the department and present themselves at the timekeeper's counter, but at the same time it means a heavy loss to the mill itself in production. There are only a very few mills who have a more rational method of distributing wages payment. As one who was responsible for introducing the latter method, I gave expression to my views in my lecture on "Re-organization," to which I have already referred. My remarks under the heading "Other Forms of Waste" explain this point and hence I beg to reproduce them below :—

. . . . One of the most common forms of waste of which we know so well is the recurrent waste of time every month when we distribute wages among our mill-hands. What this waste of time means really in money very few seem to have considered carefully. It is an open secret that the production in an average mill on pay-day is only a half-day's production, though the mills have to pay in every respect a full working day's expenses. This way, full six days in a year are lost to the mills."

### III.—Housing.

17 to 22. Housing conditions for Bombay cotton mill labour are far from satisfactory. In some places they are of an appalling nature. They are practically unfit for human habitation. The Bombay Government have made some serious efforts to provide suitable dwellings for the workpeople but such efforts have, for the most part proved unsuccessful. It must be admitted that during recent years the mill-owners have largely co-operated with the Government in providing for the workpeople sanitary dwellings. The co-operation consists in their paying, though not with a smiling face, Re. 1 per bale of cotton on all cotton coming into Bombay. This evy on cotton is called "Town Duty," which approximately means Bombay mill-owners' contribution of about a million rupees per year. The tenements constructed by the Government have, no doubt, relieved the situation which would have otherwise been accentuated. It was reported to the Tariff Board that about 69 per cent. of these tenements were lying vacant. The reasons mentioned were difficulties of access, absence of bazaars, and, above all, the unsuitability of the construction of these tenements. The Tariff Board declared that it was alleged before them that the tenements being built of cement were too hot in the hot weather and too cold in the cold weather. Ill-housed workpeople can never be expected to be efficient up to a certain standard, but it was unfortunately not very well realized that the industry which demanded protection against foreign competition had deprived itself of the efficiency of its workpeople to a very great extent due to most unsatisfactory housing conditions in Bombay.

In my opinion the best way out of the difficulty would be to abolish the town duty on cotton and instead ask the millowners to form workpeople's mutual housing societies, to which they should be made to contribute each at the rate of Rs. 2 per bale consumed. The money for the construction work can be borrowed at the rate of 5 per cent. per annum. The duty levied at the rate of Rs. 2 per bale should be utilized to pay the major portion of the interest charges on the borrowed capital. We may take the instance of a mill consuming 40 bales a day, that is, about 12,000 bales per year. Its contribution to the housing society would be about Rs. 24,000 per year. The construction of 50,000 tenements have cost the Government very nearly 50 million rupees, thus one tenement costing about Rs. 1,000. If 500 tenements are provided for a mill contributing as above Rs. 24,000 per year, the cost of building such tenements would be roughly Rs. 500,000. It is reasonably certain that the

tenements built by such a society as I have suggested above, particularly under the direction of the mills concerned, so as to make them sufficiently attractive for the workpeople from their own point of view, will find a sufficient number of tenants every time. Taking the rent per each tenement at a low figure of Rs. 4 per month, the total rents realizable per month would be Rs. 24,000 per year. This amount, that is, Rs. 24,000, together with Rs. 24,000, being the mills' contribution, should enable the society not only to pay interest at 5 per cent., that is Rs. 25,000, but should leave a sufficient surplus for taxes, building repairs, reserve and sinking funds, etc. Under this scheme, about 25 per-cent. of the total complement of a mill's staff can be housed and its future expansion should not be found difficult on more progressive lines.

#### IV.—Health.

23. *General Conditions.*—These depend largely on the respective temperaments of the workpeople concerned, their mode of life and their diet. As a class, Mahomedan workpeople are temperamentally more cheerful, more practical, and more sensible to the necessity of their having to earn their daily bread under a plan of nature. The Hindu operatives, however, are in the matter of their temperament, quite reverse.

What I have said of the temperament applies equally to the physique of the respective classes. The diet of the both differs in essential particulars. The Mahomedan worker's diet is simple but wholesome. Not so of the Hindu worker, whose earnings being meagre, he has to be content with his poor diet both in quality and in quantity. Between Hindus and Hindus, the Kamathis and the Marathas of the higher class, as distinguished from the untouchables, are decidedly far superior to the rest of the Hindus. The untouchables are not permitted to work except in the spinning department.

With regard to the working conditions at mills, it must be said to the credit of the Bombay millowners, that they are, as a rule, far superior to the conditions obtainable in some of the Lancashire mills, except that the Indian workpeople are accustomed to keep their own surroundings very unclean by constant spitting on the floors and on the walls and otherwise disfiguring these places. I have visited several mills in Lancashire at Bolton, Blackburn, etc., and on a comparison being made between them and the Bombay mills, I am in a position to say that any complaint regarding working conditions generally in Bombay mills ought to be entirely discredited.

24 and 25. *Medical Facilities.*—Much has already been done and still more is being done in this direction. For this, the Bombay millowners deserve the workpeople's best thanks. As a rule, the western science of medicine has not so far gained the workpeople's full confidence. There are several mills to which dispensaries are attached and in some of these the workpeople can get English as well as country medicine. A large majority of the workpeople, being illiterate, have not learnt the value of nipping a disease in the bud. They believe in the efficacy of country medicine, which they often prepare at home. In more serious cases they go to the *Vaidis* and *Hakims* practising *Ayurvedic* and *Unani* (Greek) systems of medicine.

26 and 27. *Sanitary Arrangements.*—These call for attention. Of what I have seen in more than a dozen mills in Bombay, I say that the facilities so far provided are not only insufficient but of the filthiest kind also. In some mills, drinking water tanks are placed next to the latrines. Mills, as a rule, do not provide bathing places, and when washing places are more generously made use of by the bolder amongst the workpeople to have a bath to their own content, they create nuisance to the detriment of the rest of the staff. A more rigorous application by the sanitary inspectors of the powers vested in them may bring about a welcome change in the existing conditions.

#### 30. *Sickness Insurance.*

If the millowners desired they can work up a scheme for the benefit of the workpeople in this direction, either side by side with compensation insurance in their own mutual insurance company, or in co-operation with some existing life office. In other countries, including even South Africa, there are staff pension schemes. Under a staff pension scheme, provision is made for adequate superannuation benefits to employees on their retirement from service, a monthly income during their incapacitation is assured, and a cash sum to their dependants in the event of their death is paid whilst in service. Under a scheme like this, the mills would be relieved of all responsibilities in connection with its proper administration, as a life office may undertake to administer it on their behalf on receiving a small percentage of commission.

### VI.—Education.

40 and 41. In my own experience, I myself started at the Khatau Makanji mills three classes, one for primary education and two for technical training—one of these was a preliminary class for the workpeople and the other for an advanced course of study for the jobbers. The classes were held in the evening when the mill was closed after the day's work. The staff was wholly voluntary and was recruited from mill clerks and departmental assistants, I myself devoting two solid hours every evening to supervise the working of the classes. The classes were a great success. The workpeople were so attentive and were taking such great interest that within a short time of the starting of these classes, many of them began reading and writing simple lessons in their own vernacular. After I had left the mills, I learnt that the classes had been closed down.

42. *Effect of Education on Standard of Living and Industrial Efficiency of Workers.*—In my own experience, I have found that these effects were remarkable. The millowners seem to be in a mood to complain about everything pertaining to labour and perhaps they will try to say the same thing about labour education as they have said about welfare work. But in spite of whatever they may have to say, one thing is certain and it is this; that education means efficiency. After I had started my classes at the Khatau Makanji mills, I had the satisfaction to see that, with a set of most preliminary hints, there was an all round improvement. The departments which were at one time most notorious for being hopelessly unclean began to be scrupulously clean. There was a marked tendency on the part of the operatives who attended the classes to behave better, they took greater care of the materials, wasted less time in their excursions outside the departments, were more attentive to their work and, on the whole, there was a most satisfactory change in their mill life. The number of operatives who joined the classes was a small one, but this small number of men exercised over their fellow work-people very great influence, and I often noticed that not only the operatives who were attending the classes were trying to keep everything pertaining to their work clean, but they also saw that their neighbours were clean as well. As a matter of fact, it was a part of their lessons and they were often asked to give the benefit of their instruction to their brethren in the departments. And the way in which they loyally and faithfully carried out these instructions showed that what they learnt in their classes they placed to the best advantage while at work. In short, other workpeople were also brought into a healthy contact which helped directly to reduce the percentage of waste in different forms. Besides, every operative who attended the classes was asked to keep his body clean, to wash his clothes regularly, to have a regular daily bath. When the classes met and dispersed, they offered their prayers to God. Such are the things which I am sure would do no harm to any industry.

### VIII.—Workmen's Compensation.

51. The scale of compensation is very poor and needs to be revised. A poor man while he is unable to work for his living should not be deprived of a part of it while he is injured for no fault of his own.

The saving clause works a great hardship on an injured person. It stipulates that a workman who is able to resume normal work after 10 days or earlier shall not make a compensation. The fears that when such compensation is paid the workman will unnecessarily stay away are totally unfounded, as every case is dealt with on its own merits and compensation is paid only on a medical certificate. Perhaps it may be contended that similar exceptions are provided in other countries too. But then, it should be remembered that the scale of wages for an average Indian workman is so low, his mode of life is so miserable and in every other respect he is so totally helpless that he has no other alternative but to incur a personal liability during his preliminary illness.

The valuation of injury at 100 per cent. needs to be raised. At least, it ought to be made in proportion to the wages earned by the workman injured, irrespective of the scale of his wages, letting the present figure of Rs. 2,500 to remain as a minimum for an injury at 100 per cent.

The present scale of compensation is 30 months' wages in case of death or Rs. 2,500, whichever is less. In my opinion Rs. 2,500 ought to be made, not the maximum, but the minimum. Where the wages are higher, the compensation should be regulated according to the wages and not according to a maximum fixed arbitrarily. In matters like this, we need discretion rather than caprice.

Under the Indian Workmen's Compensation Act, the cost of a minor's life is Rs. 200, that is, less than fifteen pounds sterling. Never was the life of a domestic pet valued at so miserably small a sum, and it is no wonder that this grossest form of inhumanity which has permitted the Indian employer to keep quiet over this form of compensation should give westerners an idea that the life of an Indian coolie is less valuable than a pariah dog. It is not for the framers of the Act to say that

in the case of the minor the dependants are not likely to be helpless as they may be in the case of an adult. Apart from all considerations, the fact is, that a valuable life is lost in the course of employment, and that is enough. The framers of the Act are not infallible. When they see chances of dependence less in the case of a minor, how are they going to help the parents in their old age and distress where the minor happened to be their only child ?

There is yet one more flaw in the Act and that is about its disqualifying a workman who has been drawing above Rs. 300 from receiving any benefit from the operation of the Act. A workman is a workman, whether he earns Rs. 15 a month or Rs. 500 a month and it is absolutely inconceivable why the Act should cease to operate in his favour so long as the workman himself does not cease to be a workman. The latter ought to have as much right to compensation as any ordinary workman has.

#### IX.—Hours.

59. The time has now come when the working hours need to be reduced from 10 to 9 per day. At present, while the number of working hours per week is nominally 60, very often the men are made to work for 90 hours by working 9 days at a stretch. The reason is that if there is a holiday during the week, the mills can work on a Sunday which is acknowledged to be the day of rest throughout the civilized world. The present Indian Factories Act allows it, Sunday, therefore, needs to be made a compulsory holiday.

The reduction in the number of working hours from 60 to 54 per week may give the millowners, at the start, a smaller production, but this will be sufficiently compensated by an increased efficiency of the workpeople. The millowners themselves have often complained that though the workpeople are at present working nominally for 10 hours they are, as a matter of fact, not giving full 10 hours' work. This explains for the industrial fatigue which tells heavily on the workpeople and tends to retard their efficiency.

#### XII.—Wages.

97. The wages in Bombay cotton mills have moved with the price movements at different times. In a great and growing city like Bombay, the prices have moved rather quickly and with the moving of these prices, the workpeople had to demand higher wages. In spite of the many struggles between labour and capital in the past, the present day standard of wages, particularly in spinning departments, is fearfully low and needs to be raised.

98. It is most difficult to ascertain what percentage of the total number of mill-hands employed in Bombay mills send any amount, to their villages, and the percentage of the wages earned in case of those that did. The only thing that I can say is that the lot of an average workman is too miserable to permit him to send anything to his village. The ordinary work-people, the real toilers, have their wages standard so low that unless they eat half the bread themselves, it is not possible to send the remainder to their villages. As a mill manager, my experience is that nine out of ten workpeople are indebted to the Bania, the Marwari and the Pathan and the official banker at the mills. I am in a position to say that a majority of the work-people, even without their sending any money to their villages, do not get for themselves full half bread to which I have referred. I want the commissioners to understand this point very clearly. There are many hundreds, nay thousands, of men working in the cotton mills of Bombay who earn about ten annas a day. While considering that this small sum of money is not enough to let a person in a large city like Bombay, howsoever miserably he may be living, keep his body and soul together, one has to remember that not a small number of these workpeople are sent away from the mills every now and then on the ground that there is not sufficient work for the whole of the departmental staff. Thus, if a person can earn, say for 20 days in a month, then that person's monthly income will come to Rs. 12-8 annas, that is, about sevenpence a day. And then there are workpeople whose total wages do not exceed, even if they put in a full month's work, Rs. 13 or Rs. 14 per month, that is, about seven to eight pence per day. Surely, these are not the people whom one should expect to eat, drink and make merry while they live in Bombay and send the surplus of their earnings to their home sweet home.

There are, no doubt, a few men in the mills who are in receipt of fairly good wages. They are the jobbers, turners, fitters, carpenters, and others, but they are, strictly speaking, workmen of the supervising staff or belonging to the artisan class, and do not form the bulk of the workpeople. As a rule, weavers are better paid than spinners, but being domiciled in Bombay, they have not to send anything to their country, except under special cases.

101. The principle which was fundamentally wrong in 1879 for fixing the workpeople's wages is wrong in 1929, and yet it continues to the dissatisfaction and disaffection of the workpeople. In old days, the idea of fixing wages was very crude. The departmental head, in consultation with his jobber, found out what were the messing charges in Bombay for a workman. To this was added a small allowance for the sake of his coming to Bombay from his native country. And that was the living wage. The definition of a living wage is the same now as it was then. The only fact which the millowners recognized was that the workpeople had a duty towards their employers to live on till they worked for them as that would let the industry also live. What kind of living it was they cared little to know. Their only concern was to hire him at something less than what he was really worth or what he did really deserve.

103. After a series of attempts, the millowners have come to the conclusion, only during the last year, that it is possible to standardize the wages in Bombay cotton mills.

107. In Bombay cotton mills, wages are generally paid 10 to 15 days after they have become due. In the existing state of things this period of 10 to 15 days is really necessary to prepare wages muster rolls. If the system of monthly wages payment is to continue, wages must remain in arrears as they do now. However, the present economic condition of the worker demands that the wages should be paid weekly. The present system is most wretched in its principles, as during its existence an average workman has learnt to contract debts. As a matter of fact, in many cases, he is compelled to do so.

It is a pity that the millowners do not desire to encourage the system of short period payments. Whatever may be their fears, as one who has an intimate knowledge of the mode of cotton mill operatives' life and hence of his wants, I am in a position to say that the introduction of a system of weekly wages payment will make the workpeople more contented, more independent in their requirements and less dependent on a class of usurers, often of a most abominable type.

The committee of the millowners' association, in their letter to the *Asiatic Review* (in reply to an article by Lady Chatterjee in 1924), tried to justify the system of monthly wages payment and said :—

"Individual members of the association were requested to elicit the opinion of the workpeople as to whether they would prefer monthly or fortnightly wages : an overwhelming majority of the workpeople expressed themselves strongly opposed to the introduction of the system of fortnightly payment of wages and insisted on the continuance of the present system . . . . If the mill operatives had shown any preference for the system of fortnightly payments, the association would have certainly asked its members to pay wages to operatives every fortnight."

It will be interesting to know what steps the millowners had taken to ascertain the real needs and wishes of the workpeople and how many of 153,000 workpeople preferred a monthly system of payment so as to form themselves into an "overwhelming majority." It is rather strange that the millowners did not care to ascertain the wishes of the workpeople, in this particular matter, through their labour unions.

As a matter of fact, many of the mills in Bombay pay their workpeople, even to-day, a part of the wages earned by them in the shape of an advance. On this part payment of wages which are actually earned, the workpeople have to pay an exorbitant rate of interest. Can it ever be believed that the workpeople who have to pay an exorbitant rate of interest on a part of their own earnings would be unwilling to receive a payment of their wages on which they would not have to pay any interest at all. It is for the millowners to say that this is not correct.

The advances to which I have referred above, are made either directly by the mills concerned or, in a few cases, through the instrumentality of some other parties. It is also a well-known fact that over and above their receiving the advances from their earned wages, the workpeople have to borrow sums of money regularly from Banias, Marwaris, Pathans and others at a most prohibitive rate of interest. It is also a fact, too well-known to the millowners and their officers, that the workpeople buy their foodstuffs on credit and eventually pay a price much higher than what they would have to pay if they bought them for cash. I know Banias and Marwaris who would not pay the workpeople any sum of money in spite of their preparedness to pay the fixed rate of interest, however high it may be, unless the workpeople agreed to buy their requirements from those Banias and Marwaris. Thus this class of usurers thrive not only on the workpeople's evil habits of contracting debts but they get their pound of flesh by extorting from the workpeople as much money as possible in the ordinary course of their purchase. In this, they have a double object. The first is to keep the workpeople attached to them and second so to squeeze them

that they may never get out of their indebtedness. All these things, I beg to submit, are being done to the knowledge of the millowners. They are too well-known to their managers and heads of departments. And yet when we are told that an "overwhelming majority" of the workpeople preferred a monthly system of payment, one may like to know why they were so very fascinated with a wicked system which did them no good at all but, on the other hand, adversely affected their interests from every conceivable point of view.

I hope I shall be permitted to say something more about it. There is no secret about the fact that besides Banias, Marwaris and Pathans there is yet another class of people who freely loan money to the workpeople. These are the mill jobbers, timekeepers, and in a few cases, heads of departments. In some cases, the jobbers and the timekeepers make use of an official's money in this mutual banking business, when the departmental head remains only a "sleeping partner" in the affair and gets his share of the income. It is, therefore, as clear as daylight, that if the payment were made fortnightly, these "official bankers" of the workpeople would certainly lose their extra source of income. The fortnightly wages may be in the interests of the workpeople, as they really are, but they are not in the interests of these bankers, through whom the "real needs and wishes" of the workpeople were most probably ascertained. It is really strange that it never occurred to the millowners that the workpeople who were squeezed so clean on all sides and who were made to mortgage their future earnings to a set of merciless usurers deserved an urgent relief.

But this is not all, as a mill manager I am in a position to say that the system of fortnightly wages payment will never find favour with an "overwhelming majority" of the present day mill officials. They know that with what crude method of making wages payment they have in vogue in their mills, they are going to lose heavily in production if the wages were paid twice a month.

These are most stubborn and unchallengeable facts. They show what really lies at the bottom of the "real needs and wishes" of the workpeople. Any change, whatever its future significance, calls for better organization and more simplified methods. If this cannot be done, then workpeople are the real sufferers. But when they suffer, the industry must suffer as well.

Personally, I do not believe in fortnightly payments. They are better than monthly payments, but not as good as payments made every week. But let the "real needs and wishes" of the workpeople be ascertained through their labour unions.

108. *Indebtedness.*—I have referred to this in paragraph 107 above. How far and to what extent a mill hand is indebted in his village, it is difficult to ascertain. The village indebtedness may not be his own. It may be his father's or perhaps his grandfather's. Instances of such ancestral indebtedness are not by any means few. But his indebtedness in the industrial area is an established fact. The very fact that hundreds of money-lenders of all descriptions present themselves at the mill gates on wages payment day for collection of their dues is a sufficient proof of their indebtedness.

To help the workpeople to get out of the usurers' clutches, I beg to suggest the following remedy. In my opinion, in every mill centre there must be opened "millhands co-operative credit societies." Through such societies, the millhands should be offered an opportunity to borrow small sums of money. Perhaps some people will try to show a difficulty by saying that the millhands, some, or many of them, after receiving loans will run away. I do not wish to make a secret of the fact that the difficulty will be there, in the matter of conducting the business of such societies very satisfactorily, but if we think of the difficulties, we cannot think of the workpeople's welfare. The difficulties are, however, not insurmountable and if practical business men like the Bombay millowners approached it with a never-failing heart, there is no reason why they should not accomplish it quite satisfactorily.

106. As a mill manager, I am in a position to say, that fine, as a form of punishment, is resorted to in very exceptional cases, and in any opinion, if the practice is well regulated and if there is no chance of a greater evil being introduced through it, the practice must continue as a necessary evil and the millowners cannot be blamed for such continuance.

109. *Profit-sharing.*—The question of profit-sharing by labour in industrial undertakings in India is, in the present Indian conditions, un-arguable, and those who have been advocating in India the introduction of this measure, only make a fun of the sufferings of Indian labour. Several industrial concerns have been running their plant and machinery, though for years past they show no profit at all. In a private business, if it is found to be unremunerative, its proprietor, if he is an honest man, will like to close it down. But that is perhaps the concern only of the millowners

and of the shareholders to see why some of these concerns, in spite of their making losses year after year, are allowed to continue their operations. What I, however, want to point out is, that if it is profitable for the management to carry on business when there are no profits, it would not at all be profitable for the profit-sharing workpeople for whom probably nothing will be left.

Even as a theoretical problem, a system of profit-sharing, while it is likely to be opposed by the employers, will do little good to the workpeople themselves. What the workpeople are most concerned with, is their compensation, if any, over and above their nominal wage. They are also as much concerned that the ordinary standard of their wages will be maintained irrespective of the times being good, bad, or indifferent. How this could be possible, I have tried to show in paragraph below.

*Maintenance of Ordinary Wage Standard.*—It is only a sad mentality which wants to attack the workpeople's wages without any strong grounds. A state of mere trade depression is not at all a strong ground for reducing the workpeople's wages for the simple reason that the trade has its own cyclical periods of prosperity as well. Even while there is trade depression, there are a number of directions in which expenses can be curtailed to let the industry hold its own. After what I have seen in cotton mills in Bombay, I refuse to believe that the industry could not get on without attacking the workpeople's wages. These are matters of internal administration and perhaps they are not within the terms of reference of the present Commission, but I have no doubt in my mind that the Indian cotton mill industry will be in a position to look after itself only if the millowners pay greater attention to the matters of internal administration, which to-day, in not a few cases, is of the most wretched kind.

As regards workpeople's wages, my own opinion is that there is now time when, if labour is to be made to co-operate wholeheartedly with the industry; labour must be given a definite guarantee that no attempt will be made in future to reduce their wages, but, on the other hand, steps will be taken at the very first opportunity to ensure the maintenance of their ordinary standard. I say it is only fair that labour's ordinary wages which are the minimum must be insured. If the millowners can insure that lifeless plant, machinery and building, if they can insure their stock in trade, if they can insure their very profits, I see no reason, none at all, why the workpeople's wages should not be similarly insured. No doubt, if it is only during better times that this can be done on a firm and permanent footing. We have to remember that labour is a more permanent fixture for any industry, and that fixture needs to be well maintained if the industry is to progress on sound rational lines. For the proper maintenance of that fixture, which is a first charge on the industry, equalization of wages funds accounts needs to come into existence. It will insure the workpeople's wages against bad times and against periods of trade depression. When the wages are insured, the self-satisfied labour will insure the prosperity of the industry and will be ready to give the employers its very warm and loyal co-operation.

### XIII.—Industrial Efficiency of Workers.

112. The efficiency of the workpeople, as a rule, depends on the administrative efficiency. Yet, we find that the efficiency of the spinning departments of the Bombay mills has invariably suffered, compared to the efficiency in the weaving sheds, from the earliest days to the present times. The causes are of a varied nature. Besides lack of departmental organization, we see want of proper system of piecework, long working hours, ill-housing, ill-feeding, want of proper education and so on. The Indian Tariff Board laid special stress on the mills in Bombay introducing piecework.

The above recommendations, when properly analysed, point to the following main observations with regard to the question of efficiency:—

- (1) Spinners should be placed on piecework.
- (2) Number of spindles, per spinner, should be increased.

(7) To improve labour efficiency, there must be corresponding improvement in the standard of efficiency of jobbers.

- (8) Greater facilities for technical education should be provided for jobbers.

Considering the above observations in order, the first recommendation to place spinners on piecework is of a very sound nature. I do not think that this in itself is a radical change. With due regard to the millowners' opinion which is based on I do not know what specific grounds, I beg to submit that they are not correct in what they say. Even taking for granted that the change is a radical change, if it is introduced in a rational way, it will not only be not opposed by the workpeople, but they will be very pleased to welcome it. That is my experience as a mill manager.

The Tariff Board's recommendation to increase the number of spindles per spinner is not wise in the present condition of the spinning departments in Bombay mills. I do not say that the recommendation is not practical. But my objection to its

introduction at this stage lies in the fact that the millowners and their officials have done nothing so far to get from the workpeople the highest production from the number of spindles which they are at present attending.

With reference to this second recommendation, the millowners' fears that the workpeople will go on strike if asked to attend to a larger number of spindles are not wholly justified. The workpeople, as they are now trained, find it difficult to give a fairly good production per spindle and an increase in the spindleage would necessarily reduce the present efficiency per spindle. I do not, however, think that this is a radical change in any way. As mill manager, I am in a position to say that I have tried in both these directions and the results that I was able to obtain were highly satisfactory. In the Khatau Makanji mills where I was manager, I increased successfully not only spindle efficiency, but the number of spindles per spinner were also increased. There was no disaffection, however, and the departmental head and his jobbers who first opposed the change, finally appreciated and welcomed it.

In what the Tariff Board say regarding corresponding improvement in the standard of efficiency of jobbers, they have earned the very best thanks of the workpeople. But their last observation that greater facilities for technical education should be provided for jobbers is as unsound as it is useless. As a rule, so far as technical education is concerned, an average jobber knows much more than his departmental head. In my own experience I have found that so far as departmental practice is concerned, the technical knowledge of jobbers, particularly in the carding and spinning departments, is of a very high order and I have known technically trained students who take charge as departmental assistants to receive their lessons in departmental practice from these jobbers. What is wanted, however, is not a knowledge of the departmental technique but of departmental organization. I have already referred to this great drawback. It is in this direction that a jobber needs necessary inspiration from his departmental head. As a matter of fact, the latter is paid for that. But as the matters now are, few departmental heads have any inspiration to offer to their jobbers, and the latter are so much accustomed to the present jobber-like mode of working the departments that fewer still amongst them have any of such inspiration to draw from their departmental heads.

113. Indian workers are efficient or inefficient just in proportion as Indian mill managers and departmental heads are efficient or otherwise. I have often made this statement, but it has not been palatable to a class of officials who have been a burden on the industry. It is strange, however, that even a class of millowners find it very difficult to swallow this statement. But the very fact that the figures of production in different mills, working under almost identical conditions, are at variance, shows that there is something inherently wrong with the efficiency of Indian mills and something wrong with those too who refuse to believe it. I expressed my views on this subject as embodied in my lecture on "Reorganization." These I beg to reproduce below from pp. 15-16 of its printed copy :-

"Coming nearer home, what do we find in case of efficiency? This only a comparative study of figures can tell. While we have in our mills a larger number of operatives employed than in Lancashire or in Japan giving us a smaller production, our own figures of production at home are so erratic and incoherent as directly to reflect on our ability to look after our several departments. I have been able to collect figures from as many as 29 mills in Bombay, and the comparison that I have made therefrom is both interesting and instructive. Of these 29 mills, I have rejected 14 mills because they do not stand a proper comparison for several reasons. Of the 15 mills I have selected, I group the first three under class 'A,' six under class 'B' and six under class 'C.' I may say that in nine out of these 15 mills, the cotton used, though not the same, is practically of the same class, the counts spun are from an average of 22s to 24s with one exception where the average count spun is 18s and with another exception where it is 29s. At the same time, as far as possible, I have tried to find out the age of the machinery in each case and I am satisfied that in none of these nine mills the production could be affected on that count. My figures for the first two groups are as under :-

*Group 'A.'*

No. 1 mill	20s spindle	average	6.89 oz.
No. 2	" "	" "	6.33 "
No. 3	" "	" "	6.09 "

The general average for group 'A' is thus 6.31 oz. (in 20s converted) per spindle.

*Group 'B.'*

No. 4 mill	20s spindle	average	5.73 oz.
No. 5	" "	" "	5.64 "
No. 6	" "	" "	5.61 "
No. 7	" "	" "	5.33 "
No. 8	" "	" "	5.19 "
No. 9	" "	" "	5.04 "

The general average for group 'B' is thus 5.42 oz. (in 20s converted) per spindle . . . The difference in efficiency between the first and the ninth mills is 36.70 per cent. . . . whereas the difference between the first best and the fifteenth is 48.19 per cent. We may leave out of consideration the last six mills as the particulars both of cotton and of counts are not identical nor very near identical.

"To see what all this means in rupees, annas and pies, we shall assume that each of the two mills, or rather the groups of mills, are spinning 12,000 pounds of yarn and weaving 10,000 pounds of cloth per day. First let us take spinning. We see here that for what it costs the one mill to spin 6.31 oz. the other spins for the same cost 5.42 oz. Leaving out the price of cotton and taking the average spinning cost for 20s at 9 pies per spindle the other mill would be running (30,460 spindles for the first and 35,443 spindles for the other) 4,983 spindles more to work up its production. 4,983 spindles at 9 pies each per day would mean 233 rupees odd per day, that is, Rs. 71,531 per year. And if we take the first mill in the first group with the ninth mill in the second group we find that the second mill has to run (38,095-27,866) 10,229 spindles more to make up its production. These at 9 pies per spindle per day would cost Rs. 480 per day or Rs. 147,360 per year for spinning efficiency alone . . .

" . . . In other words, because some screws are loose here and there in your departments each of the mills in the second group is burdened with an average dead loss of over a lac and 50,000 rupees every year. And all this for the sake of inefficiency as compared with the efficiency of a few of our good mills and not as compared with the efficiency of mills in Lancashire or in Japan. The moral of the whole comparison is that the words 'Efficiency' and 'Inefficiency' are so loosely used in our everyday transactions that it is not possible to give any serious attention to this question unless we see its effect in rupees, annas and pies."

While drawing attention to these facts and figures, I offered some observations of a general nature on this subject which I beg to reproduce here from pp. 11-12 of the said printed copy:—

"To me for one, it appears that the more we go into the question of efficiency the more do we feel condemned in our own eyes. The Indian textile industry is not an infant industry. It is an industry which is three generations old. And to our greatest discredit, let me assure you that during all these 75 years our progress as mill officers is practically nil. There may be a few honourable exceptions but as you know exceptions do not form a rule. Our carding and spinning masters will be interested to know that ever since 1858 the number of men that were employed for 1,000 spindles in our spinning rooms was 12-14. Even today it is about 12. In some cases, it is 9-10, but in others it is 13-14, and in one case I know the number of men per 1,000 spindles is 17.7. This is the net result of our progress during the past 75 years. Now let us see how they stand in other countries. Mind you, the figures I give you here are not of my own compilation. I take them as published in Prince Kropotkin's excellent book, 'The Fields, Factories and Workshops.' Take the case of Germany. In 1861, she engaged 20 operatives for 1,000 spindles; India in that same year, engaged 12-14. Today Germany has brought down her old figure of 20 to less than 6, whereas we are standing where we were in our great-grandfathers' time. Take the case of England, the home of spinning industry. In 1831, that is, very nearly a hundred years ago when her spinning industry was in an exceptionally infant stage, England had only 7 operatives for 1,000 spindles and today it is less than 3. And in the United States of America, we find that one girl tended 896 spindles in 1905, and today she is tending 1,200 spindles. And amongst the less important countries of Europe the figures for Switzerland and Bavaria are from 6-7 per 1,000 spindles, and for Alsace and France about 9.5.

"Similarly, a weaver in Bombay manages 2 looms as a rule, as against 4 ordinary or 8-12 automatic looms in Lancashire. In the United States of America a girl weaver manages as many as 20 to 24 automatic looms. Whatever it may be in other countries, it appears that India is destined not to have automatic looms. And why? The secret is that if India had automatic looms, these would run automatically, but the rest of the things would not go on here as automatically as they are doing now. It means that we want to take the least trouble possible in discharging our responsible functions. Let alone the automatic looms, but to let a weaver work 4 ordinary looms, besides his looms being kept in first-class condition, he must be supplied with faultless beams from the sizing; to get the faultless beams from the sizing, the winding and warping departments would call for AI superintendence, etc., etc., but who is to do it? In his evidence before the Tariff Board Inquiry Committee, Mr. P. A. Baptist referred to the opinion of men coming from England who said that in England the weavers would absolutely refuse to work

a loom which is worked by an Indian weaver. Mr. G. Findlay Shirras, an ex-director of labour, in his evidence before the same body declared that an Indian weaver was not at all a bad weaver, and that he could get the same efficiency as was customary in Lancashire.

114. (i) In my opinion, migration of workers should not affect the efficiency to any appreciable extent. The department would, however, have to take great care in selecting "budlies" (substitutes) from the right stock. As a rule, spinners are more steady in their attendance and even while some of them are absent, jobbers use greater discretion in their selection than they do in case of doffer boys and others. The raw hands are, in the first instance, engaged as doffer boys or coolies and it is only when they have received a certain amount of training that they can expect to work as spinners. Dofing is always considered, by the way, an unimportant piece of departmental work and the slackness in this particular direction is often of a most scandalous nature. If departmental supervision is thoroughly systematic, the doffing would generally help to add to the departmental efficiency. A doffer has to learn only a few lessons which he can do satisfactorily within a short time. But that seems to be nobody's concern in a very large number of mills and when the production is low, it is very convenient to say that Indian labour is inefficient.

(iv) *Comparative efficiency of management.*—I have referred to this in several places in this statement as also in my reply to paragraph 113 above under "Industrial efficiency of workers," and under paragraph 116 below. My conclusions on the subject are that when management in Bombay mills will be as efficient as it should be, most of the present troubles will soon disappear.

115. Effects on production due to various causes including hours of work, housing conditions, dietary, piecework, etc. I have discussed generally each under a different heading in this statement.

(ix) Drunkenness is a general vice amongst the workpeople which cannot be denied. I have made very careful inquiries from a number of liquor shop keepers having their shops in mill areas, and in localities inhabited by the workpeople and I am told that the sale of liquor for the first two days following the wages payment is about four times its normal sale. This shows that though drunkenness, as a vice, exists amongst the workpeople they are not addicted to it so as to be condemned altogether. At the present moment, they are not provided with necessary amenities of life and they find in liquor shops, for two days in a month, an agreeableness which they would otherwise shun.

The result of the inquiry I have above referred to leads to confirm their being over head and ears in debt. It appears that after paying off their sundry creditors, what little remains with them, they spend in drinking, and then once again for the whole month, or at least till such time as they get their advances against their wages, they go on incurring fresh debts.

When I am here referring to the vice of drunkenness, perhaps some will come forward to argue that if the workpeople are paid fortnightly or weekly instead of their being paid monthly, as is now done, they will go on drinking every week or fortnight and thus they will squander more money in drinking than what they are doing now. I beg to submit that such argument should have no weight at all, for the very fact that if the workpeople wanted to drink more frequently and squander more money and involve themselves into a greater indebtedness, there is nothing to stop them now. As one who has very carefully studied their mode of life, I am in a position to say that instead of this vice being encouraged by their getting short period payments, they will on the other hand, learn better how to adjust their weekly or fortnightly budget, they will have fewer creditors to attend to and hence they will be better workmen than they now are. I may also say that moneylenders of all descriptions including their official bankers will be simply too pleased and ready to give them larger loans at a higher rate of interest if these workpeople wanted to drink more in their present situation. There is another outstanding fact in their favour and it is this that even now, besides getting their monthly wages, when a large majority of them receive from their mills advances against their wages on payment of interest, they never think of going to the liquor shops. This interim payment is as good as a fortnightly payment, only with this difference, that under a system of fortnightly wages payment, they would receive payment by their own right, whereas now they get it on sufferance. If the payment of advances is not objectionable, there could be no possible objection to a regular payment of wages weekly or fortnightly.

With regard to the effects of drunkenness on efficiency, I beg to submit that a habit, temporary or habitual, is not at all a virtue and the millowners should do their best to reclaim them by providing sufficient amenities of life. If this vice has any

effect on the departmental efficiency, it must be almost imperceptible as can be seen and verified from departmental figures of production for these particular days.

116. The whole secret of efficiency lies in an employer's ability to choose men who will fit the places and who are prepared to carry out the entire programme of administrative work without attempting to shirk from it. At the same time, besides administrative methods, materials play no mean part in bringing the efficiency to its highest point. Needless to say, however, that the best of methods and the best of materials will be of little use if personal efficiency is lacking in one or more of its different compartments.

So long as no attention is paid to the various methods of time study, so long as departmental organization remains in a languishing state, so long as steps are not taken to introduce rational methods in the whole system of administration, so long shall inefficiency continue to eat away the industry in its very foundations.

If it is recognised that labour efficiency must go hand in hand with administrative efficiency, if it is further recognised that a larger and better production must depend as much on labour efficiency as on administrative efficiency, then the old traditional management under which the workpeople are regarded as mere wage earners and under which the employer's will is the only code of administrative rules must necessarily die and from its ashes must rise a system of management under which workpeople and every member of the staff will be regarded as so many partners in the industry. No one needs to be frightened. When I say, partners in the industry, I do not mean the profit-and-loss sharing partners, but partners who will share industry's progress, prosperity and goodwill.

---

Messrs. CHICHGAR & CO., GOVERNMENT SHIPPING BROKERS, BOMBAY.

#### Recruitment.

5. The existing practice for recruitment of seamen till July, 1929, was that all the serangs in dock and engine department were sent to the respective officer and chief engineer of a ship for their selection. The serangs so selected were instructed to make up their full complement of crew for approval by the officer and engineer respectively. If any serangs were unable to obtain a complete crew, they used to seek our help for a further supply of men. The whole crew were accordingly sent on board, or at times at the shipping office, to put them in the articles of agreement. Before they signed articles they underwent medical examination either by the ship's surgeon or a doctor of shipping companies from shore. If any men were found unfit for employment the doctor would reject them and the serangs would look upon us for supplying men in place of those rejected.

After signing articles the crew received a month's advance and in the event of a ship sailing on coast port half advance from us in the presence of the shipping master or his representative. They were again taken on board by us, on the day of ship's sailing, with their kit from their quarters after undergoing the usual disinfection and medical examination. It does happen that some members of the crew are rejected by the port health officer at the time of disinfection and also at the time of ship's sailing and we accordingly, through the help of runners (our paid servants), replace these men and complete the crew at the last moment.

Since July, 1929, Government have appointed a special officer for recruitment of seamen.

Whilst the P. & O. and British India recruit their own men, the other companies obtain their crews from the shipping office through the special officer appointed by Government lately. Ever since the substitution of a special recruiting officer we have no hand in the recruitment of crews.

*Suggestion.*—The recruitment of seamen in Bombay is at present in the hands of the special officer appointed lately and we are unable to suggest any suggestion until the new practice is given a fair trial.

---

Dr. CLIFFORD MANSARDT, DIRECTOR, THE NAGPADA NEIGHBOURHOOD HOUSE, BYCULLA, BOMBAY.

#### I.—Recruitment.

3. (i) The existing method of recruiting labour in Bombay is largely through the jobber, a system which though securing labour, leads to various abuses, such as petty graft and jobber control over the outside life of the labourer. The system from the social welfare point of view can scarce be regarded as satisfactory.

(ii) It would seem that there must be opportunity for the direct access of the labourer to the controller of the post in which he seeks employment. An employment manager, personnel officer or welfare worker charged with both the employing and the welfare of the employees will quite likely lead to improvement.

(iii) The Nagpada Neighbourhood House, in connection with its family service, has dealt with several thousand cases of unemployment. It is our conviction that the problem can only be dealt with through a system of public employment agencies as against isolated individual attempts. An individual agency finds it difficult to make sufficient contacts to be of the highest service, and on the other hand often finds itself to be in the position of not having enough men on hand to meet a hurry up call for labour. Were public agencies established, both of these problems would be met, as well as the further important matter of being in touch with the whole labour situation instead of but parts of it.

I would be in favour of establishing local agencies in the industrial areas, all of which would be under the direction of the Government Labour Office, which office would make its contacts with the employers, study the entire situation, and instruct the local offices as to the number of men and type of men needed. A co-ordinated system of offices might prevent the running back and forth between mills that increases the labour turnover at present. The Government Labour Office would also be charged with equalizing the supply and demand in various industrial centres, as well as recommending public works when the situation seemed to demand.

#### V.—Welfare.

34. (b) For the past two and a half years the Nagpada Neighbourhood House has been carrying on welfare work in one of the most congested regions of Bombay, viz., Second Nagpada, Byculla. We have found the people ready to respond and appreciative of the opportunities provided for education, recreation and for improving the public health. It is our opinion that Bombay presents an almost unlimited field for constructive welfare work.

### THE BOMBAY PRESIDENCY WOMEN'S COUNCIL.

#### A.—Introductory.

A certain amount of welfare work is carried on in the city of Bombay: (1) by employers; (2) by other agencies.

1. Special welfare activities form part of welfare schemes carried on by (i) the Currimbhoy Ebrahim Workmen's Institute (which is working for the mill-hands of a group of seven mills. It has four centres of work); (ii) Messrs. Tata, Ltd.; (iii) E. D. Sassoon & Co., Ltd.

Welfare activities comprise of one or more of the following: (i) a creche; (ii) primary classes for women; (iii) co-operative credit societies; (iv) sewing and hand-work classes; (v) medical help; (vi) maternity benefits.

In addition to this welfare work, 10 to 12 creches have been started in other mills for the benefit of their women workers.

2. There are other voluntary agencies such as (i) Mahila Mandal (the women's branch of the social service league), and the Bombay Workmen's Institute, that are carrying on medical relief and educational work among the working-class women in Parel; (ii) the Y.W.C.A. is also working among the women at Naigaum; (iii) the Seva Mandir is another centre which is doing welfare work for the women in Tardeo.

#### B.—The Housing Problem in the District of Tardeo.

*Observations under Seva Mandir.*—Our knowledge of the housing conditions in the district of Tardeo is limited. Here we shall only state those facts which we have collected through the inhabitants or through our own observation of six or eight chawls (tenements), we come in contact with almost daily, due to our social service centre in that district. The dwelling places occupied by the wage-earning classes are of four types: (i) chawls owned by private individuals; (ii) chawls provided by the employers; (iii) chawls provided by the B.B. & C.I. Railway Company, with somewhat modern structure; (iv) tin sheds—the plots owned by the landlords.

Maneckjee Petit Mills which is in the district where we do our social work, provides 13 chawls with 400 rooms for their workers. The total number of workers at this mill is about 4,050. We are in touch with only one of these thirteen chawls provided by the employers.

There is no building provided by Government in our district, but there are four chawls provided by the B.B. & C.I. Railway Company, and the rest are owned by the private owners.

*Nature of Accommodation provided by the Employers.*—Through the studies of the chawls of the employers, we can say in general that the housing condition of these labourers is very unsatisfactory. One room is provided to each family which is not big enough for our joint family system. Also the members are allowed to sublet their rooms, to keep boarders even in the passages, on verandahs and also they build a shelf in the passage where people rest during the night. Very often one family has 14 to 15 boarders in such a small room. The mill authorities officially allows four to five members in one room, but this rule is not strictly observed.

*Chawls owned by Private Individuals.*—There seem a considerable contrast between chawls provided by the employers and private individuals. In the first case, the advantage is of the rent, which is practically half of that of the private owners. Also the rooms are better lighted and better ventilated because of the verandahs in the front. The employers' chawls also provide "Mori" (washing-place) in the room for the purpose of washing and bathing, which is a very great help to the women folk, especially at the time of sickness and delivery. Also a garbage can is provided to collect the rubbish, and we do not see open drainage in between two chawls. The above-mentioned facilities are not found in the chawls owned by private individuals. The private chawls are absolutely inadequate to meet the demand of the workers. The rooms are small, dark and stuffy. The greatest disadvantage is that they have no "Mories" (washing places), or no place even to throw water while cooking. We know of some cases where a temporary shed was put up in front of the room to wash a newly-born baby. Every kind of household washing is done in the front of the room, where the water collects. There are taps provided at the end of each story, but there is no facility in the room. There is more of sub-letting as they are free from restrictions regarding subletting, cleanliness and sanitation.

*Result on Health.*—The result of such housing on the health of the workers is detrimental. The over-crowding in the room, effects health and morals. There is no satisfactory arrangement as regards latrines, drainage, or cleanliness on the whole, either in the chawls provided by the employers or by the private landlords. There are still some latrines where there is no flush system. Also the complaints regarding bad drainage, broken pipes, etc., are not attended to by the people in charge. The Mukhadams or Bhaiyas who are supposed to look after the sanitation and see to the regular attendance of the sweepers are very slack in their duties. The result is that there is always a terrible smell in both these types of houses. The old fashioned latrines should be at once replaced by the new ones. During the monsoon, the water leaks from the roof in some cases. The ground being uneven, the water collects during the monsoon. This results in malaria and many other diseases.

*Nature of Accommodation in Tin Sheds.*—The tin sheds are occupied by the depressed classes. These are level with the streets, and are not high enough for a person to stand erect. These tins are fitted together by stones, etc., and men, children chickens and goats are herded together as one family. Each big shed is divided by cloth drapings into four or six rooms, occupied by four to six families. There is no light, or ventilation, and such huts are absolutely unsuited for any human habitation. These huts are in existence for the last so many years. There are no taps, no latrines, no water supply, and the habitants have to go a long way for their respective needs. They have no baths for days and days, and we see the children covered with dirt, playing in mud by the side of the goats and chickens. During the summer the tins are too hot in the afternoons so the inhabitants are found sitting on the roadside in the shade. Very little need be said in such circumstances regarding the result on health and morals. Just close to these huts, there are buffalo stables which has bad effect on the health of the people.

*Utilization by the Workers of the Housing Accommodation available.*—There are no Improvement Trust chawls in our district, but the chawls provided by the employers are gladly utilized and appreciated by the workers; but such chawls are very few in number.

*Rent Rates.*—There is a considerable difference in rents of the employers' chawls and those of the private owners. The employers charge about Rs. 3 to Rs. 3-8 annas per room while they vary from Rs. 5 to Rs. 8.

The system of the rent in these tin sheds is very complicated. A man who owns a piece of land has given a contract for a certain sum, to another man who lives in the neighbourhood. This man has again given a contract to the Bhaiya, who charges about Rs. 8 to Rs. 10 per shed to the inhabitants who sublet their rooms to others.

*Problem of Subletting.*—This problem is very difficult in labour classes. Often the men-folk come to Bombay from the villages and have no homes. They come and stay with their relatives and pay some money for board and lodging. The head man of the family who is directly paying the rent for the chawls provided by the employer, is not employed elsewhere, but many others in his family and the boarders, who take advantage of these chawls are not necessarily working at the same mill or factory.

*Effect on Morals.*—The present housing system leads to overcrowding and lack of privacy. The family life hence becomes very difficult, and all the activities of the home life are impeded. One great disadvantage is that many of the men-folk do not bring their wives and children to Bombay for want of room, and hence the men lead an immoral life. Often a man lives with another woman as his wife, and everything results in misery. Also when a mother is expecting a baby, she gives birth to a child in the same room where there are big grown up boys and girls. At night all men, women and children sleep together. Often a newly married couple get half of the room separated by a piece of cloth.

There are also common latrines for men and women which also has a bad result on morals.

*Improvement suggested.*—The workers should have at least two rooms with two windows and a little space in the front. There should be one "mori" in each room. Also the system of subletting should be entirely abolished. The flooring in the room should be of stone pavement and not of mud as it is at present. There should be separate latrines for men and women, and more than one tap on each floor. Garbage cans should not only be provided, but it should be seen that they are used. The supervision of the Mukhadams and Bhaiyas should be regular and strict. The municipality should take more interest, and better care of such existing huts, sheds, and chawls. The people in charge, e.g., Mukhadams, are very neglectful to the complaints of the workers. The sweepers should attend more regularly than they have been.

*Tin Sheds.*—It is impossible to improve upon the tin sheds in any way, and the only alternative suggestion that could be made is that the municipal authority should never allow such huts to be erected, and should see to it that the existing ones are demolished as early as possible.

*Conclusion.*—This is our general observation about the housing conditions in the locality of Tardeo, where we conduct our work under Seva-Mandir. Our institution has been in existence for the last three years only, but we have done our best to help and uplift the cause of the workers. We have often taken women to the hospitals for their confinements and other sicknesses, for the very reason of bad housing. We have given free medical help to many women and children at our clinic. To take away children from the bad housing conditions, we have organized play centres for boys and girls in the evenings. We also have given health talks in the chawls and at our centre to women. There is also a nursery school at our centre for the children, who will otherwise be in the streets. Many girls and boys are taken to the municipal schools by our workers. The grown-up girls and women come to us daily for educational and social purposes.

Thus we in our small way are trying to help the cause of the needy and the poor, yet such private social agencies can do very little, till the very homes of our people are not what they should be.

### C.—Naigaum Social Service Centre.

Naigaum is a mill area district, consisting of 42 chawls built by the Bombay Development Department and is situated in the north of the island about seven miles from the centre of Bombay.

This district is surrounded by few Kohinoor mill chawls, Spring mill chawls, seven tin sheds and one or two old chawls. There are four or five textile mills near this district and quite a number of mill hands who work in these mills will be found living in Naigaum chawls.

A social service centre is opened in one of the B.D.D. chawls, especially to do welfare work among women and children. The centre is not strictly restricted to people living in the Naigaum chawls, but is open to everyone living in other chawls round about or near in other districts. This type of industrial work is done educationally, medically and socially.

(i) *Education.*—Nursery school is started to help the children of those mothers who work the whole day long in the mills. But on account of the recent riots and strike, quite a number of families have left for their villages, and its difficult to find enough children of these mothers who are actually working in the mills, to keep the school open for the whole day during mill hours. But there is a school where children,

both of mothers who are working in the mills and of mothers who stay at home come, and a trained teacher is in charge of the school, which is open from 10 a.m., to 12 p.m., and from 1 p.m. to 4 p.m.

The average number of attendance is between 20 and 25. The number is limited to 30 because there is no room to hold more than 30 children. The children first learn cleanliness. The method of teaching is on kindergarten lines.

*School for Married Women and Young Girls.*—This school is open daily for two hours. Married women and young girls who have very little chance of keeping up their reading and writing, on account of household duties and various other difficulties in the family, are encouraged to attend the school. Some of them are quite beginners. Lot of house to house visiting is done to help the women to realize the importance of education.

Some of them are willing to come but their mothers-in-law don't permit them to step out of the doors. Some feel they are married and have children and its too late to begin to go to school, but in spite of all these difficulties and barriers in the way, the average attendance daily is between 15 and 18.

Individual attention is given to each woman and the teaching is done in a most friendly way to suit the time and satisfy the needs of the women and girls. A trained teacher is employed to teach these pupils. They are also given extra lessons on geography and current events twice a week.

These are the two different kinds of educational work done in the centre. The nursery school needs a creche attached to it. The bigger children are asked to look after the smaller ones while the mothers are away in the mills. Therefore the bigger children are not in a position to go to the nursery school. Unless a creche is provided, this will not be successful. This is not possible to do for want of money.

Even though Naigaum area is a compulsory school educational area, it is not possible to conduct regular schools on account of lack of teachers and social workers to go round, encourage the parent and collect children. There are other attractions which must be provided, as for instance, gramophones, musical instruments, etc.

(ii) *Medical.*—A medical clinic is opened twice a week under the guidance of a well-known lady doctor in Bombay. The women, at first did not realize the necessity of taking any medicine to cure themselves from any illness. House to house visiting is done and new patients are encouraged to take the advantage of the clinic. The average number is between 25 and 30. In case of serious illness and special attendance, they are taken personally to King Edward Memorial Hospital, Wadia Maternity Hospital and Cama Hospital.

It is essential to ~~as~~ provide wide in each area several aids in the direction of medical assistance. Special sanitary officers should be appointed to look after the chawls. In addition there is a need of highly trained medical officers for every large mill.

(iii) *Social.*—Visiting the families is done as often as possible in the chawls in order to get the first hand information of the life of families, their economic conditions and various other difficulties.

Unemployment is found to be one of their chief problems lately. Though there is no machinery for labour exchange in Naigaum, still by keeping in touch with various social welfare agencies, they are helped more or less in getting employment or advice, but it is not very successful to find jobs for all those who come to the centre seeking employment.

*Lantern Lectures* on health are given and slides are shown on mosquitoes, flies, tuberculosis, etc., to teach them the importance of good health and hygiene.

In *Domestic Science* classes, the women learn cooking and preparing children's food, washing babies, etc., by actual demonstration.

*Sewing Classes* are held once a week for these women who sew garments either for themselves or for their children. Some of the women can't hold the needle properly, but they are learning gradually.

*Four Evening Clubs for Girls and one Sewing Class for Children* are held three times a week. The chief aim is to build up their character, to teach them discipline and cleanliness. In their clubs they have drill, story telling, games, gardening, singing, etc. They also do some handwork and sewing.

Just lately a Blue Bird Company is started under a trained leader once a week. The boys requested to have a sewing class for themselves, and their request is granted by holding a class for them once a week.

Volunteer workers who are interested in this type of social work, render their services in helping with the various activities at the Naigaum centre in charge of two permanent social workers.

The Naigaum centre is open to all without any distinction of caste or creed. The work is growing and needs encouragement and support from various directions. If adequate attention is to be given to the needs of the people in the mill area, we need assistance from :—(a) The Government in the direction of special grants to social service agencies, allowance being made for a great deal of experiments ; (b) the municipality in increasing the number of sanitary officials and social workers ; (c) the millowners in constructing creches, school buildings and in making liberal grants to the social service agencies. For after all, we are taking care of the health of the workers and thus making them more efficient.

#### D.—Concluding Remarks.

Considering the fact that there are a little more than 30,000 women workers employed in the textile mills, in the city, the existing welfare work for women touches only a very small number, there are certain things which prevent the working class women to take full advantage of the existing facilities :—(1) General illiterary and ignorance ; (2) conservatism and social customs ; (3) want of time, over and above the 11 hour working day, they have to do the household work, early in the morning and late in the evening.

Some of the following things will help in improving the conditions of work for women :—(1) The working day must be shortened and made a normal 55 hour week, and 10 hour day. (2) Knowledge of elementary laws of health and public hygiene should be first given, through talks and magic lantern slides, posters, etc. (3) At the initial stage of welfare work when one has to figure against ignorance and social custom, the only effective method will be the personal method of work. For this reason millowners should be urged to employ a trained full-time woman welfare worker wherever there are a large number of women working in the mills or factory. (4) There is a great deal of scope for this type of work to be done by voluntary agencies. Wherever they exist they ought to be backed up by millowners whose work-people are benefited by the work. (5) There is already in existence a social training centre for women, carried on by a joint committee of four societies (The University Settlement, Y.W.C.A. and two Missionary Societies). This can very well be utilized in training such women welfare workers as are needed.

Bombay being such a large industrial centre, in our opinion the millowners should be doing more social and welfare work for their employees than at present.

#### E.—Maternity Benefits.

Maternity benefits have become a law since July last, and hence in force since the last three months. But we strongly recommend to make it applicable to the whole of British India instead of only to the Bombay Presidency. Also the Government should be requested to see that the provisions of the Bill are strictly carried out by the parties concerned.

#### F.—Employment of Women in Mines.

Under the Indian Mines Act (1922–1923) the Government of India have the power to prohibit the employment of women in mines (underground). We recommend strict abolition of this pernicious system of employing women underground, as it tends to the physical and mental deterioration, and to a large extent, to the moral ruin of women workers. Women are employed in mines because they receive less wages than men.

#### G.—Factory Inspection.

A speedy increase in the inspectorial staff in the factories is urgent. We recommend that at least one factory inspectress be employed in each large industrial area.

*Adult Education.*—Adult education is a paramount national necessity. Proper provision should be made for the education and recreation of the workers, both inside and outside the mills in each industrial area. Besides education in the three R's, there should be education to the eye, e.g., cinema and magic lantern shows on hygiene, sanitation, improved methods of doing their work in factories, and evils of drinking, gambling, etc.

We also recommend that the law with regard to child labour should be safeguarded, so as to protect their future health and well-being. Indian workmen should receive better treatment than they receive now, e.g., decent living wages, better housing, etc.

Mr. TAROKNATH K. RAY-CHOWDHURY, MEMBER, INDIAN STATES PEOPLES' CONFERENCE, BOMBAY.

I tender my evidence from my several years' personal experience of Indian States. I was an official in Marwar State and an assistant engineer, P.W.D. employing a large labour force in Mewar State, both in Rajputana.

I was recently an officer in the Agriculture Department of Gwalior State, C.I., in which capacity one of my duties was to tour in British India for indirectly studying labour conditions and attracting men who have small or no lands, and such ex-agriculturists who are working in factories as well as unemployed men and ex-emigrants from the colonies to take up lands in the Gwalior State, where out of 62 per cent. of culturable lands only 32 per cent. is cultivated. I have travelled in this connection in many cities and towns of the Presidencies of Bombay and Bengal and the Province of the Punjab. I have also travelled privately in Rajputana, the United Provinces and Central Provinces. My mission had a good connection with labour in British India as compared with that in an Indian State. I can speak authoritatively on the effect of labour in British India in reference to labour conditions of Rajputana and Central India and on the subjects of origin of labour, administration and intelligence from the schedules issued by you. I do not tender my evidence from or on behalf of any Indian State or its people.

1. *Origin of Labour.*—Of the total population of 318,942,480 of India according to the census of 1921, 247,003,293 belong to the British Provinces and 71,223,218 to Indian States, i.e., nearly one-fourth of the total population of India is contributed by Indian States. Seventy-three per cent. of the population of India is agricultural; the industries having 10 per cent.; trade, 6 per cent.; transport, 2 per cent.; and organized labour, 1 per cent.

This one-fourth population of Indian States has its proportionate effect on the rest of the three-fourths of the population of India in respect of the origin of labour in India as a whole. Before the advent of British rule in India, India was mainly an agricultural country, and though there were industries like manual spinning of silk and cotton, etc., there were no factories and organized industries and labour as are growing to-day. The labour required for these organized industries has its major source in the agricultural population of India. Though the population of India has very slightly increased, yet taking into consideration epidemics, famines and emigration and the enlistment in the army and various services which absorb the increase, I can safely say that the major source of labour for organized industries is the peasantry of India. I also arrive at this conclusion from the steady falling down of villages in Indian States and rapid growth of industrial centres. In the State of Gwalior, of which I have personal experience, I have calculated that the areas of cultivated and culturable lands are decreasing for the past years at the rate of nearly 2 per cent. In the absence of statistics, I could not tell you the percentage of decrease in village population of Indian States, but from the stream of migration from these villages to industrial towns in search of employment, which I have personally seen, I am definitely of opinion that a proportion of labour of industrial centres is derived from the agricultural villages of Indian States. In the State of Gwalior a large number of villages have become entirely uninhabited and desolate. In the State, the density of population in 1911 was 124, in 1921 it had fallen down to 121. The forthcoming census would perhaps reveal a further fall.

Men from the Gwalior State have been recorded in the census report of 1921 to be going to the Assam plantations.

When I was in Savantwadi State, in the Bombay Presidency last year, I found thousands of people returning to their villages in that State for a recess during the strike. The main cause of migration in the State and Kolhapur, where I have enquired personally, is the scarcity of cultivable land and increased land revenue.

— (ii) *Causes of particular Streams of Migration.*—Some of the causes of this particular migration from the Indian States of Rajputana and Central India to British India are: (1) The increased assessment of land revenue; (2) neglect of improvement in agricultural methods by the State administrations; (3) neglect of improvement of agriculture in States by irrigation and co-operation as compared with British India; (4) the scientific agriculture and aid of co-operative societies to agriculturists in British India, who produce more at less cost and less labour than States peasants and thus under-sell their produce; (5) the consequent poverty of States peasants; (6) the earning of fixed wages at factories, railways, plantations, etc., in British India; and (7) the better government, liberty, organization, better wages, scope for improvement and amenities of life in British India, which are not available in Indian States.

137. *Effect of Difference in Law in Indian States and British India.*—No labour legislation in India would be useful for India as a whole and for the world in general if all the states are not made to enforce the broad international principles of the same. The difference between labour laws of Indian States and British India would produce discontent and there would be unhealthy competition and constant movement of labour from the one to the other. Factories established in Indian States with sweated labour at starvation wages working for 22 hours a day, would ruin factories in British India working for a restricted day. Indian States would then continue to be a menace to economic factory production in British India and to international civilization. When Britain is trying through the League of Nations for the notification of International Labour Conventions in foreign countries, they should at least get them notified in their own Indian States. A natural India cannot be divided into two artificial Indias—one to be civilized and progressive and the other uncivilized and backward. Whatever progress is made for the amelioration of labour conditions in India, the same would be incomplete, if Indian States with their one-fourth of the population of India, are not allowed as equal partners. Little improvement can be done to labour in Indian States if the States do not progress with their political administrations in uniformity with British India. The Indian States are in subordinate co-operation to British India only when the sovereign power deems the same to be to its advantage. Whatever progress British India has done is due to British civilization and the British could have done the same for the progress of civilization in Indian States if they had not neglected their duty to 71,000,000 of their subjects. Two years back the Rt. Hon. Sir V. S. Shastri said in a speech in South Africa that the cause of India's slow progress is the Indian States. These 71,000,000 of suppressed people of India are like a heavy stone chained to the leg of British India. So long as the labour administrations of British India and Indian States are not of the same type, India cannot progress and she will grow to be a constant menace to world civilization, which is bound to react on Great Britain. the Empire and the world.

My remarks, though general, do not apply to progressive states like which are exceptional.

The Indian States have pledged themselves to co-operate in Imperial. Modern labour problems are not only imperial but international. The state be glad to co-operate with the suzerain power in this matter only if the invites them sincerely to co-ordinate.

## THE SHOLAPUR BRANCH OF THE BOMBAY TEXTILE LABOUR UNION

### II.—Staff Organisation.

11, 12 and 13. We believe no system is being observed by the management in training and promoting workmen to higher posts. Invariably claims of workers who have put in long services and know of the departmental work more than any new recruit, have been set aside only because he happens to be not in the favour of the superiors. Favouritism is the only qualification that is required for a workman for promotion and even the management do not care to see how far the claims of workers of long standing have been superseded. Blacklegs are sure to be appointed to higher posts. In making appointment to superior posts, no heed is paid to the capacity of the workers themselves. It is a great misfortune that the millowners are dependent upon the so-called efficient blacklegs, who proved useful at the time of strikes without looking to their efficiency.

### III.—Housing.

16. All the mills provide housing for their employees and nearly 12 per cent. of them take advantage of it. Government has not done anything in this direction and the remaining number of the operatives, nearly 80 per cent. have been accommodated at the housings provided for by private landlords and the housing conditions of those are certainly not fair.

17. Though there are many possibilities to acquire suitable land for the use of workers, efforts have not been made so far in this direction either by the local Government or local bodies. Sholapur is not a congested place like Bombay and Ahmedabad and the housing conditions of the workers can very well be improved if the municipality takes it into its consideration, with the help of the Government.

137. *Effect of Difference in Law in Indian States and British India.*—No labour legislation in India would be useful for India as a whole and for the world in general if all the states are not made to enforce the broad international principles of the same. The difference between labour laws of Indian States and British India would produce discontent and there would be unhealthy competition and constant movement of labour from the one to the other. Factories established in Indian States with sweated labour at starvation wages working for 22 hours a day, would ruin factories in British India working for a restricted day. Indian States would then continue to be a menace to economic factory production in British India and to international civilization. When Britain is trying through the League of Nations for the notification of International Labour Conventions in foreign countries, they should at least get them notified in their own Indian States. A natural India cannot be divided into two artificial Indias—one to be civilized and progressive and the other uncivilized and backward. Whatever progress is made for the amelioration of labour conditions in India, the same would be incomplete, if Indian States with their one-fourth of the population of India, are not allowed as equal partners. Little improvement can be done to labour in Indian States if the States do not progress with their political administrations in uniformity with British India. The Indian States are in subordinate co-operation to British India only when the sovereign power deems the same to be to its advantage. Whatever progress British India has done is due to British civilization and the British could have done the same for the progress of civilization in Indian States if they had not neglected their duty to 71,000,000 of their subjects. Two years back the Rt. Hon. Sir V. S. Shastri said in a speech in South Africa that the cause of India's slow progress is the Indian States. These 71,000,000 of suppressed people of India are like a heavy stone chained to the leg of British India. So long as the labour administrations of British India and Indian States are not of the same type, India cannot progress and she will grow to be a constant menace to world civilization, which is bound to react on Great Britain, the Empire and the world.

My remarks, though general, do not apply to progressive states like Mysore, which are exceptional.

The Indian States have pledged themselves to co-operate in Imperial matters. Modern labour problems are not only imperial but international. The states would be glad to co-operate with the suzerain power in this matter only if that power invites them sincerely to co-ordinate.

## THE SHOLAPUR BRANCH OF THE BOMBAY TEXTILE LABOUR UNION.

### II.—Staff Organization.

11, 12 and 13. We believe no system is being observed by the management in training and promoting workmen to higher posts. Invariably claims of workers who have put in long services and know of the departmental work more than any new recruit, have been set aside only because he happens to be not in the favour of the superiors. Favouritism is the only qualification that is required for a workman for promotion and even the management do not care to see how far the claims of workers of long standing have been superseded. Blacklegs are sure to be appointed to higher posts. In making appointment to superior posts, no heed is paid to the capacity of the workers themselves. It is a great misfortune that the millowners are dependent upon the so-called efficient blacklegs, who proved useful at the time of strikes without looking to their efficiency.

### III.—Housing.

16. All the mills provide housing for their employees and nearly 12 per cent. of them take advantage of it. Government has not done anything in this direction and the remaining number of the operatives, nearly 80 per cent. have been accommodated at the housings provided for by private landlords and the housing conditions of those are certainly not fair.

17. Though there are many possibilities to acquire suitable land for the use of workers, efforts have not been made so far in this direction either by the local Government or local bodies. Sholapur is not a congested place like Bombay and Ahmedabad and the housing conditions of the workers can very well be improved if the municipality takes it into its consideration, with the help of the Government.

18, 19 and 20. Overcrowding in rooms provided for by employers is not uncommon. The rates of the rents in other parts of the town are high and the employers' chawls are more convenient to the workers in respect of low rates and the possibility of attending the mills punctually.

#### IV.—Health.

23. (iii) In some of the mills the supervisors and head-jobbers are so much after exacting work from the employees, that not even a minute's leisure is allowed to them, or if the worker absents himself for unavoidable cause, he is suspended or dismissed; even no time is allowed at times for drinking water or at the nature's call. As regards medical facilities for women no provisions have been made and the one that has been made by the employers by opening dispensaries in the mill premises, are not taken advantage of by women.

26. At work places much scarcity of water is felt. It was one of the grievances of the workers in the last strike, that there were not sufficient water taps, that is, not more than 12 in one mill. It is after the strike that the management made extra provision and the number of taps was increased. The accumulated effect of the scarcity of water and the exaction of work, was, that the workers on many occasions had to go out of the mill premises to take their food where they can get sufficient water. In many cases, too, they had to finish up their meals without having a drop of water to drink. Where there is so much clamour in mill premises, what provision the mills must have done for bathing and washing and to what extent they must have been used by the workers can only be imagined. So far as the question of water supply is concerned, we must say that the Sholapur labour is the most unfortunate in the Bombay Presidency. Sholapur is known for its scarcity of water and the hours for getting it are limited to five in the morning and three in the evening. At home places in nearly 80 per cent. of the cases the water supply is found insufficient for factory workers. We have met with instances in the employers' chawls where the woman has had to be satisfied with only two buckets of water and that too after waiting for two hours. It is a daily scene that female workers wait near the water taps for hours together, in hundreds, and get with great difficulty a little quantity of it.

#### VIII.—Workmen's Compensation.

51. So far, we have never come across a case in which the employers were found unable to pay compensation to the workers. But it is desirable that provision be made against possible loss to the workmen by means of compulsory insurance. The Government of India have circulated letters on this question and such influential bodies as the Chamber of Commerce have given their qualified consent to the proposal. When some millowners have actually insured their concerns against possible claims, as they think it desirable, there is no harm to make it compulsory to avoid delay in payment and to ensure safety to the workers.

53. Here again the Act requires some important changes and scales require to be enhanced. We meet with instances where a workmen under a temporary disablement used to get Rs. 2½ as half-monthly compensation. The Government of India, too, seems to be of this opinion that in the cases of more poorly paid workmen, scales of compensation should be raised. In the case of temporary incapacities, whether partial or total, the recommendations of the International Conference should be brought into effect and the rates of compensation should be increased.

#### XII.—Wages.

96 and 97. The wages of Sholapur Textile workers are the lowest possible. For the present we are in possession of only two reports on an enquiry into the wages and hours of labour in the cotton mill industry in Bombay Presidency. One held in 1921, and the other in 1923. Report for 1926, is not yet ready and therefore for the subsequent changes in the wages of operatives we have no authoritative information. However, we have here relied mainly on the report of 1923 and from our experience we are sure that since 1923, there are no increases in the wages of the operatives. As regards cost of living, from the report of the Administration of Bombay for 1927-28, it can be seen that since 1923, there was a slight rise, but in 1927 it has come to the same points as in 1923. As for wages, whether of ordinary labour, in rural or urban areas, there are no increases since 1923-24, but decreases to 4 or 5 points. From the experience of the present rates of wages and from the published reports we are sure that the Sholapur workers are the most poorly paid by the most profit making concerns in the whole of India. Operatives

are employed on piece and time work systems. Those in the spinning department, mainly male workers, are time workers; female operatives are mostly employed in reeling and winding departments on piece-work system. The average daily earnings of men, women, big lads and all work people in 1923 report are shown as Re. 1; 6 annas 4 pies; 9 annas 1 pie; 12 annas 9 pies respectively. 98.4 per cent. of women operatives earn from 4 annas to 9 annas a day in any case. From the report of the enquiry into family budgets of Sholapur City, out of 290 women in cotton mill workers, 131 have been shown as earning from Rs. 6 to Rs. 9, and 139 have been shown as earning from Rs. 9 to Rs. 12. We are quoting figures as they appear in reports published by labour office. The defect of the enquiry is that "separate earnings of every individual are not known," that is, we are not in a position to say what a particular individual earned after deductions for fines, forfeiture, or when there was no work given, etc. Wages quoted above are average wages, but in the piece-work system we have instances to show that some pieceworkers, after having put in an average month's attendance, did not even get Rs. 1 or 2. There may not be many examples of such nature, but, taking into consideration the lowest level of wages, it can only be imagined what hardships labour have had to suffer when they are to lose in fines or some such deductions. We have quoted some figures for 1923, but since then changes have taken place in the earnings of the operatives, not for the better but for the worse. The average earnings of operatives in 1921 and 1923 are shown as follows:—

	1921			1923		
	Rs.	a.	p.	Rs.	a.	p.
Men .. .. .	25	13	9	22	3	10
Women .. .. .	10	15	9	8	9	7
Big lads and children'.. .. .	14	2	0	12	7	11
All work people .. .. .	20	9	4	17	10	6

It will be seen from this table that systematic reduction in wages was made since 1921 to 1923 that is, in the boom period of the mills. The wages of 1921 were raised after the general strike of 1920. Average full-time workers' monthly earnings were Rs. 27 for men, Rs. 12 11 annas for women, Rs. 15 5 3 pies for big lads, and Rs. 21 8 annas 3 pies for all work people. With regard to male operatives the wages of those are also considerably low; men winders were shown to get 9 annas 8 pies per day at Sholapur; the male operatives in spinning departments also got no more than Rs. 16 to Rs. 18 a month. In 1923, table spinners in this department are shown to get 11 annas 1 pie for piecers and 8 annas 2 pies for tarwallas or followers. In this connection comparative tables for Bombay and Ahmedabad will be of great interest. From the study of the tables for 1923 and 1921, it can be seen that no woman gets more than Rs. 8 to Rs. 10 a month, and no male operative more than Rs. 18 to Rs. 20 a month. The disparity in the wages of the male and female workers is nowhere, in other industrial parts, so great as in Sholapur. Figures for 1926 are not available, but those that were provisionally supplied by the labour office to the Fawcett Committee published on page 125 of that report, show that wages of 1923 nearly correspond to wages of 1926. There are no increases in the wages but there must have been decreases. The percentage increase in the wages of weavers to that of spinners comes to 141, that is not the case in other industrial centres such as Ahmedabad and Bombay. Women in Ahmedabad get nearly 50 per cent. more than women at Sholapur. The disparity in the wages of male and female operatives in Sholapur is very great.

As regards movements in wages with regard to cost of living, no information is available to show the relation of wages to the cost of living in recent years. The labour office have tried in 1921 to apply the cost of living index for Bombay to other centres, but they knew their mistake, and in their report for 1923 the officiating director stated that he was not satisfied that the index numbers for Bombay would at all approximate to the other centres. Even in the United States of America the index numbers for different cities vary from 153 to 183 points. Even in official reports such as the *Labour Gazette* no information is available about Sholapur, except retail prices for food articles; even wholesale prices are not given just as for Karachi or Bombay. It will be seen therefore, that there are no statistics to show the relative value of the cost of living of Sholapur to other centres. Even the labour offices had intended to overhaul their system of arriving at the correct cost of living index. As regards the reports of the wages and hours of work that are published by the labour office, we have to suggest that complete information ought to be supplied with separate earnings and the information must not be given on voluntary lines, but it should be made compulsory by enacting a law on the basis of "Statistics Act" prevalent in Dominions and other countries for compulsory collection of statistics.

Sholapur mills are the most profit making cotton mill industries in the whole of India. One mill has made more than 3 crores on a paid-up capital of Rs. 8,00,000 and the share prices are quoted at such a high rate as 4 to 5 times their original value. The other mills also, such as Vishnu and Laxmi, are one of the most "liquid" concerns and their quoted prices also run as far as 5 to 6 times their original value. The profits of the companies are, compared with other mills of the Presidency, most exorbitant. Comparison with Ahmedabad or Bombay, will show that the profits earned by Sholapur mills are greater than what other mills had earned. It is stated that, in Ahmedabad, 48 mills in 1925 made Rs. 50,00,000, 56 mills 2,00,000 in 1926; and 51 mills 4,900,000 in 1927; while in Bombay in 1925, 79 mills are shown as having sustained losses amounting to Rs. 133,00,000; in 1916, 76 mills sustained losses amounting to Rs. 50,00,000, and in 1927, 75 mills have earned profits amounting to Rs. 95,00,000. But in Sholapur it will be found that 4 mills have earned Rs. 35,62,000 in 1925; 25,98,000 in 1926; and 26,61,000 in 1927. These figures are given approximately. We give below a table showing the net profits of mills in Sholapur from 1920 to 1927. These 4 mills absorb nearly 17,000 to 18,000 workers. Only 1 mill, that is Jam, engaging 1,400 to 1,600 hands has been omitted from this table.

Year	Profit in rupees.
1920 .. ..	1,12,09,063.
1921 .. ..	1,51,90,685.
1922 .. ..	1,27,36,231.
1923 .. ..	75,76,815.
1924 .. ..	45,35,812.
1925 .. ..	35,62,370.
1926 .. ..	25,98,996.
1927 .. ..	26,61,511.

The figures of these profits, whether in the boom period or at any other time, will show comparatively the best financial position of the mills compared with others in the Presidency. The lowest scales of wages shown above will speak for themselves.

105. One of the most intricate of the subjects in point of administration is the fixing of minimum wage in industries. The Government of India in reply to the questionnaire issued by the International Labour Office have practically dissented from applying the minimum wage machinery in India. This subject is beset with innumerable difficulties. But it should be remembered that the principle has been applied in Canada, France, Norway, Austria, Rumania, Uruguay, South Africa. The laws in force in those countries vary according to conditions. But the principle has been applied. Secondly, the principle that where workers cannot conclude effective agreements with the employers, the minimum wage principle ought to be applied. For instance, in Sholapur there are more than 2,000 to 3,000 persons engaged in hand-loom industry. They have no organization. Factory Act is not applied to them. Where wages are exceptionally low and the workers disorganized this principle ought to be applied without delay.

106. Sholapur will be undoubtedly ahead of all the industrial centres in respect of fines. Sholapur is well known for its double "Khada" system. For one day's absence two day's absence is marked. Here too, there are 2 systems. One is that the operative even if he turns up for work the other day, is not allowed to work; and the second system which is more harmful is, that the operative works at his tools but forfeits the wages earned on that day. But this is not all. We have met with instances where the workers lose more than they can actually earn for 2 days, for 1 day's absence. Suppose a time-working spinner absented for 1 day without leave. Then he is marked "double Khada". His fixed wages amount to 12 annas per day. According to the ordinary system he is to lose Re. 1 8 annas for 2 days. but in many cases the workers have lost at the rate of Re. 1 or Re. 1 4 annas when he is actually getting 12 annas or less than a rupee per day. This is simply illegal. Apart from these there are suspensions and dismissals. They are left at the discretion of the superior officers. For damaged cloth, for alleged insubordination, or some such other misconduct the superior suspends him for 4 or 5 days. The point in suspending the workman for more than 4 days, is that he, in consequence of his absence, loses his Jwari and Dal concessions. In Sholapur, the workers are given Jwari and Dal for Rs. 2 8 annas, the market price of which comes to Rs. 3 8 annas or Rs. 4. For bad or negligent work dismissals follow. There are no limits with regard to the extent to which fines were inflicted. In some cases the authorities act like criminal courts. An instance in point may be cited. A worker was alleged to have taken away a turban of another workman. The manager of the mill inflicted a fine of Rs. 10,

on the person who was alleged to have committed the theft. The thing stolen was not the mill's property. The manager had no right to inflict such fine at all. It was a criminal case and ought to have been decided by the court and not by the manager. Had the property belonged to the mill there would have been some ground for such deduction. In some cases the authority resting in the manager is simply arbitrary and illegal. The fines thus inflicted are certainly not corrective, but if they are compensatory to a certain extent, they are certainly morally and legally indefensible. In this connection also in 1925, the Government of India addressed letters to the provincial governments and asked for their opinions, whether any action could be taken to effect the wrongs.

107. Workers here are paid their wages in the 3rd week of the 2nd month, and this operates as a calamity to them. He should be paid in the 1st week of the next month at the latest.

As regards unclaimed wages, it is a common practice in Sholapur that they are forfeited, even if the worker attends the mill on pay-day. At times he is not given his wages and is asked to claim them as unclaimed wages in future. For irregular attendance, wages of the operatives are suspended and they are marked as unclaimed wages. Unclaimed wages which are not claimed within a period of six months are forfeited by the rules of the company. With regard to fines, etc., we believe that some action ought to be taken and statutory provision ought to be made on lines of English Truck Act. Even the Fawcett Committee have suggested remedies to the effect that unclaimed wages should be paid to the operative when claimed by him, if he is sufficiently identified, and have approved of Bombay mills rules to the effect that the amount of fine should not exceed in any case 2 per cent. of the operative's earnings. We fully endorse the views expressed by the committee so far as it only relates to unclaimed wages and scales of fines.

#### XIV.—Trade Combinations.

120. Only recently a labour union has been formed at Sholapur on the 5th May, 1928. It is a branch of the Bombay Textile Union. (In the month of March, 1928, owing to the low rate of wages, a strike in the old mill took place and the workers approached some local men. At the time it was thought desirable to ask Mr. N. M. Joshi to come over here and start a labour union under his guidance. Accordingly a branch of the Bombay Textile Labour Union was formed.) Since then the union has been working. The main grievances of the workers for the mill strike were low wages, and bad treatment at the hands of the management. (The executive of the union is solely in the hands of the workers and they manage all the activities of the union. There are no outsiders except one as secretary for the present. The workers understand the importance of the organization but the attitude of the mill owners towards the union movement, and especially their campaign of victimization against those who even remotely stand in better relations with the union, has greatly come in our way. At the time of the strike some 8,000 to 10,000 persons had the courage to join the union and to fill in the regular forms, but failure in the strike brought in its turn such a set back to their enthusiasm that not many workers from the mills, where strike ended in favour of employers, have the courage to join the union now. About the attitude of the employers towards the union it is of a purely antagonistic character. So much high-handedness prevails in their attitude while dealing with union questions or grievances that they are blind to their responsibilities as employers, utterly ignorant of their duties towards their employees and even are foreign to social etiquette too. We may cite one instance in point.

*How Mr. N. M. Joshi was Insulted.*—After a normal resumption of work in old mill all the other mills followed suit and the strike continued for some days. The President of the union, Mr. N. M. Joshi, personally came down to Sholapur in order to study the situation, saw the officers of the mills and decided to call off the strike at once. On one occasion when he, along with another respectable gentleman in the city and the local labour leaders, proceeded to see the manager of one mill, the Parsee gentleman asked Mr. Joshi to apologise first for the alleged strong wording of one of the labour leaders without knowing what Mr. Joshi came for, or what he had to say. After a few exchanges of words the gentleman plainly asked Mr. Joshi to walk away. He ought to know that even a king cannot ask others to apologise without giving reasons. We would never have referred to this personal incident had it not been a sure index to show the extent of employers' irresponsibility; but this is not all. His, we may say, was a rustic part, but look at the enlightened side of the attitude. Mr. Joshi thereupon personally interviewed all the managers of the mills and finding that the strike situation would not improve for the better in the interest of the workers, called off the strike on the 10th October, 1928. The very second day workers went to their respective mills to resume their duties, but to the surprise of

all, one and all were refused admission by the four mill managers concerned. Reasons were not assigned for the refusal to admission, but it was reported to us that the managers took objection to some of the remarks of Mr. Joshi, in which he had stated that in order to get strength, we have to accept failures, at times.

121. Sholapur labour have had to tell a long tale about the defects of the Trade Union Act as well as the attitude of the mill-owners towards the labour movement. According to the present Act only registered trade unions are exempt from civil and criminal liabilities. We do not know why this restriction has been imposed upon the free combinations of workers. Question of registration is, we understand, immaterial in other countries and the same liberty ought to be given to the workers in India also. It might be argued that there are no difficulties in getting the unions registered, and it can very easily be done. Yes, to a certain extent it is so. But so long as any combination of workers is carrying activities, without criminal intentions of doing wrong to owner's business, why should that body of persons be under an obligation to have itself registered? Well, further, even if a union is registered what guarantee is there that the registered body will not indulge in activities purely on destructive lines? The whole problem comes to this that if the workers are to be given free rights of combination they must not be under any sort of imposition whatsoever, and must be exempt from civil wrongs which are ordinarily actionable. The principle of the law is that no cause of action lies when a body of persons in the interest of their accomplices only ask them to break their contract. The actual breaking of contract is actionable under the present Act, too. So, when the workers are privileged to work in combinations and to enjoy the rights of civil and criminal exemptions how does it stand to reason that only those unions that are registered are privileged? The principle has been acknowledged that even in ordinary law a doctor or physician is not made liable for civil wrongs who asks his patient in his interest to break the contract with the employer if the doctor finds that by continuing in his contract he is sure to mar his health; so also is the case with a relative who asks his dependent or near relative to break his contract. Moreover, it is not possible under every circumstance to have the combinations registered when they are of temporary nature. If no rights are given to unregistered trade unions the present Indian Trade Union Act is nothing short of an amendment to the Indian Registration Act, and not a declaration of inherent rights of the workers.

*Civil Suits.*—We have dealt with the general principle of the Act above. Coming to a specific instance of the mill-owners' attitude towards the trade union movement and how they take protection under the non-registration of unions, we narrate below the history of the civil suits filed against the Sholapur labour union officials. The case is still before the court, and the issues on which it is being fought are altogether different. Our contention is that the Sholapur union is the branch of the Bombay Textile Labour Union which is registered, and therefore no action lies. Plaintiff's contention is that it is not registered and hence the suit. The matter is sub-judice.

Even though we are barred from entering into the merits of the case extensively, we take the opportunity of presenting the only aspect prominently brought forth only so far as it reflects upon the attitude of the mill-owners' towards the trade union movement. Four mills have joined as plaintiffs, claiming Rs. 25,000 as damages, they have sustained owing to our activities, picketing, etc., as they have put it in their plaint. In their plaint they have stated that they have sustained incalculable damages but as the defendants are not men of means they have brought down the figure to Rs. 25,000. We have mentioned this incident only to show the nature of the suit. Is it a suit of civil nature or a suit of vexatious nature? If they have sustained losses amounting to lakhs, why should they not proceed to recover all? If they cannot recover a substantial sum, why should they be satisfied with only a nominal sum of Rs. 25,000? From the very nature of the suit, it is manifest that the suit is for harassment and for nothing else. Further, to recover that sum they have engaged a legal acumen of the highest standing in the Bombay Presidency, we mean the Hon Mr. D. F. Mulla. We do not know to what extent the plaintiffs have incurred the expenses. The whole thing comes to this, that the Plaintiffs are fighting for something different from the recovery of any sum. It is very clear from their past attitude towards the union that any how or other they want to kill this movement and make it impossible for a man of means to take interest in the labour work. And the defective nature of the Trade Union Act has given them ample opportunities to do so. It is said often in politics that the extremists of to-day become the moderates of tomorrow; but in Trade Union activities moderates of to-day are sure to become the extremists of tomorrow, if the mill-owners' attitude is not changed.

#### XV.—Industrial Disputes.

123. The latest dispute occurred in the month of April, 1928. It affected only one mill. Low wages, the treatment at the hands of the management, the arbitrary rules of the mill, were the main grievances of the workers. Some workers were found

not to get more than a rupee or two in a month on account of the systematic cut made by the management in the wages of the operatives. The strike in the old mill ended in a partial compromise between the labour leaders and the management. In the months of June and July the other four mills went on strike; in the meanwhile the union had been formed and the grievances of the workers were intimated to the management by a notice. No consideration was given to the demands of the workers, and they had to go on strike. In those two mills, Vishnoo and Laxmi, the treatment meted out to the workers was simply inhuman. One of those mills went on strike on account of severe beating to a worker at the hands of one of the superiors of the staff. This dispute lasted to the end of September and the beginning of October. The strike was called off by Mr. N. M. Joshi on the 10th of October, 1928. The union officials tried their best to settle the disputes but the owners being adamant no compromise could be arrived at. The dispute ended in favour of the employers. During the continuance of the strike the employers did their level best to subjugate the workers and even the police authorities were at the back of the mill-owners. Workers living in employers' chawls were asked to vacate the rooms. In some cases the roofs of houses were forcibly removed. In some cases water supply was prohibited to the strikers by the mill-owners in the chawls. The manager of the Vishnoo mill delegated all his powers over the chawls to a Mahommadan contractor who took a prominent part in breaking the strike. The Government also took no small part in the struggle. Picketing was resorted to from the 24th of August, 1928, and on the fourth day the picketers were prosecuted by the police under Section 61 (Q) of the District Police Act. Some ten picketers standing by the road side could not have obstructed the traffic. It was nothing but a part played by the police in helping the mill-owners in their fight to annihilate the labour movement. We know that the police order to withdraw picketers was disobeyed by the picketers and their labour leaders; but the order itself seemed to us quite unwarranted and hence illegal, as it certainly cannot be said that a few volunteers standing by the road side could have obstructed the traffic so as to justify the police order. The police were in search of an excuse. They wanted, they found, and they used. Attitude of the police towards the movement, we are constrained to say, was not of an impartial character, and even one of the superiors of the police had to suffer for his silly words. After the prosecution of the volunteers by the police the learned magistrate convicted them to pay a fine of from 20 to 30 rupees. There still remained the union officials. The president and secretaries of the union were convicted under Sections 447 and 341 of the Indian Penal Code respectively. Thus ended the picketing, thus ended the strike, and thus were the labourers placed in their position worse than in what they were before. In the second strike in which a European firm was involved, police seemed to have taken a prominent part on behalf of the mill-owners. Black legs were being brought under police protection to the mills. During the period of three to four months of the strike not a single incident of threat, violence or breach of peace had occurred. Workers were intimidated by the agents of the employers. If Government's attitude towards the industrial disputes is to be judged from acts of the police it seems to us to be partial towards the management, especially in the second strike. The Government assumed the part of a third party. In the first strike when we approached the Government for settlement the district collector informed us, that unless both parties agree, Government will take no action. In industrial disputes it is easy and convenient for Government to take no interest unless called for by necessity of maintaining law and order, but it should at the same time be remembered that strict neutrality and silent impartiality are both dangerous to that class of workers who are not sufficiently organized to fight their own cause and who have been perpetually exploited by the capitalists. This frame of mind on the part of the Government is the more provoking when they are in a position to know the real and legitimate grievances of the workers.

### The Bombay Y.M.C.A.

*Backwardness of Indian Industry.*—In the consideration of questions affecting labour in India it must not be overlooked that there are present in Indian industry many incidental undesirable features of the West. We note a tendency to compare conditions here with those prevailing in other countries. As a member of the League of Nations, India will no doubt, both give and receive much through the International Labour Conference, and action taken for labour in western countries will ultimately affect and largely benefit labour in India, e.g., "As India was a member of the League of Nations and had participated in the International Labour Conference in 1919 she was called upon to ratify the conventions and recommendations passed at

that Conference. In view of the stage of industrial progress reached, and her peculiar position as a tropical country, the case of India received special consideration. She was however asked to introduce a 60-hour week in factories and mines, to prohibit the employment of women at night; to raise the minimum age of employment to 12 and to enquire into the possibility of granting maternity benefits to women industrial workers.\* All of which has now received attention.

*Disproportion of Sexes.*—The League of Nations recognizes India's backward industrial position, but it needs to be more generally recognized that industrialism is in its infancy in India. The proportion of factory workers and their dependants to the rest of the population is little more than 1 per cent. Out of Bombay's population of over a million, less than 200,000 were actually born in the city itself. (*Vide* Census Report, 1921, Vol. IX). In Bombay the majority of the workers have their roots in the village. The labourer by heredity, training and instinct is a villager. He comes to the factory and remains no longer than he can help. For this reason he does not as a rule bring his family to the city to make a home near his work. This in part, explains the proportion between the sexes in Bombay as 66 to 34. (The estimated population in the middle of 1927 was males 849,322, females 449,386, *vide* Administration Report of the Municipal Commissioner for the city of Bombay). If we note the proportion between men and women coming from adjacent districts, e.g., Ratnagiri, it is about 67 to 33, while in the case of those from the more distant Provinces like the U.P. it is 89 to 11, while from Madras it is as 79 to 21. We are bound to have unsatisfactory conditions in the mill area so long as a minute percentage of the Factory labourers have their families with them in Bombay. We regard this as a question of first-class importance, the solution is extremely difficult. We are aware of the main causes of the existing situation in social customs, housing, lack of education, and recreational facilities, wages, etc., but what steps can be taken to remedy matters can, we believe, be determined only after much fuller study of the problem than has yet been made. We suggest that steps be taken to have such a study made. We are aware of another aspect, viz., that the villager becomes factory hand "having a home and work to which he can return when he ceases to be employed in a factory gives him a certain strength" (†) but this *instability* of labour constitutes a fundamental difficulty for the employer as well as for all those who have at heart the welfare of the industrial workers.

*Difficulties.*—We will now refer to what, in our judgment, are some of the causes for the present discontent. We are aware of the obstacles that stand in the way of schemes for betterment, not the least being the labourer's own indifference to, and lack of desire for, improvement, but there are signs that he is becoming aware of that possibility for himself, in view of which we would advocate well conceived schemes of welfare service, which should include a co-ordinated plan of primary and adult education. For the aim of education, besides supplying the equipment needed for earning a living and preparing men to take their part in the life of the country, is to satisfy the spiritual needs of men. Our general plea, therefore, is for education and more education, albeit, suitable education, so that labour will retain its best representatives in industry.

*Housing.*—The happiness and efficiency of labour is dependent in a large measure on the conditions under which the labourer lives. It is true that the labourer is from the village and will have the habits of the villager, but the overcrowding in many parts of the city does militate against securing that privacy to which even the villager is accustomed. Much has been done in recent years on the part of Government, the various authorities in the city, and many employers to provide accommodation, but much remains to be done to relieve the congestion hereunder noted. It will be observed that there has been no diminution in numbers in the southern congested wards, as one would expect, in view of the big building schemes in the northern part of the city.

Ward.	Density of population per acre.	Census 1921.	Municipal Commissioner's Report, 1927.
A .. .. .	.. .. .	51	53
B .. .. .	.. .. .	203	208
C .. .. .	.. .. .	431	450
D .. .. .	.. .. .	89	102
E .. .. .	.. .. .	114	126
F .. .. .	.. .. .	28	34
G .. .. .	.. .. .	44	52

With this table, the figures of certain districts will make clear precisely where overcrowding exists.

\* See Labour in Indian Industries by G. M. Broughton.

† Op. cit. pp. 83, 158.

Area.	Density of population per acre.	Census 1921.	Municipal Commissioner's Report, 1927.
Kumbharwada .. .. .	.. .. .	736-86	799-57
Kamatipura .. .. .	.. .. .	714-05	786-21
Second Nagpada .. .. .	.. .. .	699-03	719-48
Kara Talao .. .. .	.. .. .	581-55	592-87
Chukla .. .. .	.. .. .	489-07	484-97
Bhuleshwar .. .. .	.. .. .	471-30	470-09
Umarkhadi .. .. .	.. .. .	469-18	477-68
Market .. .. .	.. .. .	411-69	445-20

To relieve this congestion the workers should be induced to move into the unoccupied chawls erected by the Bombay Development Department and we suggest two things, (1) increased facility of access, both by road transport and if possible by the provision of more direct footpaths from the chawl areas to mills, workshops, etc., and (2) a comprehensive scheme embracing the education and recreation of the workers and their families during their leisure time. This we are convinced would make life worth while in the chawls of Worli, De Lisle Road and Naigaon.

We agree with the recommendation in the Report of the Indian Industrial Commission, viz., "To avoid congestion in future no industrial concern should be started, except in the N.E. of the Island of Bombay or in S.E. of Salsette, without the consent of the municipality" (page 283).

*Indebtedness.*—One of the chief contributory causes to the discontent in industry is, we believe, the indebtedness of a large percentage of the workers. Social and religious customs play an important part, but sickness and unemployment also drives the worker to the moneylender. When the workers can read and write and "know figures" there will be less opportunity for the moneylender to obtain the present extortionate rate of interest on loans. The existing state of affairs could be remedied to a certain extent by an arrangement whereby loans will be made available on easy terms. Co-operative credit societies serve some branches of labour, when approved security is forthcoming, but we agree with the authors of the Report of the Bombay Riots Inquiry Committee that the subject should be examined by the Provincial Banking Committee (page 88).

*Absence of Family Ties.*—This constitutes a problem in Bombay because of the presence of a vice area. Not only does it demoralise men while they are here, but the danger of returning to their village with venereal diseases can be better imagined than described. We are glad to note that Government action is contemplated to suppress the brothels, and this should considerably lessen the risk of infection, moreover the effect on the labourer of such action will be that he will no longer feel that provision is made for him in this respect by the authorities and thus many will be led to think twice before seeking gratification in this manner.

*Wages.*—It has been said that the standard of wages in factories is governed by the amount necessary to tempt the poorest type of cultivator from his holding. The first charge upon industry is a living wage for the workman and every workman should give an honest day's work in return for his wages. It is admitted that many of the mill workers are paid low wages. Standard rates of wages if adopted by all mills for skilled and unskilled labour would, we believe, remove one cause of discontent.

*Hours of Work.*—We are of opinion that there is need for thorough expert investigation of this important question. There has been much dogmatic statement in regard to the most satisfactory hours of labour, and where it has not been dogmatic it has been too frequently based on inadequate data. We suggest that the time has come when the whole subject should be submitted to scientific investigation.

*Recruitment of Labour.*—One thinks of jobbers, mucedams, mill operatives, etc., when using this term, but we believe the recruitment of labour opens up a bigger question than that of unskilled labour for mills, factories and workshops. Unemployment in the city is a serious problem, affecting whole groups of citizens, other than manual workers. With it must be considered the question of producing more educated foremen, jobbers, etc., those who will be in a position to lead labour intelligently, with a background of full technical knowledge of the particular industry they serve. At present there are very few, if any, leaders from the ranks of labour.

*Labour Exchanges.*—In this connection we suggest the establishment of Government Labour Exchanges be considered as a means of dealing with this problem. Such exchanges would make for mobility of labour and generally assist not only the labouring classes but those in other walks of life who cannot find employment at any one point. Inducements should be held out to educated youths to enter industry in larger numbers which will strengthen the ranks of labour and find employment for those engaged in the already overcrowded clerical and general

office ranks. The Indian Industrial Commission deals fully with the need for providing facilities for training middle class youths for industry. To some extent this has been done, but we believe more could be done to attract youths to manual vocations, and with this in view the curricula in primary schools should include suitable subjects. Night schools should be governed by the same principle, of course. Certain millowners in Madras give primary education to their workpeople. "The industrial bias imparted by the education given has had the result of keeping the pupils in the mills as intelligent and efficient workers instead of leading them to desire clerical appointments, and the scheme may, therefore, legitimately be regarded as a great investment." (1).

*Ex-Sepoys.*—Working as the the Employment Committee of the Soldiers Board, the Bombay Y.M.C.A. has found employment for 5,388 ex-sepoys during the past seven years.

Services such as this could be extended to meet the demands of an industrial city like Bombay; whether these should be undertaken by Government labour exchanges, or by subsidised voluntary agencies is a question to be determined.

*Adult Education.*—A well-thought out scheme of night schools for adults would appear to be a prime necessity at this juncture, but we would strongly urge the appointment of a small committee to study the question of adult education in India in all its aspects.

*Fines.*—Where fines are imposed they should be fair and reasonable, and all such deductions credited to a welfare fund for the benefit of the employees.

*Welfare Supervisors.*—We would further suggest that consideration be given to the employment of trained welfare supervisors for each mill or group of mills to deal with all questions of personnel. Such officers might have works committees to assist them. It must also be remembered that present day industry demands thorough scientific study and research, and the time is coming when specially trained welfare officers will be set to work to keep India abreast in the realm of Industrial Psychology whose "aim is to discover the best possible human conditions in occupational work, whether they relate to the best choice of a vocation, the selection of the most suitable workers, the most effective means of avoiding fatigue and boredom, the study and provision of the most valuable incentives to work, the causes of and remedies for irritation, discontent and unrest, the best methods of work and training, the reduction of needless effort and strain due to bad movements and postures, inadequate illumination, ventilation and temperature, ill-considered arrangements of material, or defective routing, layout, or organization." (1).

Thus welfare supervisors and experts in Industrial Psychology will be needed in the Indian industry of the future.

*Right use of Leisure.*—The proper utilization of all leisure time by the labourer reacts on his work. It is, therefore, of the utmost importance that the temptations to drink, gambling and immorality be counteracted by agencies that attract him and whose services make for his improvement and contentment. Provision for such facilities should be looked upon as a good investment by employers of labour.

*Welfare of Factory Labour.*—We agree with the authors of the Report of the Indian Industrial Commission when they say, "The inefficiency of Indian labour can be remedied by the provision of education, the amelioration of housing conditions, the improvement of public health and a general policy of betterment." (Page 282).

*Y.M.C.A. Service.*—The Bombay Y.M.C.A. lays special emphasis on a general policy of betterment along the lines of welfare service, the programme being designed to meet the physical, mental and spiritual needs of the workers. It includes: Provision of open spaces for playgrounds, etc. "Play for all" policy is adopted (8 centres already operating); akhadas and gymnasiums; education in night schools; propaganda regarding intemperance, gambling and immorality; cinema and lantern shows; lectures and talks; hygiene and sanitation; Indian music, drama, etc.; scouting for boys—camps where boys do everything for themselves. (See separate report on scout camp).

At present we operate in the city at the following centres:—

1. Naigaon, in Y.M.C.A. hut .. ..	For mill employees.
2. Worli, in chawls .. ..	For B.B. & C.I. Railway employees.
3. Love Grove, on municipal property..	For municipal employees.
4. Arthur Road, on municipal property..	For municipal employees.
5. Dadar, on municipal property ..	For municipal employees.
6. Mustan Shah Baug, playground ..	Open to the public, no restrictions.
7. Gilder Tank, playground .. ..	Open to the public, no restrictions.
8. Ripon Road, Willingdon Memorial Playground.	Open to the public, no restrictions.

(1) Industrial Psychology ed: by C. S. Meyer page 6 (1929).

The service rendered is in line with the latest advances in Industrial Psychology. The solution of the problems ultimately rests upon the adequacy with which we deal with the human element in the industrial world. That adequacy depends upon; (a) enlightenment, leading on to correct decisions; (b) domestic comfort, ending in contentment; (c) wholesome and elevating environment, helping, or encouraging the growth of true community life.

*Development of Human Personality.*—The Bombay Y.M.C.A. would stress the importance of the due recognition of human personality, and of the necessity for providing such facilities for the labourer as will develop personality and enable him to create a standard of comfort that makes for personal happiness and contentment, and stability in industry. "The industrial world is constituted not by economic individuals acting always under the influence and guidance of enlightened self-interest, but by human beings acting under the influence of human impulses, emotions, and passions, arising out of fundamental human needs."(1).

A statement regarding welfare service already attempted by the Bombay Y.M.C.A. is attached (2). Since it was drawn up, requests have been made—and will be met—for two more welfare centres for municipal menial employees and another for Port Trust employees in their village at Antop. It is true to say that the extent of our service is only limited by our financial resources. We are in entire agreement with recommendation No. 104 of the Report of the Indian Industrial Commission which reads:—"The responsibility for general welfare work among factory labourers must devolve mainly on private individuals and associations. Government and local bodies as well as employers should, however, assist them as far as possible." (Page 283). It is our experience that all such service is better done—both in the interests of employers and employees—by unofficial agencies, to ensure the greatest and most lasting benefit.

## THE BOMBAY ELECTRIC SUPPLY AND TRAMWAYS COMPANY, LTD.

### I.—Recruitment.

1. Our labour is all recruited in the city of Bombay. Much of this labour is of purely local origin, but in our traffic department many of our tram-car drivers are up-country men, for instance, from the Punjab and United Provinces. On the other hand, our conductors are chiefly Mahrattas and Konkanis.

(i) We are not seriously inconvenienced by migration of labour. At certain times of the year, especially just before the monsoon, a large number of men avail themselves of leave.

(ii) In our opinion the attendance of our labour has improved in recent years.

2. (ii) *Extent of Permanent Labour Force.*—Abstracted from July, 1929 pay sheets:—

Officers	..	..	..	..	..	30
Clerical and kindred staff	..	..	..	..	..	591
Electric supply branch	..	..	..	..	..	660
Omnibus and tramways branch	..	..	..	..	..	3,387
						<u>4,888</u>

July being a monsoon month, these figures are somewhat lower than average, which may be taken at 5,000.

3. (i) We have no trouble at all in recruiting all the labour we require.

*Traffic Department.*—Candidates apply personally at the appointed time, and the officer responsible selects likely looking candidates from among the applicants. Fitness for service is the chief point taken into consideration, but preference is given to men who have had some education, and give intelligent answers to simple questions. Candidates are then subjected to medical examination, after passing which they are required to sign an agreement, accepting the general rules of the company embodied therein. After the formalities are completed, they are sent to our schools to learn their duties for periods varying from 4 to 10 weeks, for which they receive a subsistence allowance of Rs. 15.

(1) Industrial Psychology ed.: by C. S. Meyer page 19 (1929).

(2) (a) Social Welfare Service of the Bombay Y.M.C.A. (b) Report on a Scout Camp, held August 31st—September 1st, 1929. (Not printed).

*Engineering Departments.*—Skilled labour is recruited either on the basis of testimonials or recommendation by a trusty employee. In all cases actual engagement is subject to actual trade tests, or periods of probation. Promising unskilled labour is trained by working with skilled labour, and promotions are made, after passing trade tests, when vacancies occur. We always endeavour to promote our own rather than engage new employees.

*Unskilled Labour* is generally obtained by muccadums or employees already in the service of the company.

(ii) Our experience has not shown the necessity for any methods other than those detailed above.

(iii) Our experience has not shown the necessity for public employment agencies.

7. (i) We have no means of knowing definitely what is the extent of unemployment in this city, but we do know that unemployment must be considerable, judging by the enormous number of applications for employment which we receive.

(ii) We consider that the unemployment that exists has partly been caused by the retrenchment that has taken place in all large concerns, in consequence of the bad state of trade.

8. (i) *Traffic Department.*—The length of service, as in August, 1929, was as follows :—

Years of service.	Conductors.	Drivers.
1	123	37
2	137	42
3	190	52
4	110	22
5	160	60
	720	213
6	172	36
7	172	45
8	34	14
9	38	51
10	14	21
11 to 15	1	19
16 to 22	4	20
	435	206
Total ..	1,155	419

At the beginning of 1925, though we then employed 1,612 conductors and 712 drivers, only 42 conductors and 110 drivers had over 5 years' service. There are various reasons which account for the marked declension in the total numbers employed, but these do not appear to affect a conclusion that the duration of the service of such employers has materially improved.

*Clerical Department.*—The average length of service, as in August, 1929, was as follows :—Clerical staff, 8 years 7 months ; sepoys and office boys, 5 years 8 months.

*Workshop Department.*—The years of service, as in August, 1929, was as follows :—

Years of service.	Number of men.	Years of service.	Number of men.
1	22	8	26
2	21	9	19
3	58	10	71
4	30	11	52
5	45	12	24
6	56	13	17
7	59	Over 13	30
		Total ..	530

In this department the average service in August, 1929, was approximately 7 years.

(ii) As regards casual employment, this is practically confined to the temporary engagement of coolies for such work as laying electric cables. It seldom amounts to more than about 10 per cent. of the permanent labour force, or about 30 per cent. of the mains department alone.

(iii) (a) The numbers employed in our workshop during 1928 averaged 640 ; absenteeism averaged 62·5 daily, evenly distributed throughout the year. Absenteeism is greater amongst the higher paid men than amongst the lower paid.

In the mains department absenteeism averages about four days per month without leave.

Causes of absenteeism are sickness, domestic and property troubles, personal work at homes, long leave in employees' native places covering religious and other ceremonies.

(b) Unskilled employees usually take some leave, prior to, or at the beginning of the monsoon, chiefly to repair their houses in their native country, or to make agricultural preparations.

Traffic employees suffer more sickness in the monsoon and cold weather.

(c) It is difficult to estimate time and wages lost, but in our mains department it is estimated to be about four to six weeks per unskilled employee annually, amounting to Rs. 30-40 in wages.

In our workshop during 1928 :—299 working days  $\times$  62.5 absenteeism daily = 18,687 men days were lost, or an estimated equivalent in wages (at Re. 1-8 annas per day average) of Rs. 28,031.

## II.—Staff Organisation.

12. (i) The company relies largely on its apprenticeship scheme for filling the junior officers appointments. Young men are put through a three or four years' course as apprentices in the various departments of the company. Those that show marked promise are usually promoted to the appointment of "technical assistants" on completion of their apprenticeship. Others may, or may not, be retained in the company's service. When vacancies occur amongst the junior officers, the technical assistants are given first consideration for promotions.

(ii) No special arrangements exist, but in practice skilled men usually train unskilled men, many of whom in course of time, after passing the various trade tests, earn promotion.

13. (i) To the best of our belief the relations are generally good. It has been our experience that officers in charge of departments have, as a rule, treated complaints with consideration. The instructions to such officers are that the policy of the company is to remove a genuine grievance at once, if it is at all possible to do so. Officers are also instructed at all times to hear and consider complaints with care and deliberation.

14. (i) A special time keeping department, under the control of the secretary of the company, keeps the time of all employees. Clocks are used in certain departments where feasible, for instance in the workshop. The timekeeping department is subject to inspection and check by the company's own audit department.

(ii) From the timekeepers records, pay sheets are prepared by the same department. These are subject to audit by the company's audit department, and, prior to payment being made, all officers concerned are required to certify that the pay sheet is correctly drawn. The pay sheets are then passed to the cashiers who draw the necessary funds, handing them over to the pay clerk's department, which is responsible for placing the money due to each man in a special envelope for that man. The timekeeper issues a chit to each man, giving his number and amount due. On presentation of this chit at the appointed time and place the pay clerk hands over his particular envelope, in exchange for the pay chit or time card.

15. (i) The company maintains its own workshop, where a commercial costing system is in force. If it is considered that work can be executed cheaper by outside parties, specifications are prepared and tenders called for from outside contractors, as well as our own departments. The contract is awarded to the contractor whose tender is the most economical.

The majority of work let out on contract is for the construction of new buildings.

(iii) The company's chief officer concerned supervises the work, the contractor employing labour at his discretion, but indemnifying the company in respect of the Workmen's Compensation Act.

## III.—Housing.

16. (i) The company owns the following housing accommodation :—(a) Nineteen quarters for officers, and six small quarters for subordinates ; (b) One chawl, containing 160 rooms of which half are reserved for the traffic department, and half for the workshop department ; (c) One chawl, containing 12 rooms in the workshop compound ; (d) One chawl, containing 44 rooms at the company's Colaba depot, chiefly occupied by traffic men based on Colaba.

(iii) Officers and employees, who do not live in the above quarters or chawks, rent their accommodation from private landlords.

18. The large and modern 160-room chawl is of standard Bombay Improvement Trust design, the rooms being 120 square feet in area. The accommodation in this, and in the other chawls belonging to the company, is popular largely, we think, because we have made a practice of fitting one electric lamp in each room. Modern latrines and water supply are available in all the chawls. Considerable expenditure in incurred in efforts to keep all the chawls sanitary and clean. Whitewashing is frequently carried out as often as three times in two years.

19. The company's chawls are always full, with the exception of the 80 rooms in the large chawl allotted to the traffic department. In that block of 80 rooms practically every room is occupied, but as so many of our men are either bachelors, or married men who leave their families up-country, four such men are allotted to a room on the basis of four berths per room. Vacancies occur chiefly in these berths.

20. In the 160-room modern chawl the rents are fixed at Rs. 8 per room and Rs. 2 per berth per month, inclusive of electric light.

In the old fashioned Colaba chawl, the rentals are calculated according to the number of berths available in each room, at the rate of 12 annas per berth per month.

In the small workshop chawl the rents are Rs. 8 and Rs. 6 for the large and small rooms, respectively.

21. The company raises no objection to officers living in company's quarters, arranging for paying guests in other employ to live with them. Should any of these quarters fall vacant and not be required by any officer of the company, efforts are made to let them to outside parties.

As far as the company's chawls are concerned, every room must be let to an employee of the company, but no objection is raised to the tenant allowing close relations to live with him, provided no overcrowding is caused, i.e., in excess of four per room; two children being considered as one adult.

So far no cases of eviction from chawls have become necessary.

22. We know that other authorities who have more extended housing facilities, have less difficulty in obtaining unskilled labour than we have.

It is considered that the conditions in our chawls have certainly improved the morals of the tenants, mainly due to the strict enforcement of rules and regulations for such accommodation.

#### IV.—Health.

24. *Extent of Medical Facilities Provided*—(i) *By employers*.—The company provides free medical attendance and medicine to such of its workshop, traffic and other employees, who attend at the company's well-appointed dispensaries at Colaba and Dadar Tramway depots.

25. *Extent to which Medical Facilities are utilised*.—The average number of attendances at the dispensaries daily for the first seven months of 1929 has amounted to about 140. This figure includes cases, in which "first aid" has been rendered by the assistant surgeon in charge, to workshop men meeting with accidents.

26. *Sanitary Arrangements*—(i) *Latrines*.—Ample latrines are provided at the company's depots, the number of seats provided being in excess of that required by the Factory Act.

(ii) *Drinking Water*.—Special tanks, directly connected to the municipal mains for the supply of drinking water, are provided where any appreciable number of employees work. It is of course impossible to provide such tanks for the use of all employees in an undertaking of this nature.

(iii) *Bathing and Washing*.—No special facilities are provided, but use is allowed and made of the various taps, fitted in the depots for the purposes of washing tramcars.

30. (iii) The company's senior medical officer states that, with over 28 years of professional experience, he can definitely say that prejudices against western medicines are gradually dying out. The company's staff readily avail themselves of the treatment on western lines afforded by the company.

#### V.—Welfare.

32. (i) A special "employees welfare fund" is maintained. To this fund are credited all fines recovered from employees, donations made by passengers and proceeds of "lost property" sales.

The fund is available at the discretion of the general manager for making small loans to necessitous employees, and for other deserving cases, which cannot properly be assisted with company's moneys.

Loans, which normally do not exceed two months' salary or wages, do not bear interest, and must be repaid within one year by monthly deductions from salary or wages. Such loans are not granted to applicants who are eligible to receive loans from the provident fund.

The utilization of the credit balances of this fund is from time to time considered by the board of directors, the intention being that such surplus funds shall so far as possible be expended on welfare work to the advantage of those employees of the company, who have in part contributed to that fund in the shape of fines deducted from their wages.

33. The company does not employ any welfare officers, but a senior employee is designated "welfare supervisor," his general duties being to receive complaints and make recommendations regarding welfare, and to see that the various company's chawls, canteens, etc., are maintained in a satisfactory state of cleanliness and repair.

34. (i) An excellent modern canteen has been provided at the company's Colaba depot. A small canteen has also been provided at the company's Tardeo depot. A tea shop exists at the workshop. The two former have only been in existence for a few months, and their advantages are only beginning to be appreciated. In the workshop, however, the tea shop does a large trade amongst the 500 odd men employed there.

The company does not employ any women, consequently it has no shelters or creches.

(ii) A club building has recently been erected at Colaba tramway depot, adjacent to the company's head office, for the benefit of the men based on that depot, and living in the chawl thereat. This building, which is approximately 54 feet by 32 feet, inclusive of verandah, is divided into two portions—one half being a club room, with refreshment bar, where indoor games may be played and music availed of. The other half is used as an akhada or gymnasium, in which wrestling and various gymnastic exercises are continuously practised. The club is provided with a small garden; also with a very small paved area for outdoor gymnastics, together with a sand pit for the children living in the chawl.

Efforts are being made to obtain the use of land for two tennis courts in the Fort area for the benefit of the clerical and other staff who desire to play tennis, but at present our applications have received no reply.

Further, two large plots of vacant building land at Dadar are lent by the Bombay Improvement Trust for outdoor games, such as cricket and football. This land will however have to be vacated at 24 hours' notice, if required by the Bombay Improvement Trust for their own purposes.

The best sports club cannot at present be considered to have commenced operations, but it is hoped that it will function successfully during the coming cold weather.

35. It is too early at present to say what results have been achieved by the activities outlined above, but there is no doubt that the provision of amusement and facilities for recreation tend to improve the contentment, and consequently the efficiency, of the employees generally.

36. Except for the Company's Apprenticeship Course, and for the deputation of a few of the company's younger and promising employees, to attend instructional courses in electrical wiring, etc., at the Victoria Jubilee Technical Institute, the only educational activities in force at present are classes for instruction in first aid. We also have two schools for training conductors and drivers in their duties.

37. A Provident Fund has been in force since 1914. All officers and employees, other than those employed on probation or temporarily, in receipt of salary or wages of not less than Rs. 15 for a full normal month's work, are required to become members of, and subscribe to, this fund.

A member drawing a salary or wages of Rs. 100 or over per month contributes 16 pies per rupee, but in the cases of those drawing under Rs. 100 per month the compulsory contribution is 12 pies per rupee or, at the members' option, 16 pies per rupee.

The company contributes to the fund monthly an amount equal to the members' own contribution for that month and allows interest, which is credited monthly, at the rate of 5 per cent. per annum, calculated on the monthly balances standing to the credit of all members, including the contributions made by the company.

All costs and expenses of administering and working the fund are borne by the company.

The company's contributions are only paid in full to members leaving the company's service after completing 15 years therein. For service between 10 and 15 years two-thirds are paid, whilst for service above 5 years and not exceeding 10 years one-third is paid. In cases, however, of retrenchment or death, the full company's contributions are paid.

Members can obtain advances up to one-third of their own contributions, bearing interest at the rate of 5 per cent. per annum, for the purposes of sick leave, medical assistance or other special emergencies.

Dismissal from the company's service for dishonesty, gross misconduct, or leaving without notice entails forfeiture of all claims on the company's contributions. Such of the company's contributions as are forfeited or withheld, revert to the general revenues of the company.

The whole of the credit balances of the fund are invested in the business of the company.

*Savings Fund.*—In addition to the provident fund, the company instituted a savings fund in 1914. Salaried members of the provident fund only are eligible to join this fund, and may contribute either half an anna or one anna for every complete rupee of monthly salary. The company allows interest at the rate of 5 per cent. per annum, calculated and credited monthly. But, in addition, the company, on the 1st January each year, credits each member in respect of his monthly balances during the previous year, with further interest, dependent upon the length of service with the company as follows:— $\frac{3}{4}$  per cent. for service exceeding 5 years but not exceeding 10 years;  $1\frac{1}{2}$  per cent. for service exceeding 10 years but not exceeding 15 years;  $2\frac{1}{2}$  per cent. for service exceeding 15 years.

Balances standing to the credit of members are invested in the business of the company.

*Gratuities on Retirement.*—The company instituted in 1921 a system of gratuities on retirement. The scales now in force are as follows:—

*To the whole of the Traffic and Engineering Staff:—*

7 years' service .. .. .	3 months' pay.
10 years' service .. .. .	6 months' pay.
12 years' service .. .. .	9 months' pay.
15 years' service .. .. .	12 months' pay.

In all the cases quoted above, whatever his length of service, no officer or employee shall receive as a retirement gratuity more than the equivalent of one year's substantive salary or wages.

In the opinion of the management, these funds tend very materially to the success of the company's working. The sums standing to the credit of various employees at the end of their service are frequently very substantial for persons in their class of life.

#### VII.—Safety.

44. The number of accidents of every description, however slight, which occurred in our workshop in 1928 was 24.

45. Accidents have chiefly been due to disobedience of orders, carelessness in transporting heavy materials, and other directions, e.g., electrical burns, and burns from molten metal as moulders refuse to wear shoes.

46. All machinery is well guarded, belting fenced, and lifting tackle tested. Men are fined for removing safety devices. Factory rules are rigorously adhered to. The factory inspectors have on more than one occasion sent officers of other firms to see, and learn from, our safety arrangements.

48. A qualified doctor attends employees who seek his advice. An assistant surgeon is on duty during working hours, in a well equipped dispensary, to render first aid.

50. The daily working hours ( $8\frac{1}{2}$ ) do not seem to fatigue employees unduly, but in the hot weather, towards the end of the day, there is a slacking off, which cannot be considered unnatural. Men are allowed to take tea or cold drinks in the shops between 9 and 11 a.m., and between 2.30 and 4.30 p.m. Thirty minutes are allowed daily as "Latrine" time. Meals can be obtained on premises at cheap rates.

General health is good; cases of long illness are infrequent; deaths amongst employees are of very rare occurrence.

#### VIII.—Workmen's Compensation.

51. *Workmen's Compensation Act.*—(i) Those provisions of this Act, which affect this company, are utilized to the fullest extent. Employees also take full advantage of the Act on their side, not infrequently through agents, who make a business of putting forward claims, but no case has yet occurred in which the company, through taking immediate action, has not been able to ignore applications from such agents.

(ii) From the 1st July, 1924, when the Act came into force, up to the end of 1928, out of Rs. 10,685 which became payable in respect of 188 cases of accidents falling within the scope of the Act, only Rs. 38 in respect of 10 accidents have not been claimed.

It is however, to be noted that in addition to the compensation for which the company was liable under the Act, an additional sum of Rs. 2,990 was paid in respect of temporary disablement included in the 188 cases mentioned above. These additional payments were made, because it has been the practice of the company, for many years to pay full wages for the full period of disablement, necessitated by justifiable accidents.

During the above period a further 932 cases of accidents occurred, in which the employees were not entitled to any compensation under the Act. In the majority of these cases, full or partial compensation amounting to Rs. 4,955 was paid in accordance with the company's custom.

(iii) We do not consider that the Workmen's Compensation Act has caused any effect at all in this company, as it has been our custom for many years to pay full or partial wages in all cases of justifiable accidents, met with when fulfilling duties in the service, and in accordance with the rules and regulations, of the company.

53. (i) In connection with the revision of the Workmen's Compensation Act, we have already given our opinion to the Local Government that, in the cases of some higher paid employees, the scale fixed for temporary disablement is somewhat on the low side, e.g., an employee drawing Rs. 200 per month would only be entitled to draw Rs. 1 per day during disablement.

(ii) We think the conditions governing the grant of compensation are somewhat harsh and to the detriment of the employer, e.g. :—

Under Sec. 3 (1) (b), (ii) and (iii) the employer is exempted from liability, in respect of any injury to a workman resulting from an accident, which is directly attributable (a) to the wilful disobedience of the workman to an order expressly given, or to a rule expressly framed, for the purpose of securing the safety of workmen, or (b) to the wilful removal or disregard by the workman of any safety-guard or other device which he knew to have been provided for securing his safety. In such cases the onus rests on the employer of proving that the disobedience or removal by the workman was wilful, i.e., deliberate. This is an extremely difficult matter and acts unfairly on the employer.

## IX.—Hours.

### A.—Factories.

55. (i) 8½ hours daily for 5 days per week ; 5½ hours on Saturdays ; Total 48 hours per week.

(ii) Overtime worked is negligible.

(iii) The workers are not on call after the workshop closes daily.

60. (i) One hour daily for tiffin, except on Saturdays.

(iv) All employees are granted 4 general holidays annually with pay. Employees of over 10 years' service also receive full pay for about 7 sectional holidays. Part day leave without pay is also granted in cases of certain religious festivals. No pay is given for Sundays, on which men do not work but pay is allowed for 3 hours leave on Saturday afternoons.

### D.—Other Establishments.

78. (i) In the *Traffic Department* conductors work 8½ hours and drivers 8 hours respectively. The average of hours worked per month approximates closely to these figures, but the daily hours worked vary considerably in accordance with the various duties on various tramway routes.

(ii) The actual working hours, i.e., including overtime, are not materially in excess of the above hours, for, as a general rule, the working of overtime is not permitted if it can possibly be avoided throughout the company.

79. The normal working days per week are six, but in a company working the transport services, and supplying electrical energy throughout the City and Island of Bombay, work never ceases. In those departments where the nature of the work requires regular attendance on Sundays, and/or general public holidays, a day off is allowed for each such attendance. Employees working shifts are all allowed one shift off per week, i.e., their normal week's work comprises 6 shifts of 8 hours.

## XII.—Wages.

96. (i) Average earnings (i.e., Bonus, Gratuity, Provident Fund, etc., not taken into account) of certain employees during July, 1929, were as follows:—

Number on which average is ascertained.	Designation of Employee.	Average Earnings in Rupees.
8	Blacksmiths .. .. .	60
13	Cabinet Makers .. .. .	86
48	Carpenters .. .. .	69
68	Coolies .. .. .	26
8	Drillmen .. .. .	49
75	Fitters .. .. .	62
49	Fitter's Assistants .. .. .	40
10	Hammermen .. .. .	31
11	Moulders .. .. .	66
5	Painters, Good .. .. .	60
30	Painters, Rough .. .. .	39
14	Turners .. .. .	62
9	Watchmen .. .. .	38
12	Winders (Armature) .. .. .	87
28	Wiremen .. .. .	60
9	Writers .. .. .	65
1,085	Conductors .. .. .	45
390	Drivers (Tramways) .. .. .	48
83	Drivers (Omnibus) .. .. .	72
(iii) Total salaries and wages actually paid in cash for 1928 (officers excluded) .. .. .		Rs. 31,62,086
Bonus .. .. .		1,60,489
Add : Gratuity (average for 3 years) .. .. .		22,859
		<hr/>
		Rs. 33,45,434
Company's Contribution to Provident Fund .. .. .		1,89,956
Cost of medical facilities .. .. .		15,875
Difference between return at 6 per cent. on cost of company's chawls and the net return .. .. .		26,549
Clothing issued .. .. .		44,253
		<hr/>
		2,76,633
Money value of all earnings .. .. .		36,22,067

Therefore, the proportion of money wages to money value of all earnings was as 100 is to 108.26 during 1928.

97. (i) Prior to 1916 the wages generally paid throughout the company had been constant for several years, but, owing to the Great War and the consequent increase in the cost of living, the scale of wages had to be reconsidered in that year (1916). "War" allowances were then introduced, the scale being revised in 1919 as follows:—

To employees drawing from Rs. 126 to Rs. 200 per month	10 per cent.
To those drawing from Rs. 76 to Rs. 125 per month ..	17½ "
To those drawing Rs. 75 and under per month ..	25 "

This scale has never been altered and is still in force at this date, though the cost of living has varied from that in 1916 when the scale was introduced.

Several alterations in the rates of salary and wages of individuals have, of course, from time to time been made, largely in view of the additional responsibilities falling on such employees, owing to the growth of the company's business.

In 1922, strikes occurred both in our workshops and traffic departments, and adjustments in rates of wages were then made in certain cases and are still in force.

The scales of salaries and wages now paid are thought to be favourable, when compared with other undertakings of a similar nature. It is not the company's custom to adjust such scales in relation to the profits of the company earned annually.

101. In the workshops, at the time of the strike in 1922, a promise was made to the then employees that the company would pay wages equivalent to those paid by the G.I.P. Railway authorities for similar classes of work. Since July, 1927, new employees have been engaged on flat rates of pay, approximating to the rates above referred to. In no other department of the company can it be said that wages have in any way been fixed by negotiating agreements; they have usually been fixed at favourable rates, after due consideration has been given to rates paid by other comparable concerns in the city.

102. As has previously been explained, the company's business is continuous. Questions do not, therefore, arise as to work on Sundays. Those employed on shift work six shifts per week. Others, who may have to work on Sundays or Public Holidays, are allowed one day off per week.

The rules in the various departments of the company regarding payment of overtime vary somewhat.

*Traffic Staff.*—All overtime is paid at the rate of time and a quarter, but double time is paid to men called up for duty on their weekly day off.

*Workshop Staff.*—Overtime up to four hours per month is paid for at the rate of time and one quarter, but at the rate of time and a half for all overtime over four hours per month put in by workmen.

Foremen and mistries are paid at ordinary rates for overtime worked in excess of eight hours in any one month. They are not paid for overtime not amounting to eight hours.

No workman is entitled to draw extra pay for overtime unless the hours he has worked during any month amount to more than the total ordinary working hours for that particular month.

The company's policy is to reduce overtime to the absolute minimum. Consequently in practice very little overtime is worked.

106. (i) It is laid down in the company's standing orders that deductions in respect of fines shall not exceed 5 per cent. of salaries or wages, except in cases of outstandings when employees leave the company's service. Fines inflicted in excess of 5 per cent. of salary or wages are deducted in two or more instalments. All fines recovered are credited to the company's "Employees Welfare Fund." The fines inflicted on 2,754 of the company's employees during 1928 amounted to 0.19 per cent. of the total wages paid, namely, to Rs. 4,390, or Rs. 1-9-6 pies per man fined.

(ii) Deductions are made from employees' pay in respect of provident fund, provident fund advances, savings fund, fines, rental of accommodation in company's quarters or chawls, income tax, advances from the employees' welfare fund, cost of extra clothing (if any) issued, and cost of tools lost.

In the case of traffic department conductors, deficits in cash returns in respect of tickets sold, is also recovered from pay.

(iii) *Utilisation of Fines.*—This has been fully explained in answer to Question 32.

107. (i) The whole of the company's staff is paid once per month for work during the previous month. In cases in which casual labour is employed, payments are occasionally made weekly, or in some very exceptional cases daily.

(ii) The payment of the company's staff for any month's work is completed during the first 10 days of the following month.

(iii) The company opposed, with the utmost emphasis it could command, the proposals to introduce legislation with a view to regulating the periods of wages payment, and to prevent delay in such payment. Such legislation, if introduced, would cause considerable trouble and expense. It is, moreover, very doubtful whether employees would appreciate the payment of wages at intervals of less than one month. It is the custom of the country to make all purchases for payment on a monthly basis. It is considered that no deviation from that system would be welcomed either by sellers or buyers. It is strongly felt that the present monthly practice calls for no alteration.

(iv) Wages unclaimed for more than three years revert to the general revenues of the company, but can be claimed at any later date. It is not the company's practice to withhold payment of any such wages at whatever date they may be claimed. Quite recently an instance occurred of wages earned approximately eight years ago being claimed and paid.

108. (i) To minimize the burden of indebtedness by relieving them of heavy interest charges, loans are advanced to employees:—(a) From the provident fund, bearing 5 per cent. interest per annum; (b) from the employees' welfare fund, bearing no interest; (b) cannot be availed of, if a loan is permissible under the regulations of (a).

From (b) (the employees' welfare fund) loans were advanced during 1928 and 1929 as follows :—

Year.	No. of Employees.	Total amount of loans advanced.	Average amount of each loan.
1928	444	Rs. 33,713	Rs. 76
1929 } 1st 8 months }	446	Rs. 29,505	Rs. 66

The working of this fund is explained in answer to Question No. 32 (1).

109. (i) No profit-sharing schemes have ever been in force. A suggestion to introduce some such scheme was made in 1922, but it was pointed out that there would be the greatest difficulty in working such a scheme to the satisfaction of all employees, many of whom are illiterate. As an alternative, the introduction of the payment of "gratuities on retirement" was suggested and was forthwith sanctioned by the board of directors.

It has been the custom of the board of directors to sanction, and the shareholders in annual general meeting to confirm, the payment of an annual bonus to all officers and employees in the company's service since 1916. This bonus is calculated at the rate of one month's salary for salaried employees, and one-twelfth of actual earnings, excluding overtime, for other employees.

It is hard to say what the effect of the introduction of the payment of annual bonus has been. There are many pros and cons to such procedure, but it has now been in force for so many years, that extensive opposition would arise were the payment to be discontinued.

110. *Annual or other Leave*—(i) *Extent to which taken by workers*.—Mains, 4 to 6 weeks per year. Clerical, average 28·6 days; sepoy and boys, average 24·6 days—leave of all descriptions during 1928.

*Traffic*.—Statistics of actual leave availed of for 18 months, 1st January, 1928, to 30th June, 1929 :—

Particulars.	Conductors.	Drivers.
Number of men .. .. .	916	408
.. men-days .. .. .	4,34,294	1,91,352
.. men-days absorbed by long leave ..	57,402	24,603
.. men-days absorbed by sick leave ..	15,530	6,090
Average number of days long leave per man ..	62 or 13 p.c.	68 or 12·8 p.c.
Average number of days sick leave per man ..	16 or 3·5 p.c.	15 or 3·2 p.c.

*Workshops*.—Absences during the year 1928 :—

Periods of absence.	Number of Men.
Present on every working day .. .. .	10
Absent between 10 and 15 days .. .. .	189
.. .. 16 and 25 days .. .. .	96
.. .. 26 and 35 days .. .. .	86
.. .. 36 and 50 days .. .. .	90
.. .. over 50 days .. .. .	59
	530

(ii) *Extent to which countenanced and/or assisted by Employers*.—For details please see standing order 27/18 on page 31 in attached copy of standing orders.\* Speaking broadly, 15 days "leave pay" per annum is granted to workers. Clerical staff are allowed 31 days full pay per annum to cover leave of all descriptions.

### XIII.—Industrial Efficiency of Workers.

112. *Workshops*.—Employees have gained considerable knowledge of western methods. They do not take long to fall in with modern ideas and the handling of up-to-date machinery, thus increasing production.

*Mains*.—No very marked changes in case of unskilled labour.

*Clerical*.—Opportunities do not occur frequently to replace older clerks, etc.,<sup>a</sup> by better educated and more efficient employees. This process, however, slowly takes effect, resulting in increased efficiency. Generally the efficiency of the clerical staff might be considerably higher, and efforts are being made to achieve that end.

\* Not printed.

*Traffic.*—Since the end of the war the education of the employees has undoubtedly improved. We have many more English speaking conductors than we had in 1922, the year in which the last traffic strike occurred. The overall efficiency has also shown marked improvement. We think the improved scale of free issues of clothing has tended to increase employees' self-respect.

Speaking generally, the prevailing unemployment has acted as a restraining influence on employees. Those that have jobs intend to try to keep them; consequently they are more amenable to discipline than in past years.

115. (iv) Efficiency is undoubtedly improved by provision of housing for the following reasons :—(a) Less sickness as sanitation is much better; (b) more regular attendance at work, owing to accommodation being reasonably near work; (c) more regular meal and rest hours are possible; more hours are available for rest; (d) men on early, late, or irregular duties arrange with others sharing their rooms to prepare their food for them, and thus save the time normally devoted to preparing their own food.

#### XIV.—Trade Combinations.

117. (i) An entirely unofficial federation of the senior officers or partners in engineering firms exists in Bombay, under the name of "The Bombay Engineering Employers Federation." The members of this federation meet, when occasion demands, to discuss unofficially questions of interest relating to engineering problems met with in Bombay. The federation is officially recognized to the extent that the Director of Labour Intelligence usually furnishes copies of proposed legislation to the federation for opinion.

(ii) At the time when the serious labour unrest prevailed from about 1920 to 1922, many unions were formed in Bombay, amongst others being a union (Bombay Tramway Union) for the benefit of tramway employees. The company, when asked to recognize that union, laid down certain conditions to be fulfilled, prior to recognition being granted. Those conditions have not so far been fulfilled. The union, which is now known as "The Tramway Men's Union," is not recognized by the company. It is understood that in their Annual Report for 1928-29, the union claimed to have 881 members, of whom practically all were said to be employed in the company's workshop and other engineering departments. No traffic employees are said to belong to the union.

122. (i) In this company every employee has the right to appeal to the head of his department. Such appeals are made either personally, by deputation, or in writing. It is, however, generally known that, in the event of an employee not being satisfied with the decision of the chief officer of his department, an appeal lies to the general manager of the company. Judging from the number of appeals that are received, it can be assumed that this procedure is thoroughly well known. In the event of the general manager's decision being unsatisfactory, a further appeal lies to the board of directors of the company.

In the past negotiations have been, and they are still occasionally, carried through by deputations from employees in various departments to the chief officer of the department concerned, but in some cases directly to the general manager of the company.

(ii) *Workshop.*—Many employees do co-operate. Where up-to-date plant has been installed, they have increased production. Production will, it is hoped, be further increased by the formation of the sports club mentioned elsewhere, as a good foundation in sport is likely to be reproduced to some extent in work.

*Means.*—Definite improvement is noticeable in the case of skilled labour in recent years.

*Clerical.*—Response has been feeble, probably on account of :—(1) Long established traditional methods of working; (2) older employees not appreciating the appointment of new employees, who are frequently considerably better educated than they themselves.

*Traffic.*—There is a very marked inclination on the part of many of the men to co-operate, e.g., no labour trouble has been experienced since the 1922 strike. The tone of the men generally shows considerable improvement, no doubt in part due to the company's efforts to make their work as little irksome as possible, and to provide facilities for their welfare generally.

#### XV.—Industrial Disputes.

123. Since the formation of the company in 1905 the following strikes have occurred :—

*Traffic Staff.*—1910. A short strike of conductors and drivers. 1920. From the 7th October to the 21st November. A general strike. 1922. From the 18th September to the 22nd November. A general strike.

*Workshops Staff.*—1919. 23rd January. 149 men struck work and were discharged. 1920. From the 26th January to the 7th February. A general strike. 1920. From the 7th October to the 2nd November. A general strike. 1920. From the 23rd December to the 29th December. *Hartal*; no work done though men presented themselves in the workshop. 1920. From the 30th December, 1920, to the 5th January, 1921. Workshop employees locked out.

The foregoing strikes occurred chiefly during the period of intense labour unrest, which prevailed for a period after the conclusion of the Great War.

The causes may be attributed to the increased cost of living, and arising therefrom to questions of pay and also partly to questions of hours worked, and leave granted.

At this distance of time, it is impossible to give information regarding the loss caused to the company and to the workers themselves, but it may be added that, in the traffic strike of 1922, 1,300 men were discharged, with loss of company's contributions to the provident fund and gratuities on retirement.

124. The difficulty that has always been experienced in handling the strikes which have occurred, has been to find any individual or any representative deputation of the employees, with whom negotiations could be carried through successfully.

In one or two cases gentlemen with no interest in the company have been agreed upon as interpreters. Assistance has not been rendered by official or non-official conciliators in settling disputes. Help has, however, been given by one or two independent gentlemen, who have advised both the company and the employees.

No use has been made of any statutory powers. No joint standing machinery is in existence for the regulation of relations between employers and employed.

(v) *Opportunity afforded to Workpeople for making Representations.*—This question has been fully answered under question 122 (1) above, but it may be added that it has been definitely proved on many occasions, that traffic employees specially take severe punishments or hardships lightly, *provided* they are given the opportunity to represent their cases. This is always done, and every man is given a patient hearing. His demands may not be acceded to, but he goes away happily, as he has attained his end by securing all he wanted, namely a full hearing.

#### XVII.—Administration.

138. The Factory Act provides that certain notices are to be exhibited in various languages in all factories. Such notices are exhibited in the company's workshop, which alone comes under the Factory Act.

139. (i) The factory inspector visits the workshop on an average twice a year, and his reports have indicated that very little of an unsatisfactory nature has been found.

---

Major S. K. ENGINEER, O.B.E., F.R.C.P.E., Physician, J. J. Hospital,  
BOMBAY.

1. At present if a seaman is ill while the ship is in the docks or in the stream, he is treated on board by the company's doctor in cases of ordinary illness; if he requires special surgical treatment or is too ill to be treated on board, he is sent to one of the local hospitals for admission and treatment.

If the medical officer suspects malingering on the part of a seaman, he is kept under observation either on board or sent to the hospital for opinion.

While at sea, he is treated either by one of the officers or the chief steward of the ship who plays the part of a doctor.

2. At present there is no separate accommodation for a sick seaman. He has to sleep in the same room together with other seamen. This room contains from three to six berths for three to six seamen.

3. While at sea, if he is found suffering from any of the venereal diseases, he has to occupy his own berth together with other healthy seamen in the same room.

While in port, there is no accommodation at present in the Indian hospitals for such seamen to be treated as inpatients when surgical interference is required, then and then only are they admitted for treatment.

4. The ship's medicine chest is at present in any nook or corner. I have seen it even in the captain's bathroom. It contains drugs, instruments and such other appliances as are laid down in the Ship's Captain Medical Guide.

It contains some drugs which are as old as our grandfathers. There are others which are never used at all from the time the ship is launched till she is scrapped. There are no drugs recognized as specific for such conditions as cholera, dysentery, asthma, chronic bronchitis, rheumatism, etc.

Some instruments and appliances are not replaced even when they go out of order.

5. The doctor, the officer or the chief steward has also to do the work of the compounder and the dispenser.

6. The recipes in the Medical Guide are either obsolete or antiquated at present times.

7. The crew has to undergo vaccination two or three times in a year either in the same or at different ports without any necessity for doing so or for no fault of theirs. This is their common complaint.

8. The doctor, the officer or the chief steward does not receive any instructions in the handling of the instruments or the appliances. Whenever an emergency arises he reads the Medical Guide and tries to carry out the instructions to the best of his ability.

The officer receives lessons in first aid and has to pass the examination before he goes up for his "ticket", but it is not compulsory for the chief steward. Such certificates are valid for three years only. He is to be re-examined at the end of that period.

*Suggestions.*—1. While in port, if a seaman refuses to receive treatment or undergo an operation considered necessary by the company's doctor, he must be paid off and not allowed to stay on board under any pretext. The opinion of the company's medical officer must be final.

While at sea, if an operation is considered necessary, or the illness is of such a nature as not to be entrusted to one who acts as a doctor on the ship, he must be sent to the hospital, even if the necessity for such an operation or the treatment of the illness does not exist at the first port of arrival of the ship, for observation, opinion or treatment.

If the hospital authorities certify, he may join the ship or be paid off according to the circumstances.

2. Every ship must have a hospital consisting of two or more beds for sick seamen, while in port or at sea, suffering from dysentery, diarrhoea, gastritis, etc., in order to segregate them from others who occupy the same room.

3. While in port, venereal cases, even if suffering from a sore, must not be treated on board, but must be sent to the hospital or venereal clinics for treatment at those places where they are in existence. No seaman is to be "signed on" until he produces a certificate to the effect that he is free from the disease.

A venereal clinic card, such as one that is carried by the white crew, is to be demanded from the Indian crew, stating all the particulars of the kind of treatment he has received while at different ports, to enable the doctor in the next port to give further necessary treatment if required.

4. The ship's medicine chest must be located in the ship's hospital, and must contain such recognized drugs as are in common use at present by the medical profession.

The medical officer of the company must be held responsible for the medicine chest to be in order according to the regulations.

5. Those drugs that can be obtained in the form of pills or tablets must replace the present drugs—liquid or crystalline—to prevent any mistake on the part of those inexperienced who carry on the work as the compounder or the dispenser.

6. The Medical Guide requires thorough revision by a committee consisting of European and Indian doctors who have experience of Indian mercantile marine service.

7. Whenever the members of the crew of a ship have undergone vaccination or inoculation against smallpox, cholera, enteric, etc., each member must be supplied with a certificate to that effect signed by the medical officer. Such a certificate is to be held valid according to the regulations or the instructions of the port health officer.

8. Every officer after obtaining his first aid certificate must produce, before being promoted, a certificate of having passed an examination very nearly on the same lines as are prescribed in the book for "Home Nursing" by the St. John Ambulance Association, and on further promotion of having received instructions in the use and handling of instruments and appliances as are required in cases of emergency and for which they are provided in the medicine chest.

These instructions and certificates will not be a burden on the purse of those who have to perform these duties as they have to pay fees for instructions and certificates for the first aid, and whenever they go up for re-examinations. From my personal experience of nearly nineteen years I am of opinion that these further instructions will be much appreciated by those who have to perform their duties as doctors without any previous training. There is no necessity for an officer to get certificates in first aid every third year till he is promoted to the rank of captain. This present system is certainly a burden on his purse and unnecessary waste of his time, money and energy.

## Messrs. MACKINNON, MACKENZIE &amp; COMPANY.

## PART I.

*Recruitment etc., of Crews in Bombay by P. & O.S.N. Company.*

The Employment Bureau which exists as a sub-office of the Government shipping office in Bombay is not made use of by the P. & O. for recruiting purposes.

The method of recruiting seamen for the company's ships varies in each department and the following are the methods in use :—

*Deck Department.*—On the arrival of a time-expired crew in port, the serang reports to the marine superintendent and his name is placed on the roster.

He is told as far as practicable how long he is likely to have to wait for his next ship and is allowed to proceed to the country to await his next appointment. He is assured that his turn will not be missed and he and his crew leave Bombay for his village up country.

A serang being next on turn for employment is warned about a month in advance to what vessel he is to be appointed. A list of ratings required is given him, and he is required to present himself about 10 days in advance of the vessel's arrival with the nullies (continuous certificates of service) of his crew. These documents are carefully scrutinized by the company's marine superintendent and if satisfactory the crew are ordered to muster for his inspection. They are next examined by the company's surgeon and are then ready to be drafted to the ship.

The serang having had good warning of the date of his appointment is in nearly all cases, able to make up his entire crew from his own and adjacent villages.

Every encouragement is given to this, as it has been found on all occasions to tend to better discipline and to add to the general contentment of the crew.

*Duties.*—The Lascar seamen's duties when at sea commence at 6 a.m. and finish at 5 p.m. with two hours for meals.

On Saturdays during the forenoon a part of the crew are detailed to clean quarters. At 1 p.m. work ceases and the afternoon is allowed for washing and mending clothes.

On Sundays work ceases at 9 a.m. and the crew are allowed the day for rest.

In terminal ports the work is from 7 a.m. to 5 p.m. except in winter time when it is from daybreak until dark.

It frequently happens that a vessel arrives in port during the night hours. On these occasions the crew are given time off during the next day.

*Engine Department.*—Men for the Engine room department are recruited from amongst Peshawuri Pathans, Chachi Pathans and Punjabis. The serangs are kept on a roster and given ships in order according to their suitability for the class of ship, time out of employment and the particular Jhat to which they belong.

There is a ghat serang for each community and his duties consist solely in aiding serangs to collect their crews and in providing odd ratings required for any purpose.

A serang selected for a ship is required to produce the discharge certificates of his men which are carefully looked through in the office before the men are produced for inspection and medical examination. Practically none of the men employed in the engine room crews have their homes in Bombay and, although there is generally a considerable number of men from each community staying in Jamatkanas, or boarding houses, in Bombay, it is often necessary for serangs to telegraph to their tindals or others to bring the men down to Bombay. This is especially the case during the harvest season.

It cannot be said that there is any serious unemployment amongst these men.

Unfortunately through the reduction in the number of the company's ships and the fact that many ships are now oil driven we have on our books many more serangs than we actually need. This means that serangs who have completed a year at sea are required to stand off to give others a turn of employment and that they will be on shore for a period of about 15 to 20 months.

The serangs do not wait in Bombay but go to their villages until near the time they may be required. Some even wait until they are sent for to take their turns.

This method has proved entirely satisfactory to the company and to the men themselves.

Every effort is made to prevent bribery and the serangs and men are warned at muster that any giving or taking of bribes will lead to instant dismissal from the company.

As neither the ghat serangs nor the brokers have any influence over the choice of serangs there is far less bribery than formerly and one or two cases of summary dismissal have discouraged the serangs from squeezing their men.

*Duties.*—Men are on three watches, working 4 hours and resting 8 hours.

*Saloon Crews.*—Only Goanese are employed in the native saloon crews of the P. & O. company's ships and these men are selected individually without any assistance from butlers or pantrymen.

Every man employed in P. & O. has his name registered in the company's books where a complete record of his service is kept.

When men are required for ships a list of men is made out from the register, names being taken in order according to the time they have been out of employment. If any men whose names are on the list fail to present themselves a message is sent to the man's club to ascertain if the man is in Bombay.

There are two unions in Bombay to which these men mostly belong—The Indian Seamen's Union and the Bombay Union. The majority of the P. & O. employees belong to the latter.

These unions are of assistance to us in bringing forward the men required. Although in the past the men have suffered heavily through mismanagement and defalcations in the Indian Seamen's Union, this appears now to have been remedied and as long as the unions use their funds for the benefit of their members and not for the benefit of the professional exploiters of labour, they should be of considerable service to the men during their long periods of unemployment.

The majority of Goanese are Portuguese subjects domiciled in Goa but they come to Bombay for employment, living in Goanese clubs or boarding houses of which there are over 300 in Bombay.

There is unfortunately a serious state of unemployment amongst these men and far more men are offering themselves for employment at sea than can be taken on.

With the exception of certain of the higher ratings no men are allowed to serve more than one year at sea. They must then come ashore to make room for others. The usual period of unemployment for the company's regular servants is, for pantrymen and saloon waiters about 16 months, for other ratings about nine months.

So far as the P. & O. company is concerned, this state of unemployment has been largely brought about by the men themselves or rather by unwise action of the Indian Seamen's Union in forcing them into a strike some three years ago.

*Duties.*—As in all other lines carrying Indian saloon crews.

The wages paid in the P. & O. company for ships engaging crews in Bombay is as follows :—

*Deck Department.*

Serang	..	..	..	Rs. 80 p.m.
Tindal	..	..	..	Rs. 51, 45 and 39 p.m.
Lascars	..	..	..	Rs. 32 p.m. (if with four years' sea service).
"	..	..	..	Rs. 29, 26, 23, 14 p.m., according to service.
Bhandary	..	..	..	Rs. 34 p.m.
Topas	..	..	..	Rs. 30 p.m.

*Engine Department.*

Serang	..	..	..	..	..	Rs. 80 p.m.
Panniwallahs	..	..	..	..	..	.. 44, 40, 36-3 p.m.

## PART II.

**Resignation.**

Mazagon Dock is a marine engineering, shipwright and stores concern, dealing principally with the repairs and requirements of vessels of the P & O., B.I.S.N. Cos., and allied fleets sailing to and from the port of Bombay.

**Recruitment.**

*Labour.*—The bulk of the skilled labour employed comes from districts in the Bombay Presidency, the different classes employed are Hindu and Mahomedans, with some Indian Portuguese. The first named usually visit their homes once a year, more than the other classes. Casual and unskilled labour is not employed to any great extent in the works and is of the usual coolie class engaged as occasion requires.

*Absences.*—A small proportion of the workmen as stated above absent themselves before or after the monsoon to attend the cultivation of their fields and repairs to their homes.

*Number Employed.*—The average daily attendance of workmen in the engineering and shipwright departments is 2,300, with a minimum of 1,700 and maximum of 2,600 respectively. In addition, casual labour is engaged through the contractors, averaging 40 per day for the above, and a further number averaging about 250 men per diem are requisitioned by ship's officers for cleaning and scaling of vessels in the docks and harbour.

*Method of Recruiting.*—Skilled artisans are more or less permanently employed, with some fluctuation according to whether busy or slack times, other skilled or semi-skilled labour when required is obtained from men offering themselves for

employment and is selected according to proficiency and general ability of the applicant. The supply is usually greater than the demand and as selection is thus possible there is no need of employment agencies.

### Employment.

*Average duration of Employment.*—Workmen in the shops are allowed to work without any particular age limit, provided they continue physically fit, and some old workmen who have done good service in the past are retained under these conditions.

*Promotion.*—Skilled workmen are promoted to higher grades as opportunities occur, i.e., in the event of the position of mastery falling vacant by death or retirement.

*Retrenchment.*—This must necessarily affect the permanent workmen disadvantageously when sufficient work does not present itself to give employment to the whole number, but to minimise the hardship as much as possible the men are put on shifts during slack periods which is apportioned as equitably as possible.

*Labour for Mail and Passenger Service.*—Casual labour to the average of about 230 men weekly is employed through contractors, on the arrival and departure of vessels, in the handling of mails and passengers' baggage.

*Relations between Staff and Workmen.*—These are generally satisfactory. The workmen have always access to their superior officers and through him to the general manager, or even direct access is not denied.

### Time-Keeping.

*Registers.*—Attendance is registered by timekeeper and staff of clerks, checked by the superior officer in each department and extensions checked by accounts department. Men working outside or on vessels are mustered and sent out on a "challan" (description of work to be done form) to the officer of the vessel, or to any other party, where requisitioned.

### Wages.

*Payments.*—Payments are made in cash monthly, on a daily rate of wage; payments are made about the middle of the month, the payment boxes being filled in the managing agents' offices, brought to the works and distributed by, or in the presence of responsible departmental officer. Daily paid or casual labour engaged through contractors is paid by them.

*Basis of Payment for Overtimes.*—Overtime is calculated on the same basis as ordinary pay, i.e., 8 hours per day.

*Deduction by Fining.*—Is not resorted to.

*Unclaimed Wages.*—These are returned to the managing agents if not claimed within a week or ten days.

### Health.

*Sanitary Arrangement in Works.*—Suitable latrines and water supply is provided, with drinking water taps and wash places are provided.

*Accidents.*—There is a surgery with an apothecary in attendance, to provide first aid in the case of accidents, which if serious are conveyed to the hospital.

### Hours.

*Hours per Weekday.*—Working hours in engineering and shipwright departments are: weekdays from 7.30 a.m. to 12 noon, and 1 p.m. to 5 p.m.: 8½ hours. Working hours on Saturdays from 7.30 a.m. to 1.30 p.m., 6 hours: totalling 48½ hours per week.

*Holidays.*—There are four paid holidays in the year, viz., New Year's Day, Good Friday, King Emperor's Birthday and Christmas Day. Sunday is observed as a day of rest, except when urgent work on steamers demands attendance.

*Small Craft Flotilla.*—There is a number of tugs, launches and barges in use for harbour work, manned by an aggregate of 500 men. These men more or less live on board the craft and do not serve under articles of agreement. The Indian Merchant Shipping Act does not apply to these vessels.

*Stores.*—A large store is maintained for ships' requirements giving employment to 60 permanent coolies and about 28 occasional men per day.

### Welfare.

*Recreation.*—A teashop is run by outside agency situated on the premises and a sports club which is chiefly patronized by clerical staff.

*Loan Society.*—An employees' co-operative society was instituted seven years ago, open to all workmen and clerks, the purpose of which is to enable employees to invest savings in a safe and remunerative manner and to obtain loans on reasonable terms and so avoid usurious money lenders.

The present number of members is 888, the issued share capital is Rs. 96,501, and the outstanding loans are Rs. 81,975.

*Safety.*—Every reasonable precaution is taken for the safety of workers, which is carried out to the satisfaction of the Factory Act Inspector in the guarding of moving parts of machinery, testing of crane wires, etc., which measures are not only consistent with humanitarian motives, but in self interest. The Indian Compensation Act provides a strong incentive to safety measures.

*Workmen's Compensation.*—According to the Act employees "waiting periods" are paid for at compensation rates.

### Trade Combinations.

*Individual Trade Unions.*—One union so far has been constituted i.e., the Mazagon Dock Employees Union. This is in its infancy, and about 50 per cent. of the workmen are members. So far, its attitude generally speaking, is similar to other unions, under the management of outside labour leaders whose view point is always one-sided, without any regard to equity between the worker and the employer; the demand generally being increase of pay, irrespective of skill and efficiency in the worker, and continued employment whether there is work or not for him. Strict impartiality is observed in dealing with unionists and non-unionists. A desirable feature in these unions would be the management of their own concerns without interference from outside unions.

#### List of Minimum and Maximum Rates for June, 1929.

Designation.	Minimum.	Maximum.	Average.

LETTER FROM MESSRS. MACKINNON MACKENZIE & CO., AGENTS,  
THE BRITISH INDIA STEAM NAVIGATION CO. LTD., NO. S/3479, DATED  
11TH DECEMBER, 1929.

We have the honour to address you on the subject of the evidence tendered to your Commission on 23rd ultimo by the shipping master and the secretaries of the Indian Seamen's Union and the Bombay Seamen's Union, and would make the following comments in case they may be helpful to the members of the Commission.

### Recruitment.

We agree with the shipping master that the present system is quite satisfactory to employers. It was stated by the secretary of the Indian Seamen's Union that the engagement of serangs for this company is controlled by the shipping broker, but we would point out that this is not the case. We keep a register of serangs and butlers and they are engaged direct by our respective superintendents in conjunction with

the commanders and chief engineers, and all other qualifications being equal preference is given to the man who has been longest out of employment. If we have no suitable serangs available, we apply to the shipping master for a few to be sent to our office, from which we make our selection quite independent of the brokers.

With regard to the suggestion that all seamen should be registered and employment offered to them in rotation, we do not favour this. It is our experience with regard to deck and engineroom crews that to obtain satisfactory results it is essential that the serangs and the men have mutual respect for each other and the present system under which the serang and his men come from the same locality or the same village lends itself to the smooth and efficient working of the department. It is not uncommon in the event of a serang leaving a ship through illness or other cause, for the crew to refuse to sail under another serang, and we think the idea of a serang having to engage men in rotation would prove most unsatisfactory even if found practicable. Naturally we prefer crews who have experience of our methods of working and we could not agree to being required to take men strictly in order of rotation. The company is responsible for the lives of passengers and the safe carriage of cargo, and we are therefore entitled to have a free hand in the selection of our men, in the same way as any other employer of labour.

We do not consider that unemployment is as serious as it appears at first glance, and we would point out that according to our information it is the custom for Indian seamen to return to their country for a considerable period, even up to eight to twelve months, after a year's service afloat, therefore only a portion of the seamen shown as unemployed are seeking employment, for it is our experience that, at times, serangs have difficulty in mustering a crew. We agree that the number of serangs offering is far in excess of the demand but do not think that it would be possible for more than three quarters of the serangs to muster a full crew at the same time. Most of these men would secure employment within a reasonable period if they were willing to sign on as lower ratings.

As we feel that it may be possible to arrange for the engagement of Goanese saloon crews in rotation by registering each suitable applicant for employment and engaging them in rotation, we have been experimenting in certain of our steamers. Results to date have not proved entirely satisfactory, for when the crew is appointed, the butler invariably complains that certain members of the crew are not to his liking, and it is found that the men to whom he takes exception are men who are not from his native village. When the butler is called upon to explain any shortages of plate, linen stores, etc., on the vessel's return to port, he protests that he complained about certain of the crew appointed and claims that he cannot be held responsible for the actions of men of whom he does not approve.

*Calcutta Crews on Bombay Steamers.*—It was mentioned that Calcutta crews were brought to Bombay as their wages are lower than those prevailing in Bombay. Wages in Calcutta are slightly lower than in Bombay, but when the cost of bringing the men across is taken into consideration there is little or no saving.

We may say our reason for employing Calcutta engineroom crews is entirely due to their being found more efficient under the conditions which the vessels they are employed on run. The disadvantage of employing them is that to replace men who desert or fall sick we have to send to Calcutta, and this takes a few days to do, and sometimes results in a vessel sailing without her full complement.

In April, 1928, we appointed a Bombay engineroom crew to the "Karoo," on the African Mail Line, but the result was not a success. On the first three voyages it was found that the trimmers although keeping six hour watches had great difficulty in supplying the firemen with sufficient coal. On the fourth voyage the trouble was more serious, and the steamer left Seychelles a day late, and some of the deck crew were sent below to assist the firemen and trimmers. The coal consumption of the steamer also increased very considerably owing to bad firing and we, therefore, had no alternative but to revert to Calcutta men.

In July, 1928, we tried a Bombay engineroom crew on the "Ellora," on the African Line, with similar results. As a Ratnagiri crew could not be obtained (which seems to discredit the reports of unemployment) a Punjab crew was signed on, and they were personally selected by the shipping master. Adverse reports were received after the first voyage, but the chief engineer was willing to persevere with the men and latterly they turned out fairly satisfactory. As 26 of these men refused to sign on again on expiry of articles, and it was impossible to obtain a suitable Ratnagiri crew, we were compelled to engage a Calcutta crew.

It has been our experience throughout that Calcutta engineroom crews are more satisfactory than Bombay crews on steamers which have to maintain a fairly high speed.

The following statement shows that the number of Bombay crews employed on the company's steamers based on this port is far in excess of the number of Calcutta men engaged.

	Deck crew.	Engineroom crew.	Saloon crew.
Slow Gulf Service :			
Five steamers .. .. .	Bombay	Bombay	Bombay
Fast Gulf Service :			
Three steamers .. .. .	Bombay	Calcutta	Bombay
African Service :			
Five steamers .. .. .	Bombay	Calcutta	Bombay
African Coast Service :			
Two motor vessels .. .. .	Bombay	Bombay	Bombay
Karachi Service :			
Two steamers .. .. .	Bombay	Calcutta	Bombay
Malabar Service :			
Two steamers—1 steamer .. .. .	Bombay	Calcutta	Bombay
1 steamer .. .. .	Bombay	Bombay	Bombay
Home Line :			
Two motor vessels—1 motor vessel .. .. .	Calcutta	Calcutta	Bombay
1 motor vessel .. .. .	Calcutta	Bombay	Bombay
Four steamers—2 steamers .. .. .	Bombay	Bombay	Bombay
1 steamer .. .. .	Bombay	Calcutta	Bombay
1 steamer .. .. .	Calcutta	Calcutta	Calcutta

*Brokers.*—The broker's only duty in connection with new crews is to make an advance of one month's pay to each man who is engaged. Should any man desert or be signed off articles before he has earned the amount of his advance, the loss of the unearned portion is borne by the broker. In return for this immunity from loss the company pay to the broker a commission of 5 per cent. on all advances made by him. It was suggested that this work might be performed by a Seamen's Co-operative Society, and we would have no objection provided we are guaranteed the same immunity as at present.

We trust that the contents of this letter will prove of assistance to the members of your Commission and we shall be glad to supply any further information you may desire.

Mrs. SHAREEFA HAMID ALI, VICE PRESIDENT, ALL INDIA WOMEN CONFERENCE AND PRESIDENT KOLABA WOMEN'S ASSOCIATION.

### III.—Housing.

16. Very few houses are supplied for labourers by factory or millowners. Their housing accommodation is usually extremely insanitary. Eight or twelve people sometimes occupy one small room in large industrial cities like Bombay.

There are one or two mills which have built good quarters for their workers. I consider the Sholapur mills, owned by Narotamdas Morarji as a model mill in this respect. Private houses are more expensive than those supplied by millowners or factories and their sanitary condition much worse.

It is urgently necessary that Government should appoint more women inspectors to supervise the housing of women labourers as housing accommodation has a good or evil moral effect on workers, especially the young women and girl workers.

### IV.—Health.

23. General health of working class mothers is far from good. Opium is given to babies as a rule by the working-class women to keep them quiet. This leads, of course to great infant mortality and physical deterioration of the children.

Every factory which employs women should be made compulsorily to keep a creche and to appoint a trained factory welfare worker. In this respect India is far behind England where in a place like Horrocks works for instance five welfare workers are employed. And this is pretty generally the practice in all the centres of labour in England.

25. Even when medical facilities are provided the women do not know how to make use of them. For this it is necessary either to employ or to encourage social workers to come and teach the women the necessity of using sanitary arrangements,

taking care of their drinking water, the need of bathing and washing and also more necessary than anything else the need of getting in only trained midwives or women doctors for maternity cases. Unless registration of dais and midwives is made compulsory the women labourers will undoubtedly send for the cheapest help and that will be the untrained filthy dai who is chiefly responsible for the appalling mortality amongst women and children.

#### V.—Welfare (other than Health and Housing, but including Education).

Employers must be made to feel responsible about the general welfare of their workers. As far as women are concerned they must be given the use of hospitals, creches and maternity homes, and arrangements made for their education, not in schools necessarily, but by talks on health, hygiene, food values, baby nurture, cooking, housekeeping and training of children, and arrangements should also be made to teach the three "R's" to those women who are willing to learn.

Very few mills or factories even provide a shelter for meals. The Sholapur mills is the only place I have seen where a canteen for millhands is provided.

56. Reading and writing for men and children should be compulsory, and a good deal of teaching in various domestic and health subjects should be given by lantern slides for men, women and children.

38. Co-operative grain shops and cloth shops should be provided by every mill and factory.

#### VI.—Education.

41. It is desirable to have vocational and industrial schools attached to teach the future workers.

42. The right type of education does undoubtedly increase the efficiency of industrial workers.

#### X.—Special Questions relating to Women, Young Adults and Children.

82. The admission of infants in factories is necessary, but employers must be compelled by law to provide a creche for each factory.

83. Women should not be allowed to work for more than six hours, because they are compelled to do a good deal of work at home before and after working hours.

---

#### Miss M. KARA, SEVA MANDIR, BOMBAY.

*The Housing Problem in the district of Tardeo.*—Our knowledge of the housing conditions in the district of Tardeo is limited. Here we shall only state those facts which we have collected through the inhabitants or through our own observation of 6 or 8 chawls (tenements) we come in contact with almost daily, due to our social service centre in that district. The dwelling places occupied by the wage earning classes are of four types :—

- (i) Chawls owned by private individuals, (ii) chawls provided by the employers, (iii) chawls provided by the B.B. & C.I. Rly. Co. with somewhat modern structure, (iv) tin sheds. The plots owned by the landlords.

The Maneckji Petit Mills which is in the district where we do our social work, provides thirteen chawls with 400 rooms for their workers. The total number of workers at this mill is about 4,050. We are in touch with only one of these 13 chawls provided by the employers.

There is no building provided by the Government in our district but there are four chawls provided by the B.B. & C.I.Rly. Co., and the rest are owned by private owners.

*Nature of Accommodation provided by the Employers.*—Through the studies of the chawls of the employers, we can say in general that the housing condition of these labourers is very unsatisfactory. One room is provided for each family which is not big enough for our joint family system. Also the members are allowed to sub-let their rooms, to keep boarders even in the passages, on verandahs and also they build a shelf in the passage where people rest during the night. Very often one family has 14 to 15 boarders in such a small room. The mill authorities officially allow 4 to 5 members in one room, but this rule is not strictly observed.

*Chawls owned by Private Individuals.*—There seem a considerable contrast between chawls provided by the employers and private individuals. In the first case, the advantage is of the rent, which is practically half of that of the private owners. Also the rooms are better lighted and better ventilated because of the verandahs in the front. The employers' chawls also provide "mori" (washing place) in the room for the purpose of washing and bathing, which is a very great help to the women folk, specially at the time of sickness and delivery. Also a garbage can is provided to collect the rubbish, and we do not see open drainage in between two chawls. The above mentioned facilities are not found in the chawls owned by private individuals. The private chawls are absolutely inadequate to meet the demand of the workers. The rooms are small, dark and stuffy. The greatest disadvantage is that they have no "mories" (washing places) or no place even to throw water while cooking. We know of some cases where a temporary shed was put up in front of the room to wash a newly born baby. Every kind of household washing is done in front of the room, where the water collects. There are taps provided at the end of each storey, but there is no facility in the room. There is more sub-letting, as they are free from restrictions regarding sub-letting, cleanliness and sanitation.

*Result on Health.*—The result of such housing on the health of the workers is detrimental. The over-crowding in the room affects health and morals. There is no satisfactory arrangement as regards latrines, drainage or cleanliness on the whole, either in the chawls provided by the employers or by the private landlords. There are still some latrines where there is no flush system. Also the complaints regarding bad drainage, broken pipes, etc., are not attended to by the people in charge. The Muccadams or the Bhaiyas who are supposed to look after the sanitation and see to the regular attendance of the sweepers are very slack in their duties. The result is that there is always a terrible smell in both these types of houses. The old-fashioned latrines should be at once replaced by the new ones. During the monsoon, the water leaks from the roof in some cases. The ground being uneven the water collects during the monsoon. This results in malaria and many other diseases.

*Nature of Accommodation in Tin Sheds.*—The tin sheds are occupied by the depressed classes. These are level with the streets, and are not high enough for a person to stand erect. These tins are fitted together by stones, etc., and men, children, chickens and goats are herded together as one family. Each big shed is divided by cloth drapings into 4 or 6 rooms, occupied by 4 to 6 families. There is no light or ventilation and such huts are absolutely unsuited for any human habitation. These huts have been in existence for many years. There are no taps, no latrines, no water supply and the inhabitants have to go a long way for their respective needs. They have no baths for days and days, and we see the children covered with dirt, playing in mud by the side of the goats and the chickens. During the summer the sheds are too hot in the afternoons, so the inhabitants are found sitting on the roadside in the shade. Very little need be said in such circumstances regarding the results on health and morals. Just close to these huts there are buffalo stables, which have bad effect on the health of the people.

*Utilisation by the Workers of the Housing Accommodation available.*—There are no improvement trust chawls in our district, but the chawls provided by the employers are gladly utilized and appreciated by the workers; but such chawls are very few in number.

*Rent Rates.*—There is a considerable difference in rents of the employers' chawls and those of the private owners. The employers charge about Rs. 3 to Rs. 3-8 annas per room while they vary from Rs. 5 to Rs. 8.

The system of the rent in these tin sheds is very complicated. A man who owns a piece of land has given a contract for a certain sum, to another man who lives in the neighbourhood. This man has again given a contract to the Bhaiya who charges about Rs. 8 to Rs. 10 per shed to the inhabitants who sub-let their rooms to others.

*Problem of Sub-letting.*—This problem is very difficult in labour classes. Often the men-folk come to Bombay from the villages and have no homes. They come and stay with their relatives and pay some money for board and lodging. The head man of the family who is directly paying the rent for the chawls provided by the employer, is not employed elsewhere, but many others in his family and the boarders, who take advantage of these chawls, are not necessarily working at the same mill or factory.

*Effect on Morals.*—The present housing system leads to overcrowding and lack of privacy. The family life hence becomes very difficult, and all the activities of the home life are impeded. One great disadvantage is that many of the men folk do not bring their wives and children to Bombay, for want of room, and hence the men lead an immoral life. Often a man lives with another woman as his wife, and everything results in misery. Also when a mother is expecting a baby, she gives birth to

a child in the same room, where there are big grown-up boys and girls. At night all men, women and children sleep together. Often a newly-married couple get half of the room separated by a piece of cloth.

There are also common latrines for men and women which also have a bad result on morals.

*Improvement Suggested.*—The workers should have at least 2 rooms with 2 windows and a little space in the front. There should be 1 "mori" in each room. Also the system of sub-letting should be entirely abolished. The flooring in the room, should be of stone pavement and not of mud, as it is at present. There should be a separate latrine for men and women and more than one tap on each floor. Garbage-cans should not only be provided, but it should be seen that they are used. The supervision of the Muccadams and Bhaiyas should be regular and strict. The municipality should take more interest, and better care of such existing huts, sheds, and chawls. The people in charge, e.g., Muccadams are very neglectful to the complaints of the workers. The sweepers should attend more regularly than they have been.

*Tin Sheds.*—It is impossible to improve upon the tin sheds in any way; and the only alternative suggestion that could be made is that the municipal authority should never allow such huts to be erected, and should see to it that the existing ones are demolished as early as possible.

*Conclusion.*—This is our general observation about the housing conditions in the locality of Tardeo, where we conduct our work under Seva-Mandir. Our institution has been in existence for the last three years only, but we have done our best to help and uplift the cause of the workers. We have often taken women to the hospitals for their confinements and other sicknesses, for the very reason of bad housing. We have given free medical help to many women and children at our clinic. To take away children from the bad housing conditions, we have organized play centres for boys and girls in the evenings. We also have given health talks in the chawls and at our centre to women. There is also a nursery school at our centre for children, who would otherwise be in the streets. Many boys and girls are taken to the municipal schools by our workers. The grown-up girls and women come to us daily for educational and social purposes.

Thus we in our small way are trying to help the cause of the needy and the poor, yet, such private social agencies can do very little till the very homes of our people are what they should be.

---

Dr. NUSSERWANJEE HORMUSJEE VAKEEL, M.R.C.S. (ENGLAND),  
L.R.C.P. (LONDON).

Practising for the last 17 years in Bombay, I have been associated for the last 14 years with the textile mill industry of this city in the way of being medical officer to four different mills, viz., The Simplex Mills, the Mathradas Mills, the Hong Kong Mills, and the Wadia Woollen Mills. Of these at present I am medical officer of the first two mills only. During these 14 years, I have had a fair insight into the working of medical relief for the textile mill hand in this city, the effect of such relief on the physical well-being of the textile labourer and where such relief to my mind is defective.

In 1914, and up till the War came to an end, medical relief to the mill hands was poor indeed. Most of the mill dispensaries were very miserably equipped with medicines and the dispensaries were a disgrace. Even to-day, though several mill dispensaries have vastly improved, and some of them actually good, there are yet a good many where there is plenty of room for improvement, both in the quality and quantity of medicines supplied, as well as the general appearance and equipment of these dispensaries. In spite of this, as will be seen from the attached statistics of the two mills I have been in charge of (and I dare say other medical officers of some of the well-equipped dispensaries of some other good mills are of the same opinion), much good is done by these dispensaries; and if a personal interest is taken in the physical well-being of the mill-hand by the medical officer himself and not left to his subordinates, these dispensaries become very popular. The textile labourer shows on the whole, appreciation of work done and feels grateful for what is being done by the mill agents for medical relief.

The economic factor is largely responsible for the somewhat bad state of a good few of these dispensaries, as, much economy is exercised in the ordering of drugs. Imported drugs are very expensive in Bombay, and although much head-way is made in the way of manufacturing several drugs in India, and these can be bought in the market at comparatively low rates, they do not compare in quality to the product of the west and so the individual that suffers owing to cheap drugs bought, is the patient. In Great Britain great facilities are provided by the Government for the labour population to supply medicines cheap, and I do not see why the local Government or Government of India cannot help the mill-owners in these critical times to supply medicines to these institutions at very low rates. This can easily be done if the imported drugs are supplied to the mills at import duty-free rates. The indents for the supply of medicines for each month or each quarter of the year may be sent to special Government departments for inspection and endorsements. The medicines can then be bought at the usual market rates by the mill agents and then the Government can be asked to pay the mills the difference in the cost, which, in other words would mean that the medicines would be supplied duty-free. If this be done, better quality medicines and a larger amount of them can be bought by their agents for the relief of their employees.

In spite of much agitation, great talk and a number of strikes, I can unhesitatingly say that the health and general physical condition of the textile labourer, in general, has vastly improved since the years 1914-16, and in my opinion the factors responsible for this improvement are various :—

- (1) Better pay.
- (2) Lesser hours of work.

(3) Great improvement in the sanitary conditions of such parts of Bombay in which the mills are situated—the roads, which were the most horrible in Bombay are to-day, about the very best, minimizing the nuisance of dust (which means much less disease) ; and narrow lanes are converted into fine broad roads. The northern part of the island where most of the mills are situated is thus a different place in many respects.

(4) The chawls, though they are not all that is desirable and a few of the criticisms directed against them are certainly true, are, however, infinitely better than the horrible hovels in which the labourer used to stay in days gone by, as there is certainly more light and ventilation for fresh air in these new chawls than there used to be in the old dwellings.

(5) Lastly, the Compensation Act has been of very great benefit to the worker. Few can appreciate the real advantages of this Act more than men like me who were accustomed to see the ill-effects of the absence of this Act and compare them with the great advantages derived from its existence at the present time. It may be said at once, that even in pre-Act days, many mill agents at the recommendations of their managers were very humane and generous in compensating their men for injuries, but in most cases few cared as to what happened to the injured person—whether he lost a finger or a limb or his life, and the irony of losing a finger or a limb, was often, though not always, that he lost his job also—perhaps the only compensation he received. With minor injuries, certainly, he had to work day after day, causing him much pain and suffering and very often it was the jobber who was responsible for this cruelty as he was in those days more powerful than what he is to-day, and the movement of the injured parts with work caused not only pain, but slow healing of wounds. To-day things are vastly different. Whether the accident be small or great, the injured person is at once taken to the departmental head who sends the patient, accompanied by a jobber, to the mill dispensary. There the wound is examined and receives first-aid at once, the wound being thoroughly sterilized. If the nature of the injury is serious, the patient is at once sent to the hospital in a municipal ambulance which runs an admirable service, being always very prompt in honouring calls for accidents. If the injury is not so serious it is treated all the time at the mill dispensary and until the injured part is cured the patient is not allowed to work, and he gets full pay for the time he is recovering, provided of course, the medical officer in charge of the dispensary certifies to his regular attendance for treatment.

Although as a result of this Act, which, thanks mostly to the goodwill of the mill agents appears to work comparatively smoothly, the interest of the injured being thus secured, there must be set on foot some movement amongst the men themselves by resorting *en masse* to insurance against illness. It is a common and very often a sad sight to see men with high fevers trying to work against their strength and ability, not for one or two days but for several days together, because of the fear of loss in wages for the time they are absent ; and when recovered from the fever,

Mathuradas Mills, 1926-27.

## AMBERNATH LABOUR UNION.

## I.—Recruitment.

Workers of various communities from different parts of India are working at Ambernath in the factory owned by The Western India Match Co., Ltd. Pathans, Criminal Tribe settlers, Mahomedans from Northern India and Malabar, Navaganis from the Deccan plateau and Konkanis from neighbouring villages and the sea-coast, Malbari Hindus and Bhayas from Northern India, Christians from Goa and other parts, Telegus and others from Southern-India form the labour force of Ambernath.

In the rainy season when cultivation starts the village workers are frequently absent from work and some of them take final settlement and go away returning to seek employment when agricultural work is over. About 1,500 workers are generally employed in the factory.

Recruitment is practically through the supervisors resulting in favouritism and jobbery. If the workers are recruited by the management in co-operation with the local union favouritism and jobbery may be put a stop to.

There is much unemployment at Ambernath. Some workers have been victimized since the failure of the last strike in July, 1929. Lack of village industries is also responsible for unemployment to a certain extent. The village boys are often found seeking jobs in the factory in order to supplement their family income. There is more supply of labour than there is a demand for and this unemployment cannot be checked unless a few more industries are established at Ambernath.

*Unemployment Insurance.*—Some scheme for the relief of the unemployment at least for workers permanently settled in the Industrial Centre is necessary.

*Employment is Insecure.*—Leave rules are not liberal enough to meet human needs. Workers have often to take final settlement and go away because they cannot get leave even for a legitimate purpose. When they are able to resume work they come back to seek re-employment. Workers are in no way benefited by sticking loyally to their jobs. Absenteeism prevails to some extent. There is no difference made between regular and an irregular worker. The favourites of the supervisors are allowed all sorts of latitude while others are harassed. Agricultural operations in the rainy season, undetected and unrecorded sickness and necessity of relaxation to remove strain of work are some of the causes of absenteeism.

## II.—Staff Organization.

The manager of the factory, the works manager and the officers in charge of different departments are generally Europeans who do not know the language of the workers sufficiently well. They have, therefore, to depend on the supervisors who are recruited from English knowing workers in some cases. These middle men are in no way superior in culture to the workers and are responsible for many malpractices prevailing in the factory.

There are no facilities for the training either of the supervisors or workers. Promotions of workers are rare. There is no human touch between masters and men. The relations between them are quite mercenary. The system of employing supervisors of low standing is responsible for many malpractices. Works committees, works councils and industrial councils are not in existence. Record of work done and attendance are kept by supervisors. Wages are paid to workers in the departments through the officers in charge of the departments. Works committees started in a patronizing spirit cannot work satisfactorily. If the workers' representatives on a works committee are elected through the workers' unions, where they exist, such organizations may help both the employers and the employees.

## III.—Housing.

The majority of workers are housed by the management. There are four types of rooms built. New chawls have been recently built for higher class of workers, the monthly rent of each room being about Rs. 6 in addition to water charge at the rate of 6 annas per head per month. The second type of houses are concrete buildings and a great many workers have to live in rooms made wholly of iron sheets. These last are quite unfit for human habitation as they get very hot in the hot season and very cold in winter. Generally the working class families live in one room tenements. This results in overcrowding and is detrimental to health as well as to morals of the people concerned. Rents vary from Re. 1 to Rs. 6 per month according to the type of room occupied. During strikes the workers do feel the disadvantages of living in houses built by the employers. If workers are encouraged to build cottages in village fashion on modern plans they can be housed very cheaply and each family

may be allowed to have as many rooms as its number require. If Government and the management encourage the workers in organizing a Co-operative Housing Society the above suggestion may be carried out resulting in removal of overcrowding and consequent physical and moral improvement of the workers.

#### IV.—Health.

The general health of the workers is not satisfactory. There are annual visitations of malaria and other epidemics. Evil effects of disturbance of sex ratio are also marked.

Medical facilities are provided by the employers by maintaining a dispensary for workers. But as the present doctor in charge of it is very unpopular with workmen they use it only when they cannot do without it. They often prefer to go for treatment to another local doctor who is in charge of a dispensary in the Dharamsi Morarj Chemical Works, even though they have to pay for it. No provision is made of women doctors, trained midwives or dais. Sanitary arrangements are not satisfactory. Latrines both in the factory and the chawls are often out of order. There is a scramble for water supply at certain common water taps where water can be had only at stated hours and crowds are always seen doing penance for water. Bath-rooms and washing places are not provided.

Sickness insurance is urgently needed by working class people. They are in a great plight when they fall sick as their absence from work even for a single day deprives them of their wages and they have to incur additional expense to get cured.

A nursing home conducted with the ideal of service will make medical help popular with the people.

Maternity benefits have not yet begun. There are cases of women who have even lost their jobs after confinement.

#### V.—Welfare.

There is no welfare work done by the employers. The labour union has recently made a small beginning by organizing a Co-operative Credit Society and a store for the workmen. The management is willing to help such activities.

Two shop-keepers are allowed to run refreshment rooms in the factory. These rooms are shabby and are far from satisfactory. The so-called creche in the factory is a mockery. There is no systematic attempt made for provision of physical culture recreation and amusements.

The labour union since it started work in May, 1928, has arranged a few dramatic performances, a magic show and two magic-lantern lectures for the recreation of the workers.

For adults no education facilities are made available. For workers' children a primary school is maintained by the employers, but as its working is entrusted to a christian mission it is not as popular as it ought to be.

Provision ought to be made for old age and premature retirement of workers; otherwise they are sure to be stranded when they are no longer able to work and they are no more able to earn their living or be a drag on the earning members of their families. The necessaries of life such as food and clothes ought to be supplied to workers at cost price so that their meagre earnings may be made to go a long way.

#### VI.—Education.

There is a local board school at Ambernath for the children of the locality in addition to a school maintained by the match factory. There are no facilities for adult education and industrial and vocational training.

#### VII.—Safety.

"Safety first" propaganda ought to be carried on by the employers even in their own interest. Some measures ought to be immediately adopted for the prevention of cases of burning and other accidents in the match factory. Accidents are very frequent at Ambernath.

#### VIII.—Workmen's Compensation.

The workers are benefited by the Workmen's Compensation Act. The union and the employers co-operate in seeking that due compensation is paid in each case. Insurance by employers ought to be made compulsory so that the employers may not be tempted to deprive the injured of their dues. Workers, meeting with accidents, ought to be paid full wages till they are in a position to resume work or they are compensated for the injuries sustained.

**IX.—Hours.**

Hours of work per day should not exceed eight. Ten hours a day causes too much strain and is responsible for much of the loitering and irregular attendance by workmen. Generally six days are worked per week.

The workers go to the factory at 7 a.m. and work up to 12 noon. They resume work at 1 p.m. and leave at 5.30 p.m. or 6 p.m. There is one hour's recess after five hours' work. If there are two recesses instead of one at the end of each three hours' work there will be less fatigue and there will be more output of work. There is generally one holiday in a week.

**XII.—Wages.**

Rates of wages as cut down in 1927 prevail at present at Ambernath. The workers are paid twice a month. The wages vary between 10 annas to Rs. 3 per day. In surrounding agricultural area the wages are as low as 8 annas per day but the worker is fed in addition to his daily wage once during the working hours.

Overtime and Sunday work is paid at  $1\frac{1}{2}$  of the usual rate. Minimum wages ought to be fixed by law. At present the minimum wage earned by a woman comes to about Rs. 14 per month and that by a man to Rs. 20, a minimum fixed by law ought to be at least Rs. 30 per month.

Fines are imposed for absence without leave at the rate of half a day's wages for one day's absence. A worker is also fined for negligence. Rent and water charges are deducted out of wages.

Amounts collected as fines are distributed as bonus amongst workmen meeting with accidents. Wages for fifteen days are in the case of each workman withheld and then payments are made. Unclaimed wages ought to be paid whenever demanded by the worker to whom they are due.

Workers are heavily indebted. The rates of interest range between 75 per cent. to 300 per cent. in the industrial areas and between 25 per cent. to 50 per cent. in the villages.

Bonus and profit sharing schemes are not in existence. Supervisors are paid bonuses according to the production of workers.

All leave is without pay. Since the starting of the union leave is granted for legitimate purposes on representations being made. Workers from neighbouring villages go on leave generally in the rainy season and unreported sickness is also a cause for absence. Generally it is difficult for workers who are illiterate to obtain leave even for legitimate purposes on account of the unsympathetic attitude of the supervisors. Some privilege leave ought to be granted every year to every workman after one year's service in order to enable him to go on a holiday.

**XIV.—Trade Combinations.**

The Ambernath labour union was formed on the 1st May, 1928, during a strike. The strike ended successfully on the intervention of Mr. N. M. Joshi the president of the union. There was another strike at the end of July, 1928, owing to the management's policy of victimization. This strike was also successful. The union has represented about 500 grievances of the workers to the management and majority of them have been redressed. Night work by women was detected by the union. The union has successfully exposed many of the malpractices practised by supervisors and some of them have been brought to book. Two supervisors have been fined in Law Court. One has been dismissed by the management after an enquiry instituted on representations made by the union. One has been transferred to another department and still the management is partial to supervisors and hard on workers.

The workers as a class appreciate the work done by the union so far but religious differences between Hindus and Mahomedans are hampering the progress of the union; there was an unsuccessful strike in July, 1929. The failure was due to communal differences of which full advantage was taken by the management. Since this event the union's activities have suffered to a certain extent though all the activities started by it are still going on. Three workers have been sacked and about twenty workers have been still kept out of employ.

The attitude of the directors and the manager is not unsympathetic. The union has established a practice of meeting the management once a week to get all grievances redressed. This method wards off all avoidable trouble and maintains peace and order in the working of the factory.

There were three general strikes since the union was started. Two of them were successful and one failed. The first strike lasted for two weeks, the second for a week and the third only for a day. The first two strikes were amicably settled and the third failed owing to communal tension amongst the workers.

The union has affected the conditions of workers to some extent. Dismissals have become very rare. Fines are in some cases cancelled when imposed without sufficient reason. Jobbery is checked and all sorts of legitimate grievances of workers are redressed. Physical punishments and abuse of workers have vanished.

The union has organized a Credit Co-operative Society and a store for the benefit of all workers and an out-door dispensary has been recently started.

Ambernath is surrounded by a group of villages the residents of which are also being beneficially affected by the activities of the union. An association of farmers has started work and it is undertaking co-operative sale of paddy this year and intends to organize social work for the betterment of village people.

---

#### THE COMMITTEE OF THE MAHARASHTRA CHAMBER OF COMMERCE.

*Introductory.*—The committee of this chamber are alive to the fact that capital as well as labour are both essential to industry and that their harmonious relations are a *sine qua non* of the prosperity of industry, other factors being what they should be. The committee, therefore, have always tried to view with sympathy and understanding all proposals, from whatever source emanating, for the good of labour. They desire, however, to emphasize that unless there is an appreciation and understanding of the whole situation by the workers themselves and unless they are alive to the exigencies of the true industrial position in this country, no great advance is possible in the direction of amelioration of the working classes. The committee have watched with increasing uneasiness the recrudescence of working class unrest all over the country, during the last year or two. It is rather unfortunate that frequent stress should be laid upon the want of identity of interests between labour and capital by even those who claim to be working for the good of labour. This unnecessarily creates cleavage and fanned class-feeling and even at times class-hatred, rendering reciprocal appreciation of each other's difficulties extremely difficult, due to the generation of heat. An atmosphere of suspicion or mistrust, wherein each party views the other's expressions and actions as moves calculated to deliberately defeat its own purposes, is certainly not conducive to the mutual understanding or to the solution of difficulties facing both the parties. The committee, however, have to say that such an unpleasant atmosphere has existed in this country in any case so far as Bombay is concerned, for some time past, and consequently the task of adjustment of mutual differences has been rendered very difficult.

#### XIV.—Trade Combinations.

*Genuine Trade Unionism is in every way desirable.*—The committee take this opportunity to state that they stand for genuine trade unionism and its healthy growth. The rank and file of labour can only learn to correctly appraise labour problems and see things in their true perspective through the schooling of such a growth. That will, in course of time, render it possible for both labour and capital to understand each other better than they are doing at present. It is always preferable to have an organized and intelligent labour than to have a large crowd of workers without any organization, cohesion, or discipline. It is desirable more particularly from the point of view of the employers, as it is more convenient for them to understand labour grievances from the unions than from the individual workers, who often number several thousands in any decent-sized, well-established and organized modern industrial establishment.

*Workers are fairly well organized in the Cotton Textile and other Industries of the Country.*—As far as the cotton textile industry is concerned, the workers are fairly well organized in unions. The Bombay textile workers are organized to the extent of 70 or 80 per cent. The textile workers at Ahmedabad also are similarly organized. The other industrial centres in India, like Cawnpore, Calcutta and Nagpur, have also unions of their workers. The workers in the match industry and the steel industry in the country are also organized. The growth is more or less recent and covers for the most part a period of about a decade, the period that has elapsed since the close of the great European War (1914–1919). The value of trade unions is being increasingly appreciated both by the workers themselves and by the capitalists. Although trade-unionism in this country has had the advantage of experience of the movement in other western countries to guide it, and although its growth has been rapid enough, it is still in its infancy and trade-union activity is not still regularised, although the 1926 Trade Union Act has gone a great way in putting trade unions on a proper basis. As has been earlier observed the rank and file have not yet learnt

enough and naturally their control of the unions' policy is not quite effective. It must, however, be noted that the workers are becoming more intelligent day by day and they are evincing greater interest in problems that affect their interests. After all the workers are not so ignorant as they are commonly supposed to be. The attitude of employers is no longer one of hostility or opposition to these unions, though in some cases one may occasionally see unwillingness on the part of the employers to recognize the union. This is not quite an unusual or a new thing to notice in the early days of trade union movement in a country. Similar opposition was evinced in England by the employers in the infancy of the trade union movement. Both the employers as well as the employees will have to adjust themselves to the requirements of the new situation which the evolution of the modern organized industry has called into being. The question is only one of time. The railways in this country are gradually passing into the hands of the State. There is no valid reason why employees in State-owned industrial concerns should be in a different category, so far as the application of trade union principles to them is concerned. It is possible to say that the employees in the "public utility" services stand on a different footing on account of the nature of the services in which they are employed. Even there it is only a question of how and where to draw the line of demarcation between these and others.

*Strike is a Weapon to be used in the Last Resort; Many Grievances can be removed by Representation and Negotiation.*—It is rather unfortunate that strikes are often, and at times, one is tempted to say, unnecessarily declared even for redress of smaller grievances as could be seen from the history of the recent Bombay strikes in the textile industry. They are sometimes declared even without the knowledge of the union officials. The workers are not yet educated in the true principles of trade unionism and they naturally think that strike is the most handy weapon. It is not, as a matter of fact, a weapon to be so lightly used now and then, it is to be used only in the last resort. Many grievances are such as can be at once removed by means of representation and negotiation. There may be others which cannot be at once removed by these methods, but which surely yield to the same treatment if persisted in for some time. It will be yet some time before labour leaders rise from the rank and file of workers themselves and make outside help unnecessary. The mass from which the average industrial worker in this country is recruited is illiterate unlike the general mass of people in the western countries. Naturally they lack, at least in the beginning, the sense of responsibility. The blame for this appalling illiteracy of the working class rests primarily with the Government of the country which has done so little to wipe it off.

## XII.—Wages.

*The General Lowness of Wages in this Country is due to a Variety of Causes.*—It is true that the general level of wages of industrial workers in this country is low. The committees, however, think that no comparison could be usefully instituted between the wages here and those in the West. It would lead us nowhere. Unlike the advanced countries of Europe and America, this country is industrially very backward. Not only are there few industries, but even those that exist are mostly quite in their infancy; and none have grown to a robust height mainly on account of the *laissez faire* policy followed by the alien Government of this country. When the industries themselves are not thriving and prosperous, it naturally follows that wages have to be low. Apart from the smallness of wages and causes such as want of thrift, lack of foresight, etc., on the part of the workers, the principal and the most powerful cause which accounts for the miserable condition of the Indian working class is the wide-spread drink evil. He has little savings, if any, due to the smallness of his wages, and these again are frittered away in drink.

*The Drink Evil is the Bane of our Industrial Worker.*—The general conditions of life in this country are different from those that obtain in the west; and hence the generally recognised western standards of a worker's life, must not be applied here, in their entirety without due regard to the factors which mark the conditions here.

Wages in manufacturing industry are higher than those in agriculture. The Bombay mill workers are not at present adequately remunerated as the industry is not paying. Bonus is paid to the workers but the committees are not aware of any profit sharing scheme instituted anywhere except for an attempt that way in one place in the country. The extent of the exploitation of workers by jobbers deserves to be investigated. The committees do not consider that it would be either advisable or possible to establish minimum wage by law in this country to-day.

It has to be admitted that labour has become more efficient than what it was some years back. It is, however, still behind the western workers in point of efficiency. In India a large percentage of factory workers are still not industrial workers throughout the year and attend for some months to their fields also. This

has some advantages but from the point of view of the efficiency of the workers it has some disadvantages also. The class of workers however, who are purely industrial workers is steadily growing. The tropical climate of this country as also the conditions under which he works have also something to do with his comparative inefficiency as compared with the western worker. With all this our workers, it must be said to their credit, are giving a very creditable account of themselves and there is no doubt they will soon equal the western workers in this respect.

### IX.—Hours of Work.

“Shorter hours” principle and its value are being increasingly appreciated by our industrialists. The working hours are at present 10 in factories and in course of time as conditions permit they would be still reduced. The G.I.P. Railway have adopted an 8-hour day recently. But unlike other industries which have to work under a regime of free competition both internal and external Railways are in a peculiar position, due to their being in the position of monopoly public utility services and hence unaffected by competition. Shorter hours will rather therefore be slow in coming in industrial establishments. Shorter hours of work are needed for workers, so that they should have leisure for recreation, etc., but this is not possible all at once. This country has subscribed to the International Convention adopted at Washington. The committee are, however, unable to endorse the view that this country must allow itself to be dragged along with the more advanced nations in these reforms without consulting the convenience of its own national economy. The example set by the great American motor manufacturer in respect of short hours and high wages is there for the world to copy, but it will be a long time before we reach the stage when we can do that.

*Trade Unions being in their Infancy, they are rather in a Militant Mood to-day.*—There are few agencies, if any, to induce and encourage the habit of saving amongst the workers. Trade unions are a plant of recent growth, and they are too much in the militant mood of mind at present to attend to any other consecutive schemes of work for the betterment of the conditions of the working class. Their whole faith seems to be in fighting the capitalists in order to obtain better wages, not knowing that this can only be possible if the industry itself prospers and pays well. They appear to think that wages being increased other things can adjust themselves. If a tenth of the zeal and energy which the labour leaders are at present expending in fruitless fights were devoted to weaning the workers from the drink evil or to teaching them the habit of a cleaner and more hygienic living or inculcating in them the spirit of co-operation and self-help, some real and lasting good could surely have been done and the workers would have rendered a better account of themselves both in working as well as fighting. The committee note here with regret that the government of the country are mainly to be blamed for the drink evil in this country.

*The Government of the Country are mainly to be blamed for the Drink Evil.*—Workers' efficiency as well as their general condition will both be much better if this evil is root and branch destroyed. The testimony of Henry Ford is overwhelming on this point. The committee therefore urge that the Government should take immediate steps to put a stop to this drink evil. The steps will materially and markedly enhance the efficiency of the workers.

*No General Economic Policy for the Industrial Development of the Country followed by the State.*—Not only have the Government failed to encourage the industrial growth of India by following till very recently a free trade policy against which Indian political leaders and Indian economists have protested *ad nauseum*, but on the contrary they have tried to burden the infant industries by prematurely trying to give effect to the new fangled western ideas of labour benefit here. They have promptly ratified the International Labour Conference conventions and recommendations; it would, however, have been to their credit if they had equally promptly shown the desire to help industries either by trying to negotiate a settlement of trade disputes or by promptly setting up protective tariffs where a case is clearly made out. The Government are however, moving at snails' pace in this direction. The development of industries in this country has been without any plan, as no definite and general policy for economic development of the country is pursued by the State, the Government always considering that industry was no part of their business.

*Naturally, therefore, no Co-ordination of Industrial effort in the Country.*—Nothing has been done by the Government either to bring about or accelerate the growth of industries in this country. Whatever has been achieved so far is due to private initiative and enterprise. There is naturally no co-ordination of effort in the industrial development in the different parts of the country. No wonder then that machinery, chemicals, and other things have still to be wholly imported. The State has not only not cared to develop other industries, but it has not also done anything to develop even those industries which are considered to be key-industries.

Further the State has never cared till very recently, and even that under the great war time pressure, to patronize the products of Indian industry. All this has reacted very unfavourably on the industry as well as on the general economic condition of the country. The workers, as a consequence have suffered. Indian agriculture is no longer able to support the population with its growing needs.

*The Committee are for giving every Amenity of Life to the Workers, but consistently with the ability of the Industry to bear the burden.*—The committee of this chamber stand for giving every amenity to the workers—amenity which can be given consistently with the ability of the industry to bear the burden. This central fact can never be lost sight of, and it need not be pointed out that all attempts at improvement of the condition of the working class means additional expense. It is not to be inferred from this that the committee do not want to see labour benefited further. They would like to see all recognized and proved grievances redressed, either by administrative action on the part of the industry concerned, or by legislative process. In all this however, it must be stated, that due regard should be had to the Indian conditions and to the state of the industry itself which ultimately has to foot the bill. Legislative action should only be taken when both the workers and the employees have asked for the same, and after a careful consideration of the question. Howsoever desirable it may be to have a nation-wide uniformity in this respect, the committee think that in many cases it would be found to be useful as well as convenient to carry such legislation through the provincial legislatures, as conditions differ widely from province to province, this country being a sub-continent in itself.

### III.—Housing.

A fair amount of work is done for the working class in respect of housing, at least so far as Bombay is concerned.

In the matter of housing of the textile workers in Bombay, the industry, the Government and private individuals have all done work in their own ways. The housing may not be quite up to the mark from hygienic and other points of view and it can be conceded that there is scope for improvement. But what exists to-day is a distinct advance on what existed before. Housing of a big industrial population, like the one in Bombay, is no easy thing in a costly place like Bombay. In the matter of lighting, conservancy and water supply there is generally no ground for complaint. Rent charges for houses are rather high, but recently it is understood, they have been reduced to enable the workers to take advantage of the development department chawls. Sanitary arrangements both at home as well as at the places of employment are fairly satisfactory. There is enough water provided for drinking, bathing and washing purposes. If there be noticed any defect, the employers and landlords set matters right as soon as it is brought to their notice. As regards medical facilities, it can be stated that the employers, Government, the municipal corporation of Bombay and private agencies have done much in this direction.

### V.—Welfare Activities.

Welfare work is also undertaken by employers and other agencies such as the Social Service League. Employers have often done it unasked. There is much scope for work in this direction. Arrangements for recreation and education may not be quite satisfactory. They may be meagre but the industry has done something in this direction. The committee however like to state that the responsibility for seeing the masses equipped with the elementary education rests primarily with the Government and they cannot shift it on to the employers after the fashion of log-rolling as they call it. Provision of play-grounds for workers' children is not an easy question in a costly place like Bombay and the Government ought to co-operate with the employers for providing them with plots at a nominal charge, or even absolutely free of charge. It has to be admitted that there is ample scope for health and other welfare work for labour. But there are difficulties in the way even here. Incidentally it may be mentioned that some of them are so serious that it is not possible to overcome them unless state takes prompt and effective action. For instance, it is no exaggeration to say that milk sells in Bombay dearer than in the biggest cities of the world. This most essential product has now gone almost beyond the reach of the working class people. Unless the Government take prompt action by stopping the daily slaughter of milch cattle in the Bombay slaughter houses and make it obligatory on the railways to allow a larger quantity of milk free of charge to come into Bombay as they do at Calcutta and to charge nominal freight rates for taking dry buffaloes out of Bombay, no improvement in the milk situation seems possible, and milk is so essential for children, in fact it is the very best food for them. Even the middle classes are experiencing great difficulty in securing pure milk at reasonable prices.

### V.—Industrial Disputes.

*Some Machinery for settling Industrial Disputes desirable.*—The committee would like to suggest that there should be set up some machinery for bringing about a peaceful settlement of the industrial disputes between the employers and the employees on the merits of the points at issue, always bearing in mind of course the supreme interests of the industry concerned. Some such machinery would be to the interest of both of the parties for some years to come at least. Even a step in the direction of compulsory arbitration as in Germany will not be unwelcome as an experiment to begin with.

If its results are good, the same might be extended. That will save the industry from the frequent shocks and the course of economic life of the society also will not be frequently disturbed. An independent tribunal would render possible an unprejudiced and impartial handling of the points of difference.

*Forced Labour should be Abolished.*—The committee would like to suggest that the Royal Commission will do well to recommend forthwith the abolition of forced labour throughout the country. The committee would suggest its abolition, even in the Indian States, but, unfortunately, the Indian States do not come in the field of the Royal Commission's enquiry. The Royal Commission can usefully enquire into the conditions under which labour is recruited in this country for the tea estates and for emigration.

In conclusion, the committee would like to emphasize the need of (a) abolition of the drink evil in the country. That will mean increased efficiency so far as the worker is concerned. It will also better the workers' health and improve his economic condition. It will radically alter the tone of the life of our worker. (b) The committee would further like to point out the great difficulty experienced in Bombay in getting pure milk at a reasonable price. The Royal Commission would render a distinct service to the working classes if they urge upon the Government of Bombay the necessity of taking immediate steps to ensure sufficient supply of pure milk at reasonable price in this city so that the same may come within the reach of the working classes. Their children do not at present get enough milk, as the cost of the same is very high. (c) If the workers' condition is to be bettered, the State must undertake to compulsorily give to all, free elementary education, both to the children and to the young people who may be without it. (d) The committee do stand for the amelioration of the worker's conditions and for providing amenities of life for him, things which would make him better socially, physically and morally, but they like to state it as their considered opinion that these things can come only in proportion to the ability of the industry concerned to bear the consequent burden. The committee has not tried to have their say on each of the subjects in the extensive list issued by the commission. They have referred only to a few of them and expressed their views. The *laissez faire* policy followed by the Government of the country has proved detrimental to our national interests. It has reduced the economic stamina of the nation and seriously handicapped the industrial development of the country.

---

### THE BOMBAY MUNICIPAL CORPORATION.

In submitting their memorandum on the questionnaire forwarded to them by the Royal Commission on Labour in India, the Corporation feel that, owing to the insufficient time at their disposal, they have not been in a position to answer more fully and in greater detail the questions relevant to the scope and work of the Municipality. Besides, it appears from the terms of reference that the work of the Commission is mainly confined "to inquire into and report on the existing conditions of labour in industrial undertakings and plantations in British India," and consequently, although the Corporation employ a considerable section of labour in their various departments, they do not come directly within the purview of the inquiry before the Commission.

The Corporation, however, feel it necessary that such information as they are in a position to supply about recruitment, health and education of their labouring staff should be made available to the Commission when they enquire into the conditions of labour in the city of Bombay as a whole. The Corporation understand that the Municipal Commissioner has already furnished certain information required by the

Royal Commission regarding the conditions of housing of the Municipal employees. Hence, the Corporation have selected only those questions "in the subject-matter of which their experience mainly lies," and furnish brief answers to them. They are as follows :—

### I.—Recruitment.

1. The labour employed by the corporation is recruited locally as both skilled and unskilled labour is always available in the city. Both the classes of labour come in search of employment from the Konkan districts, the Southern Maratha country, and the Gujarat. The Mahars in the Health Department are recruited mainly from the Ratnagiri district, while the Halalkhores chiefly come from Kathiawar and Gujarat and a few depressed class people from the north western provinces and the Punjab are also engaged.

3. No special method of recruitment is adopted. Persons in search of employment apply for work at the different ward offices and the workshops and are engaged by the sub-engineer at the various ward offices so far as unskilled labour is concerned. All skilled and unskilled labour at the workshops and pumping stations is engaged by the mechanical engineer. Other skilled labour is recruited by the local offices of the departments in charge of the wards.

7. The greater part of municipal labour staff is recruited on temporary basis. Nevertheless, care is taken to see that the same men remain in employment as long as work is available for them. Unemployment is, therefore, not common among them, but occurs at times on asphalt works and on work in connection with the tarring of roads by the road department, owing to the closing down of such works in the monsoon. Some men in the health department are being thrown out of employment owing to the adoption of a system of removal of refuse by mechanical power and the conversion of basket privies into water-closets.

8. There is no turnover in the case of permanent labour staff, but the men on the temporary staff do not always continue in employment throughout the year. They generally go to their native places before the rains for tilling the fields and return at the end of the monsoon after gathering the harvest.

### II.—Staff Organization.

10. The unskilled labour is under the sub-engineer, or the chief inspector, or an officer of corresponding rank in charge of the wards. They have under them a number of overseers, sub-overseers, maistries and mukadams to supervise the labour staff. The skilled and unskilled labour at the municipal workshops and pumping stations is under the mechanical engineer.

11. The managing staff consists of heads of departments who are appointed by the corporation subject to confirmation by Government in the case of the executive engineer, the executive health officer, and the hydraulic engineer.

12. (i) The supervising staff in the engineering department is recruited from graduates in Civil engineering, mainly from the Bombay University. Some of the supervising staff hold foreign university degrees. The superior supervising staff in the health department, which is the other department of the municipality employing labour on a large scale, is recruited from medical graduates mainly of the Bombay University. Some of them hold health diplomas of European universities. A few of the superior officers of both the engineering and the health departments have undergone training in Great Britain. Some of the subordinate officers of both these departments also hold engineering and medical degrees of the local university, while others are practical men who have acquired their training and experience in the municipal employ.

(ii) No special facilities are provided for the training of workmen but some of the skilled supervising staff is recruited from men who have passed out from the Victoria Jubilee Technical Institute, Bombay.

13. The relation between the staff and the rank and file is cordial as a rule, because in the matter of wages, conditions of work, as well as provision for old age and death, the workmen employed by the corporation are at least as well off as those employed by any other body in Bombay, public or private. It is only in the municipal workshop which numbers among its employees a larger proportion of members of the municipal workmen's union than any other branch of municipal service, that there is occasionally a certain amount of discontent and friction with the immediate superior officers.

### III.—Housing.

16. and 17. Information in regard to these questions has already been supplied by the municipal commissioner, a copy of which is appended to this memorandum.

18, 19, 20 and 21. Information in regard to these questions has already been supplied by the municipal commissioner, a copy of which is appended to this memorandum.

### IV.—Health.

23. The general health condition of workers in municipal employ is satisfactory. There is no employment under the municipality of such a nature as affects prejudicially the health of workers.

24. No special medical facilities are provided for the municipal labouring staff, but free dispensaries and hospitals are provided in the city by Government and the municipality, of which the labour staff avail themselves. There are also charitable dispensaries where medical treatment is available. Trained municipal nurses and midwives in each ward visit the labour areas periodically.

25. The class of unskilled labour employed by the corporation do not take as much advantage of these facilities as they should.

26. (a) Where labour is stationary such as at the municipal workshops and pumping stations, latrines, water pipes and other sanitary conveniences are provided. Other workmen in the road and drainage departments, who are working in all parts of the city, make use of public latrines, water fountains, bathing places, etc.

(b) Sanitary arrangements are fairly satisfactory in the chawls provided by the corporation for the accommodation of their workmen. The nature of sanitary facilities in private chawls inhabited by municipal workmen, however, varies from bad to indifferent.

27. The chawls provided by the corporation for the accommodation of their workmen are regularly visited and inspected by their officers.

31. Maternity benefits in the shape of six weeks' leave on full pay is allowed to all women employees of the corporation.

### V.—Welfare.

32. The corporation, through the agency of the Y.M.C.A. and the Bombay Youth League, have started several welfare centres for their menial employees. Grants are made by the corporation to the organizations running those centres.

33. Welfare officers and workers, honorary and stipendiary, are appointed by the organizations running the welfare centres.

34. The nature of other welfare activities consists in providing means of recreation, amusement and physical culture. Several night schools are also conducted by the agencies.

35. Although the welfare work of the nature stated in the reply to question No. (34) has not been going on for a long time, its beneficial results are already appearing in the contentment of the workers and particularly of their children. In the opinion of the corporation the extension of such welfare work is one of the best antidotes to industrial unrest.

36. Please refer to replies on questions Nos. (41) and (42).

37. Special disability leave is granted to the municipal employees of the labouring or artizan class, whether permanent or temporary, on account of injuries received in the course of their duty, provided they are not caused by their own negligence or disobedience of orders. The period of leave on full pay varies from 1 to 4 months, according to the length of service, the minimum service required being 5 years, and in addition, 2 months' leave on half pay is granted.

As a provision for old age, a municipal servant, whose pay on retirement does not exceed Rs. 100 per mensem, and whose length of service is not less than 25 years, and whose services are required to be dispensed with owing to old age, is granted a gratuity equal to seven times his average monthly salary. If, however, such a municipal employee dies before being made to retire, the gratuity mentioned above is paid to his widow or children or in their absence to his parents, brothers and sisters, if any. Advantage of this benefit is granted to all kinds of labourers including scavengers and halalkhores, provided the conditions specified above are satisfied. The number of gratuities so granted is fairly large.

Since October, 1920, the municipality has established, on a voluntary basis, a provident fund for the benefit of its officers and servants, including labour class, whether permanent or temporary. In the case of labourers, the employee subscribes at the rate of one anna and four pies or one anna in the rupee on the amount of his monthly wages, according as such wages do or do not exceed Rs. 50 per mensem. The municipal corporation contribute to the provident fund at the rate of 100 per

cent. on the subscribers' subscription at the end of each official year and allow interest at 5 per cent. per annum on the subscriber's subscriptions as well as the municipal contribution. Advances are also granted to the employees out of their provident fund, subject to the rules made in that behalf. It is also open to subscribers to the provident fund to take out a policy of life assurance with any approved insurance company, and facilities are accorded, by way of advance, to pay the premia out of their own subscriptions to the provident fund. However, employees of the labouring class have not yet begun to take advantage of life assurance.

Subscribers to the provident fund do not get the gratuity for old age mentioned above when the amount of such gratuity plus the amount of the municipal contribution credited to the provident fund account exceed their 10½ months average monthly salary. The provisions of the Provident Fund Act of 1925 have been extended to the provident fund established by the Bombay municipality and therefore the municipal employees get the benefit of the protection afforded by the Act against attachment under any decree or order of the court in respect of any debt or liability incurred by them.

Although the benefits of provident fund are open to temporary municipal employees, the municipal contribution is paid to them only after a minimum service of five years.

38. The corporation have got no special co-operative societies for the benefit of their staff, but an effort was made in this direction by the Social Service League, which effort, however, failed owing to the fact that the corporation cannot recover the dues by deduction from the pays of their employees as desired by the League. The starting of societies, particularly for debt redemption, under the advice of the registrar of co-operative societies, is under contemplation.

40 (i) In Bombay, the labour population is mainly located in the F and G wards of the city. The population of these two wards together comes to a total of 3,14,205 persons (1,97,666 males plus 1,15,539 females as per census taken in 1921). Since 1925, the corporation have made primary education free and compulsory for all children between the ages of 6 years complete and 11 years complete residing in these two wards. Moslem girls were exempted at first, but this year such girls in these two wards between the ages of 6 years complete and 10 years complete are made to attend schools compulsorily from the 1st August, 1929. On 30th June, 1929, there were in these two wards, 14,605 children, exclusive of Moslem girls, liable to be made to attend schools compulsorily and out of them, 11,624 were actually attending schools and 2,981 were defaulters.

(ii) and (iii) The corporation have not opened special schools for children employed in factories. A few night schools attended mostly by grown-up children and adults are run by the corporation.

41. On the recommendation of the Industrial Commission, the Bombay municipal corporation resolved in 1925, to give an industrial bias to primary education in the municipal schools. Handicraft classes were accordingly started in suitable schools and the corporation are running 14 centres, where pupils from surrounding schools are given instruction in handicraft. These centres are mostly situated in schools, in which the children of the labouring classes attend in large numbers. At the end of the year 1928-29, 3,001 pupils from 26 schools were receiving instruction in handicraft in these 14 centres. The instruction imparted in handicraft classes covers a wide range of subjects, including paper-folding, paper and card board modelling, flower-making, fret-work, wood-work, wire-work, book-binding and cane-work. The work of instruction in these classes is carried out by 11 special teachers, with 1 superintendent over them, all of whom possess special qualifications in these subjects.

42. It is yet too early to pronounce opinion upon the effect of education on the working classes as a whole, because compulsion was introduced in F and G wards only just four years ago, and the children so educated have not yet been employed in industries. But even before compulsion was introduced, a good number of the labouring population had been attending schools and the corporation think that education is having a good influence upon their general habits and outlook on life.

#### VII.—Safety.

46. Adequate and proper precautionary measures are taken to prevent accidents on works.

47. The Workmen's Compensation Act does not apply to the entire labour staff employed by the corporation. But as regards the staff to whom the act is applicable, full compensation admissible under the Workmen's Compensation Act is granted to proper claimants.

Statement—continued.

Name of Department.	Extent to which housing is provided for manual workers.	Nature of accommodation provided.	Utilization by Workers of the accommodation provided.	Rents Charged.	Whether persons other than those in employ are allowed to occupy the tenements.
K.E.M. Hospital College and G.S.M. College.	228 employees of the labour Staff are provided with housing accommodation of 173 rooms.	5 chawls comprising 173 rooms.	The house accommodation provided is utilized for purely residential purposes.	Accommodation provided is rent free.	No.
Gardens Department	All the 39 employees are provided with housing.	2 chawls consisting of 39 rooms.	The house accommodation provided is utilized for purely residential purposes.	Out of 39 rooms provided, 22 are charged 8 annas per month per room, other rooms are rent free.	No.
Drainage Department.	13 employees out of 600 have been provided with housing accommodation.	8 rooms and one C.I. shed.	The accommodation provided is utilized by workers.	Rent free .. ..	No.
Engineering Department (General Branch).	All the 289 employees are provided with housing accommodation.	Permanent and semi permanent chawls.	All available accommodation is fully utilized	Do. .. ..	No outsiders are allowed to occupy rooms except nearest relatives dependent on the employee.
(Mechanical Branch)	104 employees out of 664 are provided with housing accommodation.	Permanent chawls ..	Do. .. ..	Do. .. ..	No outsiders are allowed to occupy rooms.

Statement—concluded.

Name of Department.	Extent to which housing is provided for manual workers.	Nature of accommodation provided.	Utilization by Workers of the accommodation provided.	Rents Charged.	Whether persons other than those in employ are allowed to occupy the tenements.
Engineering Department—concluded. (Roads Branch) ..	165 employees out of 1,545 are provided with housing accommodation.	Semi-permanent chawls and temporary sheds.	All available accommodation is fully utilized	Rents charged are :— 10 annas per month for a male labourer and 5 annas for a female.	The relatives of the employees are allowed to occupy the tenements on payment of a monthly rental of Rs. 2 in case of a male and Re. 1 in that of a female.
Markets Department	106 employees out of 135 are provided with housing accommodation.	Chawls and Zawli sheds, Single room tenements of permanent nature. The dimensions of the room vary from 12 ft. x 10 ft. to 18 ft. x 12 ft.	The accommodation provided is used for residential purposes.	Rent free. .. ..	No outsider is allowed to occupy the tenements. If relatives of the labourers other than those forming his family are found sharing the room, they are charged at the rate of Rs. 2 per male and Re. 1 per female.
Water Department	279 employees out of 605 are provided with housing accommodation.	Chawls and semi-permanent C.I. sheds having single and double room tenements.	Do. .. ..	Do. .. ..	No outsider is allowed to stay in the quarters.

## THE WORKERS EMPLOYED IN TANNERIES AND LEATHER FACTORIES AT DHARAVI.

1. *Hours.*—The workers in those tanneries and leather factories to which the Factory Act is not applicable are required to work daily for 12 to 14 hours, for earning a bare subsistence. These 12 to 14 hours are to be spent by the workers in performing dirty tasks in unhealthy premises.

2. *Wages.*—The workers in the tanneries and the leather factories get a very low wage. Their earnings vary from 12 annas to Re. 1 per day. They are forced to accept a wage established by competition. Hunger is the impelling motive in such competition. They are thus virtually wage slaves of the employing class. Almost all the workers are piece workers and low wages is one of the main reasons why they are required to work longer. This proves the necessity of fixing the minimum living wage by statutory law in this industry.

3. *Housing Conditions.*—It is very difficult to give a graphic picture of the houses occupied by the workers. Dharavi is the most insanitary place and its sanitation has been criminally neglected by the Bombay Municipal Corporation. It is notoriously malarious. During the rainy season many of its roads are impassable owing to the accumulation of slush and overflow from drains. The houses are not fit for human habitation.

4. *Health.*—The workers in the tanneries and the leather factories suffer from ill health. It can well be imagined how physically feeble a worker is bound to be when he is required to work in the factories for more than 12 hours, to be satisfied with two meals of the meanest stuff and to shut himself up in a dungeon during the night.

Neither the factory where they spend the whole day is an ideal place where they can work without injuring their health, nor the place where they take shelter during the night. In the absence of nutritious food, the exhaustion from hard strenuous work for over 12 hours naturally damages their health.

5. *Other Complaints.*—The tannery work is a blind alley occupation, there being no prospect of promotion to higher grades or increase in wages. In some of the factories the wages due to the workers remain in arrears and the workers continue to work without receiving their wages for three or four months. It is difficult to describe the sufferings of the families of such workers. Non-receipt of wages at regular intervals plunges the workers into chronic indebtedness. The workers being "parias" (men belonging to the so-called untouchable caste) and not knowing any other trade have to accept all these conditions if they want to keep body and soul together. They are at the mercy of the Mukadom (foreman) as he enjoys the power of dismissing them at his sweet will. They often fall victims to his tyranny and harassment. They are not free to join any trade union and they are always afraid of being victimised if they dare to form a union against the wishes of the factory owners and the Mukadoms.

6. The workers in the tanneries and leather factories are not entitled to benefits under the Workmen's Compensation Act as the factories in which they work do not come under the Factory Act. To remedy this disability as well as to put a legal restriction on excessive hours of work the Factory Act should be so amended as to include all tanneries and leather factories.

---

Mr. G. C. SEERS, Managing Director, GENERAL MOTORS INDIA LTD.,  
BOMBAY.

### I.—Recruitment.

1. *Origin of Labour.*—Mainly local. India is in its infancy with regard to the motor industry, and the number of workmen—fitters and metal workers—trained yearly in the various workshops of the railways and engineering firms, dockyards, etc., creates a supply which is in excess of the demand. Peculiar to Bombay, the recent disturbances in the mills have instilled into the minds of their quondam workers a sense of uncertainty, even fear that not only are their jobs of indefinite duration but their lives also. Apart from a very few highly skilled positions, e.g., armature winders, high grade mechanics and coach and body strippers, boiler makers (first class), etc., the greater portion of the other sections, viz., fitters, painters, tailors and less skilled mechanics can be obtained any day at the factory premises. This situation obviates any necessity of having to resort to outstations for men. Further, after a short period of operation in our plant the men are loathe to go when laid off for a very short period, and return eagerly on the appointed day. The conclusion one is

compelled to draw is that the conditions under which the men work and their environment are conducive to mental and bodily satisfaction and improvement. Furthermore the fact that the wages are slightly higher than the average obtainable elsewhere, is an additional attraction. Added to this is the treatment they receive from their sectional and departmental heads. It appears, from the fact that positions in our factory are so eagerly sought after, that the general conditions of employment are entirely satisfactory.

2. Much was heard of the bogey of workmen wishing to return to their native villages. In our case this has proved to be almost a myth, for, whilst we have not been entirely free from this experience, the percentage has been insignificant and not worth recording. This again can be attributed only to the pleasant conditions, financial and physical, under which the men work.

3. *Method of Recruitment.*—A little has been said of this earlier.

(i) At present the men are questioned separately and their credentials and certificates examined carefully. Where the nature of the work is skilled, a test of skill is imposed. All individuals are subjected to a medical examination. Thus, the plant is assured of none but the best for each job.

(ii) and (iii) Not experienced—not necessary.

4. At the outset, reports of deaths, accidents and disturbances in families of employees were not infrequent. These reports were not accepted too readily, but were investigated personally whenever possible and convenient. This method of procedure served to check satisfactorily the frequency of complaints.

8. Probably 10 per cent. of the labour over the period experienced has changed due to all causes. The period of operation does not cover a year, so statistics cannot be compiled.

(i) At least 11 months in the year possibly.

(ii) Nil.

(iii) Illness constitutes an important factor in absenteeism. Malaria, influenza, dysentery and other tropical diarrhoeas are the principal diseases concerned. Surgical accidents do occur on the average of 12 per diem both of a serious and trivial nature. Cases of malingering to get away on leave to their native places or to attend to private business or festive occasions often arise; but shamming is reduced to a minimum by efficient collaboration between the departmental heads and the medical officer, to whom such cases are always referred. On an average three medical certificates are passed daily for short or long leave, depending on the medical or surgical aspect of the case, and this in a factory which employs close on 1,000 hands. During the monsoon months, i.e., June to September, the curve of absenteeism always rises, due principally to the increasing prevalence of malaria and the migration of the agricultural labouring classes to their homes to till their soils.

Turnover for period commencing June, 1929, and ending October, 1929 (Actual):—

Number of employees on register .. ..	950	
Number of discharges from June/October .. ..	350 (approximately)	
Total number .. ..	1,300	
		Percentage.
Resignations, from June/October, 1929 .. ..	85	6.5
Continued absence, from June/October, 1929 .. ..	91	7.0
Sickness from June/October, 1929 .. ..	9	7.0
Reduction .. ..	102	8.0
Undesirable .. ..	32	2.46
Inefficient .. ..	21	1.6
Labour turnover .. ..	342	26.3

#### IV.—Health.

23. (i) *Figures of Mortality.*—Only one fatal case of tetanus occurred since the inception of the factory, in an otherwise clean and healthy wound, which was being dressed daily by the dresser. This patient used to open the dressings when at home, despite repeated warnings. He was dressed with the best and latest antiseptics at the dispensary.

(iii) The working conditions are highly satisfactory *vide* the incidence of medical absenteeism and the negligible occurrence of industrial diseases. The ventilation and sanitary systems are up-to-date and perfect, the site of the factory ideal and the water supply chlorinated and wholesome. Suitable guards are provided at danger spots, gloves and respirators are provided for the men in the paint and spray section. Conditions at home are not known to us, as the personnel reside in various parts of the city and suburbs.

(iv) The dietary of the inferior factory hand is far from satisfactory except in the case of the Pathan, Muslim, and the Northern Hindu. The meagre vegetarian fare of the local and Southern Hindus and the poorer Christian is insufficient to cope with the physical strain involved in manual labour, and must cause an appreciable amount of industrial fatigue. The remedy lies in the assimilation of better food and hygienic housing conditions. A vegetarian diet consisting of lentils (dhal), ghee, nuts, butter, bagri and jowari should be substituted for the wholesale and indiscriminate consumption of rice which is the staple diet of the Indian. The mixed vegetable diet suggested above is more nutrient and will furnish all the necessary ingredients necessary for the cells of the body. Rice alone furnishes carbo-hydrates, to the entire exclusion of proteins, fats and the necessary vitamins.

(v) Roughly speaking, 75 per cent. of the men may be said to possess the necessary physique; the rest are either below weight, under-sized or ill-nourished. The European, Pathan, Muslim and the Bhaya races of Northern India stand industrial fatigues well, their diet and inherent constitution standing them in good stead. The worst recruit is the local city man in this respect. The recruitment of weakly individuals is totally eliminated by the medical test for physical fitness. Employees going downhill are provided with intensive tonic treatment at the dispensary and otherwise advised. Men with strong lungs are selected for the duco and spray sections. These are given periodical advice on health and hygiene. A change of department or even of climate is advised in deserving cases.

(vi) The housing conditions of the factory hands are unknown, as they are spread over the city and the suburbs of Bombay. It is self-understood that the more hygienic the housing conditions are, the less the mortality will be.

24. (i) *Extent of Medical facilities provided by Employers.*—A well-fitted surgery and dispensary is provided on the spot, centrally situated for all the sheds. A qualified half-time surgeon attends from 9 a.m. to 12 noon and even later. From 12 noon to 5 p.m. the latter is at his residence for any emergency case that may occur within factory hours. An ambulance service is permanently on the spot and the patient is speedily conveyed to the surgeon by two attendants for treatment, after being rendered "first-aid" by the dressing-compounder, on the spot. The case is often treated by the surgeon at his residence, or sent in the same ambulance to the nearest hospital if very serious, or taken to the patient's home, if the latter so desires and the doctor opines likewise. Cases under the Factory Act are duly reported to the Chief Inspector of Factories, and those under the Workmen's Compensation Act to the insurance company. Fatal and severe cases admitted to hospital are reported to the police. The dresser-compounder and the hamal are on the spot during the factory hours, i.e., 8 a.m. to 5 p.m. rendering any aid then. Up-to-date drugs are provided. The "first-aid" room contains the Bets operation table (U.S.A. Army model), a stretcher, a Berkfeld's filter and a fine almirah for medicaments. All treatment is gratis. The Government aids in a very few cases that need major operative treatment or special nursing. The Jamssetjee Jeejeebhoy Hospital, the King Edward Memorial Hospital, and the St. George's Hospital are sometimes utilized for serious cases. Private treatment is taken by a few factory hands and officials, but this is almost negligible. No agencies of any kind exist to give medical aid to the employees nor is there need of any, as the existing arrangement at the factory is quite satisfactory.

(ii) *Provision of Women Doctors, Dais, etc.*—This does not arise as there is no female labour.

25. The "first-aid" department is well patronized by surgical as well as medical cases. The most illiterate coolie and the highest official in the factory come up with a tiny abrasion for a touch of tincture of iodine and a bandage, or even for a tablet of calaspiran for a headache. The daily attendances of all cases ranges between 30 to 50. A thorough course of treatment is patiently gone through, and the advice of the surgeon faithfully followed in 99 per cent. of the cases. The remaining 1 per cent. may be influenced to take indigenous treatment or to consult the charlatan. The extent to which medical facilities are generally utilized will be best appreciated by the divers types of cases treated.

Wounds and burns of all varieties and intensity, on various parts of the body. Foreign bodies in the eye. Fractures, dislocations, and sprains of minor members.

Frequent syncope. Nail injuries. Skin diseases, e.g., dermatitis, scabies, eczema, etc. Abscesses, cysts, etc. Protean inflammation. Anti-tetanic treatment (phrophylactic). All endemic diseases. Infectious diseases (so far only 1 case of small-pox and 2 of chicken-pox have occurred).

26. (i) There is an up-to-date latrine flushing system for the three sheds "N", "K" and "O" consisting of 50 latrines within and without the factory. The washing tap arrangements consist of 8 wash basins for the higher officials and 11 tap arrangements for the menial staff. The water supply of the Bombay main is stored in a sanitary tank with a separate connection from the one used for drinking purposes. The former is used for flushing purposes. The sanitary and drainage system is regularly looked after by the staff of the maintenance department, some of whom have expert practical knowledge of the subject. A corps of 17 factory cleaners and 3 sweepers is always on the spot to sweep the place and attend to cleansing measures in general. The Bombay Port Trust inspector makes periodical visits to the plant to detect larvæ in any collection of water on the premises and reports to the medical officer of the plant. A joint occasional inspection is made by the medical officer and the malarial inspector, and anti-malarial measures are discussed and used, if need be. Up to now no infectious larvæ have been detected. For the extermination of rats, which really breed in the granaries of the Bombay port sheds, rat poison has been used in the plant. The closing up of pits and burrows has been carried out, and the employees have been warned not to throw about morsels of food etc., on the factory premises. In fact, it has been decided to inflict a small fine on any one eating within the factory and neglecting the above warning. The latrines and washing places are regularly disinfected with phenyle. The medical officer submits all dead rats to the Director of the Haffkine Institute for a report. So far 6 have been sent and all with a negative report. The spot where the dead rat has been found is immediately cleansed with carbolic lotion. The ventilation of the plant is adequate, both internal and external, the open site in Sewri contributing to the latter. Exit arrangements for all effluvia is satisfactory. A special dumping place is provided at the rear end of the "N" shed. Special attention is paid to the condition of the booths and sections of the paint shop, where the men have to work in enclosed places. Cases of industrial fatigue are few and far between, and this goes to prove that the ventilation is satisfactory.

(ii) The drinking water system is put up in a good storage tank of the capacity of about 500 gallons. The fact that no water-borne diseases, e.g. typhoid, cholera has occurred shows that the water supply is so far not polluted. The chlorination of the Bombay water supply from which our supply is drawn is also responsible for the prevention of disease.

29. (i) Cases of industrial diseases are very few, and these might have been brought on by pre-existing disease in the employee, who joined prior to the appointment of the medical officer. A few cases of dermatitis of the hands and arms were noticed in the beginning in the enamel department, but these have been wiped out by the use of gloves, medical treatment and observation and hygienic advice to the patient. In the spray section (duco), only hands with sound lungs are taken on, and no case of any chemical poisoning has, as yet, occurred. The men in the paint shop are always watched for anaemic or bronchitic taint. They receive intensive medical treatment, advice on personal hygiene, diet, etc. Efficient ventilation, both at home and the factory is the principal prophylactic remedy, together with wholesome food. The medical officer and the paint shop foreman keep a constant watch on any suspicious case, and generous leave is given for a change of air to a deserving case, whose health remains below par, in spite of care and advice. Mild cases of industrial fatigue have occurred, on the average, three a week. The fatigue is mainly manifested by syncope and giddiness. Rest and stimulants have revived them very soon, often instantaneously. No case of chronic fatigue has yet occurred, necessitating a change of work or invaliding. The heat of the tropics, hunger and low diet of an individual contributing greatly to fatigue, and this case of genuine industrial fatigue may be said to be almost negligible.

(ii) No case of cholera or plague has occurred. Hookworm is rare in this Presidency, and no case of this nature has yet been detected. Hardly any labour in this factory is recruited from the Bengal Presidency where hookworm is badly endemic. Three cases of guinea-worm cysts and abscesses had to be invalided, owing to frequent absenteeism. This infection was from Poona district and not local. The employees were all vaccinated during the severe epidemic of smallpox in March last. The one coolie who refused to be vaccinated after three requests contracted the disease, but fortunately survived and rejoined the factory. He was immediately removed to the infectious diseases hospital and quarantined for four weeks. Roughly 10 per cent. of the personnel are chronically infected with malaria, which is the principal factor in sick absenteeism. The malarial curve in Bombay rises from June to October and during this period more cases are seen. The bad housing conditions, poverty and

neglect of proper food and treatment contribute to this cause. Those so infected are given routine intensive treatment at the dispensary, followed by a change of air or invaliding in the severe cases. Candidates with enlarged spleens of whatever nature are rejected from admission to the factory. Cases of tropical diarrhoeas and dysentery rank next to malaria in incidence amongst tropical diseases. These are mainly caused by chills and indiscretion in diet, and are not the result of factory conditions. Suitable treatment for bowel diseases, viz., chlorodine, bismuth and castor-oil emulsions, emetine, yatren, is given.

30. (iii) Speaking generally, the staff of this factory wholly accept western medicine, as full advantage is taken of the facilities provided by divers castes and creeds, be the case surgical or medical. Much depends on the personnel of the medical department. The results include good medical care, a perfect faith in the doctor, and the doctor's patience, and personality eliminate nearly every difficulty as regards the acceptance of allopathic medicine. Persuasion, tact and even gentle force have to be used in the small percentage of the illiterate or stubborn or superstitious cases. Gratuitous and good treatment encourage the patient to accept western medicine.

#### VII.—Safety.

44. From 1st March, 1929, to 31st October, 1929 :—Cases within the Factory Act (major), 31 ; cases without the Factory Act (minor), over 2,000.

45. *Causes*.—(1) Neglect, absent-mindedness, ignorance of handling work and material ; (2) necessary, unavoidable (pure accident) ; (3) industrial fatigue (a minor cause) ; (4) Absence of proper preventive measures for safety ; (5) enmity and jealousy ; (6) haphazard condition of material or machinery or uneven ground.

46. Accidents can be prevented by the following measures :—(1) Provision of proper guards and fencing to machinery ; (2) selection of competent men who have handled the same machinery previously ; (3) proper care and attention on the part of the operator ; (4) proper allocation and fixity of machinery and material ; (5) selection of men of sound presence of mind, good physique, clear vision, good nerves and of a healthy dietary : industrial fatigue would be thus reduced to a minimum ; (6) a thorough training in the handling of machinery by the foreman and appreciation of the possible dangers in dealing with such machinery ; (7) removal and segregation of all dangerous waste material, e.g., nails, etc., to a safe dumping place.

48. *First-aid Medical Relief*.—The half-time medical officer, the full-time dresser-cum-compounder and the hamal comprise the staff of this section. The employment and assistant employment manager give ordinary assistance to the patient, such as provision of ambulance, removal of the patient to the doctor's residence or hospital. No fatal case has as yet occurred on the premises, nor any grave case of a surgical nature, e.g., avulsion of a big member, rupture of internal viscera, etc.

*Treatment—Wounds*.—The antiseptics used are :—(1) Lotions—hydrogen peroxide, camphenol, boric and carbolic ; (2) Dressings and disinfectants—tincture Benzoïn Co., tincture iodine, iodoform and boric, etc. ; (3) Johnson's & Johnson's cotton wool, lint and bandages.

The Bets operation table, U.S.A. army model, is provided, together with Esmarchs rubber tourniquet. An ambulance stretcher is always provided for the more serious cases. The dressings are changed ordinarily every 24 hours. A prophylactic dose of Hoefts antitoxin (tetanus) of 3,000 units is administered in all infected wounds and burns, especially if the former are caused by rusty nails. Serious cases, surgical or medical, are taken in the ambulance with one or more attendants to the patient's home or hospital, after rendering first-aid at the dispensary or the doctor's residence. These cases comprised so far major wounds, fractures, dislocations, appendicitis, hyperpyrexia due to malaria or pneumonia, and synopes. Treatment is continued at the factory or hospital depending on the condition of the patient. A serious case may be admitted in a hospital for a short time and discharged. The treatment is continued at the factory and the patient certified to resume duty only when thoroughly fit. Cases of wounds requiring suturing, haemostatics or minor amputations are dealt with on the spot. Thus tendons have been stitched and arteries ligated, apart from ordinary stitching. Crushing injuries are treated with continued soda chloride solution compresses with stimulants.

*Fractures, Dislocations and Sprains*.—Cases of fractures of the fore-arm and dislocation of the shoulder have occurred. These have been set and immobilized. Subsequent splinting, massage, passive and active movements have been carried out. Ample leave is given for such conditions within the Factory Act, and none permitted to resume duty till the disjoined parts are normal. The help of the X-rays is used both

at the onset of the accident and even later. Sprains and traumatic synovitis are fairly common. Scott's dressing, lin. Iodi, and lin. Belladonna with lin. Saponis used judiciously in these cases have shown good results.

*Burns.*—Cases of burns of various degrees have been met with. These have been satisfactorily treated with carron-oil dressings, picric acid, and later with other ordinary emollients, e.g., petrolatum and weak boracic ointment.

*Foreign Bodies in the Eye.*—Pieces of metal, wood, chemicals, have entered the eye during work. Removal of the foreign body, cleansing with a daily wash of zinc and boric lotion, and shielding the affected eye have given satisfactory results as no complication has so far occurred to cause loss of the eye or even defective vision. Chemical agents in the eye are cleansed with distilled water and neutralized suitably, or treated with instillation of castor oil, depending on the type of case.

*Syncope.*—These generally occur from high fever, haemorrhages from wounds, hunger, heat or industrial fatigue. The patients are put on a stretcher and brought to the first-aid department. Sal volatile, spirit ammon. aromat., and even stimulant hypodermic injections are administered, if necessary. Ordinary cases that revive soon resume duty after little rest in the dispensary; serious cases are sent home or to the hospital, depending on the etiology of the attack. Only one mild case of electric shock came to my notice, which recovered promptly with ordinary stimulants and a little artificial respiration.

### VIII.—Workmen's Compensation.

51. Compensation is given to all cases injured on duty, provided neglect or shamming is not involved. Wages are paid for short absence, and for those accidents which require more than 10 days' leave full pay for the absent days is given. In case of a permanent injury when a function or functions of a particular member are lost, compensation is given proportionate to the extent of loss of function. The disability of the employee and his wage-earning capacity are always taken into consideration in estimating the amount of compensation. The employees take full advantage of the Act, some of them even going to the extent of shamming and sending legal notices. No deserving claim can be overlooked as the Commissioner of the Workmen's Compensation Act enquires into these cases, as well as the Government Factory Department. Locally, the accountant, medical officer of the plant, the insurance company and the employment manager deal with any such claim as to its merits or demerits. Two claims of supposed permanent injuries are being discussed at present, though hardly tenable, and the commissioner has not yet been appealed to, despite voluminous correspondence between solicitors and this firm. The fact is that the onus and blame often rests on the employee for neglect in such cases and not on the employer.

53. (iii) A very few mild cases of industrial diseases have occurred, and these have readily responded to medical treatment and hygienic advice. None have been invalidated on this ground so far, and the question of compensation has not arisen. If an otherwise healthy individual contracts industrial disease in the course of work, he is liable for compensation. A regular watch kept on any susceptible employee by the foreman and the medical officer would eliminate this factor or at least check its progress by suitable medical advice and treatment.

### XIII.—Industrial Efficiency.

114. If industrial fatigue can be reduced to a minimum, then, *ipso facto*, efficiency of workers will correspondingly rise. To effect efficiency a sound physique and good health are absolutely essential. The test for physical fitness should eliminate all weak and unsuitable candidates. A thorough knowledge of the work and machinery and healthy standards of diet and sanitation go a long way towards efficiency of workers. Addiction to drugs, owing to loss of nervous and muscular control, tends towards deficiency. Climate is an important factor both of the factory area and the native home of the employee, as the hardy races of northern India stand industrial fatigue far better than the denizens of the plains and coasts, their dietary contributing greatly to this factor. Malaria is a crippling factor and a very serious one in the causation of inefficiency in workers.

115. Selection of men of good physique, proper medical advice and treatment, with good hygienic conditions at home and the factory, should certainly turn out a better production, and easily cover the expenditure involved. The formation of workmen colonies under ideal hygienic conditions if managed well should prove an asset to both the employer and the employed.

The staple food of the factory hand and the Indian in general is rice, which does not give sufficient calorific energy for hard manual labour. A strict vegetable diet, viz., lentils (dhal), vegetables, ghee, wheat, bagri, and jwari would be ideal.

Alcohol and drug habits affect the efficiency of men and therefore production by absenteeism, also causes deficient output due to loss of nerves and muscular control. Men addicted to *ganja*, *charas*, *dhang*, or opium would be ordinarily inefficient workers. Industrial fatigue would be detrimental both for the quality and quantity of the outturn of labour.

116. *Possible methods of securing Increased Efficiency.*—(1) Selection of men of good physique in general.

- (2) Selection of men of sound experience and commonsense.
- (3) Selection of men unaddicted to drugs.
- (4) Efficient medical service to keep the men fit and regularly advised.
- (5) Elimination of the incidence of malaria and provision of proper sanitary quarters for workmen colonies.
- (6) Insistence of a suitable dieting for men with due allowance for their religious ideas.
- (7) Selection of men from Northern India and the Mofussil.
- (8) Proper supervision, instruction, and sympathy by the foreman.

## IX.—Hours.

### A.—Factories.

55. *Hours Worked per Week and per Day*—(i) *Normal.*—Eight hours per day, first five days of week; five hours on Saturday; 45 hours per week.

(ii) *Actual.*—Not exceeding 11 hours per day; not exceeding 60 hours per week.

(iii) *Spreadover.*—Workers not kept on call to exceed hours as shown in (ii).

56. *Days Worked per Week.*—Five-and-a-half days.

57. *Effect of 60 Hours Restriction*—(i) *On workers.*—Increases efficiency due to conservation of strength.

(ii) *On Industry.*—No effect in this factory.

59. *Possibility of Reduction in Maxima.*—Not considered advisable without provisions to take care of emergency cases such as breakdowns.

60. *Intervals*—(i) *Existing practice*—(a) *In relation to fatigue.*—Not exceeding four hours.

(i) (b) *In Relation to Workers' Meal-times.*—O.K.

(ii) *Suitability of the Law.*—O.K.

(iii) *Suitability of Hours during which Factory is Working.*—O.K.

(iv) *Number of Holidays given.*—All major gazetted holidays.

61. *Day of Rest*—(i) *Existing practice.*—Saturday afternoon and Sunday.

(ii) *Suitability of the Law.*—O.K.

62. *Exempting Provisions and the use made of them.*—Have been used only on two occasions this year.

## XII.—Wages.

96. (i) *In Industry.*—In this factory: Re. 1-4 annas per day minimum; Rs. 5 per day maximum. Average earnings Rs. 60 per month.

101. *Method of Fixing Wages*—(i) *By negotiated agreements.*—Yes: with workers. Starting pay based on experience of worker.

102. *Basis of Payment for Overtime and Sunday Work.*—Overtime at rate of one-and-a-half times standard rate paid for all over 8 hours on weekdays and all over 5 hours on Saturday.

103. *Extent of Standardisation.*—Wages about 50 per cent. standardised on basis of skill. Will eventually be 100 per cent. standardised.

105. *Minimum Wages—Advisability and possibility of statutory establishment.*—Considered advisable and practicable.

106. *Deductions*—(i) *Extent of fixing.*—Not in effect.

(ii) *Other Deductions.*—For lost tools only.

(iv) *Desirability of Legislation.*—Not necessary.

107. *Periods of Payment*—(i) *Periods for which wages paid.*—For calendar month.

(ii) *Periods Elapsing before Payment.*—One week after end of calendar month.

(iii) *Desirability of Legislation.*—Not considered necessary.

110. *Annual or other Leave.*—None in effect. Workmen allowed leave if considered necessary.

Rev. A. L. BRADBURY, Manager, INDUSTRIAL SETTLEMENT, HUBLI (DHARWAR).

I have noticed from newspaper reports the proposal that wages should be paid weekly has not been strongly urged before the Commission, and so I venture to ask the Commission to give this proposal further consideration.

As manager for nearly 10 years of a settlement of 2,500 people, most of whose male members are employed in the Bharat Spinning and Weaving Mill or the M. & S.M. Railway workshops, I have had a good deal of experience of Indian industrial workers, and this experience is widened by my association with a co-operative credit society and a grain shop.

A worker in the railway shops gets pay for the month on the 15th of the next month, and a worker in the mill on the second or third Saturday of the next month. That means that on pay day he is owed about six weeks' wages and that at no period after his first fortnight is he owed less than a fortnight's wages. I have considerable sympathy with the employer in the matter of keeping some pay in hand but I think that a week is ample.

The English members of the Commission know the purchasing customs of the British workman. I think it is true to say that practically all his purchases are on a cash basis. Marketing is done on Saturday. Enough money is retained to pay the rent on Monday and also to pay subscriptions to friendly societies, clothing clubs, holiday clubs, Christmas clubs, and so on.

The purchasing arrangements of the Indian workman are a complete contrast. Nearly all his purchases are on credit. His grain is purchased on credit and he is frequently two months in arrears with his payments and very likely this credit costs him two annas in the rupee. His clothes and his wife's clothes are purchased on credit. His wife purchases glass bangles on credit. His barber gives him credit. Meat, firewood, petty groceries, pan, bidies, medicines, liquor, mineral waters, are all bought on credit. The half-timer boy or girl in the mill runs a credit account with the sweetmeat roadside stall at the mill gate. The oil seller with his hand-cart of oil going from house to house gives credit. The only cash business I can think of is the cinema. Even the shroff will sell jewellery on a first payment of a quarter or a half. Add to these the serious debts at the time of marriages and births. The railway company does not give tickets on credit, but the money for a railway journey or holiday is very frequently borrowed.

I do not claim that the British workmen's weekly wages keep him on a cash basis, and the Indian workmen's monthly wages compel him to live on credit, but I am convinced that there is some considerable connection between these facts.

A few years ago a private member introduced a weekly wages bill into the Assembly. It made very little progress, and was defeated after a very inadequate debate. A Government speaker opposed the bill and stated that it would damage credit. I may have misunderstood him but if he meant that it would injure the workman's credit, and if he was right in saying this, then I maintain he advanced a most powerful argument in favour of the bill. I am confident that the very best thing that could happen to the Indian workman would be the destruction of his credit.

If the workman could be paid weekly, and get on to a cash instead of a credit basis for his purchases, I believe that before long an immense amount of his indebtedness would disappear and that slowly a habit of saving would grow with, in consequence, an immense improvement in his whole economic condition.

There are other arguments for this reform, but I venture to urge this especially for the consideration of the Commission.

---

Mr. H. H. STRUTTON, Manager, SHOLAPUR INDUSTRIAL SETTLEMENT,  
AMERICAN MARATHI MISSION.

The fact of being in charge of a settlement of criminal tribes for over 12 years in Sholapur, where we have never had less than 1,000 of them employed in the mills, and, at times, have had about 1,800 thus employed, has given the writer good opportunities of studying the labour problems in this place.

It has been the practice of the settlement authorities to distribute its workers in each mill, in proportion to the total hands employed therein, rather than to allow the settlers to chose their own mills, and the changing about from one mill to another for trivial reasons, or without proper notice being given has been discouraged.

In the early years of the settlement, the mills accepted the tribes people when they were only able to do unskilled work. They were sent here after being found committing crimes and wandering about the district, and were new to restraint of any kind, nor had their children ever attended schools. They were, in addition to being unskilled and unruly, always ready to lift yarn and small movable articles from the mills, as well as money from the pockets of other hands.

These cases of theft were always sent, by the mill authorities, to be dealt with departmentally by the manager, and the culprit, after punishment, was usually given another chance at his job. Sometimes he was fined or required to furnish sureties for good behaviour, but in all cases the managers were notified, and unless the offence was very serious, the mill accepted him back again the next day, if not on his old job, on another that he could do. In this way, by showing co-operation and a certain leniency, police court delays, with the necessity of mill clerks or departmental heads appearing as complainants, and wasting a lot of their time, was avoided, and the settlement people and its authorities were greatly helped.

No discrimination has been made in the treatment meted out to settlement people and that given to town hands, nor has any resentment been shown by other mill hands when called upon to work side by side with tribes people.

An agreement was arrived at some years back, by which the proportionate number in each mill should be maintained, even though hands had to be sent off for various reasons. This has enabled us to count on the mills as a regular source of labour absorption, and by having the younger members of settlement families trained from half-timer age onwards, we have been able to get a higher percentage of skilled workers in the mills than was possible at the outset.

The ultimate result of the mill work as a successful source of income to such people as these tribes is evident from the fact that though the settlement had a population of 2,300 in 1917, when the present manager assumed charge, it has now a population of 4,500; is the largest C. T. settlement in India; has about the smallest percentage of absconders, and the crime statistics have gradually improved, as the settlers have earned better wages and become used to mill conditions.

This improvement each year is due, in a large measure to the increased earning capacity of each settler's family, and to the persistent teaching and supervision of the children in the schools, where enforced attendance daily has been the rule all along. When the jail commission visited Sholapur in 1920, the earning capacity of our people was under Rs. 15 per month as an average, due to so many being unskilled, and a large percentage being on temporary work only. But since then the average has gone up considerably, and with the grain bonus added, we have no complaints from anyone re. low wages. In fact, our difficulty here is to refuse admission to tribes from other settlements, who are continually asking to be drafted here for mill work, or relatives of present settlers who try to get in, either inside or outside the wire enclosure.

Many of our families are obtaining from Rs. 45 to Rs. 80 in wages, from the fact that more than one member is on regular work, and this makes for great contentment.

We have been able to place from 200 to 300 settlers on work other than as mill hands. Some have been taught masonry and carpentry; others have become motor drivers or railway hands. Certain of them are too wild to ever take up work inside a mill, and these are placed on outside work for the municipality on roads, or under some settler contractor who takes up a job of supplying road metal to the P.W.D. or the railways. This latter is paid for at piece-work rates, and is very suitable for tribes who will only work outdoors.

Owing to the impossibility of obtaining sufficient cultivatable land in the settlement area, which is about 175 acres, we have not been able to take up field or farm work as a means of employment and therefore are limited to using one irrigated field of about 10 acres only as a means of employing a few troublesome lads, and those whose health unfits them for mill work.

Technical school work has been carried on, with a trained staff, for several years. The mill authorities recognize the value of this as a means of getting the boys and girls familiar with work they will, later on have to do, and, for several years past, three mills have given a liberal grant towards the expenses of this school. The children are examined by the Government inspector each year and the results are satisfactory.

In addition to the technical school grant, four mills have given us a grant towards our medical work from the beginning, and this has helped us to maintain a good standard of health amongst the people. All of them mainly live and sleep in the open air, and we have followed the system of allowing them to erect their own huts and houses rather than build chawls for them, and this mode of living suits them better, as we have proved by comparing those at Umedpur settlement with those

using some of the old police line quarters in the Kalyanpur settlement in the city. We seek to enforce cleanly habits, and have our own staff of sweepers to deal with refuse and rubbish.

About 2,000 settlers and their dependents have now either been proclaimed free, or have been placed outside the settlement enclosures on probation. In addition to these, many families have, from time to time, been allowed to leave Sholapur, after purchasing land for themselves in the districts around, and are now settled down as farmers. We keep an oversight over such families by means of probation officers, and they are only required to live honest lives, send their children to school, and, in general, fulfil the conditions expected of all honest citizens wherever they may be living. After a period of six years these people are no longer classed as criminal tribes, provided they have shown a clean record during their probation. The recalls back to settlement life and conditions are less than 2 per cent. so far.

One of the benefits that the mills have derived from the employment of the tribes people is that they can count on the number as being regularly maintained, no matter whether the local labour market is disturbed on account of strikes, virulent epidemics or bountiful harvests. During strikes here we have been able and allowed to send our people to the mills to carry on essential outdoor or unskilled duties, if only because we have put it to the strike leaders that over 1,500 idle tribes people were likely to take the opportunity of helping themselves to valuables and property in the town if idle all day. In the strike of 1920 the officials of Sholapur applied to the Government for troops to be sent here, because of the danger of looting on the part of our people, or "due to the fact that there are 4,000 criminal tribes people here who are liable to break out and cause looting of shops, etc.;" but in any cases of disturbances due to strikes our people have never been involved.

In plague, cholera and smallpox outbreaks, by a system of compulsory inoculation, not only have our people been immune from attack but they have not stampeded away, no matter how serious the outbreak.

Regular attendance at the mills is maintained by a system of settlement inspectors appointed to check the attendance of about every 300 workers employed; they report and enquire into every case of absenteeism every morning. Those who are sick are given medical attention and a certificate which prevents them losing their job.

I have gone thus far into some of the history and methods of the settlement work, not because of any need to advertise such, but to illustrate that certain of the methods adopted in the settlement to ensure regular attendance, health of workers and housing under more or less healthy conditions; technical training of the young; regular reports about, and checking the delinquency of idle workers, might possibly be adopted or developed by any labour organization or institution that may undertake to look after the benefits of any group of mill workers.

In the first place, Sholapur seems to rank a bad third in competition with Ahmedabad and Bombay, in three important qualifications for successful mill work: (1) skilled labour; (2) regular attendance of weavers and higher paid hands; (3) stable mill population, due to migratory village hands.

It is common knowledge with all engaged or interested in mill industries, that the Ahmedabad mill worker is in a class by himself. The average Guzerati man is smarter in every respect than the average Mahratta. This is partly due to the fact that one has been familiar with cotton from infancy, whereas the other has seen little but the cultivation of food grains under difficult circumstances, and he has only comparatively recently been driven to take on mill work as a dire necessity, while the Guzerati has taken it on because he likes it and is prepared to stick to it.

Then the average Mahratta mill hand still has his family fields and will stay on in his village as long as those fields yield a good return, or he will go for a few months to the mills, and back to his village to help in the annual harvest, to say nothing of the fact that he has probably left his wife and family in that same village. These facts serve to show the difficulties Bombay and Sholapur mills have to meet in the classes of labour available.

For several years I ran a hand loom weaving factory for Christian employees. I found that the only ones who made a living wage on an average of 8 hours a day were men who had been gathered, as orphans, from Guzerat; these married and maintained a family on the outturn of their looms, whereas others, from the Deccan, failed to make a living.

Sholapur, whether in spite of its mills or because of them, is said to hold the record for the Presidency, for the prevalence of the hand loom industry. From the experience gained by going in and out of the houses of hand loom weavers here, I would say that the industry is only maintained, or able to continue, because the men work at least 12 hours a day, and have the help of their women folk in the preparing and sizing of the warps, and of their children in the filling of bobbins. They have few holidays and are seldom seen idle. One can hear the looms working at all hours of the night, and if a parade of hand loom weavers was called out, few would pass an average medical test.

Another reason that it continues to hold its own is because of the facility for buying cheap yarn in Sholapur. Not only are coloured yarns of all textures that have become tangled in dyeing or by rough handling in the mills, sold at greatly reduced rates as waste yarn—a lot of which is capable of use by hand loom weavers, with their family free labour to unravel same and wind it on to bobbins or into warps; but it is a well recognized fact that a lot of yarn pilfering goes on in every mill, and much walks out of the gates every evening on the persons of women employees, the searching of whom is a task that no one will undertake.

But the chief reason that the industry continues is that these weavers came here long ago from the Nizam's dominions, a Telegu crowd, and they still have the natural desire to be their own masters, and to work at whatever class of work, little or much, as they choose. Others have joined them, and from their numbers younger men have become mill weavers. They are, to a considerable extent, hag-ridden by local money lenders, and in grievous debt to yarn sellers.

There is little doubt in the minds of employer and employed alike, that labour for the mills should be organized, and unions formed, but success in this respect will be slowly obtained. It would be a mistake to try and organize unions immediately along the lines that meet with success in the Western countries.

Experience in strikes here leads everyone to the conclusion that anyone with a glib tongue can sway the average mill-hand crowd. It will be a matter of considerable time before a union of mill hands can attain the position of winning the confidence of employed and employers to anything like the extent that this is possible in lands where two or three generations have enjoyed the benefits of sound education.

For this reason the aims of any trades union organization ought to be modified into dealing with matters that can be definitely chartered out or laid down, and such unions should have linked with them, in some capacity, an officially recognized labour expert, qualified by experience in the industry concerned, as well as experience with the Indian employee, and a working knowledge of their vernacular, to maintain some balance in the matters under dispute.

Too often, the type of union representative Bombay Presidency has had experience in, so far, has not been of the kind that will eventually serve the best interests of labour, or get for it any concessions worth while.

*Labour Arbitration.*—It may be possible to establish some kind of a labour arbitration court in the three large mill centres, later on; but before this is done, it will be necessary to have the profit-making capacity of the industry, and the efficient earning capacity of the employees properly explored and tabulated. If unions as such are established, then the various branches of employment, relative to the skill or importance of the workers should have separate union committees, and it should never be possible for a small portion of employees in a mill to engineer a strike in that mill, which might have the effect of involving others, merely because they themselves have a grievance, or because, as in many cases in the past, a worker or jobber has been discharged for some offence committed in the mill.

That there are uneven rates of pay in certain mills, due to various causes, such as long usage; special kinds of cloth or yarn manufactured in particular mills, or special processes used, that will bear adjustment after looking into, no one will deny. But such problems can best be dealt with by a small committee of experts, on which labour can have its representative. Only in this way will it be possible to arrive at standard rates of pay that will be practical and satisfactory.

*Welfare Workers* appointed to any mills will have little or no power to deal with serious cases of breaches of mill rules or the discharge of any person, even if the welfare worker is appointed by the mill itself. The few exceptions to this will be found to be men of outstanding ability and infinite tact. It stands to reason that the sub-manager or master of each department must reserve to himself the right to discharge any person for inefficiency, for insubordination, or for incitement to refuse to do any work he may allot to any hands under him. Such discharged workers always have the right to appeal to the higher authorities in the mills, if they are hands of any standing; if they are not, they use the bazaar writer. In cases where bad judgment or vexatious dismissal occurs very often, it very soon becomes evident to the management that the particular master concerned is not getting the best out of the hands in his department, or treating them with due consideration. Such a man runs greater risks here than anywhere else.

*Jobbers and Bribery.*—This question is a very old one, and there is little doubt that each mill, sooner or later, has to deal with some of its jobbers for this sort of thing. Taking the question as a whole my experience has been that such charges are usually exaggerated by disappointed workers failing to obtain work, or the particular kind of work they wanted, men who have often moved from mill to mill to see where their system would obtain for them the best job. As in the previous

paragraph referring to vexatious treatment, jobbers who are in the habit of taking bribes never get a very long run for their money, unless they are careful to stock their department with efficient and contended hands, a thing hard to do if they are ready to lay one man off against another.

Anyone really familiar with mill conditions will agree, in any case, that far less of this bribery goes on to-day than was going on five years ago, and the remedy for it lies exactly where the remedy for other inefficient work lies, in an improved mill-hand. Good workers do not need to bribe their way into any mills. Bad workers will continue to do it, jobber or no jobber.

Being one who has been aptly described as a "glorified jobber" myself, and one who has, of necessity, to get all of his able bodied men into the best possible jobs available for them, I would say that until labour is sufficiently well graded, as well as organized, to ensure the mill management being able to pick the best available workers from the local labour market, the jobber has to continue his job. I know some very decent men amongst them. Besides these, several of my best crims have been made jobbers in the local mills. I would very soon hear of it, if they started taking bribes.

*Technical Education.*—If asked to emphasize the greatest need the mill industry has to-day, I would say that it lies in the substitution of more technical education, in place of the policy of giving every bright lad, and many others, a chance to go on and get what passes for a high school education in India.

There is no remedy for the present glut of unskilled mill labour on the market—these people will live and die unskilled. But that is no reason why the rising generation should not be made skilled in many trades. The material is there, sufficient to equip and thoroughly equip every trade with efficient workers, but the dearth of properly organized technical schools throughout the Presidency is deplorable, and until the education department and each local body or municipality wake up to the need of properly training the youth of their schools, whether they will or no, into expert tradesmen, at the same time making their high school standards much higher, India will have to buy its best articles abroad, or have other countries dump them here at prices they cannot compete with.

There is no reason discoverable why Sholapur should not have one or two large and well-equipped technical schools, one of which should specialize in training lads as mill hands, in every department of such work, from raw cotton up to the best grades of yarn and cloth. Attendance at such schools should be as compulsory as at others. The marvel is that this city has escaped having such schools till now. The mills, even if they can get back to the rosy period of ten years ago, cannot run such schools here, any more than they do such things in other countries. It is as much a municipal task as keeping a city clean, or combating disease, and the education department is at last waking up on the matter, or beginning to, and will give grants, within a year or so to all local bodies who are willing to open them. Let us hope they will withhold all ordinary grants to those who will not.

Technical night schools, also, should be opened for all lads from 12 to 16, already in the mills.

*Welfare Work; Medical and Housing Schemes.*—The amount of activity along these lines should be left to each mill to decide on the grounds of its own workers' needs, plus the profit earning capacity of the mill concerned. At all events, this is not the time to offer advice to the mills on the subject when most of them are struggling with adverse balance sheets.

The fact that most of the well-managed mills started out to do something worth while along these lines when profits were good, is enough to show that they can be trusted to look after the interests of their workpeople, apart altogether from the fact that they know it is in their interest to see to this. In these days of great advancement of ideas of social work for the masses, no one can shut their eyes or pockets for long to urgent needs of this kind. To say, however, that a lot of the welfare work begun in this and other presidencies on behalf of the mill workers, has not met with a great deal of gratitude on the part of those catered for, is merely to state a fact.

With regard to the special problem of housing it is only fair to expect that if the mills are to build special houses for their workers, who then contribute in a large measure to the revenue of the city, they should not have to pay the highest possible market rates for any land they require for such purposes, especially as the rental returns they charge are nominal only. At present they have to buy in keen competition with others in the open market, or if Government land is available they have at times been asked the highest rate obtaining for the best land in the place. Wherever such land is available the lowest rate rather than the highest should be charged.

I would rather be inclined to favour co-operative building societies to cope with the housing problem in most places.

*Women Workers—wages and benefits.*—From 200 to 300 women and girl workers from the settlement are at work in the Sholapur mills.

In no department of the mills is there so great a difference in the wage earning capacity of the workers, as in the winding and reeling departments. Other jobs, where fewer women are employed need no comment, as they are stocked with older unskilled workers.

Certain women, clever and skilled, make good wages, and these are employed on the better classes of work. Mr. Shaw, when out here, put the ratio of efficiency of the men in mills as compared with Lancashire (skilled only), as four against one. He was silent about the women.

In every mill in Sholapur, I would say 20 per cent. more women can be found each week than the actual work calls for. From my own observations, it seems that quite a number are employed because they will not leave, or because they would sooner be there and do some work which will bring them in a certain amount of wages per month, plus a bonus for attendance and the grain allowance, than remain at home, and be limited to the lesser amount of pity gossip they would hear, or be idle. Certain it is, that if a minimum amount of wage was introduced into their departments, many of them would be idle. If the mills were short of space, and flush with work, then the survival of the fittest would begin, but as things are, the women will not give you correct answers if you ask about their pay; they will not thank anyone who would try to weed out the inefficient, and they have their own way of sorting themselves into or out of the different mills, till they are all somebody else's relatives.

To introduce better conditions of work and pay, or any form of social improvement into the women's departments in mills will always be difficult, if only for the reason that most of the muceddam women (jobbers again) in charge are of doubtful local repute. No other kind will undertake the job of bossing women about in any department, their tongues are not free enough.

*Maternity Benefits Bill.*—The less one says about this the better. If it were a social measure for the benefit of women in the mills, surely it would not have suggested that the women should leave an all-day standing-up job not one month before confinement, but three. It is probably meant to be a real benefit to the young women who have to go to the mills for work, but the fact that the benefit amount is fixed at about the highest wages earned by women, will have the effect of closing up many younger women's jobs, when jobbers can get older and more efficient ones, for it is age that makes for efficiency in women's work. I very much doubt whether any mill will be able to stand the extra cost that this rate will involve, if properly adhered to. For the mofussil the rate is much too high, especially in view of the fact that the women have the option of using the maternity wards that most mills either run or subscribe to. It seems to be a hurriedly conceived Bill that needs amending and adjusting to city and mofussil requirements and conditions.

It is my experience here, that the women are well treated in all of the mills, that they are keen to accept work on the present pay and existing conditions, though I occasionally have complaints as to their wanting better-class work, but these are, as often as not, made by the more troublesome types amongst them. They also have the pick of the rooms, as far as fresh air and light go, in all of the mills. The fact that we do not have to watch their attendance records as we do the men's speaks for itself.

In conclusion, I would say that I think there is a genuine desire on the part of most, if not all, of the mill managers to improve the general conditions under which mill labour exists; and if there had not been so many varied interests involved, and so much anti-capitalistic propaganda put before the ignorant masses of mill hands during the past three years or more, with its consequent dislocation of, and loss to the industry, labour conditions would have been better to-day than they are.

Intimate contact with mill managers and mill hands for 12 years convinces me that there is a far better feeling existing between the two parties than can be gathered from newspaper reports, and there is a genuine desire on the part of most mill owners and agents to tackle the question of removing removable grievances, if, and whenever possible.

Though the question may be outside the province of the Royal Commission on Labour, it is a fact that stares everyone in the face, that until some change is made in Indian tariff rules that will rectify the unfair competition that Japanese and Chinese as well as continental goods are able to come into India with—if only for the reason that India's cotton trade was established under conditions prevailing before the war—then any rules framed for the benefit of mill labour are likely to become a dead letter and unworkable.

I am an Australian, and have carefully watched for 40 years the struggle of that country to establish self-contained industries and although messes enough have been made there with tariff bolstered and subsidised industries, she could not have established what sound industries are found there now, without tackling the serious economic and tariff problems involved.

India is going to change from a self-centred, self-contained country into one that will want to increase its exports and decrease its imports. Farmers are no longer content to grow food enough for themselves and their cattle, and live on in the old communal exchange style that was the vogue when I came here 35 years ago. They want money now, so they grow peanuts for cash. They even go so far as to export the Indian egg.

Their sons are going to be industrial workers in cities, good or bad ones, according to the way they are trained. The father will introduce improved methods into his farming, not because he is advised to, but when he realizes there is money in it.

Greater changes have come into agricultural labour conditions in India during the past 10 years than are generally known. The fact that exporting firms can afford to, and already have, placed thousands of well-paid buying agents into all the large towns in India, and the Indian firms also are taking this export trade up, has to be taken into account when rural and urban labour conditions are reviewed, as it is a big factor in the increase in the cost of living for all workers, whether they live in cities or villages. The days of cheap grain foods are gone, never to return.

---

LALSHANKER J. BHATT, MEDICAL OFFICER, THE CHANDRODAYA MILLS, LTD., VIRAMGAM.

I am connected with the mills at Viramgam since last 13 years as medical officer, and during the period for about 3 years worked as representative of the official liquidator.

Mills being in existence here since last 45 years, labour is mostly local and is recouped from surrounding villages and from Rajputana, especially Marwar.

Unemployment here is generally in educated classes, and retrenchment, whenever it occurs, affects these classes (clerks, etc.) more than any other body.

Relations between the staff and rank and file are generally fair. The Chandrodaya Mills, Ltd., have got works committee out of the workers, and its existence lessens the chances of strike, etc. Attendance registers are kept by the timekeepers and wages are actually paid by the office staff. Viramgam Mills have got chawls for their workers and if provision for sullage, water, etc., is made, they may prove a blessing. Workers lose money by indebtedness and drinking, etc. To cure root cause of illiteracy and its consequences, Primary Education Act, passed by the Bombay Government, must be put in force at any sacrifice, by which morality and homely life will also come in order. Medical facilities in a limited sense are provided. To improve physique, and to reduce heat, some facilities and contrivances ought to be kept to have the temperature cool inside the mills' departments.

Illness is often the cause of absenteeism, as malaria is chiefly prevalent here. Surroundings of the mills are such, that unless these are mended it cannot be prevented.

Welfare work is not carried out here, but shelters and refreshments are kept in mill's compounds. Employers have got insurance for their workpeople and its advantage is fully taken. Wages are earned by workpeople more than other persons of the local and surrounding places, but due to their ignorance and indulgence, more money is wasted by them than others.

---

R. B. Dr. V. V. MULAY, L.M. & S., PRESIDENT, MUNICIPALITY, SHOLAPUR.

*Notes on Sholapur Municipality.*

Income, about Rs. 9,00,000. Population, 114,000. Octroi, Rs. 3,00,000. Taxes, Rs. 3,50,000. Rents on land, Rs. 35,000. Market and slaughter-house, Rs. 30,000.

The rest include sale proceeds of land, fees, Government contributions, etc.

Municipality spends on Capital works about Rs. 1,50,000.

Housing quarters for municipal menials Rs. 50,000 spent in last three years.

Housing sites for the poor are provided for in town planning scheme No. 1 and No. 2.

The whole of Telangi Pachha Peth, occupied by the weaver class people, purchased by the municipality in town planning scheme No. 1 for the benefit of the tenants.

S. No. 96, occupied by the poor class people is under development at municipality's expense.

New Tirhegaon, occupied by menials belonging to railway, mills and other working class and depressed class people, developed entirely at the municipality's expense and efforts.

(1) Credit Co-operative Society for the municipal employees; (2) Credit Co-operative Society for municipal school teachers; (3) Credit Co-operative Society for municipal staff under formation; (4) Municipal Staff Association with definite aims and objects to improve their general conditions.

Health welfare work :—Two maternity homes; three dispensaries; one Lady Dufferin hospital; Leprosy treatment centre and asylum; periodical celebrations of health and baby weeks.

Education :—Compulsory primary education adopted. Depressed class hostel maintained on municipal contribution. Industrial school under contemplation.

Extensive schemes for improvement of water supply and drainage and town improvement are already undertaken and being executed successfully during the last six years.

#### THE NARSINGGIRJI MANUFACTURING CO., LTD., SHOLAPUR.

Double khada system, whereby operatives were cut two days pay for one day's absence without leave, was stopped about a year ago. Absentees have gone up, as a result, about 5 per cent.

##### *Examination of Indebtedness in the Narsinggirji Mill, Sholapur, 1929.*

Total employees on books	..	..	..	..	..	4,035
Absentees	..	..	..	..	..	390
Half-timers	..	..	..	..	..	250
Reeling women	..	..	..	..	..	700
Winding women	..	..	..	..	..	495
						1,835
						2,200 men.

The 2,200 male workers were individually questioned regarding their debts.

In some cases they have apparently given figures which are excessive, but on the whole their statements may be regarded as reasonably accurate.

The total indebtedness of the 2,200 persons was 3,17,000. Out of the 2,200, 1,250, or 57 per cent. were in debt.

The average indebtedness per indebted person is Rs. 254.

The average rate of interest worked out on individual rates and not on the debt basis is 30 per cent.

450 out of the 2,200 indebted persons hold land or other property from which they derive income.

The average income per head per month of these 450 persons is practically Rs. 6.

##### *Some useful Information from the Narsinggirji Mfg. Co., Ltd., Sholapur.*

(1) Total number of hands on roll: 4035. Male, 2208; women, 1327; children, 500.

(2) Percentage of absentees, 12 to 15 per cent.

(3) Average number of substitutes engaged daily, 80 in spinning; 85 in weaving.

(4) Maternity benefit given per month (since Act came in force): average to 8 women.

(5) Number of accidents, 8 to 12 per year. Majority of these are minor accidents.

- (6) Percentage of Mahommedans amongst the millhands, 15 per cent.
- (7) Half-timers, boys and girls attending the school : 199 boys on register, about 164 boys present.
- (8) Average wages (including high price allowance—30 per cent. on fixed wage and 35 per cent. on piece work) :—
- |                          |                            |
|--------------------------|----------------------------|
| Spinning men .. .. .     | Rs. 17 to 20 per mensem.   |
| Spinning women .. .. .   | Rs. 7 to 8.                |
| Half-timers—Boys .. .. . | Rs. 7-12-9 pies.           |
| Girls .. .. .            | Rs. 7-12-9 pies.           |
| Weaving men .. .. .      | Rs. 20 to 25, single loom. |
|                          | Rs. 35 to 55 double loom.  |
| Grey winders .. .. .     | Rs. 6 to 8.                |
| Coloured winders .. .. . | Rs. 8 to 10.               |
- (9) Grain Benefit.
- |                      |                                    |
|----------------------|------------------------------------|
| Spinning men .. .. . | 7 to 8 per cent. on their wages.   |
| Weaving men .. .. .  | 5 to 6 per cent. on their wages.   |
| Women .. .. .        | 14 to 16 per cent. on their wages. |
| Children .. .. .     | 8 per cent. on their wages.        |
- (10) Concession of house rent in mill chawls, to those only who are housed there, 45 to 50 per cent.
- Percentage of benefit on wages comes to spinning men, 8 per cent. ; weaving men, 5 per cent.
- (11) Total number of blocks, 309 tenements in chawls ; about 1,300 people living there.
- (12) Daily bonus to half-timers,  $\frac{1}{4}$  anna (for regular and punctual attendance).  
Daily bonus to women, 1 anna (for regular and punctual attendance).  
Percentage of benefit of bonus on wages : half-timers, 11 to 12 per cent. ; women, 22 to 23 per cent.
- Every year regularly bonus is being distributed to workers.
- Last year out of 4,000 people, about 2,695 hands received full bonus, i.e., 65 per cent. of the total ; about 265 hands received  $\frac{1}{4}$  bonus, i.e., 7 per cent. of the total.
- Condition of distribution of bonus (307 working days in a year) —(a) The workers who are absent up to 76 days in a year get full bonus, (b) The workers who are absent up to 105 days in a year get  $\frac{1}{4}$  bonus, (c) the workers who are absent for more than 105 days get no bonus.
- (13) Separate latrines and urinals and drinking water taps for men and women.
- (14) Medical help given free to all millhands.
- (15) Hospital, primary school, dispensary, creche, are maintained.
- (16) An Indian gymnasium and recreation ground is kept in chawls.
- (17) After allowing for repairs, the interest on capital on chawls comes to less than 2 per cent.
- (18) Humidifying and cooling carrier plant is installed in all the three floors of carding and spinning rooms, cost of which was about one and half lakhs.
- (19) In weaving department there is underground humidifying plant and arrangement for sprinkling water on roofing also is made.
- (20) Supply of filtered cold water to the workers for drinking is specially maintained in hot season.

#### Seamen :

Measures for, *re* machinery, crane wires, etc., *McKinnon and Mackenzie*, I, p. 548.

Surgery with apothecary, provision of, *McKinnon and Mackenzie*, I, p. 547.

Security Printing, provisions of Factory Act complied with, *Willis*, I, p. 220.

### Safety, industrial workers :

#### Accidents :

Anti-tetanus injections given, *Bombay Millowners' Association*, I, p. 395.

Causes, *Government*, I, pp. 48, 162 ; *Johnstone*, I, pp. 190-1, II, 5693-4 ; *Bombay Millowners' Association*, I, pp. 394, 395 ; *Seers*, I, p. 577.

Comparison with Great Britain, *Johnstone*, I, pp. 187, 191, II, 3854.

Prevention, measures for, *Government*, I, pp. 48-9 ; *Phillips*, I, p. 216 ; *Sarabhai*, I, p. 282, II, 2080-4 ; *Bombay Millowners' Association*, I, pp. 394-5 ; *Seers*, I, pp. 575, 577.

no Record of, kept, *Girni Kamgar Mahamandal*, I, p. 458.

Reporting of, to Factory Inspector, procedure, *Johnstone*, II, 5739-41, 5746-7.

Statistics, *Government*, I, p. 47 ; *Johnstone*, I, pp. 190-1 ; *Phillips*, I, p. 216 ; *Sarabhai*, I, p. 282 ; *Bombay Millowners' Association*, I, p. 394 ; *Vakeel*, I, pp. 557-8 ; *Seers*, I, pp. 574, 577-8 ; *Narsinggirji Manufacturing, Co.*, I, p. 587.

Wages paid in full for first 10 days after disablement, *Stone*, I, p. 479.

proposed Amendments in Factories Act, *Johnstone*, I, p. 187.

Buildings, control over erection and proposals, *Johnstone*, I, pp. 186-7, II, 3828-32, *Sarabhai*, I, p. 282, II, 2080-4.

Devices for factories using power, *Johnstone*, II, 3844, 3881-8.

Effect of hours, health, etc., on, *Johnstone*, I, p. 187 ; *Patel*, I, p. 263.

Fencing of machinery, improvements in, *Bombay Millowners' Association*, I, p. 394.

First-aid and medical relief, facilities, *Government*, I, p. 49 ; *Patel*, I, p. 263.

*Kautekar*, I, p. 271 ; *Sarabhai*, I, p. 282 ; *Bombay Textile Labour Union*, I, p. 317 ; *Social Service League*, I, p. 439 ; *Seers*, I, pp. 575, 577 ; *Balabhai*, II, 1780-1, *Tata*, II, 3964-73.

#### First Aid Posts :

Desirability of establishing, *Government*, I, p. 49 ; *Gupte*, I, p. 207 ; *Phillips*, I, p. 216, II, 1374-8.

Training for, *Bakhale*, II, 4219-22.

Municipal regulations, need for, *Sarabhai*, I, p. 282.

Posters and oral instructions to workers, *Patel*, I, p. 263 ; *Sarabhai*, I, p. 282.

Provisions of Factories Act sufficient safe-guard, *Patel*, I, p. 262.

existing Regulations *re.*, *Government*, I, p. 47.

Regulations satisfactory, Ahmedabad, *Kautekar*, I, p. 271.

Safety First propaganda, need for introduction of, *Social Service League*, I, p. 439 ; *Ambernath Labour Union*, I, p. 560.

**SAINI**, woman worker, Jalgaon pressing factory, II, 7196-239.

**SAKLATVALA**, S. D., *see* *Mody*, H. P., etc., I, p. 385-418, II, 4955-5438.

**Salt Industry**, development of, a remedy for unemployment in Karachi, *J. N. R. Mehta*, II, 576-9.

### Sanitary arrangements and water supply :

Barrage and canal works, *Harrison*, I, p. 204, II, 21-6, 1073-4, 1092-3, 1118-9.

Bathing facilities, insufficient, and possible remedying of, Karachi, *J. N. R. Mehta*, I, pp. 227, 228, II, 444-6.

Criminal tribes settlement, Dharwar, adequacy of, water supply, *Strutton*, II, 7507.

#### Dock labourers :

Accommodation provided, *Karachi Port Trust Labour Union*, I, p. 235.

Bathing and washing facilities needed, *Kirpalani*, II, 682.

Conservancy, departmentally carried out in houses owned by Trustees, *Bombay Port Trust*, I, p. 464.

Washing places, provision of, at quarters, *Bombay Port Trust*, I, p. 465.

Water supply, free, in houses owned by Trustees, *Bombay Port Trust*, I, p. 464.

adequacy of, *Bombay Port Trust*, I, p. 465.

Drainage to *see* *Solomon*, II, 1274-5.

Need for, in, for new houses. *Weavers in Ahmedabad*, I, p. 288.

Efforts to improve standards of sanitation defeated by habits of workers, *Bombay Port Trust*, I, p. 389.

no special facilities provided, *Bombay Electric Supply and Tramways Co., Ltd.*, I, p. 534.

## INDEX.

### Sanitary arrangements and water supply—*concl'd.*

- General conditions, Bombay, *Government*, I, pp. 32-3; *Wagh*, I, p. 198 *Bombay Council of Social Workers*, I, p. 371.

## THE PUNJAB GOVERNMENT.

### Introduction.

1. The Punjab motto "*crescat e fluviiis*" is in itself an indication that the fortunes of the province stand mainly on agriculture, and a confession that of the three constituents of large scale industry, i.e., adjacent water, coal and iron, only one of these is abundantly available. With its Himalayan forests and its Himalayan water power the Punjab has a fair field for industrial development despite the handicap of its remoteness from seaports, but with agriculture as its supreme industry the concomitants of industrial activity, viz., specialization and urbanization have yet to make their appearance. The main class of Punjab factories, viz., the cotton ginning factories, are seasonal and spring from the cultivation and not the mining of the soil, and the process of production are complementary to agriculture and not linked in contiguity with other processes as in professional industry precipitating itself in urban agglomerations.

2. The following paragraphs from the memorandum prepared for the use of the Indian Statutory Commission by the Government of the Punjab, Volume I, Part I.—Descriptive matter may be referred to for a description of the province :—Paragraphs 15, 16, 17, 18, 19, 20, 21, 22 and 26.

3. The best comment on the present importance of the "field of industry" is the shortness of the paragraph devoted to it. The chief existing industries are weaving, dyeing, woodwork, ironwork and tanning. Among agricultural industries may be instanced oil-pressing, flour milling, cotton ginning, sugarcane crushing, rice hulling, and other processes in the preparation of raw produce for consumption. These are indigenous industries. As regards newer industries based on agriculture there should be mentioned sericulture and silk, the manufacture of paper from grass, fruit and its preservation and canning, lac, oil refining and hydrogenating. Examples of industries derived from agriculture are petroleum and its derivatives, cement, glass, and industries based on the utilization of forest products, i.e., turpentine and resin, and for this group both capital and trained skill are required.

### Descriptive Matter.

The following subjects with which the present enquiry is concerned are distributed under the portfolios mentioned :—

Portfolio of the Honourable Member for Revenue	.. Forests, irrigation, industrial matters (reserved), criminal tribes.
Portfolio of the Honourable Minister for Agriculture	.. Public works.
Portfolio of the Honourable Minister for Education	.. Industries.
Portfolio of the Honourable Minister for Local Self-Government.	Medical and public health.

For a description of these subjects reference may be made to the following paragraphs in the Punjab Government's memorandum prepared for the use of the Indian Statutory Commission, Volume I, Part I (Description Matter) :—

- Forests—paragraphs 90 and 91.
- Irrigation—paragraph 96.
- Industrial matters reserved—paragraphs 101–105.
- Criminal Tribes—paragraphs 107–113.
- Public Works—paragraphs 159–164 and 177–187.
- Industries—paragraphs 188–195.
- Medical—paragraphs 202–203.
- Public Health—paragraphs 217–231

### I.—Recruitment and Employment.

1. Agriculturally there is neither a shortage of labour, nor any superfluity. The Punjab colonies in their gradual development in the last 30 years have relieved the congestion in the thickly populated districts of the central Punjab, and the only mobility in agricultural labour is in this irregular trend to the colonies, and in the

seasonal influx of harvesters to the colonies either from adjoining dry Punjab districts or from arid Rajputana from where is also derived a considerable volume of migratory unskilled labour (including women) for building and construction work in the Province. This mobility, limited as it is, is automatic.

2. According to the census report of 1921, the total number of persons employed in 763 industrial establishments in the Punjab was 61,236, or about 25 per cent. of the total population of the province. It was then reported that 70 per cent. of the skilled labour and nearly 50 per cent. of the unskilled labour was recruited from the district of birth. According to the latest annual report on factories (1928), the total number of persons employed in all factories in the Punjab is 51,613, of which 43,296 are men, 7,534 women and 783 children (between 12 and 15 years of age).

Of the total number, 13,629, are employed in railway workshops, 4,743 in government factories such as military workshops, arsenals, etc., and 33,241 in all other factories.

Of the total number, 21,763 are employed on seasonal work, of which 21,335 are in cotton ginning and pressing factories and 428 in rice factories. Women are mostly employed in cotton ginning factories as unskilled workers, numbering 7,123 out of a total of 7,534 employed in all factories.

Of the total number of children, 93 are employed in textile mills, 246 in cotton ginning factories and 444 in other factories such as sports works, printing presses, match factories, cement factories and oil refineries.

Workers in factories other than those employed in railway workshops, textile mills and a few other engineering works belong mostly to the agricultural class and they seek employment in factories only with a view to fill in their time between harvests. The majority of skilled workers in railway and engineering works are imported from other provinces and having no interest in the land are keen upon improving themselves. Bombay and the United Provinces supply certain numbers of factory managers, engineers and head mistris, many of whom are Parsees. A fair number of engineers and boilermen are Sikhs.

The labour in factories is mostly unorganized, only the highly paid men holding positions of responsibility such as factory managers and engineers continue to remain in service for any length of time in the same factory. It is rare to find a worker earning less than Rs. 150 a month, who has been in the same factory for more than three or four years.

3. The development and maintenance of the Punjab Canals affords employment to a large body of workers. Table I contains a statement giving the gross area for each canal, or circle of superintendence. There is little, if any, migratory labour on open canals: local labour is obtained from neighbouring cultivators or village menials, who take up work on the canals where agricultural operations are slack.

As regards canals under construction, the chief engineers report that "the employment of 'local' or 'imported' labour depends on the conditions of the tract in which the canal is being constructed. In tracts thinly populated, practically all labour is 'imported', but there have been cases recently of new canals being constructed in tracts already poorly served by inundation canals in which 'local' labour was easy to get, in these, 'local' labour has been mainly employed.

"'Imported' labour comes from the north-west frontier province, Afghanistan, Bikaner State, and the dry districts of the Punjab where rainfall is scanty and conditions bordering on famine frequently prevail. Labour from the North-West Frontier Province and Afghanistan works only under contractors from its own tracts and always returns home for the hot weather; labour from Peshawar will sometimes remain throughout the hot weather, but only with great difficulty.

"The amount of 'imported' labour obtainable from the dry districts of the Punjab and Bikaner State depends almost entirely on the monsoon; if rainfall is good very little labour is obtainable in the following winter and then only at high wages.

"Statistics of labour employed on Open Canals are not maintained; statistics maintained on canals under construction show that: (a) in one circle the average number of men employed daily from 1st January, 1925, to 31st October, 1926, was 6,644, the maximum number was 12,414 in February, 1926, and the minimum 3,431 in October, 1925; (b) at a headworks, now nearing completion, the average number employed daily from beginning of November, 1926, to end of June, 1929, was 2,172 men, the maximum number being 5,448 in February, 1929, and the minimum 945 in August, 1927."

4. In the industrial field such migration of labour as there is tends towards (a) the canal colonies, (b) such business and industrial centres as Lahore, Amritsar, Ludhiana, Sialkot. The Director of Industries notes, "It was noted by the district census officer of Amritsar in 1921 that of 5,000 labourers at Amritsar in the busy season not more than 500 were permanent labourers. Most of these labourers

are drawn from the agricultural class. They frequently return to their villages at sowing and harvesting time or for ceremonial purposes. The labour employed in factories cannot be described as an industrial proletariat whose only source of livelihood is work in factories. On account of the development of agriculture in recent years the movement of labour towards the canal areas in Lyallpur, Montgomery and Multan has considerably increased. It may, however, be noted that most of the labour employed in cotton ginning factories in these areas is seasonal. It should also be stated in this connection that so far as the unskilled labour is concerned it is so plentiful that on no occasion has any difficulty been experienced in obtaining it." Skilled labourers, i.e., technical workers, foremen, mistries, have in the past been imported from the United Provinces, and from Bombay and Calcutta, but the growth of technical institutions in the Punjab in recent years is supplying the want in the way of qualified engineers, surveyors, draftsmen, mechanics and fitters. In areas where factories have been established a tendency is reported on the part of labour available in surrounding villages to take up factory work in preference to work on the field on account of its being more remunerative, but the volume of such work is small indeed, and the Punjabi, possibly from lack of sufficient opportunity, has still to take kindly to factory work.

5. As regards the method of recruitment, there is both direct recruitment, i.e., the applicant applies for employment usually in the evening for work on the next day, or the factory owner sends out agents to secure the labour he needs. The cotton ginning and baling factories usually employ a labour contractor who makes a daily payment to the labour he has recruited. In other industrial establishments labour is, as a rule, recruited directly. In the North-Western Railway workshops recruitment is now done through a labour bureau. On canal and construction works contractors have to look for their labour from the neighbourhood, and imported labour usually will not make a move till advances of money are given. In the Forest Department (felling and other work) labour is often nominally recruited by petty contractors, but actually cash advances against promises to work are made by the Forest Department on behalf of the contractors. Employment agencies and exchanges could perhaps be usefully employed with regard to the recruitment of skilled labour, but as regards unskilled labour, the present methods of recruitment work satisfactorily enough, and have the merit of being cheap.

6. *Unemployment.*—The Punjab Government in 1927 appointed a committee, whose terms of reference were:—"To investigate and report—(i) The extent of the existence of unemployment among (a) educated, and (b) the uneducated classes of the community in the Punjab; (ii) the causes of unemployment; and (iii) the possible remedies for unemployment."

The committee's report was published in pamphlet form in 1928. The committee came to the conclusion that there is no evidence of any serious and widespread unemployment among the uneducated classes, and such unemployment as did exist was voluntary rather than forced. The Director of Industries points out that in western countries where occupations are properly classified and where workers belong to sub-groups of a specialized trade, it is easy to determine the extent of unemployment, but in the Punjab where an ordinary mistry may take a job wherever he may get one without reference with any specialization on his part, it is by no means easy to appraise the quality and extent of unemployment. There is no such unemployment in the Punjab amongst skilled workers.

As regards the so-called unemployment among workers in cotton ginning factories, the committee were of the view that "as the cotton ginning season only lasts for four or five months it would appear to be more correct to say that the cotton ginning season is the off-season for their other employment." In fact, such labourers as are not in any way connected with agriculture (and this proportion is very small) easily find other employment on the termination of the ginning season, in the building trade, with local grain dealers or as private servants.

There is then little, if any, unemployment in the Punjab as far as labour is concerned. The reason is that there have been no great material developments carried out under any industrial system of private enterprise, bank credit and the specialization of labour, and consequently there is as yet no price to pay for these developments in the way of unemployment. Normal periodical unemployment due to cyclical fluctuations of trade is negligible, but here and there may occasionally be found an instance of unemployment incidental to industrial change and growth, as for example, at the Khewra Salt Mine, where the introduction of up-to-date plant has decreased the demand for manual labour in an immobile professional population.

As the report of the committee on unemployment shows, the local government is greatly exercised about possible methods of alleviating and remedying distress among the educated youth of the country, but so far as industry is concerned, the

Punjab is not an industrialized province, and consequently the effects of maladjustments in industry are on the whole negligible, and, therefore, no unemployment insurance scheme is needed for individuals condemned in virtue of their specialized trades to involuntary unemployment. The unskilled labour is mainly casual, and neither asks for nor needs decasualization. As regards the applications of international conventions, the need thereof may be gauged from the following ambiguous approval of the Director of Industries :—“ It appears that the Articles contained in the International Draft Conventions are indeed beneficial to the case of the working classes and may, therefore, be applied to the Punjab with certain modifications to suit the local conditions.”

7. The Director of Industries' opinion is that for skilled labour the average duration of employment varies from four months to four years, and that of unskilled labour from two to three months. The Inspector of Factories would put the period of casual employment in factories from four to seven months, depending on the season; the remaining portions of the year are spent in working on the land. In the forest department, seven months is the average duration of employment in the case of extraction of timber from the hills and resin tapping. Mr. Charles, Superintendent, Central Workshops, Public Works Department, Amritsar, which employ 400 to 500 men, has supplied the following note on unemployment and labour turnover in his workshops :—

“ *Skilled Men.*—That there must be a certain amount of unemployment among skilled men is indicated by the ease with which I can secure fresh men, but among skilled mechanics, etc., I do not think the matter is serious. I receive about six to eight applications for work in a month for skilled men.

“ Apart from temporary labour to meet specially urgent work, only about four or five of my regular men leave me of their own accord in a year. Many of these are young men who, having been taught their trade and gained some experience at these works, are looking out for advancement.

“ It is naturally my object to keep the labour turnover as small as possible and I have several men who have worked in these workshops for 15 years or more. These are mostly skilled men.

*Unskilled Men, Coolies, Menials, etc.*—In this case the matter is entirely different; there appears to be a lot of unemployment and the labour turnover is high. Many of them leave of their own accord, but there are plenty to fill their places. Half of those leaving go in order to try and get better pay. The remainder for no particular reason, for family reasons or merely for a change.

“ Out of 97 coolies employed, 6 have been at these workshops over 10 years and 35 over 2 years. During the year 1928, 39 coolies left and others were engaged to fill their places. Approximately one-third of the coolies leave every year.”

## II.—Staff Organisation.

1. In large scale works, e.g., the Attock Oil Co., Punjab Pulp and Paper Mills, the Portland Cement Works, the managing staff is recruited from abroad. The subordinate supervising staff is drawn from the province itself, but recruitment from among the operatives is rare. There is a wide gulf between skilled and unskilled labour. Workmen are usually illiterate, and an unskilled worker has no opportunity of qualifying himself as a skilled worker. There are no facilities for workmen corresponding to technical evening classes in England. Lack of education is likely to stand in the way of any forwarding of the purpose underlying works committees and the like.

2. The notable personage in India is the contractor. If a job has to be done, or things or men are to be got, you employ a contractor. No task is trivial and possibly no task is too big for an Indian “ thekedar,” who may be described as being a public utility undertaking, operating nearly always with profit to himself. Works committees, works councils, and the like all coalesce here in the contractor, and his universal function of a supplier of labour. In Government construction works “ mistris ” or men of little education, and mates—themselves of no education—super-vice work done by labour supplied by contractors. The pivot is the contractor. For example, though piece-work records are kept in the Forest Department by the subordinates of the department, wages are paid by contractors or their agents, and all felling, logging, sawing, carrying and floating of timber is given on contract.

3. The Inspector of Factories has supplied the following note :— . . . . .  
“ Wages are sometimes withheld for two or three months, and then the employer takes an opportunity to get rid of the worker.”

4. Technical institutions in the province are proving increasingly useful in supplying subordinate supervising staff both in public concerns and in private enterprises.

### III.—Housing.

As far as Government is concerned, a lively road policy is being pursued, but it is not an integral part of any deliberate housing scheme. No enquiry has been conducted into the housing conditions of labour in towns and municipalities or into facilities provided by employers for their operatives. Big towns like Lahore and Amritsar are badly congested. In Lahore an improvement trust has been established which works in conjunction with the municipality, but there is no labour tenement or particular area in Punjab cities. Housing finds no part in public utility undertakings, and there is practically no expenditure on housing out of rates.

2. In its own factories and undertakings, Government provides housing accommodation for both the supervising and subordinate staff. No rent is charged for occupation of quarters by menials, but in the case of subordinate and clerical staff a deduction of 10 per cent. by way of rent is usually made from salaries. For unskilled labour a quarter 10 ft. by 10 ft. with a verandah is the prevailing type.

3. In privately-owned factories of any size, quarters are provided for the permanent staff, and some of the bigger mills house a proportion of the entire staff within the factory at a nominal rent. In cotton ginning mills no accommodation is provided—workers return to their homes at night and this is the common rule. In canal colony areas, where villages and small towns are planned by the Colonization Officer in consultation with the Director of Public Health, space is allotted round the walls of a factory for workers who can build their own quarters or huts for themselves. Workers are only too glad to get any accommodation provided by the employer, but the need to provide accommodation is rare.

4. There is not in the Punjab any differentiation between the housing conditions of industrial workers and their neighbours in the same social grade. There are no industrial slums as such, or any peculiar urban inflammation due to the presence of agglomerations of factory or other workers, and the housing of labour is not to be differentiated from that of the ordinary poor citizen. The North-Western Railway has set up its own colony at Moghalpura, but it does not cater particularly for the labour employed in the workshops.

### IV.—Health.

1. As regards the organization of the Department of Public Health, reference may be made to paragraphs 217-231 of the Punjab Government memorandum, prepared for the use of the Indian Statutory Commission, Volume I, Part I, Descriptive Matter.

2. Labour, as regards health, groups itself under the following classes—mill and factory labour, industrial and artisan labour, certain classes of railway and public works labour, migrant labour, and labour under restriction in jails and criminal tribes settlements.

In the Punjab there is no Ministry of Labour with a health side. The Public Health Department works under the Ministry of Local Self-Government, while labour interests are looked after in a number of other portfolios, e.g. :—

Labour generally .. .. .	H. M. R. portfolio.
Criminal tribes .. .. .	" .. .. .
Convict labour .. .. .	H. M. F. ..
Factories .. .. .	H. M. E. ..
Industries .. .. .	" .. .. .
P. W. D. labour.. .. .	H. M. A. ..

while railways are the concern of the Government of India. None of these departments have public health advisers of their own. The needs of labour are therefore not envisaged at first-hand with emphasis on its needs for public health and sanitation. The sanitation of the quarter of towns, in which industrial and artisan labour mainly live, is of course the direct concern of the Ministry of Local Self-Government, which also controls the Health Department, but here, too, there may be room for greater control of local bodies with a view to secure better housing and better health amenities for the poor.

3. As regards vital statistics in relation to labour, the Director of Public Health has supplied the following note :—

#### Vital Statistics.

1. *General population.*—The birth rate and death rate of the Punjab during the past sixty years is shown in the attached chart (Table II)\*. It will be seen that the death rate is extremely high. The mean death rate during the past five years was 33 per mille, or about 3 times the death rate of England and Wales. The most striking

\* Not printed.

feature, however, is the extreme variability of the death rate, which is attributable to the peculiar liability of this province to be the scene of virulent epidemics, and it is due to this circumstance that the death rate of the Punjab usually exceeds that of any other province of India and, indeed, of most other countries in the world.

2. The infantile mortality rate is likewise extremely high—approximately 200 per 1,000 births (as compared with 70 in England and Wales)—and as this rate is not greatly affected by epidemics (except malaria), it indicates the existence, apart from epidemics, of a low grade of health. A favourable and hopeful feature is the high birth rate—40 per mille as compared with about 20 per mille in England and Wales. That the province should exhibit a remarkably high birth rate, in spite of being constantly decimated by epidemics, indicates not only the high fertility, but also the great recuperative power, of its inhabitants. Given good health, the population should at least have doubled itself during the past 40 years, but as a matter of fact, instead of increasing by 100 per cent., it has only increased by some 3·7 millions or less than 20 per cent. during this period or a mean annual increase of about 100,000 as compared with 262,000 in England and Wales during the same period. Another striking feature of the vital statistics is the disparity between the sexes; the number of males exceeds the number of females by over 2 millions in a total population of 20·5 millions. This feature is mainly attributable to the fact that the female death rate under almost every head of mortality is invariably higher than the male death rate, whilst the contrary is the case in England and Wales, where the female death rate, after the first year of life, is lower than the male death rate at all age periods.

3. Of special interest from the point of view of labour is the fact that the urban death rate is relatively and absolutely high as compared with the rural death rate, which is indicative of the fact that the artificial conditions associated with an urban environment are peculiarly prejudicial to health.

The death rate under all heads of mortality, except malaria, which is essentially a disease of rural areas and the outskirts of towns, is appreciably higher in towns than in rural areas. The most striking feature is the high respiratory disease death rate of towns, which in 1928 was 5·79 per mille as compared with 2·18 per mille in rural areas. This feature is in large part due to the great prevalence of pulmonary tuberculosis in towns which is the outcome of neglect of sanitation, intense congestion, and bad housing, to which must be added such disgenic habits and customs as child marriage and the purdah.

The death rate from dysentery and diarrhoea in towns is also about three times higher than it is in rural areas, and this fact is attributable to the gravely insanitary conditions prevailing in urban areas.

4. *Labour.*—It is unfortunately impossible to quote any statistics bearing specially upon the health conditions of the labouring classes, and it is only possible to state in this regard that as for the most part the death rate increases *pari passu* with a decline of social status and as labour is almost solely drawn from the poorer classes the remarks made and the conclusions drawn in respect of the general population apply with special force to the hewers of wood and the drawers of water.

5. *Summary.*—This brief review of the vital statistics permits of the following conclusions:—

The Punjab is inhabited by a vigorous and prolific people, where "natural increase" is held in check by the high mortality occasioned by disease and pestilence. The low grade of health is indicated by the high death rate, apart from epidemics, the high infantile mortality rate and the high female death rate, all of which are characteristic of a society in an early phase of social, economic, and cultural development. The relatively high insalubrity of towns, where, owing to congestion of the population, the need of sanitary safeguards is infinitely greater than in villages, is a reflection of the low standard of municipal and domestic hygiene.

4. In discussions with the Director of Public Health the following weak points have been brought to notice by him:—

(a) While general health problems of the people as a whole as has been shown in the account of the organization of the department are dealt with by the Department of Public Health, the special problems of the health of labour are not specially or directly dealt with. This is mainly because labour questions, as has been shown above, are the direct concern of departments, who do not possess public health experts, and are dealt with, in the first instance, from an angle of view in which health is not necessarily a primary or prominent consideration.

(b) In his opinion the Public Health Department should advise (and their advice should be followed) in connection with large concentrations of labour employed by the Public Works Department or railway on works. Though after his advice adequate provision for the health of labour has now been made in one instance, i.e., in the Hydro-Electric Scheme, similar provision

on similar advice should be made in the case of all works. The difficulty of the problem is enhanced because much of the work is carried out by contractors and the labour works and is paid in the main not directly by Government departments but by the contractors.

(c) As regards factories, we may state his view that, in addition to the appointment of the Director of Public Health and the Assistant Directors of Public Health as additional inspectors of factories, district medical officers of health should also be appointed.

(d) The Director of Public Health should be concatenated with the Colonization Officer who founds new towns, and with the newly sanctioned town planning engineer to secure planning and building regulations on hygienic lines.

(e) The Director of Public Health should be more closely and continuously connected with planning and management of criminal tribes settlements.

(f) As regards municipal committees, notified area committees and small town committees, although many towns have now inaugurated a policy of better drainage and water supply and some have effective health officers and staff, many are still careless as regards sanitary and health measures generally, and pay much less attention to them than is required, particularly in the poorer quarter of the towns, where the industrial and artisan population mainly dwell. The question of giving a more effective voice to the expert opinion of the Director of Public Health and his officers in such matters is largely mixed up with the general control of the Ministry of Local Self-Government over municipalities and local bodies.

5. As regards medical facilities, reference is invited to the extracts previously quoted from the Punjab Government memorandum prepared for the Statutory Commission (paragraphs 202-203). The State provides necessary medical aid free of cost and workers are entitled to receive free medical attendance, free medicines, and free lying-in accommodation in hospitals and dispensaries maintained by Government and local bodies. There are in the Punjab 964 hospitals and dispensaries of all classes. . . . . Medical facilities are provided in some of the larger factories and undertakings, for example, in the Dhariwal Mills and Punjab Portland Cement Works, Wah, and a few factories have an arrangement under which a doctor pays a weekly visit. Mention should also be made of a private hospital—Sir Ganga Ram's hospital at Lahore—which gives free medical aid to all comers.

6. A great need in the province is the provision of medical aid for women by doctors of their own sex. Provision has been made in the scheme for expansion of medical relief for (a) the building of a hospital for women at the headquarters of each district; and (b) the addition of a female section to hospitals at the headquarters of selected tahsils. Women are trained at present at the Punjab Medical School, Ludhiana, and are now admitted to the King Edward Medical College, Lahore.

The untrained indigenous "dai" continues to ply her trade, and she is largely responsible for the high infant mortality. There are, however, now many centres in which modern training is being given to dais.

7. As regards official supervision, a properly qualified medical officer is in medical charge of every jail where convict labour is employed. With reference to factories, the Indian Factories Act provides for the appointment of certifying surgeons in all factories, but the functions they discharge are limited to certifying the age and physical fitness of persons seeking employment and do not extend to providing medical aid for factory employees.

8. To quote from paragraph 3 of the review of the latest annual report on Punjab factories :—

"The supply of water both for drinking purposes and for meeting the ordinary requirements of factories was adequate throughout the year. Lighting arrangements were on the whole satisfactory: almost all the perennial factories were fitted with electricity, while the newly erected factories provided ample light. The conditions in factories situated in congested city areas, however, are not quite satisfactory. Sanitary conditions were generally satisfactory. Ventilation in all the newly erected factories, particularly in perennial, showed a distinct improvement, and the Governor in Council is glad to note that the Banktेशwar Cotton Spinning and Weaving Mills, Amritsar, has given a good lead in this direction. The Government Demonstration Weaving Factory at Shahdara should serve as a model of the standard in this respect. Ventilation in cotton ginning factories is a difficult matter, but it is satisfactory to read that the palliative of having doors and windows open is generally observed. New rules with regard to the control of artificial humidification in cotton spinning and weaving mills have since the close of the year been introduced, and it is hoped that they will ensure comparatively comfortable conditions for the workers."

These special rules for the control of temperature and humidity have been recently framed by the Punjab Government under Section 37 (2), Clause (g) of the Indian Factories Act for the control of temperature and humidity in cotton factories. There are three cotton spinning and weaving mills in which artificial humidity is at present being used affecting 750 operatives.

As regards the control of the construction of new factories, the Government of India was of opinion in 1926 that it is desirable that local governments should be vested with the power of controlling the construction of new factories. At the same time the Central Government held the view that the most that the Government of India could do would be to ask the Central Legislature to pass a measure giving powers to local Governments to adopt such methods for the control of factory construction as they considered suitable. Provincial Governments were accordingly asked to submit legislative proposals if they desired to proceed further in the matter. The Central Government has not as yet passed any enabling measure, nor has any province so far as it is known framed any rules except the United Provinces, which has framed some model bye-laws for the guidance of municipal and district boards for the purpose of regulating the construction and alteration of factory buildings in the province.

9. No industrial diseases have been reported in any of the factories in the Punjab. There is irritation, malaise, worry and monotony, and all the disadvantages of a larger labour turnover, and there is no due allotment of time between work and leisure.

10. The Draft Conventions and Recommendations concerning sickness insurance adopted by the Tenth International Labour Conference, 1927, were placed before the Indian Legislature and the following resolution was adopted by the Council of State and the Legislative Assembly on the 20th and 27th March, 1928, respectively:—

“That this Council Assembly having considered the Draft Conventions and Recommendations adopted by the Tenth Labour Conference recommends to the Governor-General in Council that he should not ratify the Draft Conventions, nor accept the recommendations.”

The Government of India, however, were of the opinion that the possibility of introducing some provision for sickness insurance required further examination, and requested that the question may be investigated by the local governments by a small and informal committee, including a few representatives of employers and employees.

Accordingly an informal provincial committee consisting of seven members, with the Director of Industries, Punjab, as chairman, met on the 12th February and 2nd March, 1929, to discuss the points mentioned in Government of India's letter No. L. 1518, dated the 20th September, 1928, which formed the agenda of the meeting.\*

11. The Punjab Government in submitting this report to the Government of India noted that inasmuch as the province is not the home of any such large scale industries the question of the introduction of sickness insurance is not of much practical importance for the present, and from a provincial point of view there is no need for any legislation, but should the Government of India decide to take up central legislation the local government will make no opposition, provided the legislation is made elastic enough to leave the province sufficient powers to adopt any such legislation to suit local conditions. The Punjab Government, while commending for consideration the recommendation of the committee that any scheme should be applicable to any permanently employed workers (which term should include within its scope the classes specified by the committee), suggested that a beginning should be made only with workers coming under the Workmen's Compensation Act, the Factories' Act, and the Indian Trades Union Act. Further, Government desired to dissociate itself from any acceptance of the suggestions in the committee's report defining the measures of State assistance which should be afforded, though liability for the cost of administration was accepted.

#### V.—Welfare (other than Health and Housing).

Such welfare work as there is in the province is paternalist. In the way of what is termed “Rural Uplift” on the part of the State, the district of Gurgaon, with which the name of Mr. F. L. Brayne will long be associated, has done pioneer work, but in towns and urban areas welfare work is confined to the ministrations of State departments such as Public Health (including health schools, health visitors, and municipal welfare centres), medical and education. Employers, speaking generally, are not interested in or alive to the need for welfare work, and the idea of a works

\* The report of this committee is not printed here, but is given in full in Appendix V to the memorandum of the Government of India.

committee has yet to form. The number of large establishments in the province is small, and the teaching of mutual responsibility has only occasional scope. Punjab labour is largely unorganized, partly migratory, illiterate and apt to return to the land. Employers have little money and no concern for benevolent activities, and too often are criminally indifferent to statutory rules. The vagaries of weather and markets occupy their attention. Recent enactments such as the Workmen's Compensation Act, Trades Union Act, Trades Disputes Act, and the protection afforded by these measures may herald the beginnings of some community spirit both among workers *inter se* and in the relations of employer and employee.

2. Some welfare work is attempted in a few important mills. At the New Egerton Woollen Mills, Dhariwal, playgrounds are provided by the mill authorities for the use of their operatives and are kept in good condition. An uplift club is also provided for the subordinate staff and a well run social club for the supervising staff. A hospital and a school both for boys and girls have also been started by this mill. The mill also runs a co-operative society for the benefit of the workers. In addition to this, two other factories, *viz.*, the Punjab Portland Cement Works at Wah and the Bankteshwar Cotton Mills at Amritsar, have also evinced some interest in this direction in providing recreation grounds and clubs for the benefit of their employees. So far as the provision of educational facilities is concerned, Dhariwal Mills alone provide facilities for their workers. The Amritsar Carpet Manufacturers have been recently urged to provide half-time facilities for education of the children employed in the factories. They agreed, in theory, to the desirability but have afterwards professed inability to translate the suggestion into practice.

3. In the way of co-operation, factories are backward. At Dhariwal there is a flourishing co-operative society among the employees of the New Egerton Woollen Mills. This society does both supply and loan work, and is very keen on the improvement of its employees' conditions. There is also a large supply society at Moghalpura, whose members are employees of the railway workshops. The criminal tribes also have supply societies in their settlements and plantations.

4. The annual report of the Co-operative Department is also interesting in this connection. In 1928, the total number of non-agricultural societies in the Punjab was 2,616, with a membership of 88,613 and a working capital of over Rs. one crore. These societies include (a) credit, (b) purchase and sale, (c) production and labour, (d) production and sale and (e) thrift societies. Most of the credit societies consist mainly of Christians or menials. The menials' societies, particularly those of Chamars, are said to have worked very satisfactorily. Among Production and Labour Societies there are two presses in Lahore one of which is said to be doing well and the other badly. The number of Industrial Societies is 289, with a membership of 5,313 and working capital of Rs. 6 lakhs. Industrial societies include all kinds of artisans like weavers, woodworkers, shoemakers and goldsmiths, etc. Special mention may be made here of a few societies which are known as Better Living Societies. Their number is 231, with a membership of 8,665. The object behind the formation of these societies is to discourage expenditure on ceremonies and jewellery, etc. The remarkable success that has attended the co-operative movement in rural areas, though due undoubtedly to the heavy rural indebtedness which distinguishes the Punjab, would seem to indicate that its further infiltration into industrial spheres may in course of time stimulate team work on the part of workers themselves to speculate on questions affecting safety at work, improvements in environment, better cleanliness and air and recreation and the like.

## VI.—Education.

For a general description of the growth of facilities for general education reference is invited to Chapter VI of the Memorandum prepared for the Indian Statutory Commission, Volume I, Part I, descriptive matter. The marked progress of recent years is bound to be a potent factor in raising the standard of living.

2. Industrial areas being mainly in municipalities or small towns, children not in employment come under the control of the system of compulsory education covering the primary classes, but such compulsory education stops at the fourth primary class, *i.e.*, many years before the age of fifteen. No special arrangements exist for the education of children employed in factories. Indeed, such children are few, except in the carpet factories at Amritsar. A suggestion has been recently made to the carpet manufacturers that with the double object of restricting the hours of the children's labour and giving them the elements of education, half-time classes should be started either in the factory premises or by arrangements in neighbouring municipal schools. But the factory owners shelter themselves under the opposition of the master weavers to any such restriction of hours, and the children continue their blind alley occupation.

3. Facilities for the education of adults have been increasingly provided in recent years. There are now over 2,000 schools for adults maintained by local bodies with help of grants-in-aid from Government, with an enrolment of over 5,000 pupils. These schools, it has to be noted, are not confined to urban or industrial areas: they are mainly in the villages, and the establishment of village vernacular libraries in nearly 2,000 village schools is a benefit which only the rural classes enjoy. Some 35 small towns in the Punjab have attempts at libraries, but these libraries are in English and they suffer from lack of suitable accommodation and adequate funds. It is also only in the country that odd examples can be found of private employers maintaining schools for the benefit of their employees, e.g., Major Vanrenan on his estate at Renala Khurd (Montgomery District) for the children of his tenants, and Rai Bahadur Ram Saran Das at Kot Mela Ram (Multan), for the same object. An organization like the Workers' Education Association, or any Institute of Adult Education for getting together a sufficiency of industrial workers for evening tutorial classes is yet to be born, and there are no indications that a Sir Ernest Cassel will appear in the Punjab.

4. On the other hand, industrial and vocational training under direct State guidance is making good headway. In 1912, an engineering school was established at Rasul to train sub-overseers for both branches of the Public Works Department. In 1923, the MacLagan College of Engineering was opened with the object of providing efficient and practical training for young men in mechanical and electrical engineering.

5. There are now over a score of industrial schools in the Province, and all the schools have recently been provincialized. These schools, with the exception of the Government Technical School in Lahore, are middle schools with nearly half the pupils coming from the artisan class. The main crafts taught are carpentry, metal work, weaving, lacquer turning, and copper smithy. A full-time inspector of Industrial schools was appointed in 1928, and in the current year a scheme of studies has been prepared for type I schools (middle), type II (high), and it is hoped in course of time to establish type III schools which will include in their curriculum, mechanical and electrical training and practice. The Government Technical School, Lahore, has an attendance of nearly 800 pupils, 86 per cent. being sons of artisans, and the progress of the school can be indicated by recent appointments to the staff, such as an electroplater, padder, polisher, smith and pattern maker. For technical institutes of various descriptions, reference may be made to the list in paragraph 192 of the Punjab Government memorandum for the Indian Statutory Commission and the reports of the Department of Industries, Punjab.

#### VII.—Safety.

As regards existing regulations, incidence of accidents in factories, causes, accident prevention, first-aid, medical relief and enforcement of regulations, see Memorandum of Inspector of Factories.

The complaint is general that courts take no notice of repetition of offences and inflict only small fines. A great deal of the Inspector's time is taken up in attending court often with little result.

The Punjab Government in 1928 issued directions that factory cases in four of the important industrial districts in the Punjab should be tried by a magistrate specially nominated for that purpose, and that the Local Government is alive to the need for more rigour in enforcing regulations will be apparent from the following two paragraphs from the last year's review (1929) on the working of the Indian Factories Act:—

“The number of accidents rose from 707 in 1927 to 1,019 in 1929 and an increase of 250 occurring in the railway workshops. In privately-owned factories the number remained the same. As will appear from the comparative statement below, there was an increase under all heads:—

Year.	Fatal.	Serious.	Minor.	Average per 100 operatives employed.
1927 .. .. .	16	14	677	1.4
1928 .. .. .	29	36	954	1.97

"The railway workshops showed an increase of 4 fatal accidents as compared with last year, while the sudden collapse of the Verumal-Mula Mal Ginning Factory, Amritsar, accounts for 5 deaths and 7 injuries. The building of this factory was very old and the main girder collapsed as a result of the wall opening out at one end, probably due to weakness effected by rains and vibration. When the factory started working after having remained idle for 2½ years, the roof collapsed in a few hours. Government is considering what steps should be taken to prevent a recurrence of such accidents. Eight fatal accidents occurred to workers in the main shaft alley of cotton ginning factories. Serious accidents in the railway workshops increased from 5 to 18, of which 8 were injuries to eyes. There were also 151 minor injuries to eyes in the workshops. The use of eye protectors is being encouraged as a safeguard against such injuries.

"The number of prosecutions rose from 91 to 130, of which 108 resulted in conviction. This result is satisfactory, and no apology from the factory inspector is required. There were as many as 28 cases of overworking labour and children and 17 cases of illegal employment of women and children brought to court. Less satisfactory is the attitude of the magistracy in penalizing infringements of factory law, particularly in the matter of overworking employees and the illegal employment of women and children. The Governor in Council has recently observed with regret a statement from the Sheikhpura District in which fines of Rs. 15 or Rs. 10 were imposed for such offences where men were concerned, while for offences against women and children the offenders were 'warned.' It must be remembered that the operatives are seldom in a position, owing to poverty and migratory conditions, to move the civil law and secure damages for infringement of essential conditions of labour, and that the onus rests on the State to ensure that the employer in his relations to labour does not stray beyond the limits which the statutory law imposes on his treatment of labour."

2. The coal mines in the Punjab are not important. The supervising agency is that of the Chief Inspector and his Assistants. As regards the Provincial Government, the Director of Industries (except in the matter of checking concessionaries' accounts) and the Factory Inspector have no concern with the mines, and the District Magistrate, who by virtue of his office has most of the powers of an Inspector, is usually too busy with other duties to exercise any effective control.

3. As regards the effect upon safety of hours, health, light and working conditions generally it can only be broadly stated that fatigue is undoubtedly responsible for many accidents. The very notion of industrial psychology is unknown in either seasonal or regular factories, and while the Inspector must see to accident prevention, illumination, ventilation and the like, he is neither competent nor required to advise on problems like monotony, irritation, rest pauses and other concerns of an Industrial Fatigue Board.

#### VIII.—Workmen's Compensation.

An increasing use is being made of the provisions of the Workmen's Compensation Act, as will be seen from the following table, which gives the number of cases accruing in factories which came within the purview of the Act :—

Year.	Accidents.	Number in which compensation was awarded.	Percentage.
1924 .. .. .	46	8	17
1925 .. .. .	458	392	86
1926 .. .. .	523	461	88
1927 .. .. .	376	340	90
1928 .. .. .	953	837	88

The provisions of the Act are now fairly well known, but illiterate workmen are still imperfectly posted in the procedure of making claims, and trade unions, speaking generally, do nothing to help them.

2. The following paragraphs from the review of the latest report (1929) on the working of the Workmen's Compensation Act may perhaps be appropriately included :—

" There has been a considerable increase in the number of accidents reported to have occurred in factories to which the Workmen's Compensation Act is applicable, and a much higher percentage of cases coming within the purview of the Act. The disparity in the years 1927 and 1928 is worth tabulating :—

Year.	Number of accidents reported.	Within purview of the Act.	Fatal.	Disablement.		Percentage of 2 on 1.	Cases in which compensation was paid.	Percentage.
				Perma- nent.	Tempo- rary.			
1927	707	376	16	14	346	53	340	88
1928	1,019	950	29	36	888	94	376	90

" The increase in the number of accidents as reported is more a matter for regret than the increase in the number of cases brought within the Act is a source of satisfaction. Reporting has improved, and the figures afford ample testimony to an increasing familiarity on the part of operatives with the provisions of the Act, and credit seems due to the Factory Inspector and his staff for giving publicity to the method of presenting claims. Government, however, views with some alarm the increase in the number of accidents on the reasons for which the report is silent.

" Concurrent with the increase in the number of cases, there has been an unexplained decline in the amount of compensation awarded in the major cases. Sums paid for temporary disablements will always vary, but there has been a striking decline in 1928 in the average amounts paid for fatal accidents and permanent disablements, *i.e.* :—

	1926.	1927.	1928.
	Rs.	Rs.	Rs.
Fatal accidents . . . . .	1,320	1,298	579
Permanent disablements . . . . .	722	787	398

" It may be that accidents have been more rife among the lower paid employees or it may be that insufficient amounts have been deposited by employers, or it may be that workmen have accepted whatever amount was offered rather than have recourse to Commissioners. There is perhaps some truth in the last view. It will be seen that, in spite of the big increase in the number of accidents and cases, the number of cases filed before the Commissioners for the Act was the same as in the previous year, *i.e.*, 86. The Commissioners disposed of 74 cases, 17 of which were contested, but in all cases the claim was finally allowed.

" It will be observed from the statement included in paragraph 4 of the report that in the matter of fatal accidents and permanent disablements considerable delay occurs in the settlement of claims. In fatal accidents, for example, only 9 cases reached a settlement out of the 29 that occurred during the year, and only 17 out of the 36 cases of permanent disablement. Reference to return A will show that Commissioners are responsible for the delay in the matter of fatal accidents, and employers as regards permanent disablements. The major accidents for which no compensation has been paid are in the main the concern of privately owned factories. Fatal accidents occurred in five cotton factories in 1928, and nothing in the way of compensation seems to have been paid. Government would be glad to have a further report on the matters referred to in this and the preceding paragraph.

" In the case of mines coming under the Indian Mines Act, there were 16 accidents against 21 in the previous year. The amount of compensation awarded for 7 cases was Rs. 2,536, as against Rs. 2,040 for 8 cases paid during the previous year."

3. The Punjab Government's opinion on the proposed amendments which the Government of India have in contemplation to the Workmen's Compensation Act will be found in its letter No. 3032-S. Rev., dated 16th July, 1929, to the address of the Government of India, Department of Industries and Labour. Briefly, the gist of that opinion is as follows :—

(i) The scope of the Act should be extended to workers in all organized industries whether hazardous or not—at the same time the extension of the Act to workers in unorganized industries is not practicable till a scheme of compulsory insurance can be introduced. At the moment such introduction is so difficult as to be impracticable.

(ii) Pending the inclusion of unorganized industries within the scope of the Act an increase in the scale of compensation of 25 per cent. in respect of the more poorly paid workmen (say, earning an average wage of Rs. 25 per mensem), and 10 per cent. in respect of workmen paid more than Rs. 25 per mensem seems desirable—also the minimum scales of compensation might suitably be raised.

(iii) The waiting period should be reduced from 10 days to a week.

(iv) As regards "proof of dependence" it is suggested that provision should be made so as to enable a dependant who claims compensation to approach the Commissioner direct for the settlement of his claim without first applying to the employer—claimants then in the proceedings before the Commissioner may reasonably be required to submit "some proof of dependence" without this limited onus jeopardizing the claim for compensation as against the employer.

(v) Employers should be required to report fatal accidents at least within 15 days to the Commissioner who, when seized with a report of the accidents, should be empowered to set the machinery of the law into action.

4. As regards the machinery of administration, the Act is administered through Commissioners appointed under Punjab Government notification No. 905-6-2535, dated the 18th February, 1924. The Senior Sub-Judges of Ambala, Ferozepore, Lahore, Amritsar, Rawalpindi, Lyallpur and Multan, and the District Magistrates in the other districts of the province are the Commissioners under the Act for their respective districts.

## IX.—Hours.

### A.—Factories.

Reference may be made to the memorandum of the Inspector of Factories as regards the position in the Punjab :—

As far as seasonal factories are concerned, the time is not yet ripe for the establishment of the principle of the 48-hour week. Punctuality and steady work are not yet the rule among factory workers. A considerable amount of time is wasted in getting to the actual job and leaving it and, as things are, it is improbable that in a 10-hour day the average worker is on his job for more than 8½ hours.

### B.—Mines.

2. The Salt Mines at Khewra are a State concern, managed by the Imperial Government in the Salt Department.

3. There are coal mines privately owned in the Jhelum, Shahpur and Attock districts. In the Jhelum district (Dandot Chitidand and other collieries) the normal working hours are reported to be 36 underground and 48 above ground and no overtime is put in. Payment is by piece-work.

In the Shahpur district (Tajuwala colliery) the hours are reported to be in the mine 8 hours a day and 48 hours a week. Outside the mine 10 hours a day and 60 hours a week. There is no overtime. There are three shifts.

In the Mianwali district (Makkarwal colliery) the actual hours are, in the mine, 42 hours per week, outside the mine, 56 hours a week. The only interval in all these coal mines is the seventh day of rest.

### D.—Criminal Tribes Settlements.

4. One reformatory, 8 industrial settlements, 19 agricultural settlements and 3 reformatory schools, established so far in the Punjab, accommodate a total population of 10,839 souls, which consist of 3,659 males, 2,633 females and 4,547 children. Of the males, 1,521 hold tenancies in the agricultural settlements, where they reside with their families, and the rest are employed in the reformatory and industrial settlements.

In the reformatory settlement fresh arrivals are first employed in the factory attached to the settlement, and remain so employed till they are considered fit for outside employment. Other able-bodied men are employed outside the settlement on different paying jobs for which they are considered fit. Youths are trained in various industries such as carpentry, tailoring, shoe-making, weaving, etc.

In 5 out of the 8 industrial settlements the inmates are employed in forest plantation work, while those of the Palampur Settlement in the Kangra Valley are employed in the tea gardens. In the Moghalpura Industrial Settlement the labour is employed in the railway shops. In the Lyallpur Settlement men are employed on agricultural work as well as under different contractors.

In the industrial settlement the maximum working day is of 10 hours, though in railway shops and forest plantations the actual working day is shorter. In all settlements one holiday is allowed in a week to enable the workers to attend to their household affairs. In agricultural settlements no working hours are fixed as each tenant works according to the actual requirements of his holding.

5. As regards labour in jails, reference may be made to Chapter XXII (Labour and Jail Industries) of the Punjab Jail Manual. The main provision regulating the hours of labour are :—

(i) No criminal prisoner shall be "kept to labour" for more than 9 hours in any one day ;

(ii) Sundays and certain other days in addition are days on which convicts are exempt from labour ;

(iii) The class of labour to be performed in prescribed by the medical officer of the jail in accordance with the physique and capacity of the convict ;

(iv) There is a period of rest of 2 hours in the middle of the day ;

(v) Tasks are prescribed, the task for the adult female or juvenile not to exceed two-thirds of the maximum task for adult male convicts ;

(vi) The objects on which convict labour shall be employed are—*First*—The requirements of the jail and Jail Department ; *Secondly*—The requirements of Government in any other respect ; *Thirdly*—Other demands which the Inspector-General may from time to time approve.

With regard to the second item, the Lahore Jail does the bulk of the vernacular printing for Government (notably for the Department of Land Records). Modern lithographic plant has recently been installed.

6. In industrial establishments not coming under the Factories Act the normal customary hours of work are from sunrise to sunset—12 hours in summer and 10 hours in winter—with an interval of about one hour at midday for meals. Sunday (or Friday in places where Muslim labour predominates) is usually observed as a holiday, and work is also suspended on festivals and religious occasions ; and if permanent labour is required to work on holidays extra wages (usually  $1\frac{1}{2}$  times the average wage) are paid. There is regular recourse to overtime when there is a rush of work. The important carpet factories at Amritsar are not on the factory register because they do not employ any motive power, and the attempt to apply to them some modification of working hours' legislation has met with strong opposition. Workers in these factories do put in very long hours, and the majority of them are boys between the ages of 9 and 15. In small workshops where daily wages are the rule work is carried on during all the seven days, the worker taking such holidays as he chooses.

In these unregulated establishments it doubtless is desirable to have some regulation, but practically the enforcement of any regulation, with opposition both from the employer and employee, would be surrounded with difficulties, though some kind of "Employment of Young Persons' Act" may eventually be found necessary. In forest work there is hardly any need of regulation of hours in view of the piece-work basis, and the leisurely nature of the labour.

## X.—Women, Young Adults and Children.

### A.—Factories.

The Punjab Government would again quote the Inspector of Factories :—

"The curtailment of the hours of work and prohibiting women and children from certain employment has had a good effect, though the argument is still occasionally used that restrictions placed on the employment of women and children have tended to place them at a disadvantage in the labour market. There is no doubt that the wages earned by women are low, but the restrictions placed by the amended Act are in my opinion justified.

"The admission of infants into factories is discouraged as far as practicable ; it is, however, difficult to always keep them out because they are too young to be separated from their mothers. In 1924 and 1926 I issued an order prohibiting infants from entering into cotton ginning rooms whilst ginning was in progress, as the atmosphere was laden with dust. There were many protests against this order, and after two years I found the order could not be enforced without hardship to parents, who must lose their employment in factories if infants were not allowed in, and the order had to be revoked.

"The present regulations with regard to the employment of women and children in factories are quite suitable. Hours of employment for women are the same as for men, except that the former may not be employed before 5.30 a.m. or after 7 p.m. This also applies to half-time workers, i.e., children between the ages of 12 and 15 years, whose hours of work are not to exceed six hours a day.

"I have seldom noticed the employment of children in two factories on the same day, but it is not improbable that many of them work at other occupations during the part of the day they are not employed in factories.

"The local government have made use of Section 2 (3) (b) of the Indian Factories Act by applying it to cotton ginning and ice factories employing not less than 10 persons on any one day during the year. The extension of the Act in this behalf became necessary as most of the factories deliberately kept the number of their employees below 10, and so avoided coming within the purview of the Act, so as to be able to work longer hours and employ women and children at all hours. The Act could be usefully extended to all other factories in order to regularize the hours of employment of women and children—it would also cut down much unfair competition which exists at present."

2. There is good reason to suspect that in the busy time in ginning factories the practice is general of overworking women and children. While the rule prohibiting night shifts for women is generally observed, the infringement of regulations generally consists in the adding of an additional hour or two before the prescribed time in the morning and adding a like period after work should be over in the evening. As noted in the last review on factories: "When the woman only gets three-quarters of the man's pay on gins, the permission for night work or night shifts is bound, under present conditions, to infringe the rule prohibiting the employment of women and children at night." As it is the common lot of women to do the dirty work, and as in England at any rate it was the State regulations of the hours of labour with reference to women and children that brought about a limitation of the hours worked by men, the tightening of control over the labour of women and children seems the first desideratum—women in the ginning establishments and children in Amritsar—amenable and not discontent material, but to a liberal view "factory fodder" all the same.

There are hardly any opportunities of apprenticeship. There is no reluctance on the part of boys to take "blind-alley" jobs. The channel of apprenticeship needs widening.

3. The whole question of the employment of women in the salt mines at Khewra and elsewhere in the Salt Range is engaging the earnest attention of the Government of India. Women are still employed in the salt mines, working in conjunction with their men folk, but the number of them is being systematically reduced with a view to ultimate abolition. This reform does not appeal to their men folk.

In the coal mines under private management, women are not permitted to work underground, but women relatives of the permanent force of miners settled at the mines undertake light duties outside the mines, e.g., loading coal. It is, however, to be suspected that "juvenile" labour is not altogether excluded from underground working.

4. Women are at a premium in the Punjab, and the more their work is concentrated on the care of the rising generation, the better for the province.

#### **XI.—Special Questions relating to Seamen and Workers in Inland Navigation.**

This province is not concerned, though it may be noted parenthetically, that men from the Attock district in the far north find employment as stokers at sea.

#### **XII.—Wages.**

A periodical survey of wages has been carried out quinquennially since 1912. In Tables III and IV, figures are given showing the prevailing rates of wages in the factories of the Punjab at the four surveys since 1912, and also figures showing the average wages earned by skilled and unskilled labour during the past eight years. Since 1912 the scale of wages paid in factories has risen a great deal and roughly speaking wages have nearly doubled.

The regular quinquennial survey deals with the wages of certain classes of workers in the three principal towns of Lahore, Amritsar and Multan, in selected villages unaffected by urban conditions, and also at certain railway stations to serve as a means of comparison with rural wages in the same neighbourhood. The classes of labour which come under scrutiny are as follows:—

1. *Urban Areas.*—(i) Workers in iron and hardware; (ii) brass, copper and bell metal workers; (iii) carpenters; (iv) Cotton weavers; (v) masons and builders; (vi) unskilled labourers.

2. *Rural Areas.*(i) Carpenters; (ii) blacksmiths; (iii) masons; (iv) ploughmen; (v) unskilled labourers.

3. *Railway Areas—Coolies.*—The survey does not deal with certain occupations which at any rate in the rural areas are governed by status rather than by contract. The Indian village is a self-contained unit, and it still maintains all the artisans which its simple agriculture and mode of life require—i.e., the carpenter, blacksmith, weaver, potter, and worker in leather, upon whom there is a customary obligation to render certain services to villagers in return for customary payments in kind at harvest or on certain occasions such as festivals, marriages, births and deaths in the families of their patrons. In addition to these agricultural "kamins," as they are called, there are domestic purveyors of services, i.e., barbers, cobblers, washermen, etc., whose remuneration is fixed by custom and status.

The last and fourth regular wages survey was held in December, 1927, in Lahore, Amritsar and Multan, and in 1,948 villages removed from urban influences.

1. *Urban Wages.*—Labourers of classes (i) to (vi) described above are paid by the day, except at Amritsar, where those falling under (i), (ii) and (iv) are paid by the job. The daily wages of these classes were found to work out as under in 1927 :—

Class.	Lahore.	Amritsar.	Multan.
	As.	As.	As.
Workers in iron and hardware .. .. .	40	28 to 32	24
Brass, copper and bell metal workers ..	28	14 to 16	32
Carpenters ... .. .	36	28 to 32	26 to 32
Cotton weavers .. .. .	Nil	14 to 16	Nil
Masons and builders .. .. .	36	28 to 36	26 to 32
Unskilled labourers .. .. .	14 to 16	14 to 16	10

Amritsar and Multan are markets for iron and hardware. The brass and copper-ware industry in Amritsar has been badly hit by the rapid introduction of aluminium ware.

Lahore offers a big field for the employment of carpenters, masons, builders and unskilled labourers, both by reason of its size and its growth. Its trade in wood work makes a demand for a large number of carpenters. Wages are consequently higher than in Amritsar and Multan.

2. *Rural Wages.*—Workers in the rural areas can be classified under the following heads :—

(1) Whole time workers—(i) Carpenters; (ii) masons; (iii) ploughmen; and (iv) unskilled labourers.

(2) Part time or customary workers called kamins. (i) Carpenters; (ii) blacksmiths; (iii) cobblers; (iv) potters; and (v) barbers; ministering to the calls of their clientele at certain times and on certain occasions. It will be seen that carpenters fall under both heads.

The wages of these classes fall under four types :—(i) Purely cash wages; (ii) cash wages with supplements; (iii) purely grain wages; and (iv) wages other than in cash or grain.

The rates of wages, inclusive of money value of any supplements in kind found commonly prevalent at the survey of 1927, were as follows :—Carpenters, 16 to 32 annas a day; masons, 16 to 38 annas a day; unskilled labourers, 5½ to 16½ annas.

A table showing variation in the wages of unskilled labourers since 1909 is appended (Table V). It shows that wages varied between 2½ and 3½ annas in as many as 10 villages, between 3½ and 4½ annas in 87, and 4½ and 5½ annas in 102 villages in 1927. The average has risen considerably since 1909, though it has dropped since 1922. It was found to be lower in 1927 than in 1922, as a result of the return of more stable conditions after the war. The local variations of wages are due to the differences in the quality of the work and the local demand.

The enquiry into the earnings of the railway coolies was for the incidental purpose of finding a means to compare and verify the standard of wages earned by other labourers. Selected stations only were brought within the purview of the enquiry.

The returns show that the daily earning of the railway porters and coolies ranged between 8 annas at Jagadhri near United Provinces, and As. 12-6 pies in Pattoke, in the Lower Bari Doab Colony. As a class they are better off than the unskilled labourers of the same locality in the south-east and in the un-irrigated parts of north and north-west of the Punjab in the matter of daily earnings. They are slightly to the bad on account of having to conform to scheduled rates in the congested centre of the province near Batala and Wazirabad, where the local supply of labour is limited and fetches a higher value outside. In canal colonies they are on the same level as ordinary unskilled labourers.

2. On Government canals, labour is employed either on a monthly or daily wage. The present sanctioned monthly wage for unskilled labour is Rs. 13 per mensem, which is low. The daily wage demanded by unskilled labour varies from 8 annas to Re. 1 per diem with the time of year and the state of agricultural operations.

In regard to labour employed by contractors—labour employed on earthwork is usually paid on "piece work" that employed on masonry and other works is paid daily wages as above.

The common rate for daily unskilled labour in forest work is 8 annas a day.

3. The relation of wages to prices and cost of living has not been worked out. As regards prices reference may be made to two publications of the Board of Economic Enquiry No. 7, Sixty years of Punjab Food Prices (W. H. Myles), No. 13, Eighty years of Punjab Food Prices (Brij Narain).

4. Payment in kind is confined to rural areas. There are (a) purely grain wages, (b) supplements to cash wages, (c) wages other than (b) or (c). Purely grain wages as a form of remuneration for daily or monthly work are going out of vogue, and are mainly confined to carpenters, blacksmiths, cobblers, barbers and potters, and for the performance of customary work in relation to agricultural operations.

They are paid in the form of sheaves of corn, reckoned according to the number of ploughs which were at work during the harvest.

Wages in kind in the case of shoemakers consist in some parts of the province, in the skins of dead cattle which are placed at their disposal on the understanding that new shoes will be supplied free.

The third type of wages in kind is in the nature of a retainer, intended to ensure the continued presence of the worker to be utilized as occasion may arise.

There are no payments in kind to industrial labour. In all factories wages are now strictly paid in cash.

5. In rural areas wages are, as a rule, regulated by contract except in the cases of labourers living among and dependent upon agricultural communities, especially carpenters, blacksmiths, cobblers, potters, barbers, who are looked upon as Kamins or permanent servants. Even carpenters and blacksmiths received negotiated wages in rural areas, in respect of non-agricultural work. As a general rule, the wages of carpenters and blacksmiths for agricultural work and of cobblers, potters, and barbers are customary and non-competitive. These wages have relation to certain crops grown and go by a fixed number of sheaves of corn, usually the staple of each locality, after every plough working during the currency of the harvest. Customary wages are, however, entering on a competitive stage under the stress of changing conditions.

The scope for business has widened considerably in almost every direction and to that extent the scope of customary duties has contracted. Labour has become more mobile and can afford to defy the village communities by emigrating to the canal colonies, where there is much demand for it. In the case of several crafts, notably among carpenters, blacksmiths and cobblers, the customary has given place to the competitive wage. The advent of modern implements of agriculture and the replacement of wooden by steel gear for wells have a tendency to set the carpenters and blacksmiths free to shift to more prosperous centres and insist on cash payment in place of the deferred payment in kind. Similarly, the cobblers and shoemakers have developed a tendency to dispose of their wares in the open market. At all events, their ministrations to their sepidars or clientele are of a much more circumscribed character. In many instances, the supply of new shoes has come to be limited to shoes for the adolescent only.

6. In urban and industrial areas wages are fixed by the dictates of supply and demand at the locality, and are the result of direct negotiation between the employer and the employee. The employer, however, really dictates his own terms. There is no combination or coherence in labour for any bargaining. Variations are both seasonal and local. In the building trade, for example, wages are appreciably lower during the rainy season than at other times during the year. The mobility of labour

3. *Railway Areas—Coolies.*—The survey does not deal with certain occupations which at any rate in the rural areas are governed by status rather than by contract. The Indian village is a self-contained unit, and it still maintains all the artisans which its simple agriculture and mode of life require—i.e., the carpenter, blacksmith, weaver, potter, and worker in leather, upon whom there is a customary obligation to render certain services to villagers in return for customary payments in kind at harvest or on certain occasions such as festivals, marriages, births and deaths in the families of their patrons. In addition to these agricultural "kamins," as they are called, there are domestic purveyors of services, i.e., barbers, cobblers, washermen, etc., whose remuneration is fixed by custom and status.

The last and fourth regular wages survey was held in December, 1927, in Lahore, Amritsar and Multan, and in 1,948 villages removed from urban influences.

1. *Urban Wages.*—Labourers of classes (i) to (vi) described above are paid by the day, except at Amritsar, where those falling under (i), (ii) and (iv) are paid by the job. The daily wages of these classes were found to work out as under in 1927 :—

Class.	Lahore.	Amritsar.	Multan.
	As.	As.	As.
Workers in iron and hardware .. ..	40	28 to 32	24
Brass, copper and bell metal workers ..	28	14 to 16	32
Carpenters .. .. .	36	28 to 32	26 to 32
Cotton weavers .. .. .	Nil	14 to 16	Nil
Masons and builders .. .. .	36	28 to 36	26 to 32
Unskilled labourers .. .. .	14 to 16	14 to 16	10

Amritsar and Multan are markets for iron and hardware. The brass and copper-ware industry in Amritsar has been badly hit by the rapid introduction of aluminium ware.

Lahore offers a big field for the employment of carpenters, masons, builders and unskilled labourers, both by reason of its size and its growth. Its trade in wood work makes a demand for a large number of carpenters. Wages are consequently higher than in Amritsar and Multan.

2. *Rural Wages.*—Workers in the rural areas can be classified under the following heads :—

(1) Whole time workers—(i) Carpenters; (ii) masons; (iii) ploughmen; and (iv) unskilled labourers.

(2) Part time or customary workers called kamins. (i) Carpenters; (ii) blacksmiths; (iii) cobblers; (iv) potters; and (v) barbers; ministering to the calls of their clientele at certain times and on certain occasions. It will be seen that carpenters fall under both heads.

The wages of these classes fall under four types :—(i) Purely cash wages; (ii) cash wages with supplements; (iii) purely grain wages; and (iv) wages other than in cash or grain.

As a general rule, the wages of carpenters and blacksmiths for agricultural work and of cobblers, potters, and barbers are customary and non-competitive. These wages have relation to certain crops grown and go by a fixed number of sheaves of corn, usually the staple of each locality, after every plough working during the currency of the harvest. Customary wages are, however, entering on a competitive stage under the stress of changing conditions.

The scope for business has widened considerably in almost every direction and to that extent the scope of customary duties has contracted. Labour has become more mobile and can afford to defy the village communities by emigrating to the canal colonies, where there is much demand for it. In the case of several crafts, notably among carpenters, blacksmiths and cobblers, the customary has given place to the competitive wage. The advent of modern implements of agriculture and the replacement of wooden by steel gear for wells have a tendency to set the carpenters and blacksmiths free to shift to more prosperous centres and insist on cash payment in place of the deferred payment in kind. Similarly, the cobblers and shoemakers have developed a tendency to dispose of their wares in the open market. At all events, their ministrations to their sepidars or clientele are of a much more circumscribed character. In many instances, the supply of new shoes has come to be limited to shoes for the adolescent only.

6. In urban and industrial areas wages are fixed by the dictates of supply and demand at the locality, and are the result of direct negotiation between the employer and the employee. The employer, however, really dictates his own terms. There is no combination or coherence in labour for any bargaining. Variations are both seasonal and local. In the building trade, for example, wages are appreciably lower during the rainy season than at other times during the year. The mobility of labour

is determined by demand as well as the prevalent rate at which wages are paid. A large number of trans-frontier Pathans, Kashmiris and the inhabitants of Central India range over the province. The first two classes during the winter months only, and the last class at all seasons of the year in search of employment, and are attracted to "mandis" and factories mainly in colony areas. The pitch of wages paid in the Punjab would appear to be higher than in the United Provinces for example and this partly accounts for the influx of labour from Central India.

7. As regards the statutory establishment of minimum wages, the province can scarcely be said to have reached that state of industrial development to permit the introduction of any wage fixing legislation, the administration of which would be difficult and the results perhaps of dubious value. The development of agricultural areas is continually creating a demand for more labour.

8. The practice of inflicting fines on workmen is common enough in many factories for offences such as spoiling material or wasting time. The factory inspector notes that in one or two well run mills fines are credited to the employees' provident fund, but as a general rule fines go to the pockets of the factory management, and legislation is not likely to be of much use on account of the illiteracy of the average worker. There is no practice of fining labour on Government, *i.e.*, canal or forest work.

9. Wages to workers in regular factories are paid monthly from the 5th to the 20th of the following month. Casual workers in cotton ginning factories and coolie workers in other factories are paid at the end of the day through the labour contractor who usually settles his accounts with the factory owner monthly. Legislation to assure prompt payment to factory employees is needed. Employers too frequently obtain a hold on their workers by delaying payment, and the worker gets into the hand of his shopkeeper. With labour illiterate and unorganized, it should be made a penal offence to keep a man waiting for more than a week or 10 days for his previous month's wages. In a press at Amritsar in July this year there was a lightning strike ended in a day to protest against the non-payment of wages from the middle of May to the middle of July. In the coalmines in the Salt Range where miners are paid by piece-work, a miner earns from Re. 1 to Re. 1-8 annas per day, and the trolley coolies earn from annas 10 to Re. 1-4 annas per day. In both cases wages are paid weekly, and generally a week or more (extending up to two weeks) elapses before payment is made.

10. In rural areas the survey of 1927 disclosed that fact that wages were paid on the daily basis to carpenters in 89 per cent., blacksmiths in 15 per cent. and masons in 74 per cent. of the villages selected for the survey. The ploughman's wages were monthly in 49 per cent. of the villages. A substantial proportion of the earnings of the village artisans and ploughmen is paid by the harvest—without being really six monthly. In so far as it has reference to specific crops, *e.g.*, so many sheaves of chari, barley, wheat, sugarcane, etc., it is paid by instalments, as it were, and the worker is not made to wait for full six months.

The agricultural work of the village artisan is far from all absorbing. It occupies a small fraction of his time only and leaves him free to ply his trade for the general customer. The postponement of his dues therefore occasions no hardship. He receives various facilities at the hands of his clients and patrons in the form of fodder, firewood and other things and presents in clothes and money at marriages or other functions. The ploughman receiving his wages in cash or kind at harvest depends for his immediate needs upon his employer and occasionally receives an advance upon his wages before they actually fall due. There can be no delay in the nature of things in the payment of grain wages. As a rule, they are paid by sheaves of grain or by measure before the produce is allowed to leave the threshing floor.

11. In the matter of indebtedness, the rural Punjab is eminently a countryside of peasant proprietors, and the volume of indebtedness per head is greater than elsewhere in India. That is perhaps the main reason why the co-operative credit movement has made such marked headway in the province, though it has as yet only touched the fringe of the problem of indebtedness. The conquest of the wastes which has been going on for the last 30 years through the agency of canal irrigation has shifted the seat of wealth in the way of landed property from the central developed districts, where the Sikhs have their ancestral stronghold, to the newer colonies, bringing with it a notable change in the standard of living. The great war in more ways than one helped to raise that standard. High prices for agricultural produce at the end of the second decade and the beginning of the third decade of the present century promoted the scale of expenditure, and with the thriftlessness prevalent among the peasantry it is a general paradox that the wealthier a locality, the greater is the volume of indebtedness. The colonists in Lyallpur should be in a position to stand several lean years; yet the failure of

important crops which has occurred in the last two or three years seems to have put a definite and unexpected strain upon their capacity to meet their commitments. In dry areas, i.e., the south-west, south-east and north Punjab the standard of living is lower, though since the war it has risen though not to the same extent as in the wealthier "wet" areas.

In the south-western Punjab ten years ago there were localities in which Rs. 5 per mensem with a blanket and a pair of shoes at harvest was all that the agricultural labourer could expect. In the colonies wages are twice as high and the standard of living is much better. Generally speaking, there has been of recent years a considerable improvement in the condition of the agricultural labourer, both in apparel and food and possibly housing. He is invariably in debt, but in this respect he is little worse off than the peasant proprietor, who, however, is a landlord.

As regards urban and industrial labourers, no enquiry has been made as to the extent to which indebtedness prevails among them. Probably the range of solvency and insolvency varies according to localities. It may, however, be safely assumed that the great majority are in debt to their food suppliers.

12. In seasonal factories no question of leave arises. Work goes on for the season and then ends. In other factories leave is only taken for a religious festival or a domestic event, though managers in the bigger concerns usually get a month's leave during the slack season. As regards labourers the factory inspector notes with truth that "since they are not seriously concerned whether they get back to their previous jobs or not it is only a question of taking leave when an employer owes the least amount of pay for labour done."

### XIII.—Industrial Efficiency of Workers.

The Director of Industries is of opinion that the efficiency of Indian workers has been increasing steadily in recent years. This he would attribute to the growth of industrial educational institutions, and also to the "central localization" of certain industries, e.g., the sports goods industry, steel trunk making and cutting industry in Sialkot, and woollen goods in Dhariwal. Factory owners are also endeavouring to expand the system of division of labour. In handicrafts, such as woodworking, the Punjabi, especially the Sikh, is a natural adept, and he is also a fair smith. The inspector of factories has supplied the following note:—

"I am of opinion that the efficiency of the highly paid workers has increased considerably during the past 5 or 6 years. The industrial educational institutions have to a great extent been responsible for this. But in the case of labouring classes no improvement has been noticed: in fact the efficiency of these workers has not kept pace with the advent of modern machinery in the factories. In recent years the tendency in this province has been to install small unit plants in factories, usually with an up-to-date oil engine of 10 to 40 horse power in preference to the old type of heavy steam engines and massive machinery: and the same men who used to operate the old machinery are put on the new and complicated machines. I have seen instances of accidents to workers on new type of machines in factories, which would never have occurred had the worker received a little training before being asked to work on it. On the other hand, new types of machines are made as fool-proof as possible, dangerous parts being guarded in where possible."

The Principal of the Mayo School of Arts, Lahore, who has had many years of experience with skilled craftsmen, both as teachers and workmen, sums up his experience of the Punjabi workman as follows:—

"The Punjabi workmen, the selected ones with whom I have to deal, are intelligent, strong, keen to learn, but like uneducated workmen in Europe slack except under supervision. Their predominant fault is that though quick to use new ideas they are quicker to forget and to revert to traditional methods. Their lack of education makes it almost impossible for them to grasp the meaning of scientific methods of work or the essential of accuracy of thinking and doing.

"I find that they show a marked intelligence in improvising tools or apparatus for a desired purpose, but an utter lack of ability to formulate a new idea, such as designing a joint for a special purpose or overcoming a difficulty by a better method of construction."

With factory and industrial labour so casual, seasonal and migratory, it is perhaps redundant to enlarge on the disadvantages under which workers labour owing to the absence of scientific management or any notion of industrial psychology. Employers would say that the reduction in the number of working hours from 12 in 1911 to 10 in 1922 has reduced the output *pro-tem*. Housing is poor, dietary deficient, facilities for recreation nil, wages are low, dependants many, and climate, excepting the winter,

enervating. Ventilation and sanitary arrangements in factories are, however, receiving increased attention. Under Section 9 (1) (b) of the Cotton Ginning and Pressing Factories Act, such factories are now constructed in accordance with plans and specifications approved by the prescribed authority (in this province the Director of Agriculture). The rules and standard plan prescribed by the Director of Agriculture will be found in Appendix F. These rules are intended mainly to ensure the purity of cotton, and have no particular regard to the requirements of healthy conditions of work. Ginning factories put up since 1925 are consequently a decided improvement on previous ones. The employers' outlook, however, is very limited. They can appreciate rationalization, i.e., such co-ordination and regulation of production as will prevent wasteful cut-throat competition. There is a pool system among ginning factories in certain localities, but the consideration of conditions of work and life favourable to the development and preservation of the workers' personality are beyond the ken of the ordinary employer. As for possible means of securing increased efficiency, the main appeal to the worker can only reside in an improved method of remuneration which will give him a fair share in the increase of output. In the Forest Department a bonus on production is given in the case of resin tapping. The worker for his part will have to try not to change his occupation too often.

#### XIV.—Trade Combinations.

Trade unions are in their infancy: the Indian Trade Unions Act was only passed in the year 1926. The idea of a trade union as directed towards promoting "industrial prosperity and with it the progressive improvement of the standard of living of the population" has yet to take root. The Punjab has no heavy concentration of industrial labour, and consequently the extent of organization among both employers and employed is up to the present little in extent. Among the employed, however, a vague striving towards co-operation and combination is now being evidenced, revolving round the cardinal question of remuneration and the merits and demerits of strikes in the way of forwarding workers' claims. In the Punjab no communist influence is noticeable, and disputes have been due to the normal antagonism between employers and employed in the matter of pay. Contrast Calcutta, Bombay, Admadabad, Sholapur, Jamshedpur, and the continuous series of strikes during the past eighteen months.

2. The Indian Trades Union Act was brought into force on the 1st June, 1927. During the nine months of the financial year 1927-28, 10 applications were received for registration from various unions but only 6 could be registered. Three of these related to the workers in different departments of the North-Western Railway, one to the organization of homoeopathic doctors and two to workers engaged in public transport. The total number of members at the beginning of the year for these unions was 5,378 which rose to 5,799 at the close of the financial year.

Ten unions were registered during the year 1928-29 of which three are federations of trade unions and the remaining seven are unions of workers formed to protect their rights, to secure regulation of hours and wages and for settling disputes among members and employers. The total membership at the time of registration of these unions was 222.

3. It may be noted here that with the exception of one union at Dhariwal all other unions have head offices at Lahore. The professions and occupations in which the unions were formed during the year 1928-29 are given below.

- (1) The Textile Mill Workers Union, Dhariwal.
- (2) The Electric Supply Company, Limited (Lahore) Workers' Union.
- (3) Punjab Mechanical Engineers' Union, Lahore.
- (4) The Punjab Revenue Patwaris Union.
- (5) The Punjab Christian Labour Union.
- (6) The Scavengers Union.
- (7) The North-Western Railway Compilation Union (Union of Clerks).

There are no organizations of employers in this province. Sometimes, however, pools of employers are formed among owners of cotton ginning and ice factories which are usually short lived. Pools in cotton ginning factories are formed on account of shortage in cotton crop at the end of the season and in ice factories to force prices up by limiting supply. These pools, it must be stated, are not registered under trade unions, and should therefore be regarded as temporary trade combinations.

4. As regards the nature of the activities of the trade Unions hitherto formed, reference may be made to Appendix B, in which the aims and objects of four trade unions are set forth.

5. The following trade unions have so far been registered in the Punjab under the Indian Trade Unions Act, 1926. Their history is given in the statement below :—

Name of Union.	Date of registration.	Number of members at beginning of year.	Number of members at end of year.
1. The Punjab Motor Drivers' Union, Lahore.	28-8-1927	21	206
2. The Punjab Tonga Workers' Union, Lahore.	28-8-1927	—	239
3. The Upper India Homœopathic Association, Lahore.	24-10-1927	19	19
4. The North - Western Railway Union, Lahore.	1-1-1928	5,000	5,000
5. The North - Western Railway (Audit) Account Union, Lahore.	29-2-1928	323	320
6. The General Workers' Union, North-Western Railway, Lahore	31-3-1928	15	15
7. The Punjab Labour Board, Lahore	2-4-1928	Number of members at time of registration 9.	
8. The Textile Mill Workers' Union, Dhariwal.	18-8-1928	16	
9. The Electric Supply Company, Limited (Lahore) Workers' Union, Lahore.	28-7-1928	16	
10. The Punjab Mechanical Engineers' Union, Lahore.	15-9-1928	18	
11. The Punjab Provincial Trade Union Congress, Lahore.	10-10-1928	15	
12. The Punjab Revenue Patwaris' Union, Lahore.	7-11-1928	15	
13. The Punjab Christian Labour Union, Lahore.	9-11-1928	10	
14. The Central Labour Federation, Punjab, Lahore.	10-11-1928	8	
15. The Scavengers' Union, Lahore..	2-7-1929	17	
16. The North-Western Railway Compilation Union, Lahore.	20-3-1929	98	

With no big scale industry, saving the North-Western Railway workshops at Lahore trade unionism is likely to make slow headway, but its inception on however small a scale is bound to result in a steady pressure for increased wages, and that in its turn will stimulate management to improve its efficiency.

#### XV.—Industrial Disputes.

Out of fifteen strikes reported since 19th August, 1921, only eight occurred in industrial establishments, while the remaining seven occurred among workers in various trades and professions. A great majority of strikes have taken place in industrial centres such as Amritsar and Lahore and in the woolen mills at Dhariwal. Industrial unrest in other parts of the province is as yet unknown, and such strikes as have occurred in industrial establishments relate only to those concerns which are the largest organized employers of labour.

It is also worth noting that in no case the strike was complete, and in all the bigger strikes workers had to surrender unconditionally. In the railway workshops strikes and the strikes at Dhariwal, those who refused to return to work by a specified date were replaced by fresh recruitment, and the majority of the strikers lost their employment. The vocalisation of the desire for a "square deal" has, however, come to stay.

3. No official or non-official conciliation or arbitration machinery for the adjustment of disputes between the employers and the employees exists in this province. The parties concerned enter into their own direct negotiations.

The Trades Disputes Act came into force on 8th May, 1929. No use has yet been made of it.

3. The Punjab Government has no hesitation in admitting that in industries on any considerable scale trade unionism and combinations are indispensable as a means of ensuring that the reasonable demands of workers are brought to notice and their angle of view is impressed on the employers.

4. In industrial disputes there are standing orders that the industrial surveyors should promptly report to the local government the existence of a strike, its causes, progress and extent, and the Director of Industries is expected to keep himself in touch with the situation, and if required to lend his offices in explaining the position of the two parties to each other, with a view to removing possible misunderstandings.

5. The Government of India have recently suggested to local governments that they consider the desirability of appointing a Labour Commissioner to help in the settlement of industrial disputes. So far as the Punjab is concerned, the need for any such appointment is not evident. In the Dhariwal strike at the beginning of 1928, the employers and operatives came to terms themselves and the only action taken by Government apart from the "interpretation" enquiries of the Department of Industries, was to send a few police to watch the situation and to deal with intimidation and sabotage if it arose. On the railway a strike is always a serious thing, and from time to time there are manifestations of unrest in the Lahore workshops. During the early part of the present summer there has been some unrest—mainly owing to a change in the method of paying for work done. The North-Western Railway have now appointed a special labour officer who deals with the recruitment and grievances of labour. This appointment has been all to the good, and is likely to mitigate lightning strikes, and will tend to remove misunderstandings. Works councils enjoying participation in the framing of factory rules securing protection against arbitrary dismissal, and discussing short time working, for example, should have their niche in trade and workshop disputes, but workers have not yet had either the coaching or the opportunity of forming ideals to light up their path, or even realizing some of the implications behind the slogan of the Central Labour Federation, Punjab (membership 8), which is "Workers of the world unite."

#### XVI.—Law of Master and Servant.

Contractors on Government works (e.g., canals) are frequently under the compulsion to give labour advances to induce men to recruit. While the Workmen's Breach of Contract Act was in force advances were freely given, and the crop of cases for recoveries was always heavy. The effect of the repeal has been wholly to the good. Contractors have to exercise more caution and show more indulgence in their treatment of labour, and incidentally the magistracy have been released from attempts to extend the scope of the Act to spheres for which it was never intended. The problem of advances is, however, a real problem not only for contractors, but also for Government, which in the matter of forest fellings is often hard put to it to recover advances to contractors.

#### XVII.—Administration.

The constitutional position of the Central and Local Governments with respect to labour matters has been noted in the chapter on the machinery of the Executive Government, and in that chapter mention has also been made of the administrative authorities concerned with labour in the Provincial Government. The Director of Industries is the administrative officer for all acts of the legislature concerned with labour. In recent years the Government of India have directed the attention of the Punjab Government to the conditions under which child labour is employed in the carpet factories in Amritsar and have asked the local Government to ameliorate those conditions, with no result up to the present. On the other hand, the local government has recently suggested to the central Government that forest work, fellings and the like, should be scheduled as hazardous occupations for the purposes of the Workmen's Compensation Act. The Central Government, however, did not see its way to fall in with the suggestion. Claims for compensation are, however, adjudicated following the scales in the Workmen's Compensation Act, and it may perhaps be noted that awards based on the Act are two or three times the amount which would satisfy those concerned.

2. There is no labour office or officer in the Punjab. The consequence is that the body of statistical material in regard to labour is very meagre and uncorrelated.

5. In this province the factory inspection staff consists of one full-time inspector, five industrial surveyors under the control of the Director of Industries, who are notified as additional inspectors under certain sections of the Act, and one personal assistant to the inspector, who is also notified as additional inspector under certain sections of the Act.

The total number of factories in the province at present is 602.

Besides the Punjab, the full-time inspector has got jurisdiction over three other provinces, namely, North-West Frontier Province, Delhi and Ajmer-Merwara, making a total of 725 factories in his jurisdiction. In the case of Delhi and Ajmer-Merwara the full-time inspector is assisted by another industrial surveyor stationed at Delhi, who, like those in the Punjab, is also notified as additional inspector under certain sections of the Act.

The above arrangement will cease from 1st April, 1930, from which date the local Government proposes to sanction the appointment of one full-time inspector, withdrawing the powers conferred on the industrial surveyors under the Act. Thus, from 1st April next there will be one chief inspector and one inspector to administer the Indian Factories Act in all the four provinces with 725 factories to inspect.

7. The Punjab Factory Rules will be found on pages 130-168 of T. C. Ray's Indian Factories Act (1928).

8. As regards mines, the Mines Act of 1923 applies only to coal and salt mines in the Punjab. Other mines in the province consist of open excavations where the safety of workers is not endangered. The provincial rules under the Act of 1923 will be found in Punjab Government's notification No. 3224 D—Industries, dated 14th July, 1927, reproduced in Appendix D.\* There is no provincial mining board. The Chief Inspector of Mines or his assistant makes periodical inspections, and the district magistrate of the district has the powers of an inspector. The district magistrate's attention is, however, mainly directed to the control of prospecting licences and mining leases. The accounts of concessionaries are checked by the Director of Industries, who for the rest has no concern with the working of the Indian Mines Act and the rules made thereunder.

It must be confessed that the local Government has little knowledge of the working of supervising agency. The Punjab coal mines are comparatively unimportant, and, moreover, far distant from areas on which the chief inspector and his assistant must necessarily concentrate their attention, and prosecutions are rare.

#### XVIII.—Intelligence.

Statistics relating to the administration of the Indian Factories Act are compiled by the Inspector of Factories, Punjab, and are shown at the end of the annual report. Statistics relating to the number of operatives, hours of work and wages are supplied by the factory occupiers in response to circular letters issued by the factory inspector.

Statistics relating to trade unions are collected by the Registrar of Trade Unions (Director of Industries) at the time of the registration of the trade unions, and also at the end of the financial year. A six-monthly statement of the number of members is also called for. The general secretary of the union is responsible for the supply of these figures. The figures supplied are presumably accurate and are published at the end of the annual report on the working of the Trades Unions Act. Statistics relating to the Workmen's Compensation Act are collected from the following agencies:—(1) Employers under the Workmen's Compensation Act, (2) Factory occupiers under the Indian Factories Act, (3) Insurance Companies with whom the factory owners have insured their labour, (4) Commissioners appointed under the Workmen's Compensation Act in all districts.

3. There are six industrial surveyors in the province, a part of whose work is to make enquiries into the position of various industries, and to collect statistics relating to them. But only one monograph has as yet been published—on the textile trade. No enquiry into labour conditions has yet been thought of.

The Director of Industries notes:—

"At the present moment only such statistics are collected as are required either by the local Government or by the Government of India. The scope of these statistics could be very usefully widened and information on many interesting subjects relating to labour could be collected by this department, provided a suitable agency could be established. This province has no labour office. The entire work is done by a small section of the Director of Industries' office."

On this statement the comment is necessary that the small section at headquarters with the six industrial surveyors in the field under the supervision of a gazetted officer in the person of the touring assistant to the director should not be entirely inadequate for intelligence work as regards provincial labour, but not, of course, for comprehensive commercial intelligence, in which sphere the Director of Commercial Intelligence, Calcutta, has an organization to be drawn upon.

4. The Board of Economic Enquiry, Punjab, has conducted a series of investigations and has published twenty monographs in its rural section publications. The only urban sections publication is a study made by Mrs. Caleb in 1920 on the family

\* Not printed.

budgets of low-paid clerks, i.e., on salaries of Rs. 50 per mensem or less—a valuable study, now out of print. The rural bias of the Punjab outlook could hardly have a better illustration.

## APPENDIX B.

*Aims and Objects of Certain Trade Unions.*1.—*The Punjab Labour Board, Lahore.*

*Aims and objects.*—(a) To organize trade unions and labour associations of different classes of workers in the Punjab in accordance with the Indian Trade Unions Act.

(b) To strengthen, improve, help, advise and put on a right footing the various trade unions and labour organizations in the province.

(c) To control, direct, supervise and develop the various trade unions and labour organizations in the province, and the labour movement in general.

(d) To centralize and co-ordinate the activities of various trade unions and labour organizations and those of the different labour workers, organizations and sympathizers.

(e) To improve, develop and further the interests of the labouring and depressed classes in general, and those of the labour movement in particular, in all matters affecting it legally, economically, socially, politically or otherwise.

(f) To better, improve, ameliorate, advocate and further the cause of labourers and workmen, whether skilled or unskilled, literate or illiterate, organized or unorganized, whether in service or out of service, or otherwise.

(g) To better the relations of employees and employers, and to act as arbitrators in disputes between them.

(h) To advocate the legal, economic, social and political cause of labour in the province, and to co-operate with similar boards or organizations existing elsewhere in India, or out of India.

(i) To carry on labour propaganda in the province by all legitimate means and spread labour ideas among the masses and infuse a labour spirit in them.

(j) To collect, arrange and disseminate information about labour and the trade unions movement in the province and act as the Labour Information Bureau in the Punjab.

(k) To affiliate, with or without fees, trade unions and labour organizations in the province, whether registered under the Indian Trade Unions Act or not, or whether recognized by the employer or employers or not.

(l) To act as a labour party in the province and to carry on all sorts of activities, whether of a political character or not, as labour parties in other countries act and carry on.

(m) To represent the grievances and demands of labourers and workmen in general and those of the members of trade unions and labour organizations affiliated with it in particular.

(n) To convene and hold mass labour meetings from time to time and hold a Punjab Labour Conference once a year or so.

(o) To obtain adequate franchise for labour as such and adequate representation in the various legislatures dealing with the Punjab, local bodies, national organizations, and so forth.

(p) To run labour members in elections for the legislatures, local bodies and other national, educational, social and political organizations.

(q) To start, maintain, manage and utilize a general fund and a political fund in accordance with the provisions of the Indian Trade Unions Act.

(r) To publish an organ or organs in any language understood in the province, to foster and further the cause of labour in the country and create consciousness among the workers in general.

(s) To do all or any of the above objects or any other not mentioned above which may be deemed most beneficial for the cause of labour in the province in accordance with the provisions of the Indian Trade Unions Act.

2.—*North-Western Railway Union.*

The objects of the union shall be to secure the complete organization of all workers (manual and mental, including mechanical labour) employed in any division or shops or at any other place over the North-Western Railway.

(a) To improve the conditions and protect the interest of its members, to obtain and maintain reasonable hours of duty, rates of wages, adequate retiring allowances and other conditions of labour, to settle disputes between its members and their employers and to regulate the relations between them by collective withholding of labour or otherwise.

(b) To further, if and when and so far as the same shall be or become a lawful object of the trade union, the interest of members by representation to the railway authorities, in the local legislature and in the Legislative Assembly, and to employ the funds of the union in procuring such representations.

(c) To regulate the relations between this union and its members and to settle disputes between the union and any member or members or between any member or members and any officer or officers of the union by way of appeal as provided in these rules.

(d) To provide temporary assistance to members when out of employment through causes over which they have no control, or through unjust treatment or through any dispute existing between the employer and a member or members of the union.

(e) To provide legal or other assistance when necessary in matters pertaining to the employment of the members or for securing compensation for members who suffer injury by accidents in their employments; also to use every effort to provide for the safety of railway work and of railway travelling.

(f) To make grants to deserving railway employees and members or officers of the union in order to improve their future knowledge and prospects to educate and get training in the social, political, economic, and in the industrial life of the labour movements in India and abroad.

(g) To provide donations to any institutions from which members may derive benefit to have power to render, as occasion may arise, assistance to other trade unions and other lawful purposes, also to enable such members as voluntarily desire it to provide funds for their relief in sickness or temporary disablement and for their retirement and also to aid the young orphan children or widows of members, to provide accident benefit to members who may have met with accident whilst following their employment.

(h) To provide a grant of money to members of the disablement fund when permanently disabled, or when by reason of old age they cannot follow their regular employment, or to their representative in case of death or accidents, or otherwise.

(i) To carry on all business, within the meaning of assurance fund, unemployment fund, death benefit, sick benefit, and mutual assurance benefit as provided for in Appendix A to these rules.

### 3.—*The Textile Mill Workers' Union, Dharawal.*

#### *Aims and Objects.*

To improve the conditions and to protect the rights of its members to obtain reasonable hours of duty, rates of wages, retiring allowances, and other conditions of labour. To settle disputes between the members and the employers and to represent the interests of its members to the employers in the legislature (local and provincial) and to utilize the fund in furthering the cause of the union and its members.

### 4.—*The North-Western Railway Compilation Union.*

#### *Objects.*

(a) To encourage the spirit of co-operation amongst employees of the Compilation Section.

(b) To devise means whereby the status of the clerical line is improved.

(c) To deal with questions affecting the common rights and privileges of the members and get grievances, if any, removed by constitutional methods.

## APPENDIX F.

### *Rules prescribed by the Director of Agriculture under Section 9 (i) (b) of the Cotton Ginning and Pressing Factories Act.*

(1) Kapas shall enter at centre of the factory and shall be carried by broad stairs shown at the points marked A, B and C, D in the rough sketch plan T annexed hereto, on to the gin platform direct.

(2) A door at each end of the cotton (ru) platform for the carriage of cotton (ru) shall be provided at the points marked E, F and G, H in the aforesaid sketch plan.

(3) Width of kapas platform shall be 10 feet from shaft to inner surface of the wall making the minimum width of the factory 32 feet.

(4) There shall be an iron sheet shield not less than 1 foot high fitted on knife rail in front of a gin to prevent kapas and cotton seeds from passing over the knife rail of the gin and getting mixed with the cotton (ruj). This shield shall be made in order to compensate for the wear and tear of the ginning roller.

(5) The belting on centre of cotton platforms shall be covered entirely to a height of 18 inches above ground to prevent cotton getting mixed with oil.

(6) There shall be a movable frame 2 feet 4 inches by 2 feet 4 inches by 2 inches to receive cotton (ruj) coming through gins and keep it off floor. The frame shall be removable at will.

(7) The space for drying platform shall be at the rate of 1,000 square feet per 10 single roller gins or their equivalent. There shall be minimum of two platforms in each factory, and these shall be separated by a pathway at least 15 feet wide.

(8) There shall be easy means of ingress to and egress from factory compound, in order to prevent congestion of traffic.

(9) The area for a cotton ginning factory containing 32 single roller gins or their equivalent shall be a minimum of 4 acres and for a factory with larger number of such gins the area shall be increased at the rate of one acre for every 10 single roller gins or their equivalent to a maximum of 8 acres, except in special cases.

(10) Sufficient godowns for storing cotton and kapas shall be provided and different varieties of cottons shall be kept in separate godowns.

---

**Mr. A. L. HOYLE, COMMISSIONER, NORTHERN INDIA SALT REVENUE DEPARTMENT.**

*Preliminary.*

The Royal Commission's schedule of subjects reached me at the end of August. My evidence, which is to be submitted through the Central Board of Revenue, has to reach the Royal Commission not later than the 25th September, 1929. This is the budget season, and this year fortuitous circumstances have conspired to render it a peculiarly busy season in every direction. It will therefore be understood that it has been impossible to deal in any sense adequately with the Commission's questionnaire in the time at my disposal.

2. Excluding the Kohat Mines Division, where the salt is the property of local quarry owners and the function of Government is mainly to see that the excise duty is collected, the Northern India Salt Revenue Department is concerned with two salt producing areas, the Rajputana Salt Sources Division and the Salt Range Division in the Punjab. I deal below with each area separately. The serial numbers correspond with the headings in the Schedule.

*A.—The Rajputana Salt Sources Division.*

This division includes the three salt sources of Sambhar, Didwana, and Pachbadra. At the two latter the salt is extracted by, and purchased by Government from, the local owners of the pits, and Government is only indirectly concerned with the labour employed, much of which is supplied by the families of the pit owners. The Royal Commission will therefore, I think, not wish to receive any evidence in connection with these two sources. Sambhar Lake, the most important of the three salt sources in this Division, with an average output for the last five official years of approximately 73 lakhs of maunds of salt, is held under agreement with the Jaipur and Jodhpur States within whose territories it lies, by which the right of manufacturing and selling salt are leased to the Government of India.

*I.—Recruitment.*

1 to 3. The work of extracting and storing salt is given out by the Northern India Salt Revenue Department on contract. The contract for this work at Sambhar, Gudha, and Jhapog at the eastern end of the lake has since the year 1922-23 been in the hands of the Gudha Co-operative Society which recruits its labour from 12 neighbouring villages, known as Bara Gaon, within the jurisdiction of the Jaipur and Jodhpur Darbars. At Nawa, 15 miles distant from Sambhar toward the western end of the lake, the contract is in the hands of a private firm which recruits its labour from Nawa and the neighbouring villages. Both these agencies engage their labour through mates employed on commission. To encourage recruitment the contractors pay advances recoverable in instalments from the labourers' wages at the time of extraction.

7 and 8. The employment of extracting and storing salt is seasonal. Its duration is ordinarily not longer than four months in the year, and may be as little as two and a half months. The labourers are of the agricultural class, and when not employed under the department are engaged in their fields. Some employment is also offered by the department during the period from November to March when works of various kinds are under construction. The labour for these purposes is recruited from the town of Sambhar by the contractors engaged on the works.

### II.—Staff Organization.

10. The work of extracting and storing salt is done by contractors (including the co-operative society). Works of construction are partly done by contractors and partly departmentally; workshop labour is departmentally employed. The labour that is departmentally employed on construction is controlled by inspectors assisted by peons of various grades, and in charge of each work, or group of works, is a superintendent who is a gazetted officer. The work of the superintendents again is supervised by the general manager and assistant general manager. Workshop labour is under the control of the engineer (mechanical and electrical), assisted by certain technically trained subordinates. The engineer himself is under the control of the general manager.

11 and 12. The departmental superior staff is recruited by selection and competitive examination. The inferior staff is recruited from local men and to some extent from candidates from the United Provinces.

13. Relations between staff and rank and file are cordial.

14. As an employer of labour, Government is concerned here mainly with the workshop staff, who have recently been put on daily wages. Attendance registers are kept by a clerk who also acts as time-keeper. Wages are paid by the engineer.

15. (i) As already stated, the work of extracting and storing salt and some of the construction work are given on contract. These represent the most important activities of the department.

(ii) Sub-contracting does not exist.

(iii) The terms upon which the contractors employ their labour (which is not regularly employed but which finds casual and temporary occupation here during a limited season) are not controlled by the departmental officers. As is stated in later paragraphs, the department assists in the provision of certain amenities, e.g., housing and medical aid.

### III.—Housing.

16 to 23. The labour, as has been seen, is mainly local, and ordinarily lives at home. Government however, provides grass shelters during the extraction season for the housing of labourers from the more distant villages, and has also erected two model barracks at Gudha and one at Jhapog. These barracks are divided into rooms 12 feet by 12 feet, and have a verandah running along the front. Water is supplied by Government from a well worked by an electric motor. There are no conservancy arrangements. These barracks have proved fairly popular with the labouring community. A nominal rent is realized at 4 annas a month per room. The labourers are frugal and industrious by habit, and no moral improvement as the result of this accommodation is noticeable or was desired. The workshop employees are provided with rent-free quarters.

### IV.—Health.

23. No statistics are available. The physique of the workers is not remarkable, but in general they keep very fair health, though during the extraction season malaria is common and is probably stimulated to some extent by the nature of the work, which consists largely of wading in the salt pans.

24 and 25. The department maintains a dispensary to which a fair number of labourers have recourse for treatment of minor maladies and injuries, such as sores.

26. (i) Latrines are not provided, but sweepers are employed for the removal of night-soil.

(ii) Drinking water is provided by the contractors, who transport it to the works by rail or on camels.

29. (i) No statistics are available.

(ii) Malaria is widely prevalent. Cholera is rare. Hookworm has not come under notice.

**VI.—Education.**

40 to 42. The Jodhpur and Jaipur States provide both primary and secondary education, but it is not compulsory.

**VII.—Safety.**

43 to 50. Accidents are of very rare occurrence and no special safeguards appear to be necessary.

**IX.—Hours.**

55. (i) The hours of work for the seasonal labour on extraction, etc., are not regulated. In the workshop, pump house, etc., the hours of work are 48 per week and 8 per day.

(ii) Drivers and firemen employed on locomotives used for extraction, work sometimes for 12 hours. Overtime is paid.

(iii) The only class of workmen who are liable to call to duty at any hour are fitters. These are only eight in number.

60. The workshop workmen are given an hour off duty for meals. These men being employed on a variety of jobs are not subject to the same degree of fatigue that specialized labour induces.

61. Sunday is observed as a day of rest except during the extraction season when all concerned with extraction are expected to work daily to ensure harvesting all the salt.

**XII.—Wages.**

96. (i) In the workshop the average wages are Re. 1-0-6 pies per day. Labourers employed on extraction can earn 10 annas a day for a full day's work.

(ii) In the surrounding agricultural areas, men earn 7 annas and women 6 annas a day.

97. Wages in recent years have increased. This is due to the demand created by construction work on railways, irrigation works in the States and the building of New Delhi. The index of cost of living is not available for the locality.

100. Payment through contractors appears generally to work satisfactorily, though at times the contractors are inclined to strike a hard bargain at the expense of the labourers.

101. Wages are fixed in the case of labourers employed by contractors on harvesting salt by agreement between contractors and labour, and in the case of workshop hands with reference to rates obtaining in the railway workshops at Ajmer and Phulera.

102. Overtime pay for workshop hands is on a scale based on wages. It ranges from one anna per hour in excess of eight for workmen on 15 annas a day to three annas for workmen on Re. 1-8 annas to Rs. 2-6 annas.

103. Standardization does not exist, since the workshop is small and jobs of varied kinds.

106. Fines are imposed on factory workmen for offences such as negligence rather than for inferior work. They are infrequent.

107. (i) The workshop hands are mostly on daily wages. Labourers on extraction are paid by the week.

(ii) Two weeks.

(iii) No action necessary.

(iv) Cases of unclaimed wages are very rare.

108. Among extraction labourers the extent of indebtedness is not known. The workshop labourers appear to be free from debt.

109. There are no bonus or profit-sharing schemes.

110. Men on monthly wages earn leave under the Civil Service Regulations. Workers on daily wages earn no leave.

**XVII.—Administration.**

137. The Workmen's Compensation Act being inoperative there is no employers liability in cases of accident; otherwise conditions are much the same as in British India. Relations with the local civil authorities are cordial.

*B. Salt Range Division.*

The department works three mines at Khewra, Warcha and Kalabagh. Khewra, with an average annual output of 28½ lakhs of maunds of salt, is the most important. Except where otherwise indicated, my replies are applicable to all three mines.

**I. Recruitment.**

1. Excluding ticket-of-leave men employed on loading trucks in the depot, there are four classes of labour :—(a) The hereditary local miner caste, who have worked in the salt mines of the Salt Range for centuries and now work almost exclusively underground. (b) Workshop and power-house labour recruited from the blacksmith and carpenter classes of Khewra and neighbouring villages. (c) Semi-permanent labour employed on loading and unloading trucks and working mechanical drills underground, recruited in neighbouring villages from agricultural classes originally employed on collecting stone, wood and gypsum. (d) Casual labour, semi skilled or unskilled, employed on construction and repair work, recruited from the same class as (c).

There is practically no migration among the miner class; none among the engineering class, while the semi-permanent labour tends to leave the mine at harvest season.

2. (i) The miners live at Khewra itself. The workshop and the semi-permanent labour pay weekly, fortnightly, or occasionally monthly visits to their villages.

(ii) The total permanent labour force including miners, workshop hands and some of the semi-permanent labour is about 1,100 (including women) at Khewra, 250 at Warcha and 200 at Kalabagh.

(iii) No special methods of recruitment are in force, there being no scarcity of labour.

7. There is a certain amount of unemployment among the miners because the demand for rock salt is much in defect of the available supply. The best method of alleviating this unemployment would be to secure an increased demand. Endeavours are at present being made (though for reasons not connected with unemployment) to stimulate the demand by securing reduction in railway freights. The introduction of machinery has to some extent created unemployment, but this cause is less serious than the other. The general disinclination of the mining community to take up other work at casual labour rates, suggests that unemployment does not cause them very serious distress, though some of the community are endeavouring to secure land from the Punjab Government at concession rates as an alternative means of employment. An annual two months' holiday taken by the miners in August and September produces unemployment to the extent of 40 to 80 per cent. during those months for the workshop and casual labour classes.

8. (i) The average duration of employment, except for the permanent Government staff and the more skilled and essential of the workshop labour, is 10 months only, the miners being on vacation for two months annually.

(ii) The extent of casual employment varies very widely according to the amount of construction work in hand.

(iii) There is no serious absenteeism, except during good harvest season, when 30 to 40 per cent. of the semi-permanent labour may be absent. Figures of time or wages lost are not available. At Kalabagh casual labour tends to migrate to Afghanistan during the hot months.

**II. Staff Organization.**

10. The staff consists of a general manager, a superintending electrical and mechanical engineer, assistant commissioner or manager in charge of Khewra mine, assistant commissioner in charge of Khewra depot and preventive work and superintendents in charge of Warcha and Kalabagh mines. These are assisted by junior superintendents (gasetted) and inspectors (non-gasetted). The mine manager at Khewra is assisted by two superintendents and four inspectors, two of whom work as surveyors.

11. The general manager and the superintending engineer are specially recruited technical men. The remainder of the staff are officers of the Salt Department. The miners themselves work under gangmen, who are ordinarily hereditary leaders of the gangs.

12. (i) See (11) above. As far as possible, departmental officers with aptitude for mining work are selected. Junior superintendents in special cases are sent to the Dhanbad School of Mines for training.

(ii) There are no special facilities for training miners. The majority are illiterate.

13. (i) Relations generally are satisfactory. The miners have no hesitation in bringing any grievances to the notice of the mine manager or general manager. Questions affecting the well-being of the mining community as a whole are discussed by the general manager at conferences with the gangmen and the more intelligent miners.

(ii) Jobbers are not employed.

(iii) and (iv) There are no regular works committees, councils or industrial councils. The gangmen, 41 in number, elect annually a *panchayat* or committee to deal with small local disputes. Their decisions are ordinarily accepted by the miners without question.

14. (i) Attendance of all labour is checked and registers kept in accordance with the Mines Act. In the case of the miners, attendance is taken from slips submitted by gangmen, in the case of labour on contract from the contractors' figures, and in the case of workshop and semi-permanent labour from the inspectors' or clerks' figures.

(ii) Wages are invariably paid by a gazetted officer.

15. (i) The bulk of the construction and repair work is given out on contract. Other work is done departmentally.

(ii) There is no sub-contracting, except a little on loading and unloading.

(iii) Control over work on contract is practically the same as over that done departmentally. Contractors are kept to the specified hours prescribed by the Mines Act.

(iv) The contract system has saved Government money, and does not appear to have affected working conditions adversely.

### III.—Housing.

16. (i) and (ii) The workshop and some of the semi-permanent and casual labour are housed by Government, which is the employer.

(iii) Practically no housing is provided by private landlords.

(iv) The mining community build their own houses. At Khewra each miner has two houses, one in Khewra village and another for the vacation on the Salt Range.

17. The Department own considerable areas near Khewra and Warcha villages, and acquisition is unnecessary.

18. (i) The accommodation provided by Government for the workshop labour is at least as good as, or better than that which the labour would provide for itself. The accommodation provided for other labour consists of reasonably comfortable barracks.

(ii) High compound walls for privacy are provided in accordance with Punjab custom. Whether this practice is altogether healthy is open to question.

(iii) Most of the Government quarters at Khewra are provided with electric light, and at Khewra and Warcha there is an excellent supply of drinking water. Four sweepers are employed for conservancy in Khewra village, but there is some room for improvement here.

19. All accommodation provided is utilized.

22. The present housing conditions appear to have no bad moral effect. The people are conservative, and it would be difficult to persuade them to make any changes.

### IV.—Health.

23. (i) and (ii) Statistics are not available up to date. Births and deaths are registered by a *choukidar* employed by the district authorities.

(iii) (a) The working conditions underground as regards ventilation and lighting are generally very good. (b) Conditions at home are fair. The situation of the mining villages on the slopes of the hills makes to some extent for cleanliness.

(iv) The staple food of the community as a whole is ground unrefined grain, which costs normally about one anna per pound. Meat is obtainable at a fixed price of seven annas per seer. Vegetables are scarce, which appears to conduce to anæmia.

(v) The physique of the mining community as a whole is somewhat below that of agricultural labour in Punjab.

24. (i) and (ii) The Department maintains hospitals at Khewra and Warcha, and there is also a hospital in Kalabagh city which is used by the mining community.

(iv) A midwife is attached to the Khewra hospital, and the appointment of a health visitor at this place is under consideration.

25. Below are statistics for three years showing attendance at the hospitals :—

Year.	Males.		Females.	
	In patients.	Out patients.	In patients.	Out patients.
1926 .. ..	31	8,288	2	3,663
1927 .. ..	79	11,215	27	5,222
1928 .. ..	88	13,245	16	6,360

26. (i) Latrines are provided under ground, but usually not in the villages.

(ii) Ample drinking water is provided from standpipes at Khewra and Warcha.

(iii) Khewra has special tanks for bathing and washing.

29. (i) No industrial diseases are prevalent. Conjunctivitis and granular lids are not uncommon, but this is the case in all Salt Range villages, whether mining or otherwise.

(ii) Cholera and hookworm are unknown. Statistics for malaria are as under : 1926, 983 ; 1927, 628 ; 1928, 770. Goitre is endemic, and was formerly serious but has declined, possibly as the result of the supply of a better quality of drinking water.

30. The work people as a whole do not favour sickness insurance. They are very conservative, and it probably would be unwise to enforce any such system on them. Western medicine is not unacceptable in the mining areas when it has been tested and found to be of benefit.

#### V.—Welfare.

31 to 35. There are no maternity or welfare activities in this area.

36. The department does not provide educational facilities. There are district board schools.

37. The miners contribute one pie per rupee of their wages towards a pension fund, and fines recovered from them are also paid into this fund. The recipients are chosen by the gangmen and lambardars in consultation. The awards seem to be reasonably just. The usual rate of pension is Rs. 4 or Rs. 5 monthly.

38. A co-operative supply shop was started at Khewra, but failed because the shareholders took no interest in its progress. At Warcha the Superintendent of the Mine kept the working of the shop almost in his own hands, and achieved somewhat better results, but this is not co-operation.

#### VI.—Education.

40. There are district board infant and primary schools at Khewra, and an infant school at Warcha. The attendance last year averaged about 240, composed entirely of children not in employment. Children under 13 years of age are not employed in the mine or workshop. There are no educational facilities for older children or adults.

41. There are no facilities for industrial or vocational training.

42. Education in this area dates from only the last ten years, and cannot yet be expected to have had any marked effect on the standard of living or industrial efficiency of workers.

#### VII.—Safety.

43. Conditions are regulated by the Mines Act No. IV of 1923, and the accompanying Regulations for Metalliferous Mines.

44. The rate of accidents for the past three years is—Fatal, 1 per 1,000 ; serious, 4.7 per 1,000. An accident which keeps a workman absent from work for 21 days is classed as serious, and this classification includes a number of accidents involving relatively minor injuries, such as loss of a finger.

45. The most common accidents are haulage accidents, i.e., persons knocked down or run over by mine trucks. Only one death in the last ten years was due to a fall of roof. A number of simple accidents are due to women while carrying salt dropping it on their feet or other parts of their body.

46. Precautions are taken—(a) by arranging safe travelling ways to and from the working places ; (b) by closing off all dangerous parts of the mine ; (c) two whole-time permanent overseers are employed on regular inspection of the mine roofs, and (d) by careful fencing and guarding of all machinery.

48. The hospitals are situated as close as possible to the mines, and a number of men are trained in first-aid.

49. The mines are inspected annually by the mines inspector and periodically by the electrical inspector, deputy commissioner, health and other district officials. The superintendents and inspectors make tours of inspection writing up the results in a book.

50. The hours of work are not long, and conditions generally are good. These factors inevitably conduce to safety.

#### VIII.—Workmen's Compensation.

51. (i) and (ii) The advantages of the Workmen's Compensation Act were not at first fully understood by the work people. They now understand them, and claim compensation whenever it is due. Six claims were paid in the last three years.

(iv) and (v) There are no insurance facilities. Compulsory insurance does not seem necessary where accidents are so relatively uncommon.

53. The scales of compensation allowed by the Act appear to be adequate without being so liberal as to induce workers to shirk returning to work for the sake of drawing compensation. Payment by instalments seems preferable to payment of lump sums. The conditions under which compensation is granted are just and call for no alteration.

54. I do not consider that such legislation as is indicated is necessary.

#### IX.—Hours.

63. (i) Nine hours for surface and ten hours for underground labour with the exception of female labour which works from four to six hours daily.

(ii) Actual working hours correspond very closely to normal working hours as practically no over-time is worked.

(iii) Surface labour breaks off about mid-day for two hours' rest in the hot weather making a total working day of 11 hours of which 9 are actually working hours.

64. There are six working days in the week. Sunday is a holiday at Khewra and Warcha, and Friday at Kalabagh.

65. The hours of work per week were always under 60 hours before the 60 hours' restriction was introduced. The restriction has therefore had no effect.

66. Work is not ordinarily at very high pressure, therefore it seems unnecessary that the maxima should be reduced.

67. The shift system would be of no advantage, since the working hours are already well under the maximum, and therefore do not need to be divided between two or more shifts of workers. The mining community resent strongly any interference with their immemorial habits, and would object to the enforcement of the shift system. From the Department's point of view there is no objection except that shifts would involve some increase in expenditure on supervision.

68. I do not consider that any limitation is desirable. The daily work is well within the miners' physical capacity, and as already indicated they are not appreciative of artificial restrictions.

69. (i) and (ii) Miners usually take from half to one hour's interval daily according to their own wishes. Workshop labour is allowed one hour's interval in the cold weather and two hours in the hot weather. The intervals correspond with the workers' meal time, and are not fixed with any relation to fatigue.

(iii) Including the miners' two months vacation the number of holidays per year—is 132.

70. See serial No. 64, regarding weekly holidays. Only urgent repair work to machinery, permanent way, etc., is carried out on these days.

71. All workers get much more rest than is provided by law. Obviously no further provision is necessary.

#### X.—Special Questions.

91. A period of ten years has been accepted by Government as the period within which women are to be excluded from the mine. The miners will object since this involves interference with their immemorial habits and will reduce their earnings. The effect on the industry, so far as I can at present foresee, is likely to be negligible, since the community as a whole is not at present fully employed.

#### XII.—Wages.

96. (i) The average income of Khewra miners during the last three months was Rs. 39 per head, per memsem. Output increases in the winter and the average for the year will probably approximate to Rs. 50 per memsem. The rate at Kalabagh is about the same as at Khewra, and at Warcha the average is about Rs. 35. Rates paid to workshop labour vary from ten annas per day for unskilled labour to about

Rs. 3 for highly skilled workmen, but the average is about Re. 1-12 annas per head. Wages on loading and unloading trucks vary from nine annas to Re. 1 per day, and on construction from nine annas to twelve annas per day, the lowest rate being paid only to very young or very old workers.

(ii) In the surrounding agricultural areas rates vary from ten annas to Re. 1-8 annas or Rs. 2 per day, the higher figure being only paid during harvest season.

(iii) Where free quarters are provided the concession may be taken to be worth Re. 1 to Rs. 5 monthly.

97. (i) Wages rose very considerably between 1914 and 1922. Since then there has been no marked fluctuation.

(ii) The increase would appear to be due to the general increase in industry in the Punjab as a whole.

(iii) Analysis of the cost of living of a family consisting of two parents and three children seems to show that the cost is about Rs. 35 per mensem. This, however, pre-supposes that the worker buys all his supplies in the bazaar. Actually a large number of workers buy food-stuffs direct from the farmers, and it appears that a family can live on Rs. 16 to Rs. 18 per mensem.

100. The contract system seems to work satisfactorily. There are practically no complaints from labourers against the contractors.

101. Wages have generally been fixed in relation to prevailing rates in the district.

102. No special rates are paid for overtime or Sunday work.

104. Changes in wages have little effect on labour supply in the case of miners, as they are not readily attracted to other work. With the other classes increased wages generally attract more labour and decreased wages make it difficult to obtain labour. Over a certain point, however, which may tentatively be fixed as that which gives a workman 25 per cent. profit on his earnings, increased wages appear to conduce to slackness and absenteeism.

105. Since the miners are paid on out-turn, the introduction of a minimum wage would be both difficult and probably not advisable.

106. (i) The percentage of fines recovered to total wages paid during the past year was 0.7 per cent.

(ii) Other deductions are made on account of the cost of blasting powder and hire of drilling machines, and a voluntary contribution fund is levied at the rate of one pie per rupee.

(iii) The fine fund plus the voluntary contribution fund forms, as already noted, a pension fund for the old and infirm people of the village.

107. (i) Wages are paid in some cases weekly, in others fortnightly and in others monthly. This has been arranged after consulting the wishes of the different sections of labour.

(ii) The normal period elapsing before payment varies from 1 to 14 days. In exceptional cases, periods of three weeks to one month have elapsed.

(iii) So far as the mines under my control are concerned no legislation is required.

(iv) Unclaimed wages are usually kept for about three months, but a claim for wages not previously claimed is always considered, no matter how long the claim may have been delayed.

108. (i) and (ii) The whole community is usually in debt to some small extent to the shopkeepers, but the debt in most cases is not more than the debtor could pay very quickly if he wished. In the case of about 10 to 15 per cent. of the community the debt is beyond the capacity of the debtor to repay except in instalments extending over two or three years.

109. There are no bonus or profit sharing schemes.

110 (i) and (ii) As already noted, the miners take two months' vacation annually, thus enforcing a similar vacation on the majority of the other workers. There are also about 25 religious holidays during the year. Except in cases of extreme urgency (for example during the war) the vacation is invariably granted, since it appears to be beneficial to the miners' health and efficiency.

### XIII.—Industrial Efficiency of Workers.

112. There has been little marked change in the general efficiency of workers in the past ten years, though it may perhaps be said that the mechanical skill of the blacksmith and carpenter classes is slowly improving.

113 The comparison of the efficiency of Indian and foreign workers (a term covering a very wide field) is difficult. Loading work affords a rough test. A Khewra labourer will load from ten to fifteen tons daily, a European labourer from 20 to 25 tons, and an American labourer (judging by figures which the general manager

has obtained) up to 30 tons. It may be stated with reservation that the ordinary Punjab labour is physically about 60 per cent. as efficient as ordinary European labour. Compared with African labour (of which the present general manager has experience) it may be taken to be 80 to 90 per cent. as efficient physically, though very much more efficient mentally. A good skilled Indian labourer appears to be about equal to a semi-skilled European workman.

114. The comparisons given above are affected chiefly by climate, lack of opportunities for education and physique. The plant used in the Salt Range is relatively fairly efficient, but the overall standard of management is less efficient than could be desired.

115. Improvement in dietary (alone among the subheads under this serial number) might render the workers capable of increased production, but as already stated the mining community as a whole is not at present worked up to its full physical capacity.

116. Extended use of electricity is expected to make the working of the mine as a whole more efficient. Such extension is under consideration.

#### XV.—Industrial Disputes.

123. (i) During the last forty years there has been only one strike. This occurred at Khewra mine in 1921, and was attributable mainly to the low rate of wages then paid.

(ii) It lasted for three months, and was conducted peacefully.

(iii) Government made no concession. The workers returned of their own free will.

(iv) The workers are estimated to have lost roughly about Rs. 60,000 in wages. There was no particular loss to industry.

#### XVIII.—Intelligence.

143. Statistics of attendance, wages paid, etc., are kept in the ordinary mine records which are very reasonably reliable. Statistics of health, disease, etc., are kept in the hospitals, but are less accurate, since a number of the community do not attend hospital, and thus numerous cases of illness presumably go unrecorded. Statistics of the cost of living are difficult to obtain.

145 No special investigations have been conducted regarding conditions in this area, except one investigation into the health of the Khewra miners conducted about 1922 by Dr. Gill of the Punjab. Dr. Gill's report unfortunately seems to have been eliminated from our records.

---

#### MINERS OF KHEWRA.

We, the undersigned miners of Khewra, venture to approach and lay before you the following lines for your kind perusal and favourable consideration.

The village of Khewra is inhabited chiefly by Moghals, Awans, Khokbars and Janjuas, who depend upon mining for their living. Our ancestors were the original owners of the mines in the Salt Range, and they owned and profited by the mines exactly in the same way as an agriculturist owns and makes use of his land. The mine was considered the owner's property. This fact is borne out by the oral traditions handed down from generation to generation and by the fact that persons of the same tribes are owners of lands in the district. During the Moghal and the Sikh rules our forefathers used to work out the salt from the mines themselves and realized the profits solely for their own benefit without any interference on the part of the then Governments. Since the advent of the benign British rule these mines have become State property and we, who were once the owners, cannot count ourselves in the category of even ordinary labourers.

2. Before the advent, and in the beginning of the British rule, the salt mine was situate at a distance of half a mile from the village and salt was worked out therefrom. However, since about thirty years a new tunnel was prepared and the mine went direct underneath the village. The result was that the old Khewra and the Mohallah Maswari were endangered. The officials paid no heed to this alarm and consequently half of the village was utterly destroyed, and thousands of the inhabitants were rendered homeless with irreparable loss of property in spite of the repeated requests and supplications from the villagers. This was the reward bestowed by the officers upon us for the services rendered so faithfully with the sweat of brow to fill the coffers of the Government Treasury. The benign Government has rendered

all possible aid to the sufferers during the recent floods, and it is beyond comprehension why we should be deprived of any such assistance from the Government, having become homeless, as we are. We have been crying during the last year for help, but the salt authorities would not allow our voice to be heard. Now that we have had the honour of the visit of the Labour Commission to this unfortunate village of ours we have found an opportunity to lay bare our heart and we earnestly pray that the site of the village may be shifted to some safer place, and we may be financed for building upon those sites or the Government may get us houses prepared under its own control and cost.

3. Our ancestors were the full owners of the houses occupied by them, and no Government ever claimed any right over them. Since about eight or nine years the general manager, Salt Mines, Khewra, has issued a queer order that no house should be rebuilt or repaired without a stamped deed being executed by the owner thereof in favour of the Salt Department, with the stipulation that the occupiers will be liable to be evicted if he cannot work satisfactorily according to the wishes of the Salt Department. This was the type of help rendered to the homeless during the calamity mentioned above, which also was the doing of the Salt Department itself. Thus we who once were the owners of the salt range and the houses are now required to seek permission to reside and to touch the homes of our forefathers. If we had our own homes without any interference or control we could leave the mine if not agreeable and still occupy our houses. On the other hand, if the execution of deeds continues the displeasure of the salt officers would mean exile from the village. We, therefore, request that this unwholesome practice be given stop to, and in our humble opinion you alone can give us salvation from this curse of stamp deeds, which has rendered our living worse than death, because on the face of it it is disgraceful to ask permission to live in one's own cottage.

4. We now draw your kind attention to the vital aspect of our labour that is the income of a miner. We may briefly state that previous to the year before last payment was made according to the measurements of space worked out by the miner. Since a year the system has been changed. Now the payment is made according to the number of trucks of salt a miner can supply during a certain period. Each miner is supplied with a notebook and the number of trucks supplied by him are entered in the book. The miner is paid at the rate of Rs. 3-6 per truck load of salt. On the average the daily output to the market from the mine is 10,000 maunds of salt, and this is conveyed by 250 trucks, each carrying 40 maunds. Thus the total number of trucks supplied per mensem is 6,250; 613 miners have been supplied with such notebooks. Thus, taking out the monthly average each holder of such book supplied 6,250/613, i.e., 10 trucks. The Government rate per truck is Rs. 3-6, but the expenses of gunpowder used in digging the salt and of oil incurred amount to 14 annas per truck. Deducting this actual cost the net price comes to Rs. 2-8 per truck. Thus the total average income of a bookholding miner is Rs. 25 per mensem. The miners, however, actually work for ten months during the year, it being impossible to work for the two rainy months, when the mine becomes dangerous. Making this allowance for two months a net average income of a miner comes to Rs. 20-13-4 pies per mensem. This is the only source of a miner's income. Now let us calculate the expenses. The total number of miners working is 2,677, and the number of books given is 613. Thus the number of persons depending on one book is 4½. To make the calculation easier we shall take the round figure of 4 for 4½. The monthly expenses of 4 men is as follows:—

	Price.	
	Rs.	a. p.
1. Floor, 6 chhks per head; total, 90 seers at the rate of 6 seers for one rupee .. .. .	15	0 0
2. Ghee, 3 chhks per head meal; total, 90 chhks at the rate of 8 chhks per rupee .. .. .	11	4 0
3. Meat, 10 seers; every third day a seer at the rate of 7 annas per seer .. .. .	4	6 0
4. Vegetables, pulses, etc. .. .. .	3	0 0
5. Salt, spices, etc. .. .. .	1	0 0
6. Fuel .. .. .	2	0 0
7. Clothes, shoes, etc. .. .. .	10	0 0
8. Barber, 8 annas; soap, Rs. 1-8.. .. .	2	0 0
9. Tobacco, 4 annas per head .. .. .	1	0 0
<b>Total .. .. .</b>	<b>49</b>	<b>10 0</b>

Total annual expenses, Rs. 595-8.

*Annual Necessary Expenses.*

	Rs.	a.	p.
1. Repairs of the houses .. .. .	50	0	0
2. Marriage and death expenses, etc. .. .. .	50	0	0
3. Fine .. .. .	24	0	0
4. Pie fund .. .. .	3	0	0
5. Income tax .. .. .	4	0	0
6. Illness, doctor, etc. .. .. .	10	0	0
7. Chaukidar .. .. .	1	0	0
8. Maulvi sahib and water for the mosque .. .. .	6	0	0
Total .. .. .	148	0	0
Total annual expenses .. .. .	595	8	0
	148	0	0
	743	8	0
Average monthly expenses .. .. .	61	15	4
The average monthly income is .. .. .	20	13	4

Thus the average debt is Rs. 4-2 per mensem and the average annual debt is Rs. 493-8 annas, i.e., about Rs. 500. Assuming the above figures, we can say emphatically that the poorest of human souls cannot incur lesser expenses. The basis of the Shahukars of Khewra are a living testimony of our debts. We therefore pray that some method be devised to ameliorate our wretched condition, one way being to grant lands to some of the miners elsewhere.

5. The solution to the difficulties mentioned above in para. No. 4 is found out by carefully examining the following:—The salt dealer has to pay Re. 1-9 annas per maund. Out of it Re. 1-4 annas goes to the Government Treasury as salt duty. The remaining 5 annas are charged by way of expenses incurred by the Government for labour spent in the supply of salt.

*Statement A.*

	Rs.	a.	p.
1. Wages of the labourers at the rate of Rs. 3-2 annas per truck weighing 40 maunds .. .. .	0	1	3
2. Expenses per maund for putting in trucks and carrying to the market .. .. .	0	0	3
3. Workshop expenses per truck repairs .. .. .	0	0	6
4. Expenses in the market for sewing bags and loading wagons .. .. .	0	1	0
Total, per maund .. .. .	0	3	0

*Statement B.*

	Rs.	a.	p.
1. Loading per truck .. .. .	0	4	0
2. Pulling of the truck by mules .. .. .	0	2	0
3. Engine expenses per truck .. .. .	0	3	0
4. Unloading, per truck .. .. .	0	1	6
Total .. .. .	0	10	6

*Notes.*—The carrying capacity of a truck is 40 maunds, and in statement B the expenses per truck are mentioned. Therefore the expenses per truck amount to 3 pies. This is shown in Statement A (2). It is clear from the Statements A and B that the Government expenses amount to 3 annas per maund per labour, etc. The question arises as to what use is made of 2 annas thus realized from the salt purchasers. We pray that the said sum of 2 annas above-mentioned be paid to the miners, and the rate per truck be increased to Rs. 8-2 annas from Rs. 3-2 annas per truck load for the miners. In this way the monthly income will come to Rs. 81-4 annas. If this is done the income will be more than the expenses, and we will be relieved of all anxiety and trouble and our labour will be a source of respectable living.

6. We further beg to request that some provision be made for the old and disabled miner. On account of working in a mine a miner becomes useless at an earlier age than usual, and is more often disabled on account of accidents breaking his leg or arm. Like other departments, the salt department should make some arrangement for the labourer in the form of bonus, pension or provident fund.

7. The system in vogue a year back was that the wages were paid according to the measurements of the space. The details are as follows :—1 anna 9 pies per cubic foot up to 10 ft. below the surface of the line of salt trucks, 2 annas per cubic foot from 10 ft. to 20 ft. below, 2 annas 8 pies per cubic foot from 30 ft. to 60 ft., 2 annas 9 pies per cubic foot from 60 ft. downward. The salt dust was included in the measurement. According to the present arrangement no allowance is given for the salt dust. The officers more often than once, on mere examination, declare the trucks to be lesser in weight, and thus fine the miner accordingly without getting the truck actually weighed. This is a great hardship to the miners. If the miners object that the weight is not less and pray to the superior officer for the remission of the fine, they are threatened with expulsion from the mine and the poor miner has then to content himself with his fate like dumb cattle. We therefore pray that the Salt Department be ordered to actually weigh the trucks before any deduction is made.

8. In other parts of the province committees are constituted to look after the various arrangements of the locality. A committee of four members is in existence here as well. The object of establishing this committee is to look after the sanitation, to settle disputes concerned with houses and sites. But the members of the committee are either Lumberdars or contractors who are afraid of the officers without any reasonable ground. They cannot consequently properly perform their duties. The grievances of the residents cannot reach the officers' ears because a committee exists in name only. It is therefore prayed that the members of the committee be elected and not selected.

9. The following are the general miscellaneous grievances which require redress :—

(a) The Government Salt Digging is carried on by contractors at fixed rates. The contractor Lumberdar allots different works to the miners under his control and for any damage such miners are not paid any wages although they have worked. On the other hand they are penalized to surrender their books.

(b) There is scarcity of water for the miners, the pipes being available to the public for half an hour only. The water is stored in water tanks at a distance of half a mile from the village. The water is to be brought through difficult hilly paths in hot weather from such a long distance and considerable difficulty is felt. This hot boiling water in summer is available to the few miners who have the chance to reach it first. The others are at the mercy of the clerks, who may allow them water from the pipes in their houses after great entreaties. On the other hand, the pipes in the houses of clerks are running for 24 hours. Will the honourable members do something to alleviate our trouble.

(c) A pie per rupee is deducted from our income on account of charges for repairs from the Government workshops. These workshops are opened during fixed hours when we are working in the mine. On Sundays these are closed, so we have no time to have our instruments repaired. Either the Government shops be closed or be opened at proper intervals.

(d) The Government had assigned different plots of land to several miners for maintenance. The miners prepared these lands after great labour. These lands are now being taken away from lessees for petty faults and handed over to others. We pray that either the original occupiers should not be ejected from such lands, and if they are ejected reasonable compensation should be awarded to those ejected.

(e) A pie per rupee is deducted from our income for giving pensions to old disabled and injured persons. Similarly Income Tax is being deducted but our incomes were never assessable. A penal post is being ordered at Khewra and we shall have to bear the cost. We may be saved from the extra expenses.

(f) Outsiders are employed as labourers in the electric machines and workshops. Will it not be fair that this labour should also be performed by miners so that those who cannot get sufficient work in the mines should be able to earn their livelihood in these places.

(g) According to the order of the General Manager no miner is allowed to work for more than eight hours in the mine. The machines work throughout the day till 4 p.m. The order, moreover, is that unless the chamber is clean machines won't begin to work. The miner is in a very difficult and odd position. If he does not

clean the place for the machines to work his whole day is lost; if he works after the usual allotted hours he is punished for the breach of order. Some solution may be found out for this.

(b) All the miners have equal rights in the mine without distinction. Every Lumbardar or Gangman is allotted a certain number of trucks to be supplied per month. The Lumbardar or Gangman does not divide equally the trucks allotted to him to the different miners under him. He supplies as many trucks himself as he can and in several cases supplies all the trucks allotted to him. The miners working under him are thus left without any work to do and have to starve. The system involved previously was that the Salt Officers used to divide the salt chambers themselves amongst the miners. It is requested that the same system should be introduced now so that the Lumberdars or Gangmen may not have undue advantage over the other miners.

(c) In cases of conviction, a miner after undergoing sentence of imprisonment is not allowed to work in the mine. Even in cases of Challan cases after discharge or acquittal he is considered a condemned man and a criminal although there is a judicial pronouncement in his favour. It means thus in some cases forfeiture of his property (right to work in the mine and ejection from his house). In cases of all other subjects of His Majesty no person incurs forfeiture of his property unless there is a specific order by some judicial authority. It is therefore prayed that this practice should be put an end to at an early date.

10. We have briefly laid before you a few out of many grievances with a strong belief that you will kindly spare some of your valuable time in devising some means for the amelioration of our condition. We are convinced that you have by this time fully grasped the situation and have examined the conditions under which we are working and the miserable plight we are living in. It may not be futile to say that our living is very wretched, our incomes too poor to maintain our families, and our status much lower than our agricultural brotherhood in the same locality. As compared to other countries the conditions of labour in this country are bad and we can boldly say that our lot is the worst. We are the faithful and loyal subjects of His Majesty and we have been rendering all possible assistance in times of need. As misfortune would have it, our rights have never found favour with the officers concerned, and we have always been looked down upon as mean labourers of no respect. Your visit as President of the Labour Commission to this unfortunate village of ours is a God-sent gift and we pray and hope that you will consider our grievances with kind favour.

---

### LABOURERS OF KHEWRA SALT MINES.

We, the labourers of Khewra Salt Mines, Engineering Section, most respectfully beg to lay the following grievances before you for your kind consideration:—

1. That since the mines were started men used to work on all days of the year except public holidays. On the recent introduction of the Indian Mines Act, we work only 20 or 22 days or so in the month, all Sundays and local and gazetted holidays being observed. Also, we are given leave for two months the mine is closed during the rainy season. In short, we work only seven months in a year. It is a well-known fact that the cost of living is getting higher and higher every day. This reduction in our income is telling very badly on our condition and most of us are getting into debt.

2. That like other departments, e.g., railways, we are made to work under all the usual limitations. But we are not granted any privilege like them. They work eight hours a day while we work 9 hours a day except those employed underground. They are allowed 15 days' leave on full pay in a year and receive their full pay on all gazetted holidays. At the time of cessation of their services they are given gratuity. The right to such privileges commences after one year's service. We have amongst us people who have been working for more than 8 to 10 years and who receive no consideration of the sort whatsoever.

3. In the railway department all employees are given due increments at the end of every year without the asking. We get increments at a very meagre rate at the end of four years, and that, too, is not granted to all of the men.

4. That we should be put on monthly wages instead of daily. Or our rate of pay be increased and we should be paid on all holidays. This is possibly the only way to better our condition.

5. That our previous difficulties have been multiplied by the Hasiyat Tax being levied by the District Board. We are already poor, ill-paid men, living from hand to mouth. We cannot pay this tax. If this tax is made compulsory, we will be actually starving.

6. That we are very badly in need of proper and enough accommodation at Khewra. The number of quarters is much too small for our number and we have to live several men in a small room. That one room serves the purpose of our kitchen, bathroom, store-room and sleeping-room. This condition is the most insanitary imaginable. We need quarters to accommodate all men with special regard to health, sanitation and reasonable comfort. It will not be out of place to state that many men are obliged to live in their villages and to walk to and from work three or four miles every day under all conditions of weather.

7. That we have only one vernacular primary school and there is no provision even for ordinary education. After our children have passed 4th primary it is impossible for them to learn more because (1) we have no means to send them away to read in a town; (2) in the latter case they lose their character, being out of our supervision. This tells horribly on our future generation. Our children are denied the benefit of education. We require at least one high school here.

Lastly, we beseech your kind honour to look into our troubles sympathetically and help to redress them as far as is in your power.

Mr. W. H. ABEL, INSPECTOR OF FACTORIES, PUNJAB.

*Labour in Factories in the Punjab.*

According to the latest report the total number of persons employed in all factories in the Punjab is 51,613, of which 43,296 are men, 7,534 women and 783 children (between 12 and 15 years of age).

Of the total number, 13,629 are employed in the railway workshops, 4,743 in the Government factories such as military workshops, arsenals, etc., and 33,241 in all other factories.

Of the total number, 21,763 are employed on seasonal work, of which 21,335 are in cotton ginning and pressing factories and 428 in ice factories. Women are mostly employed in cotton ginning factories as unskilled workers, numbering 7,123 out of a total of 7,534 employed in all factories.

• Of the total number of children, 93 are employed in the textile mills, 246 in cotton ginning factories and 444 in other factories such as sports works, printing presses, match factories, cement factories and oil refineries.

Workers in factories other than those employed in the railway workshops, textile mills and few other engineering works belong mostly to the agricultural class, and they seek employment in factories only with a view to fill in their time between the harvest. The majority of skilled workers in railway and engineering works are imported from other provinces and having no interest in the land are keen to improve their knowledge of factory conditions and work up to high positions. Bombay and the United Provinces supply certain number of factory managers, engineers and head mistria, many of whom are Parsees. A fair number of engineers and boilermen are Sikhs.

**I.—Recruitment.**

1. (1) When new factories are opened most of the skilled labour required is imported chiefly from places where similar concerns are already in progress. Unskilled labour is readily obtainable from villages surrounding the industry: they being land workers are attracted by a slightly higher wage. Further, when their land requires attention they leave the factory for their homes. Unskilled labour is generally plentiful in the Punjab and seldom does an occasion arise when higher wages have to be paid owing to the scarcity of workers when they return to their land during the harvest time.

In bigger concerns such as the Dhariwal Mills (employing 886 operatives) skilled labour was imported in the first instance from Bombay and United Provinces, and it is still drawn from those provinces as vacancies occur. Those living in villages near the mills have to some extent taken up employment in the mills in preference to land work. This was evident during the labour trouble of 1927, when the mill authorities were able to recruit a sufficient number of semi-skilled workers from the neighbouring villages and managed to keep the mills running.

A recently opened paper mills at Jagadhri—an entirely new industry in the Punjab—drew up to 60 per cent. of its skilled workers from the United Provinces, where paper mills had already been in progress several years. In seasonal factories, of which cotton ginning and pressing form the major portion, four-fifths of the labour is local. The period of work in these factories extends from October to April, a time which fits in fairly well with the requirements of attending to the land, and such workers are able to carry on by existing on the land during the months April to October, when the next cotton ginning season would start.

(iii) The only change noticeable during recent years is the gradual inclination on the part of the labour to take up factory work: this is probably due to the rise in wages paid by the employers: the change is, however, very slow.

3. (i) Recruitment to all centres is usually carried out by a labour contractor, who remains in touch with contractors in other industrial centres, and can usually meet the supply. Much recruitment is also made by personal acquaintances—most of the permanent workers such as engineers, mechanics and other skilled workers appear to have friends or relations looking for an improvement on their own job—and references relating to ability and certificates not being of great value, changes of service frequently occur.

Unskilled and casual labour is recruited through the labour contractor, and mostly paid by him at the end of the day. There is no guarantee given by the contractor that work will be forthcoming the following day, as it all depends on the amount of work that will be available.

(ii) I do not know of any improvement which could be effected with regard to the recruitment of unskilled labour: the existing method is simple and effective. Labour being illiterate would look with suspicion upon any change that is contemplated in the present system.

8. (i) The average duration of employment is difficult to determine. I know of cases where men have worked for 30 years, but such cases are very rare—the average being nearer 20 years.

(ii) Casual employment in factories extends from 4 to 7 months during the year, depending upon the duration of the cotton ginning season: the remaining portion of the year or some part of it is spent in working on the land.

## II.—Staff Organisation.

12. Subordinate supervising staff is to some extent supplied from the various industrial and technical institutions in the province. It is also imported from United Provinces and Bombay. There is a marked difference between the unskilled and skilled workers, the former seldom if ever attaining position of skilled workers or supervisors.

13. (i) In well established factories, particularly those run by responsible companies, the relations between the employer and employed are good and compare favourably with other countries from what I have seen. In smaller factories difficulties occasionally arise amongst the proprietors, managers, and workers chiefly on account of non-payment of wages and alleged ill-treatment, as a result of which numerous applications are received at my office from the workers who complain of being dismissed without having been paid their dues.

(iii) Works Committees have not yet been established in this province.

15. (i) Recruitment to all centres is usually carried out by a labour contractor, who is in touch with the contractors in other industrial centres and can usually meet the demand.

(ii) It is difficult to say to what extent sub-contracting is carried on, but since the labour contractor usually lives near the factory area, and seldom undertakes to contract for more than two or three factories, it is unlikely that he would resort to sub-contracting.

(iii) The contractor has little or nothing to do with the working conditions of the labour he supplies: his duty finishes when he has supplied labour up to the extent required by the factory manager.

(iv) The employment of labour through the agency of the labour contractor has on occasions resulted in the abuse of the provisions of the Indian Factories Act relating to hours of work and employment of children. I have had cases when a labour contractor having supplied under-aged workers to a factory, has been held responsible by the factory owner, who, when prosecuted by this department, has tried to push the responsibility for illegal employment on to a contractor.

## IV.—Health.

26. Latrines are provided for work people in factories according to rules laid down in the Punjab Factory Rules, except in such circumstances where the factories are open to the country on three sides. Although latrines are provided it is only in big mills and towns where they are made use of. When factory owners are taken to task for not keeping the factory latrines up to the standard laid down by the Factory Law, they frequently say "what is the good when the workmen do not use them."

(ii) The supply of drinking water is generally satisfactory in factories. In towns, where there are municipal waterworks, factories receive their water supply from municipal taps, which have proved quite sufficient to meet the demands of the operatives. In rural areas most of the factories have their own wells, and a man is employed permanently for supplying drinking water to the operatives.

(iii) No special arrangements have been made in factories to meet the needs of the operatives in this behalf. However, the factory managers do not object if the operatives make use of the tank or the well of the factory for their bathing and washing purposes.

28. (i) *Control of temperatures in factories.*—Exhaust and overhead fans are fitted in work rooms of well-organized factories, and workers themselves frequently fit up fans working from a pulley of the power shaft. Stoves are provided in Government factories during the winter months, but factories are usually kept warm enough by the power plant. Apart from this little attempt is made to control the temperature of factory rooms.

(ii) *Control of humidification in cotton mills.*—Special rules for the control of temperature and humidity came into force only last year. There are only three cotton spinning and weaving mills in the Punjab in which artificial humidity is being used at present affecting about 750 operatives. The rules are still in an experimental stage, and it is yet too early to report with regard to their suitability or otherwise.

29. (i) Up to this time no occupational disease has come to light in registered factories in this province. Woollen mills and presses report that no case of anthrax has ever come to their notice. Regarding lead poisoning, three printing presses only do their own lead melting, and these have up-to-date stoves fitted with exhausts to carry away fumes. Compositors in printing presses like the *Civil and Military Gazette*, Lahore, have been doing the same work for many years without showing any signs of ill effects.

## VII.—Safety.

43. Regulations with regard to the workers' safety are shown in rules made under the Indian Factories Act and are based on the workshop rules existing in Europe, altered where necessary to meet local conditions. An abstract of the principal rules relating to general safety is posted up at the entrance of all factories in English and in the language of the majority of workers. Apart from this every year a circular letter is issued to all factories bringing to their notice the chief requirements relating to safety measures and to other requirements of the Factory Law relating to hours of work, etc. In this circular a special reference is made with regard to the guarding of dangerous machines, and any other matter of importance which requires careful attention. When these regulations are persistently violated, prosecutions are instituted against the offenders. During 1928, 32 cases were made against factory occupiers and managers for failing to protect their workers from the dangers of machinery.

44. A reference to annual reports on the working of the Indian Factories Act in the Punjab will show that accidents have increased considerably during the last 10 or 12 years. The increase is out of proportion to the increased number of operatives.

45. The increase in the number of accidents referred to in the preceding paragraph is attributable to the following causes:—

(a) More accurate reporting of accidents by factory owners due to some extent to the strict administration of Factory Law.

(b) Operatives are themselves becoming acquainted with the fact that accidents should be reported and they frequently report themselves to the Factory Inspector's office.

(c) The introduction of the Workmen's Compensation Act has also had an effect on accident reporting as the injured persons think that by reporting accidents they might get compensation.

(d) Another reason is that since the war up-to-date machinery of entirely new patterns has been introduced into the country whilst the workmen have not had the proper training to keep pace with the new type of machinery. It is noticeable that accidents increase with the introduction of new type of machines.

(e) Ignorance of the workers and a belief in fate rather than carefulness is also responsible for many accidents. After frequent demonstrations of how to handle a particular machine, workers with apparently full knowledge of the dangers still take frightful and unnecessary risks. Reference to the causes of fatal and serious accidents shows that carelessness on the part of the worker is responsible to a great extent for accidents. Such instances as "a boiler attendant fell over the safety valve arm of a boiler when walking over the top of it, instead of going round, causing steam to escape which burnt him to death." "An engineer went to turn off an electric switch situated on the other side of the engine, to save walking round the engine, a distance of 20 yards in climbing over the rails guarding a main rope drive caught his foot in the rope and was instantaneously killed."

(f) Frequent instances of serious accidents are reported where workers remove safety guards in order to clear a jam or fault and use their hands or feet to put the fault right. This is to a great extent due to ignorance, but much also is due to carelessness and disregard of known dangers.

(g) Investigations into the causes of serious and fatal accidents to workers on dangerous duties such as maintaining of pulleys in order, oiling of bearings, etc., show that underpaid and unskilled workers are put on jobs of which they have no experience. There is no definitely laid down standard of a "skilled worker" and it is, therefore, impossible to bring home to the employer his responsibility in this respect. I have heard it argued by some employers that since they insure their labour against accidents under the Workmen's Compensation Act, there is no object in employing expensive and skilled workers on dangerous jobs, as in the event of accidents the insurance company will pay. A definitely laid down standard of efficiency amongst skilled workers along with it, if possible, a wages standard would be extremely useful. Trade Unions could possibly assist in this respect.

46. The railway workshops are the only factories to take up safety first measures seriously. Posters showing dangers and calling upon workers to be careful for their own sake are exhibited in conspicuous places. Other factories have not shown an inclination to take up the matter seriously.

Existing factory rules made under the Indian Factories Act cover safety first measures, such as compelling certain classes of workers to wear tightly-fitting clothes, to prohibit children from entering into certain parts of factories, etc., but no serious attempt has yet been made in the shape of a safety first campaign amongst factory workers.

48. First-aid boxes are provided and kept in readiness in all factories where 500 or more operatives are employed.

One mill only has its whole-time doctor always in attendance: he attends the workers and their families free of charge. A few of the bigger factories have a working arrangement with the local doctor, who visits their factories once or twice a week according to the terms of contract, but on the whole workers and their families seek relief from Government dispensaries.

49. (i) During the year 1928, 667 inspections were made, resulting in 130 prosecutions to enforce factory regulations.

The bigger and well-organised mills do consider it their duty to work to factory rules and make an effort to do so.

(ii) The seasonal factories particularly work against regulations and have little regard for factory legislation. The nature of the staple industry of the province (cotton ginning and pressing) makes it necessary to work hard whilst the season is on, also weather conditions have a considerable effect. As a result when the raw cotton comes into the factory, it is dealt with right away and regular working hours are to a great extent ignored.

As 90 per cent. of the labour in the seasonal factories is unskilled and contracted for daily, the employer has little regard for its comfort, and long hours are indulged in. As this goes on for four to six months during the year, the workers suffer hardships, as although they work longer hours, their daily wages remain the same. Prosecutions are launched against offending factory managers for this overworking. Thirty-eight cases were instituted in 1928, but the inspector's difficulties are many in bringing the offenders to book. It is well known that a reward is paid to anyone in the factory centre or villages, giving information about the inspector's arrival; chowkidars are also kept on the railway stations by factory owners with a view to obtaining timely information about the inspector's visit. False registers are maintained and no factory worker would dare give evidence against his employer.

One of the chief difficulties in enforcing factory regulations is that adequate punishments cannot be obtained in courts for offences under the Act. It, therefore, becomes a sound business proposition for a factory occupier to work his employees overtime and risk being detected by the inspector: if he is taken to court, the fine will be anything from Rs. 10 to Rs. 50, and that amount is made up by one hour's illegal work and it is fairly safe to presume that the inspector cannot turn up more

than once a month. The method of adjudging cases under the Indian Factories Act is to my mind unsatisfactory. I doubt if the prosecuting agency or the Court realize the serious nature of infringements of rules and very often when the hearing comes on, the Factory Inspection Department is not informed of the date of hearing. The accused pleads guilty, pays his small fine into court and returns to his factory to carry on as before. There is nothing in the Act, which provides for an enhanced sentence for the repetition of an offence: hence no mention of the offence having been committed before, is legally permissible in the complaint. I give below one instance in which the accused was made to pay a small fine in spite of the fact that he was prosecuted by me for the fifth time:—

(1) After having issued several warnings to the occupier of Khalsa Cotton Factory, Jaranwala, I prosecuted him for the first time in 1925 for—(a) not completely guarding the main line shaft alley, and (b) employing persons on Sunday without giving a substituted holiday.

In each of these cases the occupier was fined Rs. 45.

(2) For the second time I prosecuted the occupier of the said factory in 1926 for—(a) not completely guarding the main line shaft alley; (b) employing persons on Sunday without giving a substituted holiday; (c) for illegal employment of children; and (d) for working his factory without sending a notice of occupation.

In the first two cases he was fined Rs. 15 each and in the remaining two, Rs. 10 each.

(3) For the third time I prosecuted the occupier of the said factory in 1927 for:—(a) not completely guarding the main line shaft alley; (b) employing persons on Sunday without giving a substituted holiday; (c) illegal employment of children (3 cases); (d) for working his factory without sending a notice of occupation; (e) for not maintaining inspection book, and (f) for not submitting the monthly holiday returns.

In all these cases the accused was fined Rs. 1,250, but on an appeal preferred by him, the District and Sessions Judge reduced the amount of fine to Rs. 400.

(4) For the fourth time I prosecuted the same occupier in 1928 for—(a) allowing persons to work on transmission machinery whilst wearing loose clothes; and (b) illegal employment of children.

In one case he was fined Rs. 20 and in the other Rs. 10.

(5) For the fifth time I prosecuted the same occupier in 1929 for—(a) overworking labour; and (b) illegal employment of children—2 cases.

In each of these cases he was fined Rs. 25.

From the above it is evident that the courts take no notice of the repetition of offences under the Act and inflict only small fines. Further, when the inspector is required to appear in court as a witness, the cases which are written down to be tried summarily are sometimes delayed—the accused is either not served, or his witnesses are not available, or the Public Prosecutor is busy in another court, or the Magistrate is busy with other cases.

It is not unusual for an inspector to appear in a court, possibly 100 miles away from the headquarters, four or five times in each case, every hearing taking up a whole day, and the result is that the accused is finally let off with a warning, or fined Rs. 10 or 20. If a provision is made in the Act so that enhanced punishment could be awarded in case of a repetition of an offence, and that all factory cases to be tried summarily (by summary procedure) and if it were possible to have a Public Prosecutor attached to this department, such difficulties will be greatly minimized.

50. There are no statistics to show exactly how far reasonable working hours do keep down accidents, but undoubtedly fatigue is responsible for many accidents, and the more conditions of work are improved generally, the less will be the number of accidents.

### VIII.—Workmen's Compensation.

51. *Workmen's Compensation Act*.—This department is only concerned in collecting returns under the Act relating to factories and mines. As, however, factory workers know that the factory inspector has something to do with accidents, many reports are made to this office, the workmen sometimes appearing in person, seeking for help in obtaining the compensation due. Every year 30 to 40 injured persons or their dependants call at this office for help in this respect. Advice is always given as to the procedure which should be followed by them, and where necessary help is given to them in filling in the claim forms merely upon compassionate grounds.

If some scheme could be devised whereby claims be in simpler form and payments could be made more promptly, the claimants would be benefited. One case came

to my notice of a claimant at Sheikhpura being paid his claim in the shape of a cheque on a Calcutta bank by the insurance company, but as he could neither read nor write, the cheque was quite useless, and it took him more than six months to realize the amount.

### IX.—Hours.

#### A.—Factories.

55. Factory legislation permits working 11 hours a day, but not exceeding 60 hours a week. In perennial factories other than railway workshops, this is taken full advantage of. In flour and oil mills, where continuous production is necessary, the method is to employ one shift of workers by day and one by night; arrangements being made for each worker to be off duty two hours during his period of 12 hours of duty. During the day, the worker usually takes advantage of his rest period to go out of the mill, but during the night he prefers to stay in the mill for rest.

The operatives of many factories prefer to take half-an-hour's rest at mid-day instead of one hour; this is permitted where the total daily working hours do not exceed 8½. Railway workshops have a fixed week of 48 hours, after which overtime pay is given up to 60 hours per week.

Seasonal factories apparently accept the 60 hours' week, showing a 10-hour day for six days a week; timings are usually shown from 6 a.m. to 6 p.m., with two hours' rest. These hours of work are not strictly adhered to, especially in the case of cotton ginning factories, which are notorious in overworking their labour beyond the prescribed hours.

The method adopted by the unscrupulous factory owners who deliberately overwork their labour longer hours than is permitted under the Act is as follows:—

A factory's working hours are registered as from 6 a.m. to 12 a.m. and from 2 p.m. to 6 p.m., with rest interval from 12 a.m. to 2 p.m. Their hours are recorded on the factory notice board and a copy of it is sent to the factory-inspector. If the factory manager wants to start earlier he puts up a piece of paper on the notice board showing that the factory will start that day at 5 a.m. or 5.30 a.m. Should an inspector visit the factory at that time, working hours are in order, since the notice board is correct, and provided the manager sends a notice to the inspector within 36 hours of the change of working hours as required by Section 36 (3) of the Act, there is no offence. The daily attendance register is seldom written up for the first hour or more, so that by 7 a.m., if an inspector has not called at the factory, the manager can safely change the piece of paper already posted up on the notice board, substituting it for one reading "Factory works to-day from 7 a.m. to 7 p.m.": if an inspector visits the factory after 6 p.m., all that the manager has got to do is to send off a postcard within 36 hours of the change to the factory inspector and he is in order. The same tactics are adopted to dispense with the rest interval. A rest interval timed from 12 noon to 2 p.m. is evaded by a notice posted up reading: "Owing to engine breakdown between 10 a.m. and 12 noon, rest interval is changed from 12 a.m. to 2 p.m. to 10 to 12 a.m." If an inspector does not visit the factory until after 2 p.m. that day, the notice is taken down and workers are given about 10 minutes to take their meals once or twice during the day only.

From the above it is evident that it is not difficult for unscrupulous factory occupiers to work their labour 12 or 14 hours a day with little risk of being brought to book. I am of the opinion that sub-section (3) of Section 36 of the Indian Factories Act is defective and leaves a loophole which is taken advantage of by factory occupiers. If this sub-section were to require a factory occupier to give notice of the change of working hours before the change actually takes place, the abuse quoted above could be more effectively dealt with.

The abuse noted above is to a very great extent encouraged by the awarding of light punishments, such as a fine of Rs. 5, 10, or 20 in each case by the trying magistrates, some of whom up to this time have not realized the gravity of the offence of overworking labour.

56. Factories work for six days a week, and the seventh day, which is a Sunday or a substituted day, is observed as a complete holiday.

57. (i) So far as workers are concerned, they have welcomed the 60-hour week, since the change has not been accompanied by the reduction in wages.

(ii) The introduction of the 60-hour week was at first resented by the factory owners and opposed strenuously, but, however, it has since been accepted and the factories that their output has not suffered to any great extent by the reduction in working hours.

58. The effect of the daily limit has proved wholesome, as it has shortened the hours of work of the operatives without materially affecting the output.

59. A further reduction in the maximum hours per week is, I think, not advisable, especially in the case of seasonal factories in which punctuality and consistent work are not noticeable amongst factory workers in this province. Few factories have yet adopted the clocking in and out system, as a result a considerable amount of time is wasted in getting to and from the actual job; it is improbable that in a 10-hour day the average worker is on his job more than 8½ hours.

60. (i) (a) The break after putting in six hours' work is very useful and does go a long way in preventing undue fatigue. (b) The break after six hours' work is utilized chiefly as a rest. The workers do not generally take their meals at this time, their meal hour being earlier in the morning from 9 to 10 and again after their work in the evening.

(ii) The existing law seems to have worked satisfactorily in this direction.

(iii) Hours of work at present in force are suitable during the hot months. Hours are frequently changed so that a long break is given during the heat of the day. Hours occasionally have to be curtailed during the extreme cold days as it is too cold to start work early in the morning.

(iv) Ample holidays are given or taken by workers apart from the weekly holidays, there are many public holidays which are mostly given to workers, either extra holidays or substituted for the weekly holidays.

61. (i) The day of rest is usually Sunday, except in the case of Muhammadan factories, which observe Friday as their day of rest. It is, however, possible to change the weekly rest day at any time by giving previous notice to the inspector, and this is done whenever the necessity arises. Public holidays are often substituted for Sundays.

(ii) The existing law seems to have worked satisfactorily in this direction.

62. When the amended Factory Act came into force in 1922, it was necessary to grant exemption from regulations regarding working hours fairly freely, and up to this time exemptions are still granted occasionally; the tendency during the past years has been to grant exemptions sparingly and no serious objection has been raised to tightening up of working hours' conditions. When exemption to work more than 60 hours is granted, the overtime rule of payment of one and a quarter times the normal pay comes into force, and this has had the effect of reducing applications for exemption.

#### C.—Railways.

73. Railway workshops have a uniform 8 hours a day or 48 hours a week, after which overtime is paid.

74. Railway workshops work for six days a week, and the seventh day, which is a Sunday, is observed as a complete holiday.

76. Rest interval and weekly holidays are observed like other factories.

#### D.—Other Establishments.

78. *Hours Worked per Week and per Day.*—In establishments other than registered factories, carpet manufacturing factories are the only concerns about which I have experience. At present, carpet factories in this province are not on the factory register, because they do not employ any motive power, and the attempt to apply to them some of the working hours' legislation has met with strenuous opposition.

80. Workers in these factories do put in very long hours, and most of them being boys of very tender age (between 9 and 15) I think control is very sadly needed in this behalf.

### X.—Special Questions relating to Women, Young Adults and Children.

#### A.—Factories.

81. The curtailing of the hours of work and prohibiting women and children from certain employment has had a good effect; it is argued in some cases that restriction placed on the employment of women and children have tended to place them at a disadvantage in the labour market. There is no doubt that the wages earned by women are low but the restrictions placed by the amended Act are in my opinion justified.

82. The admission of infants into factories is discouraged as far as practicable; it is, however, difficult to always keep them out because they are too young to be separated from their mothers. In 1924 and 1926 I issued an order prohibiting infants from entering into cotton ginning rooms whilst ginning was in progress.

as the atmosphere was laden with dust. There were many protests against this order, and after two years I found the order could not be enforced without hardship to parents, who must lose their employment in factories if infants were not allowed in and the order had to be revoked.

83. The present regulations with regard to the employment of women in factories are quite suitable. Hours of employment for women are the same as for men, except that the former cannot be employed before 5.30 a.m. or after 7 p.m.

84. The present law with regard to the employment of children is also suitable. Their hours of employment are the same as for women, except that their hours of work are not to exceed six hours a day.

85. I have seldom noticed the employment of children in two factories on the same day, but it is not improbable that many of them work at other occupations during the part of the day they are not employed in factories.

89. (i) Local government have made use of Section 2 (3) (b) of the Indian Factories Act by applying it to cotton ginning and ice factories employing not less than 10 persons on any one day during the year. The extension of the Act in this behalf became necessary as most of these factories deliberately kept the number of their employees below 19 and so avoided coming within the purview of the Act, so as to be able to work longer hours and employ women and children at all hours.

(ii) The Act could be usefully extended to all other factories in order to regularize the hours of employment of women and children; it would also cut down much unfair competition which exists at present.

## XII. Wages.

96. (i) Wages have shown a steady rise during the past ten years, due to the increased cost of living. A statement showing average wages earned by skilled and unskilled labour for the past eight years is given in the local government's memorandum.

106. (i) Fines are inflicted on workers in many factories for offences such as spoiling of material and loss of time, but to what extent is not known.

(iii) In one or two well run mills it is known that fines are utilized towards the employees' provident fund, otherwise fines ordinarily go to the factory management.

(iv) Legislation to cope with this would be difficult, as the average worker would be unable to prove his case, the deduction would be made on pay day and probably the worker fined would be required to sign for full pay.

107. (ii) The periods elapsing before payment of wages varies from 10 to 20 days in the case of monthly paid workers and up to 15 days for piece workers. Daily casual workers get their dues at the end of the day's work.

(iii) The legislation to assure prompt payment of wages would certainly be a great boon to workers who by reason of their having to wait for several weeks before they receive their pay are usually in the hands of their food suppliers and are at a great disadvantage.

It is suggested that legislation be made making it an offence to keep a worker waiting more than 5 days for his previous month's wages.

(iv) Unclaimed wages generally lapse to the employers except in the case of bigger mills which pass them on to the relatives of the workers, if any.

108. (ii) The extent of indebtedness is difficult to define; there are instances where an employer has taken over the debts of a good worker in order to secure his services: this is not unusual in the case of skilled mechanics. The workers are often indebted to their food supplier, to give an instance I would quote the case of workers employed in the Bankteshwar Cotton Mills, Bhiwani, which was closed down in April, 1928, and the workers were dismissed. A petition was put forward for immediate payment of wages, as until the workers had made some settlement with the "bania" to whom they owed money for food, they were not allowed to leave for their homes.

110. (i) Leave is seldom taken at regular intervals other than festivals except by supervising staff. Departmental managers in well organized factories usually get one month's leave per year during the slack season. Labourers mostly take leave when they require it and that for a few days at a time, and since they are not seriously concerned whether they get back to their previous job or not, it is only a question of taking leave when an

employer owes the least amount of pay for work done. In seasonal factories, both supervising staff and labourers work when the season is on; hence the question of leave does not arise.

#### XVII.—Administration.

137. The difference in law administered in British India and the Indian States has considerable effect on the administration of Factory Law, particularly near the borders where the two territories join. Factory owners in British India who purchase their raw material from the same markets as those of Indian States, are generally found complaining to the effect that it is unfair to apply working hours limit and other restrictions to them alone, while their neighbouring factories situated in Indian States at a distance of not more than four or five miles have got no such restrictions placed upon them; under the circumstances it becomes very difficult for them to compete with their neighbouring factories. It would not be out of place to mention here that several cotton ginning factories have in recent years removed their plants to the States territory for this very reason.

138. The average workman has little knowledge of factory legislation although copies of the abstracts of the Indian Factories Act and the Rules made thereunder both in English and in the language of the majority of workers are posted up in every factory, yet it is doubtful if the worker ever makes an effort to get to know what the posters really mean. The worker in a town factory has a slightly better knowledge of the Factory Law and by virtue of his being a little literate takes more interest in rules which govern his working conditions. We occasionally receive complaints from such workers that the factory in which they are employed is working illegally, a fact which shows that the worker is not altogether ignorant of Factory Law.

139. (i) With regard to the adequacy or otherwise of the inspection staff it is yet too early to say, until I have gained an experience for some time, of the actual working of the new scheme which comes into force on 1st April next. But as the subjects to be dealt with by the factory inspector are continuously increasing, I doubt if the proposed staff would be sufficient to cope with this ever increasing work.

At present, Government are considering to make rules whereby prospective factory builders must get plans of their factories approved before the buildings are erected. This, if brought into force, will place additional work on the inspector who will then have to undertake the examination of passing of plans for all new buildings and alterations in the existing buildings.

(ii) As far as possible, administration of Factory Law is uniform in all the provinces in India. The inspectors keep in touch with each other and frequently exchange views on subjects connected with the administration of the Factory Law.

(iii) Rigour and efficiency of administration of Factory Law depends on frequent inspections, instructions, prosecutions and finally on their results: but in the latter case the difficulty is that adequate punishments are not awarded and unless the prosecutions are followed by adequate punishments it is difficult to achieve the objects of Factory Law. A clause providing for enhanced punishment in the case of a repetition of offence of a similar nature is most necessary and I would suggest that punishment for offences such as employing under-aged children and overworking women and children should be more severe than at present.

(iv) During the year 1928, 130 cases under the Indian Factories Act were instituted against the occupiers and managers of 41 factories. Of the total number of cases, 108 resulted in conviction, in 8 cases the accused were acquitted, 11 cases were withdrawn whilst 3 cases were pending trial at the end of the year 1928.

#### XVII.—Intelligence.

143. *Existing Statistics.*—(iii) *Degree of accuracy.*—The returns are fairly accurate with regard to numbers of operatives and hours of work, but statistics showing average wages earned are somewhat misleading. Wages differ in various parts of the province, also during certain periods of the year and amongst different types of workers.

#### *Note on Carpet Factories in Amritsar.*

The chief carpet making factories in Amritsar are as under:—

- (1) Devi Sahai Chamba Mal, inside Hall Gate;
- (2) Sh. Ghulam Hussain & Sons;
- (3) Ishar Das & Sons, Oriental Rug Manufacturers, Katra Ram Gharian,
- (4) Ishar Das & Sons, Oriental Rug Manufacturers, Sultanwind Gate.

Nos. (1) and (2) are amongst the biggest, employing from 80 to 120 boys. In addition to the above, there is one factory under the Indian Factories Act—namely the Oriental Carpet Manufacturing Co.—in this factory the carpets are washed, cleaned and packed; woollen blankets are also manufactured here. No carpets are actually made in this factory.

Carpet making factories are situated in long sheds open at one side for light: the sheds are in long lines, looms being so arranged that light can be obtained on every loom.

Usually four to eight boys are engaged on a loom according to the size of the carpet to be made, one weaving master calls the counts and the work proceeds under his instructions.

Hours of work are not regular, only during good natural light can work be done. Holidays are taken according to local festivals and pressure of work.

The weaving master is responsible for the child worker, engages him and pays him—the contract for the carpet being between the factory owner, who supplies wool, loom and accommodation, and the contractor, who provides the labour.

Boys probably between the ages of 7 to 15 are employed, no girls work in the factories.

Food is brought into the factory premises by some person especially told off for that purpose, and the workers break off for food at a convenient time.

All work is piece-work, and the weaving master arranges both time of work and payment for it.

An investigation into the conditions of work in carpet factories was made under Government instructions on 18th January, 1924, and since then references have been made by Government of India to the local government on the subject of legislation to control the work in these factories.

## Mr. W. H. ABEL, INSPECTOR OF FACTORIES, NORTH-WEST FRONTIER PROVINCE.

### *Labour in Factories in the North-West Frontier Province.*

According to the latest report the total number of persons employed in all factories in the North-West Frontier Province is 854, of which 834 are men and 20 women. Child labour in factories is conspicuous by its absence.

Of the total number 673 are employed in the Crown factories such as ordnance factories, electric generating stations, printing presses, water pumping stations, etc., 95 in cotton ginning and pressing factories and 86 in all other factories.

Of the total number 163 are employed on seasonal work such as cotton ginning, pressing and ice factories.

### I.—Recruitment.

1. The majority of workers in factories in the North-West Frontier Province are under military control, and are subject to military discipline.

The method adopted for the recruitment of labour by factories owned by private enterprise is frequently that of taking a man for a week or a month, during which period wages are not always paid. A worker in search of employment hears through his friends or relations or goes from factory to factory making enquiries—this applies chiefly to permanent and superior staff.

Unskilled and casual labour is readily obtainable from the surrounding villages.

### II.—Staff Organization.

11. Managing staff in the case of privately-owned factories consists mostly of the proprietors themselves or their sons or near relations, as the factories are not big enough to warrant the employment of well-paid and experienced managers.

13. In the Government factories the relations between the employer and the employed are cordial. In smaller privately-owned concerns difficulties occasionally occur on account of non-payment of wages.

**III.—Housing.**

16. (i) In the privately-owned factories the permanent staff is provided with quarters during the season the factory works.

(ii) Quarters are provided for the majority of operatives in the Crown factories.

**IV.—Health.**

23. Health of workers in all factories appears to be generally good. No case of an epidemic is reported to have occurred in any factory, nor is any case of an occupational disease brought to light.

24. (i) Medical facilities are not provided in the case of the privately-owned factories—workers and their families in these factories depend upon Government dispensaries, which treat them free of charge.

(ii) Government hospitals treat patients from factories free of charge.

25. (i) Medical facilities, where provided, are readily taken advantage of by the workers and their families.

26. (a) (i) Latrines are provided for workers in factories according to rules laid down in the North-West Frontier Province Factory Rules, except in such circumstances where the factories are open to the country on three sides.

(ii) There is an adequate provision for drinking water in factories. The water supplied to the workers is good and pure.

**VII.—Safety.**

43. Regulations with regard to workers' safety are shown in rules made under the Indian Factories Act, and are based on the workshop rules existing in Europe, altered where necessary to meet local conditions. An abstract of the principal rules relating to general safety of the workers is posted up at the main entrance of all factories in English and in the language of the majority of the workers. Apart from this every year a circular letter is issued to all factories bringing to their notice the chief requirements relating to safety measures and to other requirements of the factory law relating to hours of work, etc. In this circular special reference is made with regard to the guarding of the dangerous machines and any other matter of importance which requires careful attention.

44. Very few accidents are reported, and it is probable that few really occur.

Privately-owned factories are mostly seasonal, working not more than two to three months during the year, and no privately-owned factory is fitted with high speed or complicated machinery.

The machinery in the case of Government factories is extremely well guarded, and the workers in these factories are highly skilled; as a result few accidents occur.

46. Existing factory rules made under the Indian Factories Act cover safety first measures, such as compelling certain classes of workers to wear tightly fitting clothes, prohibiting children from entering into certain dangerous parts of factories, etc., but no serious attempt has yet been made in the shape of a safety first campaign, namely, "exhibiting posters and calling upon workers to be careful."

49. (i) All factories are inspected once or twice annually, and factory regulations are enforced.

The necessity to overwork does not exist, and no difficulty is experienced in getting the rules observed.

Factory rules are regularly complied with in Government factories. Whenever an inspector suggests any alterations either in the working conditions of the factory or in the matter of the fixing of the safety devices, his orders are promptly complied with.

**IX.—Hours.****A.—Factories.**

55. Factory law permits 11 hours a day but not exceeding 60 hours a week, which is readily taken full advantage of by the privately-owned factories during the busy season. At other times these factories work for 10 hours a day from 2 to 3 days a week.

Government factories usually work not more than 48 hours a week at the uniform rate of 8 hours a day.

61. Factories work for six days a week, and the seventh day, which is Sunday, is observed as a complete holiday.

**XII.—Wages.**

96. (i) *In industry.*—Wages of workers in factories for the past four years are given below. The average is much higher in the case of skilled workers in the province than in the Punjab owing to the majority of them being highly skilled, and frequently imported by the army authorities for special work :—

Classification of labour.	Average per Month.			
	1925.	1926.	1927.	1928.
	Rs. a. p.	Rs. a. p.	Rs. a. p.	Rs. a. p.
<b>1. Skilled labour—</b>				
Engine driver ..	62 0 0	65 0 0	65 0 0	65 0 0
Fitter .. ..	82 0 0	80 0 0	80 0 0	80 0 0
Fireman .. ..	33 0 0	35 0 0	35 0 0	35 0 0
Oilman .. ..	25 0 0	28 0 0	28 0 0	28 0 0
Blacksmith ..	60 0 0	60 0 0	60 0 0	60 0 0
Carpenter .. ..	60 0 0	60 0 0	60 0 0	60 0 0
Mochi .. ..	45 0 0	46 0 0	46 0 0	46 0 0
Turner .. ..	110 0 0	110 0 0	110 0 0	110 0 0
Moulder .. ..	120 0 0	110 0 0	110 0 0	110 0 0
<b>2. Unskilled labour—</b>				
Coolie (man) ..	0 12 0	0 12 0	0 12 0	0 12 0
Coolie (woman) ..	0 7 0	0 7 0	0 7 0	0 7 0

**XVII.—Administration.**

138. The average workman in the case of privately-owned factories has little knowledge of factory legislation, although copies of the abstracts of the Indian Factories Act and the rules made thereunder both in English and in the language of the majority of the workers are posted up in every factory, yet it is doubtful if the worker ever makes an attempt to get to know what these posters really mean.

A worker in a Government factory has got a good knowledge of the factory law, and takes much interest in rules which govern his working conditions.

139. (i) In this province which is one of the four provinces under my jurisdiction the factory inspection staff consists of— (1) Full-time Inspector. The total number of registered factories in this province at present is 24. The present staff is adequate.

(iii) Rigour and efficiency of administration of factory law depends upon the frequency of inspections and the issue of instructions.

**XVIII.—Intelligence.**

143. The statistics collected by this department are shown at the back of the annual reports. The reports are distributed and sold, and it is not possible to say to what extent they are made use of.

(ii) Statistics are supplied by the factory occupiers in response to circular letters issued annually by this department. The statistics when received are checked by office records where possible.

(iii) The returns supplied by the factories are fairly accurate.

**THE DIRECTOR OF INDUSTRIES, PUNJAB.**

[A certain amount of the material contained in this memorandum has been incorporated in the Punjab Government's memorandum and is not reprinted here.]

### I.—Recruitment.

1. According to the Census Reports of 1921 the total number of persons employed in 763 industrial establishments in the province was 61,236, which is only about 25 per cent. of the total population of the Punjab (25,101,060). It is further clear from the figures given in this very Census Report that of 24,664 male and 542 female skilled employees the birth place of 17,491 males and 229 females was their district of employment; in the case of unskilled labourers of 21,042 males and 2,780 females, 11,130 males and 1,426 females were born in their district of employment. It will be evident from these figures that the greater proportion of the labour employed in the factories of the Punjab was then drawn from the local sources. It is believed that recent years do not show any marked change in this tendency.

It is very difficult to say as to whether the number of immigrants exceeds that of emigrants. The largest number of labourers attracted by the Punjab are those from the Rajputana Agency, the United Provinces, Kashmir and the North-West Frontier Province. An appreciable portion of the workers employed in factories other than the railway workshops, textile mills and a few other engineering works are drawn from the agricultural class of the province. They seek employment in these factories with a view to supplementing their income during the off-season when the land does not require their services. So far as skilled labour is concerned, we have in the past resorted to importing technical people like engineers, foremen and mistris, etc., from the United Provinces and even from Bombay and Calcutta, although this tendency has received a check on account of certain conditions which have been discussed hereafter. There is also, in fact, a considerable exodus of Punjabi skilled labour to Jamshedpur and other industrial centres in India.

Within the province itself there is a movement of the population to drift towards (a) the canal colonies of Montgomery and Lyallpur and (b) such business centres as Lahore, Amritsar, Ludhiana, Sialkot, etc. Movement towards Lahore and Amritsar can easily be explained by the concentration of the largest number of industrial establishments in these two districts. There is no doubt that a great part of the labour employed in Lahore and Amritsar is of a non-permanent character. It was noted by the district census officer of Amritsar in 1921 that of 5,000 labourers at Amritsar in the busy season not more than 500 were permanent labourers. Most of these labourers are drawn from the agricultural class. They frequently return to their villages at sowing and harvesting time or for ceremonial purposes. The labour employed in our factories cannot be described as an industrial proletariat whose only source of livelihood is work in factories. On account of the development of agriculture in recent years the movement of labour towards the canal areas in Lyallpur, Montgomery and Multan has considerably increased. It may however be noted that most of the labour employed in cotton ginning factories in these areas is seasonal. It should also be stated in this connection that so far as the unskilled labour is concerned it is so plentiful that on no occasion has any difficulty been experienced in obtaining it. With regard to skilled labour mention was made in the first paragraph that there was a gradual decrease in the import of this type of labour from other provinces. This is due to an appreciable extent to the growth of industrial and technical institutions in the Punjab which turn out qualified engineers, surveyors, draughtsmen, mechanics and fitters. It has also been noticed in areas where large scale industries have been firmly established for a number of years that the labour available in the surrounding villages has taken up factory work in preference to work in the field; the former being more remunerative than the latter. In these centres labour on account of the prevalence of industries has become so to say semi-skilled and also skilled in certain spheres of industrial activity. This tendency was observed when a labour strike broke out in the Dhariwal mills in 1927, and the mill authorities were able to keep their mill running by recruiting a sufficient number of semi-skilled labourers from the neighbouring villages.

2. The facts and figures given in the first paragraph clearly indicate that the villages surrounding the centre of an industry are the most important sources of the supply of labour. The tendency on the part of the workers to return to their villages at the end of the seasonal work is very strong. As a matter of fact, so far as unskilled labour is concerned it has been noticed that as soon as they can save sufficient money they generally take a holiday to their villages and return to work again when that money is spent. In the absence of any statistics it is impossible to gauge the extent and frequency of the return of this type of labour to factory work or to the field from the factory. It is, however, an established fact that the unskilled labourer goes away from his work as often as he likes. So far as permanent and skilled labour is concerned they remain from two to four weeks away from factory work in a year.

3. *Methods of recruitment.*—In the absence of highly organized industrial structure in the Punjab the existing methods of recruitment appear to be simple and effective from the employer's point of view ; but in the interest of labour, public employment agencies could usefully be started, with a view to offering suitable opportunities for employment to the unemployed workers.

4. The Punjab is predominantly a rural province, and the extent to which family life is disturbed by the employment of workers in industrial establishments in the province as a whole is very small. Figures have already been given in one of the preceding paragraphs to show that the majority of the labour generally finds employment in the district to which it belongs. It has also been noticed in one of the foregoing paragraphs that the labour thus employed in these factories returns to the land or to the home as frequently as occasion arises. In view of these facts it would appear that the family life of these labourers is not disturbed to any appreciable extent.

7. The problem of unemployment may be regarded as a mystery. There is obviously a certain amount of misunderstanding regarding the exact position of unemployment in the Punjab amongst the industrial workers. In western countries where occupations are properly classified and where workers belong to sub-groups of a specialized trade, it is easy to determine the extent of unemployment ; but in the Punjab, where an ordinary mistri may take a job wherever he gets one, regardless of his specialization, it is exceedingly difficult to determine the exact nature and extent of unemployment. It is, however, maintained by some authorities that unemployment to some extent does exist among the labouring classes, but such of it which does exist is purely voluntary. The Department of Industries has been in direct touch with the mechanical workers who are ordinarily known as second class and third class engineers. In so far as this class of worker is concerned, it may be stated that in many cases the workers do not find suitable employment. Unemployment among the skilled and better class workers is hardly noticeable. In this connection it may be pointed out that a committee was appointed by the Punjab Government in 1927 to report on the extent of unemployment in the Punjab. The committee were of the opinion that " there was no unemployment worthy of mention among the uneducated classes." Such unemployment as was reported was voluntary rather than actual. As regards the so-called unemployment among workers in cotton ginning factories, the committee were of the view that " as the cotton ginning season only lasts for four or five months it would appear to be more correct to say that the cotton ginning season is the off-season for their other employment." In fact, such labourers as are not in any way connected with agriculture (and this proportion is very small) easily find other employment on the termination of the ginning season in the building trade, with local grain dealers or as private servants. The magnitude of unemployment is, however, never too great to be a cause of anxiety to the State.

As regards the application of International Draft Conventions relating to unemployment it appears that the articles contained therein are indeed beneficial to the case of the working classes and may, therefore, be applied to the Punjab with certain modifications to suit the local conditions.

8. It is difficult to determine the average duration of employment in the absence of any reliable statistics. Cases have come to notice where workmen have stayed in a single factory for over 20 years. In a general way it may, however, be stated that the average duration of employment varies from four months to four years for the skilled labour, and that of the unskilled labour is from two to three months.

## II.—Staff Organization.

11. The managing staff in large scale industries is generally recruited from abroad. Most of the departmental managers in the Dhariwal Mills have been imported from England, and those of the Punjab Pulp and Paper Mills, Attock Oil Refinery, Punjab Portland Cement Works, Wab, and The Oriental Carpet Manufacturers (India), Limited, Amritsar, are also imported from Europe. In less important industrial establishments, such as ginning factories and other miscellaneous concerns, the majority of the managing staff is recruited from the province itself. In the selection of managing staff in seasonal factories, no attention whatever is paid to the qualifications, education or training of the individual employed.

12. Subordinate supervising staff is invariably drawn from the province itself, and is to a certain extent supplied by the various industrial and technical institutions now operating in the province. In very few cases, people from outside the province have been engaged on the subordinate staff.

No facilities for training workmen are provided by the industrial establishments in the province. It may be stated in this connection that the gulf between the skilled and the unskilled worker is generally very wide. The former seldom, if ever, succeeds in attaining positions of skilled workers or supervisors.

## III.—Housing.

18. The amount of space allotted in workers' quarters provided by the factory owners is necessarily limited, owing to the high cost of land and buildings in industrial centres. Some of the larger industrial concerns do provide suitable accommodation for their clerical staff and workers. Details of this accommodation are given below :—

(a) *The Attock Oil Co., Ltd., Khaur.*—The accommodation is divided into the following classes—

Clerks Quarters : No. 1 Line, 6 quarters ; No. 2 Line, 8 quarters. Skilled Labour Quarters : No. 1 Line, 8 quarters ; No. 2 Line, 10 quarters. Coolies Lines, Nos. 1 and 2 each containing 20 quarters : Quarters consist of 1 room 12 ft. by 12 ft., 1 verandah, 12 ft. by 6 ft. ; there are 78 men in the 40 quarters. Coolies Line, No. 5, consists of 10 quarters ; 8 quarters have 1 room, 12 ft. by 9½ ft., 1 verandah, 9½ ft. by 8½ ft. ; 2 quarters have, in addition to above, 2 rooms, 7 ft. by 6 ft., 1 bath room, 4 ft. by 8 ft., 1 lavatory, 4 ft. by 8 ft.

There are 8 men in the 10 quarters of the grade junior clerks and mistries.

(b) *Punjab Portland Cement, Limited, Wah.*—Skilled workers, namely, turners, fitters, carpenters, blacksmiths and masons, of whom they do not carry a very large number, are housed by them in quarters situated near the works. As far as possible, each single man gets one room to himself, if married he gets double this amount of accommodation. Dimensions of rooms are as follows :—12 ft. 6 in. by 12 ft. 6 in., with a verandah and a compound wall and a kitchen.

(c) *The Punjab Pulp and Paper Mills, Jagadhri.*—The mills being new, the company have not yet built any quarters for the workers. They, however, propose to do so in the very near future. The quarters designed for workers are 10 ft. by 12 ft., with a kitchen, a small verandah and a compound, and each quarter is meant for one worker.

It will appear from the details given above, that the accommodation provided by the three or four largest industrial concerns in the Punjab is suitable both from the worker's point of view and from the health point of view. In the canal colony areas, space is allotted round the factory walls for workers who build kucha houses and huts for themselves and their families, which very much resemble the conditions prevalent in villages. The houses provided in Government factories are more spacious and more sanitary. The accommodation provided by private landlords is necessarily small, as the fundamental idea is to secure the maximum rent possible for the available space. The usual dimensions of rooms are 8 ft. by 10 ft., and it has been noticed that sometimes two or three people live together in one room.

19. The workers as a rule utilize the accommodation provided by the industrial concerns when it happens to be suitable. Only those workers whose families reside in the neighbouring villages go back to their homes after their day's work and do not make use of the accommodation provided by the employers.

20. The three largest industrial concerns referred to in a previous paragraph do not charge any rent, rates or taxes from their workers. No information is available regarding the rent, rates, etc., charged by the private landlords. It is, however, believed that the workers in the Punjab pay anything from one-half per cent. to 10 per cent. of the total wages earned during the month as rent on rooms rented by them. In so far as the Government factories or establishments are concerned, no rent is charged from the menials, but from the subordinate and clerical staff deduction of 10 per cent. of their salary is made as rent.

21. The problem of sub-letting in this province does not arise, as housing is not universally provided, and where it is provided the accommodation does not permit of sub-letting.

The problem of occupation of employers' houses by tenants and other employees has never presented itself in any troublesome form in this province. If the workers declare a prolonged strike and cause breaches of the peace, the management issue orders of eviction, as was the case in Dhariwal Mills' strike of 1928 ; but this is an extreme measure adopted only in cases of violence on the part of employees.

## IV.—Health.

23. The health of workers in all factories appears to be generally good, but in the absence of statistics it is impossible to state what percentage stay away from work owing to sickness. Factory records merely show the names of absentees without showing the cause of absence. No attempt has ever been made in the Punjab to collect figures of birth and death rates, etc., for workers employed in factories. From the reports issued by the Public Health Department it appears that the average death-rate in urban areas in the Punjab for the quinquennium ending 1926 was

32.59 per mille and the birth-rate about 42 per mille. Mortality among infants, the same report says, under one year of age was 193.64 per mille. I am of the opinion that these figures with very slight modifications can also be said to apply to the workers engaged in factories.

Well organized mills are mostly well ventilated and healthy to work in, but there is much room for improvement in smaller factories, especially those built in congested city areas. Little control is exercised at the present moment over the building of factories, with the result that most of the factories are badly designed and poorly ventilated; the owner being much more interested in cutting down costs than in creating an efficient and healthy work-room. So far as working conditions at home and at the factories are concerned, there is not much to choose between the two.

(iv) From the observations made of the conditions of living of workers it is clear that an average unskilled labourer spends about 60 per cent. of his earnings on food alone. Although quite an appreciable portion of the wages of a labourer is spent on his food it is to be admitted that the food is neither sufficient in quantity nor nutritious in quality. Mostly the dietary consists of cereals like millets and wheat, and chillies, onions and pulses. No scientific observations have ever been made to judge the effect of the dietary of an average worker on his industrial efficiency and longevity of life.

(v) The general physique of an average worker should be described as good, and as a matter of fact from a comparative study of the reports of the various provinces it may be said that the physique of the Punjab worker is much better than that of the worker in Bengal and other parts of India. The conditions of work prevailing in the ginning factories are, however, not conducive to the maintenance of good physique among women and children. The dust laden atmosphere in these factories and the long hours of working which the children are required to keep in spite of the regulations of the Indian Factories Act tell very adversely on the physique of these two types of workers.

(vi) The majority of male immigrants from other provinces come without their families. A large proportion of the labour employed in cotton ginning factories is female labour recruited from the adjoining villages. The husbands or fathers of these females scarcely, if ever, find employment in the factories side by side with their wives or daughters. The females, especially widows and destitutes, thus thrown in with strange people, often succumb to temptation and cause violation of family ties.

24. Medical facilities are provided only in the larger and well established factories. Excellent examples have been set by the Dhariwal Mills and the Punjab Portland Cement Works, Wah, in this behalf. A few factories have an arrangement whereby a doctor attends to the requirements of workers once or twice a week. In certain cases factory owners or a group of factory owners have entered into agreements with a doctor to attend to all accidents occurring in factories situated in one particular area. Government hospitals treat patients from factories free of charge. Among private agencies the only one that is known to this department is that of Sir Ganga Ram's Hospital, Lahore, which renders free medical facilities to the workers employed in factories.

25. It may be stated generally that the medical facilities wherever they are provided are fully utilized, but women, especially the expectant mothers, do not readily take advantage of such facilities, as the time honoured tradition prevents a woman from taking advice from a medical man.

31. A Bill to make provision for the payment of maternity benefit was introduced by Mr. N. M. Joshi in the Legislative Assembly on the 23rd September, 1924.

The Punjab Government did not favour the introduction of this Bill on the following grounds:—

"(1) Female labour is not essential to the industries of the Punjab and the number of women permanently employed is very small. The effect of the Bill would be that employers would dispense with female labour.

"(2) Women workers would be unwilling to submit to medical examination.

"(3) It would be difficult to prevent women who are absent from their regular employment and in receipt of benefits from obtaining other temporary employment elsewhere.

"(4) That the periods during which benefits are payable before and after confinement are necessarily long."

In view of these facts the Punjab Government asked that "should the measures be accepted by the Legislature this province may be excluded from its operation."

In view of the strong opposition to Mr. Joshi's bill in 1924, both from the employers, and the employed, there is no possibility of legislation being enacted in this province in the near future.

### V.—Welfare (other than Health and Housing, but including Education).

32 to 36. Welfare work is attempted, if at all, on a very small scale in this province. The comparative absence of welfare activities in the Punjab can easily be understood when it is realised that the number of large establishments in this province is very small. The success of welfare schemes depend largely upon a number of persons who can participate in them, the understanding of the principles underlying these schemes, the stability of labour and its general development, including education, etc. In some of the foregoing paragraphs of this note it has been shown that labour in the Punjab is unorganized, migratory in character, illiterate and attached primarily to the land to which they return very frequently. Welfare arrangements can only succeed when the industrial labour has no other occupation to fall back upon and must make the best of existing conditions. On the part of the employer the main question is that of financing the welfare activities. The majority of undertakings being small (and depending upon the vagaries of weather and markets) cannot afford to indulge in these activities. With the introduction of beneficial enactments, such as the Workmen's Compensation Act, the Trade Unions Act, Trade Disputes Act, etc., and the protection afforded to labour by these measures, it is possible that the industrial workers will take a serious interest in welfare work.

In the Punjab, welfare work is attempted in a few important mills. At the New Egerton Woollen Mills, Dhariwal playgrounds are provided by the mill authorities for the use of their operatives and are kept in good condition. An uplift club is also provided for the subordinate staff and a well run social club for the supervising staff. A hospital and a school both for boys and girls have also been started by this mill. The mill also runs a co-operative society for the benefit of the workers. In addition to this, two other factories, viz., the Punjab Portland Cement Works at Wah and the Bankteshwar Cotton Mills at Amritsar have also evinced some interest in this direction. The last named concerns provide recreation grounds and clubs for the benefit of their employees. As already stated in the first paragraph, it is not easy to carry out a very extensive programme of welfare work in this province for the simple reason that the majority of the labour employed is of a migratory character and is employed in factories which are seasonal. So far as the provision of educational facilities are concerned, Dhariwal Mills alone provide facilities for their workers.

### VIII.—Workmen's Compensation.

51. *Workmen's Compensation Act* (i) The Act came into force in July, 1924, and during the early years of its working the number of claims preferred and the compensation awarded to workers or their dependants represented a low figure which was due to:—

- (a) illiteracy and ignorance of the claimants ;
- (b) inability of the workers to secure legal assistance on account of poverty ;
- (c) inability of the claimants to produce direct evidence in the court in support of their claims as no fellow worker would appear in the court against his own employer for fear of losing his job, and
- (d) the lengthy and tedious procedure for the settlement of claims in the court.

The working classes are, however, now gradually acquiring familiarity with the provisions of the Act and have begun to take advantage of the privileges extended thereunder. This is evident from the fact that the number of cases coming under the Act is increasing every year.

(ii) The number of claims would still increase if adequate arrangements were made to assist the illiterate workmen in preferring their claims. It is hoped that as soon as trade unions come into active existence to safeguard the rights of labour, the ignorant workmen will find little or no difficulty in preferring their claims. The Factory Inspection Department has so far been rendering assistance in this direction, but as they have been doing this work for compassionate reasons; it has been suggested that the Inspector of Factories and the Public Prosecutor may be authorized to help the workers in preferring their claims for compensation.

(iii) The operation of the Workmen's Compensation Act in the Punjab does not appear to have effected appreciably the industries of the province. From a detailed examination of the accidents which are reported every year, it will be seen that a large number of accidents take place in the railway workshops of Moghalpara, and the quota contributed by private factories towards the amount of compensation paid every year to the injured workmen or the dependants of the deceased, really amounts to an insignificant figure. There is no doubt that in the early years of the operation of this Act the employers did not take very kindly to this Act, as they

feared that the enforcement of the provisions of this Act would result in an increase in the cost of production. These fears seem now to have more or less disappeared, as the insurance companies have come forward to insure workmen against all possible accidents, thus absolving factory owners from unexpected and serious liabilities.

(iv) As already pointed out in the preceding paragraphs, insurance companies have come forward to insure the workers against accidents, but in the absence of any reliable statistics it is not possible to say definitely as to what percentage of employers do make full use of the facilities afforded by these companies. In the opinion of this department the system of insuring workers against accidents with the insurance companies is beneficial from the workers' point of view. Once that the workers have been insured against all possible accidents the employer feels no hesitation in supporting the claims of the injured or the dependants of the deceased and helping them to get the full benefit of the provisions of the Act.

52. *Desirability of Extending Act to other Occupations.*—This subject has been under the consideration of the Government of India and of all the local Governments. It has been admitted in these discussions that it is always desirable to insure the worker against accidents. It is, however, feared that the difficulties attending the enforcement of this Act in unorganized industries would be so great and the administrative machinery organized to carry out this administration would be so expensive that it would not be possible in the near future to extend the Act to such occupations as have now been excluded from its scope of operation. In view of these remarks it does not appear necessary to discuss the possibility of providing against insolvency of employers whom it is proposed to bring within the operation of the Act by its extension to unorganized industries. As regards the possibility of providing against the insolvency of employers, it may be mentioned here that so far no case has been reported to this department in which the employer has failed to make payment on account of compensation for the accidents occurring in his factory. It would, however, appear desirable, both in the interests of employers and the workers, that a scheme or system of compulsory insurance of the employees against accidents should be introduced and that the employment of labour without insurance against accidents should be penalized.

53. (i) The present scale of compensation is considered to be inadequate. In the opinion of this department an increase of 20 to 25 per cent. would meet the requirements of the case. This increase should be made applicable to workmen of all grades. If the scale of compensation is increased, it will not only tend to provide the injured workmen or their dependants with more money for their subsistence but will also have a salutary effect on the employer in so far as the provision of safety measures in his factory or place of business is concerned.

(ii) Under the provisions of the Act an employer is only liable to pay compensation for personal injury to a workman by accident arising out of, and in the course of his employment, provided the injury results in the total or partial disablement of the workman for a period exceeding ten days. No compensation is payable if the injury results from an accident which is directly attributable to the negligence of the workman. It has lately been represented that the waiting period of ten days is too long and results in hardships, but as the proposed reduction is likely to involve a considerable increase in the number of possible claims and to encourage malingering in petty cases, a suggestion has been made that where the disablement has lasted for more than ten days the workman should be entitled to receive compensation from an earlier date, e.g., from the fourth day of disablement. This method which is known as "dating back" may be tried as an experimental measure.

## IX.—Hours.

### A.—Factories.

59. A further reduction in the maximum hours per week is, I think, advisable even under the present circumstances, as this reduction will have a salutary effect on the idle habits of the illiterate worker who regards the wastage of time as a mere matter of routine.

### D.—Other Establishments.

78. In industrial establishments not coming under the Indian Factories Act the normal hours of work, i.e., as determined by custom or agreement are from sunrise to sunset—12 hours in summer and 10 hours in winter, with an interval of one hour or thereabouts at mid-day for meals. Sunday (or Friday in the case of establishments in which Muslim labour predominates) is usually observed as a holiday, and work is also suspended on festivals, etc., for religious observances. Permanent labour which is paid on monthly rates of wages, when required to work on holidays is paid extra wages, which are usually  $1\frac{1}{2}$  times the average daily wage. In this connection

a reference may be made to the conditions prevailing in the carpet factories at Amritsar. Workers in these factories do put in very long hours, and most of them being boys between the ages of nine to fifteen, this subject has, of late, excited a good deal of public and official attention.

The practice of working overtime in such workshops, specially when there is a rush of work, is very common, and a labourer usually puts in twelve to fourteen hours of work. Overtime dues are paid for hours worked over and above the stipulated hours of work.

With the exception of the mid-day rest the labourer is supposed to be on call throughout the time he is within the premises of the workshop. The labourer, however, manages to steal an hour or so for smoking the inevitable hukka at intervals during the working hours.

79. In small workshops where daily wages are the rule seven days are worked per week; the worker enjoying such holidays as he chooses, but in larger establishments and those in which wages are paid monthly six days are worked per week. In case of rush of work labourers are employed on week-days and holidays on payment of extra wages, as stated above.

80. There can be no two opinions regarding the desirability of regulation of hours of work per day and days of work per week in such establishments, but the enforcing of such regulations, together with the opposition from the employers and the employees are factors which appear to be almost insurmountable. The rates of wages are still very low, and the labourer gladly welcomes overtime work by which he can add to his meagre income.

#### X.—Special Questions Relating to Women, Young Adults and Children.

89. The local Government have made use of Section 2 (3) (b) of the Indian Factories Act by applying it to cotton ginning and ice factories employing not less than 10 persons on any one day during the year. The extension of the Act in this behalf became necessary as many of these factories deliberately kept the number of their employees below 10, and so avoided coming within the purview of the Act, so as to be able to work longer hours and employ women and children at all hours. The Act could be usefully extended to all other factories in order to regulate the hours of employment of women and children—it would also cut down much unfair competition which exists at present.

92. As has already been pointed out in one of the previous paragraphs, it would be desirable to introduce some sort of regulations in such establishments as do not come within the purview of the Indian Factories Act, but under the present unorganised conditions of industry, specially in rural areas, the creation of an administrative machinery will be so expensive and the difficulties involved in the enforcement of legislation will be so great that the task of introducing any legislation seems well-nigh impossible.

#### XII.—Wages.

96 and 97. A statement showing the prevailing rates of wages in industrial establishments generally and in factories coming under the Indian Factories Act for the quinquenniums ending 1912-27 is given in the local Government's memorandum.

It will be noticed that wages of ordinary skilled labourers rose gradually between the quinquenniums ending 1917 and 1922, as compared with the quinquennium ending 1912, but a fall was registered at the wages census for the quinquennium ending 1927. The percentage increase or decrease in wages of the various classes of skilled workers in Lahore, Amritsar and Multan in the quinquennium ending 1927, as compared with 1922, is shown in a statement appended at the end of this note as Appendix VI.

It will be seen from this statement that with the exception of a rise in the wages of workers in iron and hardware industry in Lahore no appreciable increase in wages of any class of labour is noticeable. This is explained by the abnormal growth of foundries and workshops during this period. The extraordinary fall in the wages of workers in this industry in Amritsar is explained by the rapid introduction of aluminium ware which has thrown out a large number of workers from the brass and copperware industry and brought about the fall in wages. The fall in the wages of other industrial labourers is undoubtedly due to the fall in the cost of living since the last wages census.

The scale of wages paid in factories has shown an appreciable increase for all classes of labour as compared with 1914 and, roughly speaking, wages have nearly doubled during this period.

98. In the absence of any systematic survey of family budgets of the industrial labourers in the Panjab it is impossible to say with any degree of precision the percentage of wages which they save and send to their villages. However, a number of stray cases were examined, and the general conclusion arrived at was that the

unskilled daily wage-earner is never in a position to save any proportion of his earnings during the period of his employment in towns. Whatever little he saves during a week of work is spent on food on days in which he is unable to secure a job or in a few luxuries, like drinking and eating on ceremonial days and festivals. If, on the other hand, the period of employment is considerably longer the labourer contracts debts at heavy rates of interest and once he is in debt he remains so for the rest of his stay in towns.

In the case of monthly wage-earners, however, savings are effected if he continues in employment, is free from sickness, and is not called upon to incur any unexpected expenditure. A fair proportion of the savings of such labourers find their way into their villages.

99. *Payment in Kind and Allied Problems.*—It may safely be asserted that payments in kind to industrial labour have completely disappeared from the Punjab. Wages are now paid strictly in cash in all the factories.

101 and 103. It cannot be said for the Punjab that wages in any industry have been standardized. This is true even of casual unskilled labour. The scale of wages, moreover, varies from place to place and in accordance with the supply of and demand for labour for the purpose. As a rule, wages are fixed by direct negotiations between the employer and the employee. It is, however, a fact that wages for the same class of labour employed on the same day by an employer cannot vary, but it is not at all necessary that the same rate may prevail on the succeeding day, or even in the succeeding month. For instance, the wages in the building trade are appreciably lower during the rainy season on account of little demand for this class of labour than during dry months. Similarly, wages for the same class of labour in adjacent towns vary considerably with the supply of and demand for labour at the time of recruitment.

104. As a rule, the labour supply is not affected by ordinary changes in wages. The labourer accepts the prevalent wages with a feeling of resignation which is due to his poverty and lack of bargaining power. This is also in a measure due to the fact that as he has no fund to live upon in case he has to refuse a lower wage than usual the question of earning daily bread for himself and his dependants forces him to accept what is offered. Lack of combination among workers also helps the employers to dictate their own terms. With the growth of trade unions and feeling of fraternity among workers, labour will be in a position to assert its claims. The extent to which the labourers have tried to force wages up or fought against cutting down of wages in recent years are discussed in answer to Question XIV—Trade Combinations.

105. *Minimum Wages.*—Theoretically speaking, it would appear to be the duty of every community, both in its own interest and in the interest of workers, to evolve a machinery which should be available for the regulation of wages of any groups of workers who may be found from time to time to be unable owing to their lack of organization and their consequent individual isolation on the labour market to maintain an equitable standard of wages. In the Punjab specially, practically in all trades no arrangements exist for the effective regulation of wages by collective agreement or otherwise, and in some trades the wages are actually very low. In order to combat these conditions the creation of a wage-fixing machinery appears theoretically to be a very sound proposition, but it is a matter of great doubt whether in a country where trade unionism is just in its very infancy and where groups of workers are yet absolutely unaware of the virtues of co-operation and combinations, such a machinery can be successfully worked. The difficulties in classifying the industries and in creating an administrative agency, which will be in a position to enforce the law in this connection will be of such a serious nature that one cannot but say that time has not yet arrived in India for the establishment of such an intricate machinery.

106. Although the practice of inflicting fines on workmen employed in industrial establishments is common throughout the province, it is not resorted to by any concern of repute or standing, and it does not constitute an evil of such a nature as to necessitate legislation to abolish the procedure altogether or to restrict it within narrow limits. The Factory Inspector has reported that in the case of one or two well-run mills fines are utilized towards the employees' provident fund. The general practice, however, is that the fines go to the pockets of the factory management.

Fines are a well recognized method of inflicting punishments and the system has not led to any great abuse so far. In the opinion of this department the necessity for a statutory legislation in this direction has not yet arisen so far as this province is concerned, and it is also felt that the enforcement of this legislation would also be a very difficult affair. The average worker, on account of his illiteracy, would never be able to prove his case. The deduction would naturally be made on pay day, and probably the worker fined will be required to sign for full pay.

107. Wages to permanent workers in perennial factories are paid monthly, from the 5th to the 20th of the following month, so that the employer always has a certain amount of hold over the worker. Casual work in cotton ginning factories and coolie workers in many other factories are paid at the end of the day.

There is not the least doubt that legislation to assure prompt payment of wages to the workers would be a very welcome move. The security obtained by the employers by means of delayed payments at the sacrifice of labour's interest is on no account a legitimate one. On the other hand, such a practice demoralises the worker and results in considerable economic hardship to him. A legislation of this nature is all the more necessary for a province like the Punjab, where labour employed in most of the industries is illiterate, unorganized and hopelessly incompetent for securing a recognition of their rights and privileges.

So far as unclaimed wages are concerned, the usual practice is that they are credited into the account of the factory owner. It would undoubtedly appear to be desirable that such wages should always be utilized towards the welfare work of the workers in the factory.

### XIII.—Industrial Efficiency of Workers.

112. The Indian worker has been condemned as an inefficient instrument of production by many writers on economics of India. To justify this statement, they maintain that the main cause responsible for this inefficiency lies in his migratory tendencies, not only from place to place, but also from industry to industry, resulting as it must in lower standards of skill in industrial occupations. As wages in one industry show a tendency to rise he rushes to that industry leaving aside his previous occupation. The natural consequence is that the employer does not take much interest in the labour in the way of its training at his own expense. Among other causes of the inefficiency of the Indian labour may be mentioned his lack of education, insufficient quantity of food taken, lack of thrift, inaptitude to learn when opportunities come in his way, etc. It may, however, be stated that the efficiency of the Indian worker has been increasing steadily in recent years. This is attributable to several causes. The industrial educational institutions, which are now operating in the province, are responsible, to a very great extent, for the production of a better and more efficient class of worker. The growth of labour legislation has also succeeded in awakening consciousness in the industrial worker. The third factor which is responsible for the increase in the efficiency of the industrial worker is the central localization of a few industries. To illustrate this point, mention may be made of the sports goods making, steel trunk making, and cutlery industries of Sialkot, woollen industry in Dhariwal, and foundry industry in Batala. In all these places the industries mentioned against their names have more or less centralized themselves and have helped in the growth of the efficiency of the labour which is available in those localities. Another minor point which has also played some part in this direction is the gradual adoption by the factory owners of the system of division of labour. In the case of skilled and highly paid workers the diminution in the number of working hours per day has succeeded in making these classes of workers more efficient.

113 and 114. *Extent to which Comparisons are Affected by Migration of Workers, etc.*—It is almost impossible in the absence of any recorded observations to give an estimate of the comparative efficiency of Indian and foreign workers. No attempt has yet been made in the Punjab to measure the comparative efficiency in exact mathematical terms. Scientific comparisons of efficiency should necessarily be based on (a) physiological conditions, (b) the general education of the workers concerned, and (c) the conditions of working in factories, and (d) the types of machinery and appliances used. In the absence of data worked out by special investigations on the basis of these preliminary conditions no opinion whatever can be given regarding the comparative efficiency of Indian and foreign workers.

115. (i) The reduction in the number of working hours from 12 in 1911 to 10 in 1922, in the amended Factories Act, 1922, has been much resented by the factory owners. The general consensus of opinion among them is that the amount of output per operative has fallen by about 20 per cent., i.e., the amount which he produced by working for extra two hours. This view of the factory owners cannot be accepted as a conclusive proof of the reduction in efficiency or in output. As a matter of fact, those industrial concerns in India which have devoted scientific attention to this subject are of the view that no reduction in output has taken place.

(ii) & (iii) It cannot be gainsaid that production is affected by other working conditions, such as well ventilated workrooms, sufficient lighting arrangements, division of labour, sanitary conditions, etc., etc., all of which tend to lessen fatigue and improve the productive capacity of the worker. It cannot, however, be said of the majority of factories in the Punjab that these conditions do prevail in them. Under the Cotton Ginning and Pressing Factories Act, 1925, a provision has been made for the

submission of plans of such factories to the Director of Agriculture, Punjab, before they can be set up. The main idea underlying this provision is to judge the plan of the building from the point of view of the health of operatives. There cannot be two opinions regarding the fact that the factories set up since the enforcement of this legislation are far better than those set up prior to the promulgation of this law.

(iv), (viii) (ix) and (x) These subjects have been dealt with above. The effect on production of housing and dietary and the habit of taking intoxicants has never been systematically observed in the Punjab, and it is difficult to say to what extent production is affected on account of insufficient provisions for housing and dietary, etc.. In a general way it may be stated that insufficient nourishment and dismal hovels in which the labourer lives tell upon his health and consequently effect his productive capacity. The industrial fatigue consequent upon these facts coupled with the absence of welfare activities and provisions for recreation, the monotony of life, low wages and large number of dependants tell upon the constitution of the worker and thereby produce a feeling of depression which pervades his actions and affect production adversely.

(v), (vi) and (vii) The movements in wage levels and methods of remuneration have been discussed above. The increase in wages, according to most factory owners, has not resulted in increased efficiency or increased production.

116. The causes of the inefficiency of Indian labour have been discussed above in answer to questions Nos. 112-113. With a view to securing increase in efficiency of labour the first consideration must be directed towards checking the too frequent migration of labour from town to town and industry to industry. Increased efficiency is a result of continued employment in one particular industry over a fairly long period, and as such the worker must be able to realize that it does not pay in the long run to change his occupations too often.

Next in importance is the introduction of bonus and profit-sharing schemes which will induce the worker to exert to his utmost, as he will be a co-sharer with his employer in the profits of the industry.

The employers' outlook must also undergo a thorough change. They should endeavour to improve the housing conditions of labour and make better provisions for sanitation in workplaces. The standard of living must also be raised and the worker should be enlightened on such subjects as dietary, sanitation and thrift, etc. It must also be realized that in the long run a better standard of living depends entirely on better education and better wages.

#### XVI.—Law of Master and Servant.

Under this section the only subject that concerns us is the types of contract commonly in use. In so far as this province is concerned, the only form of contract entered into between the employer and the employee is that of mutual understanding. There are, however, exceptions which provide for the advance payment of wages, and in these cases the employee undertakes to serve the master for a definite period, permitting the latter to deduct small monthly instalments from his wages.

#### XVII.—Administration.

136. Director of Industries is the administrative officer for all the Acts passed in connection with labour legislation.

146. *Future developments necessary.*—This province has no labour office. The entire work is done by a very small section of the Director of Industries office. Labour questions are now assuming greater public importance than ever and it is high time that we started collecting statistical data on such matters as are engaging the serious attention of the public.

#### APPENDIX VI.

The following statement shows the percentage of increase or decrease in the wages of certain classes of labourers in Lahore, Amritsar and Multan in 1927 as compared with 1922 :—

Class of labourers.	Percentage of increase or decrease.		
	Lahore.	Amritsar.	Multan.
Workers in iron and hardware .. ..	-25	-17	-25
Brass, copper and bell metal workers ..	-22	-70	-20
Carpenters .. .. .	—	-17	-9
Cotton weavers .. .. .	—	-42	—
Masons and builders .. .. .	+ 3	-11	-9
Unskilled labourers .. .. .	—	+ 7	—

Lt.-Col. C. A. GILL, D.P.H., I.M.S., DIRECTOR OF PUBLIC HEALTH, PUNJAB.

*B.—Vital Statistics.*

1. *General population.*—The birth-rate and death-rate of the Punjab during the past sixty years is shown in the attached chart (chart 1\*). It will be seen that the death-rate is extremely high. The mean death-rate during the past five years was 33 per mille or about 3 times the death-rate of England and Wales.

2. The infantile mortality rate is likewise extremely high, being approximately 200 per 1,000 births (as compared with 70 in England and Wales), and as this rate is not greatly affected by epidemics (except malaria), it indicates the existence, apart from epidemics, of a low grade of health. A favourable and hopeful feature is the high birth-rate, which is 40 per mille as compared with about 20 per mille in England and Wales. That the province should exhibit a remarkably high birth-rate, in spite of being constantly decimated by epidemics, indicates not only the high fertility, but also the great recuperative power, of its inhabitants.

Another striking feature of the vital statistics is the disparity between the sexes ; the number of males exceed the number of females by over 2 millions in a total population of 20.5 millions. This feature is mainly attributable to the fact that the female death-rate under almost every head of mortality is invariably higher than the male death-rate.

3. Of special interest from the point of view of labour is the fact that the urban death-rate is relatively and absolutely high as compared with the rural death-rate, which is indicative of the fact that the artificial conditions associated with an urban environment are peculiarly prejudicial to health.

The death-rate under all heads of mortality, except malaria, which is essentially a disease of rural areas and the outskirts of towns, is appreciably higher in towns than in rural areas. The large towns are a fertile breeding ground of disease and the starting point of many epidemics in the countryside. The most striking feature of the urban death-rate is the high respiratory disease death-rate, which in 1928 was 5.79 per mille as compared with 2.18 per mille in rural areas. This feature is in large part due to the great prevalence of pulmonary tuberculosis in towns, which is the outcome of neglect of sanitation, intense congestion and bad housing, to which must be added such dysgenic habits and customs as child-marriage and the purdah.

The death-rate from dysentery and diarrhoea in towns is also about three times higher than it is in rural areas, and this fact is again attributable to the gravely insanitary conditions prevailing in urban areas.

4. *Labour.*—It is unfortunately impossible to quote any statistics bearing specially upon the health conditions of the labouring classes, and it is only possible to state, in this regard, that, as for the most part the death-rate increases *pari passu* with a decline of social status, and as labour is almost solely drawn from the poorer classes, the remarks made and the conclusions drawn in respect of the general population apply with special force to the hewers of wood and the drawers of water.

5. *Summary.*—This brief review of the vital statistics permits of the following conclusions :—

The Punjab is inhabited by a vigorous and prolific people, whose "natural increase" is held in check by the high mortality occasioned by disease and pestilence. The low grade of health is indicated by the high death-rate, apart from epidemics, the high infantile mortality rate and the high female death-rate, all of which are characteristic of a society in an early phase of social, economic and cultural development. The relatively high insalubrity of towns, where, owing to the congestion of the population, the need of sanitary safeguards is infinitely greater than in villages, is a reflection of the low standard of municipal and domestic hygiene.

*C.—Public Health Administration.*

These local bodies were left largely to themselves, and it was hoped that something in the nature of local self-government would emerge. A sanitary board was also created and given funds with which to assist local bodies to provide themselves with sanitary amenities, and large grants were given for water supply and drainage schemes to the more important towns. When the schemes broke down or required extension, further assistance was given from provincial sources. Sometimes the grants were not used at all or they were used for an unauthorized purpose. This tentative experiment in local self-government failed to awaken any sense of civic responsibility and the inspection reports of the sanitary commissioner of 20 to 30 years ago, which might, with only a few modifications, have been written yesterday, show that no appreciable improvement and sometimes actual deterioration, has taken place in the arrangements made by local bodies for safeguarding the public

health. The standard of health remained very much what it was before. The world-wide awakening of interest in matters affecting health, which in this province dates from the inception of the reforms in 1920, gave a new impetus to local self-government and a new hope to the public health expert. A provincial health service was created in 1923, and a special staff, albeit small, was provided for combating epidemics. An insistent demand for sanitary reforms asserted itself and an optimistic feeling was engendered that great and rapid progress would be made. Many new boards and committees were created to deal with health problems, the sanitary board, by a process of fission, became the Urban Sanitary Board and the Rural Sanitary and Improvement Board, a Rural Community Board came into being, whilst the Legislature appointed a Standing Committee on Public Health.

In the mofussil, district community councils were formed, whose functions partially overlapped and partially supplemented those discharged by district boards, whilst in some districts, officials sought to create a new heaven and a new earth in the countryside by novel and not entirely orthodox (from the financial point of view) expedients.

8. The old-time administrator had behind him great traditions and wide administrative experience; their guiding hand has, however, been in large measure removed, and it is therefore all the more necessary that the Director of Public Health should be placed in a position to bring his expert knowledge to bear upon the problems, more especially in connection with labour, which demand his attention. He is attached to the Ministry of Local Self-Government, but he is not a member of that ministry.

But if he is usually consulted by the Ministry of Local Self-Government on technical questions, it is only rarely that other ministries or departments, almost all of whom have the health and welfare of labour under their care, feel the necessity of doing so. In connection with factory labour, which comes under the Director of Industries, he should be in touch with the Ministry of Education; labour problems, in connection with engineering works require that he should be in touch with the Ministry of Agriculture. Criminal Tribes Settlements are administered by the Home Department who should consult him in regard to the important question of the health of these unfortunates, and last but not least, town-planning, in so far as it affects the many new towns—the towns of the future—now springing up in the Canal Colonies requires that he should be in close contact with the Revenue Department.

There is no Ministry of Labour, and, as will be shown shortly, the necessity of safeguarding the care and well-being of labour, of which Government is the chief employer, is as yet scarcely envisaged, and, in consequence, such action as has been taken, almost solely within the past few years, is due to the initiative of the Director of Public Health and his insistence on the adoption of sanitary safeguards.

Such action, however, places the Director of Public Health in an entirely false position. It should not be necessary for him to have to incur the odium of intruding his unsought and therefore unwelcome views upon other departments or ministries. Progress should not depend upon the view to which the Director of Public Health for the time being, may happen to take of his duties and responsibilities, he should not be looked upon as an officious or obstructive person, because he desires to satisfy himself that the plans of new towns are in accord with modern sanitary requirements. Obviously, if all departments of Government who are employers of labour or are engaged in schemes of development, realized their responsibilities in respect of the health and welfare of labour, they would obtain expert advice upon all such matters.

It is now proposed to state the action taken by the Director of Public Health to discharge his task of endeavouring to provide for the needs of labour and thereafter an attempt will be made to indicate the manner in which the administrative machine might be adjusted to modern conditions.

#### D. Health Conditions affecting Labour.

9. It is first necessary to consider the precise definition attaching to the term "labour." It obviously includes mill and factory labour and those engaged in industrial pursuits. It likewise includes certain classes of railway employees, and especially those employed temporarily on new construction. It also includes those engaged in the construction of other large engineering projects. It must surely include the unorganized labour by means of which building operations are carried out in towns and cities. It may even be said that the casual migrant labour which plays a large part in agricultural operations, especially at harvest time, comes within the scope of the definition. It is proper too to include the labour, in this case forced labour, employed in the factories attached to jails and Criminal Tribes Settlements.

On a broad view, therefore, labour comprises a large section of the poorer classes and it is just because these classes have little or no political influence—although they may be exploited by those who have—that their welfare should be a matter of close concern of Government. Another reason for adopting this view, is the fact that Government is perhaps the largest employer of labour and upon Government therefore rests in a peculiar degree, on moral, economic and political grounds, the responsibility of safeguarding the health of labour.

It is not suggested for one moment that this duty has been ignored, but, in the opinion of the writer, it is correct to state the needs of labour have not yet been fully envisaged and that, in consequence, adequate provision has not as yet been made to meet them.

#### *I.—Large Engineering Projects.*

10. It has not in the past been the practice of the Public Works Department to consult the Director of Public Health in regard to the sanitary arrangements to be made for its employees on engineering works, nor can it be said that provision has ever been made in the estimates for the public health, as opposed to the medical requirements, of the labour force. It thus happened that the Mandi Hydro-Electric Scheme, which is now being executed in Mandi State by the Punjab Government at a cost of over Ra. 4 crores, was started without any steps being taken to obtain expert advice in regard to the measures necessary to safeguard the health of the labour force.

As soon as the Director of Public Health came to know of the scheme, he at once (1926) addressed the Ministry of Agriculture and pointed out that, as the area was highly insalubrious, the concentration of a large labour force at Jogindernagar would almost certainly, unless elaborate precautions were taken, be followed by serious outbreaks of disease and the decimation of the labour force.

As this warning did not appear to have been effective, the Director of Public Health proceeded to Jogindernagar to make a personal investigation and to draw up a detailed medical and sanitary scheme for presentation to the authorities concerned. This investigation revealed the fact that certain departmental arrangements had been made to deal with the welfare of the workmen. A layman belonging to the Y.M.C.A. had, in fact, been appointed under the title of a "Welfare Officer" as "an Estate Agent, Health Officer, Club Secretary, School Master, Librarian, Lecturer and Canteen Agent."

The scheme drawn up as a result of this visit at first met with opposition, but it was eventually accepted and brought into operation. The arrangements included a chlorinated water-supply and effective arrangements for the collection, removal and disposal of refuse and rubbish. The health and welfare of the labour force was placed under close observation by the Medical Officer of Health, their food supply was inspected and all recruits were vaccinated and periodically inoculated against cholera. In order to meet the needs of the wives and families of the labour force an Infant welfare centre was opened and placed in charge of a qualified health visitor and midwife. Both cholera and scurvy appeared amongst the labour force in the summer of 1928, and it is recognized on all hands that, but for the measures adopted in the previous year, the consequences would have been serious. This is the first occasion upon which adequate provision has been made in the Punjab for safeguarding the health and welfare of the labour force employed on a large engineering work, and it may be assumed that, the benefit having been demonstrated, similar undertakings will in future be treated in a similar fashion. The salary of the Medical Officer of Health was on this occasion met by the Public Health Department, whilst the Lady Chelmsford League provided the funds in connection with the infant welfare centre. The Public Health Department is, however, pressing for the recognition of the principle that in future the medical and sanitary arrangements made in connection with large engineering works shall be drawn up before the inception of the scheme, and that the cost thereof shall be included in the estimate of the project.

11. One other point remains to be mentioned, and as it is of general application, it requires detailed consideration. The investigation carried out in February, 1926, brought to notice the serious hardships and privations experienced by the labour force arising out of their mode of recruitment.

The labour employed on engineering projects is engaged by contractors, and in consequence there is no direct contact between the officials and the labour force. The employer in this case, Government, pays the contractor, who in turn pays the labour force. This system is open to serious objection for several reasons. In the first place, the employer is apt to take the view that, as the labourers are in no sense employees of Government, he has no responsibility for their health and welfare ;

but those who are responsible for the concentration of large bodies of men cannot in this manner discharge their moral responsibility for the well-being of those who "deliver the goods". Secondly, although the contractors are supposed to be men of substance, they turn out sometimes to be rogues, and instances are not uncommon of contractors decamping with the pay of their men.

Thirdly, the men are usually in debt to the contractor for advances (no doubt loans bearing interest) made to the workmen, and, fourthly, it is the common practice for the contractor to keep his men in arrears of pay in order to guard against desertion. Finally, the contractor often runs the bunnia's shop of the labour camp and, unless prices are controlled and the food-stuffs inspected, the scales are, indeed, heavily weighted against the poor and ignorant workman. Actual instances of the pernicious results of this system, which is only too likely to be exploited by political agitators, came to notice both amongst the labour force employed on the Kangra Valley Railway and at Jogindernagar. In the former case, loud and bitter complaints were made to the Deputy Commissioner by a deputation of workmen that they were starving owing to their pay being many months in arrears. In another case the contractor had absconded without paying his men, whilst at Jogindernagar, labourers (Tibetans) were encountered, some of whom, owing to their inability to obtain their pay for five months, were suffering from scurvy and in a state bordering on starvation.

I am of opinion on humanitarian and political grounds, that this system should, if possible, be abolished. The main objection to doing so, I gather, is that it would mean the employment of a considerable number of additional clerks, but where vast projects costing crores of rupees are concerned, the cost of employing a few additional clerks is trivial. It is furthermore clear that a regularly paid, properly housed and adequately fed labour force, is a contented labour force which will not desert, whilst its increased efficiency and freedom from disease will go a long way to compensate for the additional capital expenditure entailed by the direct recruitment of labour. These views, when represented in 1927, were unfavourably received, but I am glad to say, although it was not found possible to change the system, that the attention drawn to the evil and the watch kept over the labour force by the medical officers of health concerned was responsible for the removal, in very large measure, of the evils to which reference has been made. So much so is this the case that, provided the health and welfare of the labour force is properly supervised by a medical officer of health, directly responsible to the director of public health, the contractor system need not necessarily be the cause, which in other circumstances it is only too likely to be, of grave hardships to labour.

The contractor system is open to less objection in the case of engineering projects conducted in or near large towns, where, as elsewhere, engineering works are carried out, in accordance with Government rules, through the agency of contractors. The same remarks applies to the sanitary works (contribution works) carried out by Government agency on behalf of local bodies.

In both cases, the labour force finds accommodation either in the town or, if the works are situated some distance from the town, the skilled labour is provided with tents, and the labourers with temporary brick huts—the bricks being those provided for the project—roofed with thatch or sheets of galvanized iron. The water-supply usually consists of the water (unpurified) provided in connection with the project, whilst temporary latrines are dug in the vicinity. These somewhat primitive arrangements cannot be regarded as entirely satisfactory and steps will be taken in future to ensure, through the local medical officer of health, that more adequate precautions are adopted.

## II.—Railway Construction.

12. The provision made by the railway authorities for the labour force engaged on new construction was precisely similar to that already described in the case of the Mandi Hydro-Electric project. Under long-existing but forgotten orders the railway administration is required to inform the Director of Public Health when new lines are to be constructed and of the arrangements made for safeguarding the health of the labour force. When the construction of the Kangra Valley Railway was taken in hand in 1926, these orders were forgotten and little or no provision was made for safeguarding the health of the labour force until the Director of Public Health took up the matter with the railway authorities. Here again, he followed up his advice by carrying out a local investigation and thereafter submitted to the railway authorities—although it was not his duty to do so—a complete sanitary scheme on the lines of that employed at Jogindernagar, which the railway authorities eventually agreed to adopt and to put into operation.

An outbreak of cholera occurred amongst the labour force in April, 1928, and there can be little doubt that if it had not been for the protected water supply and for the efficient sanitary arrangements, including the inoculation of the whole force, many lives would have been lost.

The same contractor system was in vogue and the same efforts were made—with success—to mitigate its worst features. As the work progressed, the labour camps, huts and shelters were constantly moved, but there are advantages in a good climate of living in the open air and, as a result of the care bestowed upon the welfare and health of the men by the Medical Officer of Health, almost all avoidable hardships were eliminated.

The railway authorities now possess their own medical and sanitary staff and there is reason to believe that the procedure adopted with success—as is freely admitted by every railway official employed on the Kangra Valley Railway—will become the standard practice in future.

### III.—Factories.

13. The inspection of factories is carried out under powers conferred by the Indian Factories Act, 1911. Medical examinations are carried out by certifying surgeons, and with this aspect of the work the Director of Public Health is not concerned. Until recently no provision existed for any effective inspection of the sanitary condition of the factories or of the health of the employees. In 1928, on the representation of the Director of Public Health, he and the Assistant Directors of Public Health were appointed additional inspectors of factories, but his proposal that District Medical Officers of Health should also be appointed additional inspectors in respect of their several districts was not approved.

Only a few inspections have so far been carried out, the most important being the inspection of the Bakteshwar Cotton Mills, which the Director of Public Health inspected in company with the Inspector of Factories, with a view to the study of the question of humidification and to the drawing up of regulations which have since been promulgated. There are only two cotton mills in the Punjab—and this question is therefore not of any local importance. Something has been done, but much more remains to be done to improve the conditions under which work is carried out in factories and to provide sanitary conveniences and a few amenities for the workers.

Even more scope for useful action exists in connection with ensuring that new factories are built in accordance with modern hygienic principles. I have suggested to the Director of Industries that, before he sanctions the erection of any new factories, the plans should be submitted to the Director of Public Health for scrutiny, but so far no plans have been submitted.

### E.—A Public Health Policy for India.

16. So far as is known, no attempt has been made to draw up a public health policy for this, or indeed for any other, province of India. Public health being already a "transferred" subject the Indian Statutory Commission did not apparently consider this subject in any detail, and although the Director of Public Health, along with other heads of "transferred" departments, appeared for a few moments before the Commission during its first visit to India, the Punjab Government did not approve of my request to be allowed to submit a memorandum on the subject to the Commission. But public health constitutes the very bone and marrow of local self-government—and it seems to be a matter of vast importance to the future welfare of India, and more especially to "the silent millions" from which labour is mainly drawn, that cognizance should be taken of the arrangements for promoting their health and welfare in framing the new constitution.

It may be that the Royal Commission on Labour will rectify this omission—and it is clear, for reasons already stated, that its wide terms of reference permit it to act, if so inclined, as a Royal Commission on Public Health as well as on Labour.

In the first place, it is taken for granted that the future health and welfare of this country, whatever the nature of the constitution, will continue to be an important preoccupation of central and local administrations. Secondly, it is assumed that the insufficiency of the existing arrangement for promoting the well-being of the community is admitted. Finally, it is assumed that this public health policy must be attuned to the spirit of the times in respect of local self-government.

17. The first and perhaps the most important matter requiring consideration has reference to the manner in which the administrative machine can be adjusted so as to be capable of meeting more adequately the new functions which are now demanded of it. The views put forward in this memorandum point to the conclusion that the time has arrived when a Ministry of Health should be created. Then, and then only, will it be possible to ensure that important matters affecting public health, whether affecting departments of Government or local bodies, will be adequately dealt with. It is obvious that a Ministry of Health without technical experts would be an absurdity—and it is therefore necessary that the Ministry should include, in addition to its

administrative Secretaries and Under-Secretaries, at least one medical and public health expert and one public health engineer. A Ministry, so constituted would be in a position to examine public health problems from every aspect and its considered views on important questions of policy, of which the Minister would be the mouth-piece, would be placed before Government by the Minister and, so far as accepted, would be promulgated to the public as the official policy of Government and thereafter constitute the basis of administrative action.

On settled questions of policy, decisions and orders would issue under the authority of the Ministry. And in order that the health problems, more especially those affecting labour, of which Government is at present the chief employer, should be given due consideration, all departments of Government should be required to submit schemes having public health implications to the Ministry. The Ministry would thus consider the plans in connection with all engineering projects, in so far as their public health aspect is concerned and the arrangements for safeguarding the health and welfare of the labour force. Questions affecting town development and the creation of new towns, plans in connection with the erection of new factories, government institutions (provincial works), Criminal Tribes Settlements and the sanitary projects of local bodies (contribution works) would likewise be examined by the Ministry in so far as their public health aspect was concerned. The Ministry would be responsible for drawing up and revising from time to time all standard plans in respect of buildings and it would also be responsible for drawing up and revising the model bye-laws framed under the Municipal and other Acts.

It is perhaps not possible at once to staff the Ministry with whole-time experts, but even now, a beginning could be made by appointing the Inspector-General of Civil Hospitals, the Director of Public Health and Superintending Engineer, Public Health, as the medical, public health and engineering members of the Ministry. They would thus act for some time to come both as heads of their respective departments and as technical advisers of the Ministry, but, as local self-government progresses, their functions as heads of departments will steadily dwindle. The next step would be the creation of a Board of Public Health upon which would serve, in addition to, representatives of the Ministry, a number of non-official members of the Legislative Council. This Board, upon which the non-official element should be predominant, would review the proposals submitted to it by the Ministry in respect of all public health matters affecting local bodies and the general population. It would in fact discharge the duties now performed in respect of urban areas by the Urban Sanitary Board, and it would replace both this Board and the Rural Sanitary and Improvement Board. As the non-official members would be drawn solely from the Legislative Council, these members would also be in a position to discharge their duties as the Standing Committee of the Legislative Council on Public Health.

18. In its relationship with local bodies, who it is assumed will be given greater powers of local self-government, the Ministry would act as guide and mentor, but with the gradual withdrawal of direct provincial control and the substitution of local for provincial establishments, the security of tenure of the public health staff will have to be carefully safeguarded. In addition to the provision of adequate safeguards the Ministry must be given the powers, now enjoyed by the Ministry of Health in Great Britain, of ensuring that grants-in-aid from provincial sources are properly expended and that public health measures are carried out on approved lines. The membership of local bodies would also need to be increased, so as to include women—and at least one non-official medical man, and, in the case of District Boards, a civil official, together with a medical and public health officer and the district engineer, should act as its executive.

In this scheme there is no room for a Rural Community Board, and District Community Councils, for it is difficult to see in what respect "the co-ordination of the activities of the different departments" cannot be fully brought about through the agency of existing authorities, viz., the Deputy Commissioner and the District Board.

19. In this manner it is thought that efficient administration and technical supervision can be combined, without loss of efficiency, with the grant of additional powers to local bodies. It remains to consider the manner in which a requisite measure of co-ordination can be brought about with similar organizations in other provinces and with the Government of India. Up to date, for reasons which need not be particularized, each province has gone its own way irrespective of its neighbours and of its overlord, the Government of India, but the times have changed, and it is clear that public health problems cannot be regarded solely from the parochial and even the provincial point of view.

The steps taken by a municipal committee to suppress an epidemic of cholera is no longer purely a matter of local concern. Epidemics take no account of district or even provincial boundaries. India is the great breeding ground of disease and the source of the world-wide spread of infection; what happens in one province is therefore of vital interest not only to neighbouring provinces, but also to the whole

world. The League of Nations no less than the public opinion of the world looks to the Government of India to put its sanitary house in order and to pursue an enlightened public health policy. Apart from these considerations, the need of a co-ordinating authority is experienced by provincial Governments. Many legal enactments, if they are to be effective, or if unnecessary hardships are to be avoided, must be based upon All-India legislation, supplemented and implemented by power to frame local regulations. Such an Act is the Vaccination Act, which makes provision for local regulations to facilitate its application. There is a great need for similar legislation in other matters; a new law, for example, for controlling epidemic diseases (in place of the existing Act which is now out of date) is wanted and a law for the prevention of adulteration of food and drugs is required, and manifestly legislation by the Government of India is preferable to local enactments. Then again, without a certain measure of general supervision, the Government of India is scarcely in a position, with propriety, to accept responsibility before the world for the state of the public health of India as a whole and of its component provinces. From the provincial point of view there are occasions when the advice of the Government of India on technical problems would be of the greatest value to provincial Governments, whilst it is the proper authority by means of which, as in the remote past, necessary co-ordination and co-operation between provincial public health services could be preserved. Undue interference with the actions of the local Government would undoubtedly be resented, but expert advice on difficult problems based upon the larger experience of an All-India authority, would be valuable and should be welcomed. It is clearly necessary, too, that in respect of medical education and medical research close co-operation should exist between the central and provincial Governments, whilst there are many public health questions, such as the form and "content" of provincial public health reports, medical education, standards of health, the "observational periods" of disease, definition of stillbirths, etc., in which a uniform practice should prevail throughout India, and this can only be achieved by the co-ordinating authority of the Government of India. Whatever, therefore may be decided in the political sphere, absolute provincial autonomy in respect of health problems can only be attained at the price of inefficiency, and it may confidently be predicted that if this policy is adopted the time will come, perhaps not until after the occurrence of some disaster, when it will have to be revised.

*Note regarding Food and Diet in the Punjab,  
by Lieut.-Colonel C. A. Gill, D.P.H., I.M.S.*

The Punjabi is renowned throughout India for his energy and physique, and these characteristics, in association with high fecundity, have given rise to the conclusion that there can be nothing seriously amiss with the diet of the Punjabi.

Colonel M. C. Carrison has indeed shown that the staple food grains grown in this province are more nourishing—on account of their high vitamin content—than those of the tropical part of India. Another feature of the Punjab is complete absence of "deficiency diseases," such as beri-beri and pellagra and the rarity of rickets and scurvy.

It does not, however, follow from this premise that the Punjabi's diet is adequate in quantity and quality. The Punjab enjoys during about half the year a remarkably stimulating climate and it is possible that the Punjabi is what he is, not because of, but in spite of, his diet.

It is certain at any rate that owing to the variable character of the monsoon livelihood is extremely precarious in many parts of the province—and a few bad monsoons in succession invariably give rise to economic stress and even to famine in districts not protected by canal irrigation.

Conditions bordering on famine do readily occur and economic stress now prevails in the south of the province, where famine relief works were recently opened. In other districts, more especially Kangra, owing to the poverty of the soil, economic stress is almost a normal feature and is reflected in the relatively low birth-rate, high death-rate and the poor physique of the inhabitants. So much so is this the case that the military authorities find it difficult to obtain recruits from this recruiting ground of one branch of the Indian Army.

It is a curious fact that, in spite of precarious livelihood, the rural population display a certain unwillingness to undertake manual labour, as the result of which difficulty is experienced in obtaining unskilled labour for carrying out large engineering projects, which are in consequence largely executed with the aid of the Pathans, Afghans, Kashmiris, Tibetans and others, who visit the Punjab during the cold weather for this purpose.

The rural population is, however, more readily attracted to the towns, in which, as temporary residents, they constitute the bulk of the casual labour employed in mills, factories and other industrial enterprises, whilst many seek employment in menial capacities as messengers, servants, grooms and orderlies. It is with this class of the population—the poorer section of the urban population—that this note is mainly concerned. Speaking generally, although no statistics can be quoted in support of the statement, these emigrants exhibit a poor grade of health and a low standard of efficiency; and, as will be shown, their earnings do not permit them to obtain a physiologically adequate diet.

To what extent their inefficiency is attributable to their low pay cannot be precisely stated, but it is clear that it is not possible to expect high efficiency from underfed persons. The position is, in fact, one of stalemate; the employee complains that he is underpaid, whilst the employer retorts that he is paid what he is worth in accordance with the law of supply and demand. We thus have everywhere, in private houses, offices, mills, factories, railways, etc., excessively large establishments of relatively inefficient and low-paid employees.

But this is not all. The more or less casual labourer is drawn from the countryside, but his wages are so small that he cannot support more than himself on his pay, and the result is the family remains in his village and the home is broken up. This is the case with many menials employed in Government offices in Lahore, who are in a large measure recruited from Kangra and neighbouring districts. Their pay varies from Rs. 15 to Rs. 16-8 including Re. 1 as a Lahore allowance. They state that their diet costs about 6 annas per diem and that ordinarily they cannot afford to purchase milk, sugar or ghi. Their diet, they state, is normally as given below, the relatively high cost of atta as compared with prisoners' and soldiers' (vide Table I and II) being due to the fact that it is purchased in small quantities at retail rates:—

			A. p.
Atta (wheat flour) .. .. .	20 ounces		2 6
Pulses .. .. .	4 "		1 6
Vegetables, condiments, fuel	8 "		2 -
			6 0

This diet is not deficient in necessary food factors, but it is unbalanced and defective, more especially in respect of fats and carbo-hydrates. The food value in calories is approximately 2,347, as compared with the Indian Army 3,470 and prisoners in jail 2,847 (vide Tables I and II).

On the other hand, their work is not exacting and they are provided with uniforms and free quarters. At the end of 30 years and on attaining the age of 60 years they earn a pension of Rs. 4 to Rs. 7 p.m., according to the class of the office, and they enjoy a few perquisites. They cannot, however, afford to bring their families to Lahore, nor can they save anything or provide for their families in case of sickness or death.

Their lot is therefore not a happy one, but it is superior to that of the manual labourer on a daily wage of 12 annas per diem, who is often at the mercy of contractors or middlemen. The diet of the latter is not known, but it does probably differ greatly from that of menials on Rs. 15 to Rs. 20 per mensem. This diet compares unfavourably with that of prisoners in jails (Table I) and of the Indian Army (Table II), whose dietary has been the subject of official consideration and control.

It will be seen that in the case of the army and the jails the daily cost of the official dietary is 5-25 annas and 2-25 annas respectively. The jail figures, however, do not include the cost of vegetables, which are grown in the jail garden; moreover, the foodstuffs both for the army and the jails are bought at wholesale rates at the most favourable state of the market. We may safely double the figures in the case of the retail purchaser and surmise that the cost of the diet of an average coolie drawing 12 annas a day is about twice that of a prisoner or about 4-5 annas per diem.

The average weight of Punjabis, as judged by prisoners, is approximately 120 lbs. and as the minimum calories to maintain life is 30 calories per kilogram of body weight the diet should provide a minimum of 1,800 calories, whilst the army diet provides 3,470 and the jail diet 2,847 calories and the diet of the average labourer about 2,347 calories.

On this basis the living wage—the wage sufficient to keep body and soul together in respect of food only—for an adult man doing hard labour is somewhere about 5 annas per diem or about Rs. 9 per mensem, but this figure makes no provision

for light, clothes and rent, etc., which might amount to another Rs. 7 per mensem. In other words, a man earning Rs. 16-8 per mensem has just sufficient to live but no more—which is precisely what my chaprasis allege—but not enough to support a wife or family.

How this situation is to be met is a difficult problem.

The suggestion has been made that the imposition of a minimum wage will meet the case. This is a matter upon which I am not competent to express an opinion, but it seems clear that if the wage is fixed too low, it will standardize present conditions, and if too high, it will check industrial development and lead to unemployment. Other possible methods are fewer but more efficient workers on higher pay, but this suggestion is more easily made than carried out.

What appears to be certain is that the present position in which a large section of the poorer classes in urban areas lives permanently on the verge of economic stress is unsatisfactory and that unless action is taken matters will get worse. The fact that industry, which is in a nascent condition at present, is likely to develop rapidly as soon as Mandi Hydro-Electric Scheme is completed and cheap power becomes available, requires to be taken into consideration. But in suggesting remedies the need for caution is no less imperative than the need for action.

It may be that the remedy does not lie, at present, in more legislative enactments but in the more rigid enforcement of existing Acts, closer supervision upon the part of Government over the welfare of labour and finally more consideration for the needs of labour upon the part of employers—and more especially of Government, the chief employer.

It is useless drawing up rules and regulations either as regards wages or diets unless it is possible to enforce the former and the people have the wherewithal to purchase food. It is, moreover, useless to increase the pay of labourers if contractors and middlemen are to reap the profit. It is impossible to improve housing conditions unless Government is prepared to bring pressure to bear upon Municipal Committees to put their sanitary houses in order. Finally, it is impossible to enforce any enactments made by Government for the welfare of Labour unless a technical staff—adequate not only in quantity but in quality—is provided to see that they are carried out.

It seems to me that it is along these lines that progress is most likely to be achieved, and it will be clear that these suggestions imply firstly, a new outlook towards the labour problem and, secondly, extensive administrative changes on the lines suggested in my Memorandum on the Health, Sanitation and Housing of Labour in the Punjab.

## THE REGISTRAR, CO-OPERATIVE SOCIETIES, PUNJAB.

2. In Lahore there are two co-operative printing presses—one Urdu, the other English. The latter is working badly, and may soon have to be closed down; the former is working quite well as a press; but it is questionable whether it is of much co-operative benefit to its members.

3. In the Chhangamanga forest, in Lahore District, there is a supply society for the employees of the forest; this, however, is doing badly, and appears to have practically stopped working. There are also two supply societies among the criminal tribes who work in the forest. These are in a very much better condition. There is a large supply society in Moghalpura, whose members are employees of the railway workshop.

4. At Dhariwal in Gurdaspur District there is a flourishing co-operative society among the employees of the New Egerton Woollen Mills. This society does both supply and loau work, and is very keen on the improvement of its employees' conditions.

This society is entirely exceptional. It is, in fact, unique in the province. Its success is entirely due to the fact that the management of the mills is also the general management and the moving spirit of the society, and that, as the mills are well run, its labour staff stays with it for years. In any mill or factory where circumstances are different, the starting and running of a co-operative society of any kind is entirely out of the question.

At Khewra Salt mines there is a supply society which has gone completely to pieces owing to mismanagement and dishonesty. Arrangements are being made to cancel it. The salt miners here have also four ordinary credit societies, of which one is bad and two are average in quality.

There is a very bad supply society among the salt miners at Varchha in the Khushab Sub-Division. The salt miners at Kalabagh, District Mianwali, have a very successful credit society.

There were several labour societies in the forests and elsewhere, but these have all proved to be unsuccessful, for which the difficulty of persuading local bodies and forest officers of the lower grades to give them work, instead of giving the work to the contractors already known to them, is chiefly responsible.

## THE PUNJAB CHAMBER OF COMMERCE.

The Punjab is predominantly an agricultural province. Although some industries exist, they are small and cannot be compared with the industries of Bengal, Madras, Bombay and the United Provinces. The few industries that do exist are scattered about throughout the province, and are not situated in one area, as obtains in other provinces. No commercial towns, as such, exist. The industries are confined to cotton ginning presses, woollen and cotton mills, breweries, glassworks and a few other miscellaneous factories, the whole of the labour being small, considering the size of the province, and would not very much exceed the total labour employed in the neighbouring province of Delhi, which is a very much smaller province in comparison. It naturally follows, therefore, that the labour employed in industries other than agricultural are not subject to the same conditions as prevail in large industrial centres. Although the following memorandum will deal mainly with the Delhi Province, it will reflect the conditions obtaining in the Punjab as well.

## I.—Recruitment.

1. Originally when industries started in Delhi thirty or thirty-five years ago labour was recruited from different provinces, principally from Bombay, to work in the cotton mills. Labour from other provinces such as Rajputana and Central India was also recruited, but at the present time it is more or less settled. In recent years, that is, since the transfer of the capital from Calcutta to Delhi, building operations on a very large scale were started, for which labour was imported mostly from Rajputana and Central India.

(ii) The causes of migration are, briefly, skilled labour for the textile industry had to be imported from the Bombay Presidency, where it was already established.

(iii) Owing to the contraction in building operations in recent years in Delhi, recruitment of labour for building purposes has greatly diminished, and as time goes on and Government buildings are completed, it will be on a restricted scale.

2. So far as settled labour is concerned it has very little contact with villages but there is a certain proportion of seasonal labour which maintains contact with villages. Settled labour is more or less confined to those industries such as textile, flour milling, power supply companies, etc., which work all the year round, whereas seasonal labour is attached to those industrial establishments which work during a part of the year only, such as ice factories, foundry works, ginning factories, etc. The proportion of settled labour in Delhi roughly speaking will be 70 per cent., and of seasonal labour 30 per cent., but this proportion is reversed in the Punjab where seasonal industrial establishments such as ice factories, ginning factories, etc., attract the bulk of the labour population.

Labour throughout the Punjab as well as in Delhi is drawn from the labouring classes which have very little land of their own for agricultural purposes. Those workers who are settled with permanent industrial establishments work there all the year round and others connected with seasonal establishments work for the time these industries offer work and for the remaining part of the year they go back to the villages and work as agricultural labourers. They mostly prefer to work in the factories firstly because they get more wages than what they can earn as agricultural labourers and secondly because work on the land is more strenuous than in the factories.

3. As stated above, labour is more or less settled in the permanent industries and not much recruitment is therefore necessary. Yet sometimes when there is any need for skilled labour employers send their agents for recruitment. As regards seasonal labour, the labouring classes known when the seasonal industries start, where they go of their own accord for work, and there is, therefore, not much need of recruitment. There are no public employment agencies, nor is there any need for them.

7. Amongst the working classes there does not seem to be acute unemployment. Therefore the need for unemployment insurance or the application of International Conventions relating to unemployment is hardly felt.

8. (i) As already stated, labour in the permanent industries is more or less settled and the duration of employment is fairly long and the composition of the working population is steady.

(ii) There are, however, casual employments, the percentage of which is very small.

(iii) The chief causes of absenteeism for any length of period may be attributable to sickness. This often happens during the prevalence of malaria in the three months of August, September and October. The proportion of such absenteeism may be stated to be within 10 per cent. of the whole labour population for two months in the year. Other causes of absence are marriage festivals, casual illness and religious ceremonies, but barring marriage, the duration and extent of such absenteeism is negligible. Absence due to malaria is computed at 10 per cent. for two months and other absence at 5 per cent. for the whole of the year and taking 10 annas as the average wage of the workmen, what they lose in wages in a year owing to absence will be Rs. 12,50,000 calculated in the following manner:—

	Rs.
Ten per cent. of the working population of 100,000 (made up of 62,000 in the Punjab and 38,000 in Delhi) absent for 50 days in the year on account of malaria at 10 annas per day per workman .. .. .	3,12,500
Five per cent. of the working population of 100,000 (made up as above) absent for 300 days in the year on account of casual absence at 10 annas per day per workman .. .. .	9,37,500
	12,50,000

## II.—Staff Organization.

11. Selection of the managing staff is made after considering the individual's experience and ability. Recruitment of supervising staff is made in the same way as that of the managing staff, namely by advertisement as well as by means of personal contact. Owing to lack of education it is not easy to train labourers for promotion to the superior staff and there are, therefore, not many facilities to train them. What they learn is by experience.

13. Relations between the staff and rank and file are generally cordial.

Works committees and works councils do not exist in the provinces of the Punjab and Delhi.

14. Time-keeping, piecework, contract and attendance registers are kept by the managing staff according to the provisions of the Indian Factories Act and they are checked by the factory inspector now and then. As regards wages, in big establishments labourers are paid by the accounts staff under the supervision of a responsible officer of the employer.

15. Contractors as intermediaries are unknown in these provinces but the piece-work system is in vogue. This refers to industrial undertakings only but in the building profession sub-contract is quite general and its effect is satisfactory.

### III.—Housing.

16. In the permanently established industries housing is provided by the employers to a great extent but neither Government nor any other public agency provides housing for the labouring classes. A certain percentage of workers, however, live in rented tenements provided by private landlords.

17. As far back as 1920 a suggestion was made by Government as to the desirability of interesting local Governments in the matter of housing which this chamber fully endorsed and it is understood that Government always assist by leasing out its land for industrial concerns on favourable terms.

18. Accommodation provided by the employers is generally satisfactory and in most cases is far better than the standard of houses in which the working population lives in its village home. In providing accommodation the employer gives due consideration for the needs of the labourer and builds houses to suit his requirements, and not to any demand of his as no such demand is generally made. From the health point of view such accommodation is generally satisfactory. As regards conservancy and water supply, adequate provision is made, but as regards lighting, except in rare instances, it is not provided.

19. Whatever accommodation is made available by the employer is utilized by the worker.

20. Accommodation provided to the superior staff is rarely charged for, whereas in the case of workers the rent fixed is uneconomical to the employer which varies from 40 to 50 per cent. below the economic rent.

21. Sub-letting and occupation of employers' houses by tenants in other employ are non-existent. Cases of eviction are very rare and workers are only evicted when they leave their work, but in that case they are given adequate time to make arrangements for shifting.

22. The moral effect of industrial housing conditions on the worker has not been found detrimental for otherwise there would be many instances of disturbances in areas where houses for labourers are situated.

### IV.—Health.

23. The general health conditions of workers are satisfactory. Statistics of mortality, etc., are not kept and it is therefore not possible to give figures. It cannot be said that the present housing of industrial labourers is responsible for any increase in mortality. There is no marked effect shown owing to unequal sex ratio in the cities of Amritsar, Lahore and Delhi where the permanent industries of the two provinces are located.

24. The extent of medical facilities provided by the employers is considered adequate. No medical facilities are provided by Government or by any other public agency specially for labour except in the case of the Delhi Municipality which maintains a dispensary near the Delhi Cloth and General Mills for their labour population. This was done at the instance of the secretary of the mills who donated Rs. 10,000 for the purpose. Provision for women doctors does not exist but in certain places midwives and dhais are engaged on a restricted scale.

25. Medical facilities are generally utilized by the workpeople both male and female.

26. Sanitary arrangements at workplaces are adequate and satisfactory. Latrines and drinking water are adequately provided for, but as regards bathing and washing no special arrangement is generally made.

27. In municipal areas inspection by the health officer and his staff is frequently made. In other places the inspector of factories is the only person who makes the inspection as regards sanitary arrangements in addition to his other duties.

28. Control of temperature in factories and humidification of mills has attracted the attention of Government and statistics are now being collected for the purpose.

29. The prevalence of industrial diseases is unknown in the Punjab and Delhi Provinces but sporadic cases of cholera are reported now and then. Malaria, however, is generally prevalent and affects the industrial population. Hookworm and other tropical diseases are unknown.

30. Provision for sickness insurance in this country does not exist.

This Chamber, however, views with sympathy any scheme of sickness insurance on a restricted scale and a reference made to it by the Government of India on this subject in September, 1928, was considered by it and generally approved. The Chamber is of opinion that sickness insurance should be made compulsory and made applicable to workers in organized industries, the cost of the scheme to fall equally, in the proportion of one-third, on the worker, the employer and the State. It also holds the view that the scheme to be successful in its initial stage should be applied only within well-defined limits, either regional or industrial or both, and that legislation, as in the case of the Indian Factories Act should be central.

31. In a very restricted scale maternity benefits are available. An allowance of three months' wages is in certain cases given to women labourers, that is, two months before and one month after confinement. A Bill to make provision for the payment of maternity benefits was introduced by the prominent labour leader, Mr. N. M. Joshi in the Legislative Assembly and employers of labour are sympathetic towards the general principles underlying the Bill.

#### V.—Welfare.

32, 33, 34, 35 and 36. Employers of labour in well-established industries have now taken up welfare work more or less and the extent of such work at the present time is on a moderate scale. As regards other agencies, social reform workers also have taken it up. Employment of welfare officers and workers is also coming into vogue, though only on a small scale. Provision for refreshments, etc., is made by established industries which make them available on payment. For physical culture, recreation and amusements, facilities are provided and the results achieved have been satisfactory. Provision of educational facilities by employers is made by industries in urban areas for adult workers, half-time workers, and for workers' children and they are fairly well used.

40. The Delhi Municipality have now enforced compulsory primary education in certain wards and it is expected that illiteracy among the workers in those wards would gradually be removed.

41. In certain urban areas facilities are provided for industrial education but they are still on a restricted scale.

#### VII.—Safety.

43. Those industries which come under the purview of the Indian Factories Act and the Mines Act are bound under rules to undertake safety measures for the prevention of accidents among workers.

44. Statistics of accidents will be found published each year in the Annual Report of the Working of the Factories Act for each province.

The appalling illiteracy and absence of education amongst the workpeople is mainly responsible for preventable accidents and in certain cases the drink habit amongst the workers must be considered as one of the factors causing accidents.

46. Employers as a whole take adequate precaution for preventing accidents whether in factories or industries regulated by the Factories Act or not.

48. The first-aid and medical relief provisions are also satisfactory.

49. Stringency of inspection and enforcement of regulations are generally at times more than necessary both in seasonal and permanent industries.

50. It is not disputed that long hours of work, ill-health and poor working conditions always reduce the margin of safety and employers generally are alive to this fact.

#### VIII.—Workmen's Compensation.

51. The use of the Workmen's Compensation Act in recent years has been fairly extensive as will be evident from the fact that intelligent employers always have had recourse to insurance against accidents to workmen. It is yet too early to say whether this Act apart from humanitarian considerations has done any actual benefit to the industries generally. It is not perhaps wrong to say that workers are not fully alive to the benefits of this Act to make them more efficient.

(e) Regarding the desirability of compulsory insurance by employers the Chamber is of opinion that every employer should be compelled to insure so as to secure workmen from possible hardship by reason of the inability of the employer to pay compensation.

53. Scales of compensation and conditions governing grant of compensation prescribed under the Act are considered satisfactory.

## IX.—Hours of Work.

55. The normal hours of work are ten hours per day, but in exceptional circumstances overtime of an hour is granted under the Indian Factories Act.

(iii) Except for the period of interval during which time the worker is not on call, hours of work are calculated so long as the worker is present at the establishment, whether he is actually at work or not.

56. *Days worked per week*.—Six days.

57. The effect of 60 hours' restriction both on workers as well as on the industry is salutary.

58. The effect of the daily limit is equally beneficial.

59. There is no possibility of reduction in the maxima of hours of work as fixed for India under the Washington Hours Convention. At the Twelfth Session of the International Labour Conference held at Geneva this year, the employers' delegate, Mr. Kasturbhai Lalbhai, of Ahmedabad, made pointed reference to the special circumstances as provided in Article 405 of the Treaty of Versailles, under which hours of work for industrial workers in this country was fixed. This maximum of 60 hours a week is considered suitable for this country, and its reduction is not desirable.

60. The existing practice of granting one hour's interval has worked well both in relation to fatigue as well as to workers' meal times. As already stated, the hours of work were fixed by law and are found suitable. The number of holidays given is generally restricted. Except those provided by the Indian Factories Act and the Indian Mines Act holidays granted are almost entirely for religious ceremonies.

61. Generally speaking, Sundays are observed as days of rest, but in certain establishments week-days are also resorted to for the purpose. In all cases when there are not other holidays only one day in the week is allowed as weekly rest day.

78. The industrial establishments which do not come either under the Indian Factories Act or under the Indian Mines Act are not restricted with regard to hours of work. The desirability of the regulation of hours of work is recognised, but how far it will be possible to have it in effect is doubtful.

81. The effect of the 1922 Act on women, young adults and children has been satisfactory.

82. The admission of infants to the working premises of industrial establishments is prohibited by law. The provisions in the Indian Factories Act regulating women's work are satisfactory, and the same can be said of the work of children.

84. Hours of work, intervals, maximum and minimum wages fixed, have worked well.

85. Double employment of children is unknown.

86. Young adults are in some industrial establishments trained as apprentices, but this is not very general.

87. The dismissal of children on attaining full age is also unknown.

88. Women and children are prohibited under the Indian Factories Act to work at night. Those industries which work double shift employ them during the day.

## XII.—Wages.

101. Fixing of wages of the superior staff in industrial establishments is generally done by written agreement. As regards workmen they are fixed more or less verbally. Workers employed for more than 60 hours a week are paid overtime wages at a rate not less than one and a-quarter times the normal wages.

103. Standardization of wages is generally non-existent.

106. Deductions for bad and negligent work are not rare. Fining also is not infrequent, but such fines are generally used towards workers' welfare work.

107. The system of monthly payment of wages is generally in vogue in industrial undertakings in the provinces of the Panjab and Delhi. Some of them, however, pay wages fortnightly. Wages earned are generally paid within the 15th of the next month.

108. The indebtedness of the industrial worker is almost general.

109. Schemes for the payment of bonuses in industrial undertakings are generally based on production, but such bonuses are restricted to certain industries only. Profit-sharing schemes are unknown.

110. Workers are not generally allowed any annual or other periodical leave except without pay. But the supervising staff are usually allowed leave with full pay, and this varies in different establishments. As regards loss to workers of backlying wages arising out of their being absent on leave such instances are rare. Unless workers themselves are negligent about demanding or realizing them backlying wages are always paid.

#### XIII.—Industrial Efficiency of Workers.

112 and 113. It is admittedly a fact that in recent years efficiency of workers has improved, though slowly, and as regards comparative efficiency between Indian and foreign workers there is no doubt that the Indian worker is very much less efficient than the foreign worker. The appalling illiteracy of the Indian worker is, to a certain extent, responsible for this.

114. Comparative efficiency of plant and perhaps management contribute greatly to the lack of efficiency of the Indian worker. Health, physique, and standards of living cannot be said to affect it to any appreciable degree, but climatic conditions surely are to a great extent responsible for the Indian worker being less efficient.

115. It is doubtful whether changes in working hours will cause any increased production, whereas changes in working conditions may do so. Industries generally are in such a depressed condition at present that it is impossible for the employers to undertake any further extensive programme for the cause of health, sanitation, housing, etc. It is not understood what alteration in the method of remuneration would affect production unless it is meant to introduce piece-work system, which is already in vogue. As regards movements in wage levels, as already stated, industries are in a depressed condition, and it will be difficult for them to bear any further burden which raising the level of wages entails. It is also extremely doubtful whether raising the level of wages will mean any corresponding increase in efficiency. It may even have a contrary effect. As regards alcohol and drugs, absolute prohibition will not only raise the moral standard of the worker but will also increase his efficiency.

116. Not only primary education but provision for technical education amongst the working-classes and the introduction of up-to-date machinery will contribute to a very large extent to secure increased efficiency among Indian workers.

#### XIV.—Trade Combinations.

Compared to workers' associations, the employers in the provinces of the Punjab and Delhi are fairly well organized.

118. The effect of employers' organizations on industry has been satisfactory, but it cannot be said that the workers' organizations have contributed much to the improvement of the condition of the workers. It must, however, be said that discontent among the workers in these provinces is very rare, and they are more or less happy, as will be evident from the few strikes and lock-outs.

119. Trade union activities in these provinces are not well organized, and therefore not much history of their constitution can be given. The same applies also to the question whether the workers participate in mutual aid benefit schemes, such as payment during unemployment, sickness, old age, etc. It can, however, safely be said that no such schemes by the so-called trade unions are in existence.

122. Whenever there is any dispute between the employer and the employed some political leaders of the locality take up the workmen's cause and ultimately some compromise is arrived at. But as no serious disturbance has taken place in recent years in these two provinces no comment can be made as to the suitability or otherwise of such methods. Generally speaking, the relation between the employer and the employed in these provinces is cordial.

#### XVII.—Administration.

137. The effect of differences in the law relating to working conditions or administration between Indian States and British India has been to the detriment of the latter in various ways. It will be evident from the speech of Mr. Furt Wangler, the German workers' delegate at the Twelfth Session of the International Labour Conference, held at Geneva (May-June, 1929), that there is an impression abroad that the Factories Act in India is not seriously administered, and that the ratification of the Washington Hours Convention is merely in name. This impression has been caused by the want of any strict regulation in the Indian States about the hours of work, etc., an impression which certainly is undeservedly to the detriment of British

India in international circles. This is one aspect of the question, whereas from the employers' point of view the factories situated in Indian States have practically no regulations about hours of work, employment of women and children, etc., so that they can favourably compete with the factories situated in British India. No doubt when the Commission sat in connection with the Peace Treaty in January, 1919, H.H. the Maharaja of Bikaner made a reservation that whatever the representative Lord Sinha accepted on behalf of the Government of India would not apply to Indian States. Yet every representative of the employers from this country to the last International Labour Conference at Geneva brought this matter up and while Sir A. Chatterjee, the delegate of the Government of India, explained the defects connected with the introduction of similar factories legislation in native states, the Secretary-General of the International Labour Organization, in reviewing the position, said, "Will the work, partial but still considerable, accomplished in British India for the production of labour survive if competitive industries, exempt from all social charges, develop uncontrolled in the native states?"

There is no doubt that uniformity of legislation is very desirable from all points of view.

198. It has already been said that want of education amongst the workpeople is universal. This being the case, it is not expected that they should be fully acquainted with factory legislation. At the same time it must be said that they have a faint idea as to the significance of the inspections often done by the Government agencies.

---

Mr. H. F. ASHTON, CHIEF ENGINEER, PUBLIC WORKS DEPARTMENT  
IRRIGATION BRANCH.

I.—Recruitment.

The works carried out on open canals are in the aggregate large, but taken individually they are small; it is only occasionally that large works may become necessary at a headworks, or perhaps on a main canal. As the works are scattered over large areas it follows that practically all labour employed on open canals is employed in small bodies and comes from villages near the sites of works. This local labour is composed of cultivators and village menials who turn to canal works when agricultural operations are slack and wages offered tempting; these men will not take up work more than two or three miles away from their villages to which they return each night. There is but little "migratory" or "imported" labour on open canals, as there is seldom sufficient concentrated work for it; it is only when some big work has to be carried out that the employment of "imported" labour becomes necessary and economical.

As regards canals under construction the employment of "local" or "imported" labour depends on the conditions of the tract in which the canal is being constructed. In tracts thinly populated practically all labour is "imported," but there have been cases recently of new canals being constructed in tracts already poorly served by inundation canals in which "local" labour was easy to get; in these "local" labour has been mainly employed.

Imported labour is of two kinds:—(1) Permanent, (2) migratory.

The permanent labour is merely of the "Baghri" and "Od" classes from round about Bikaner; they move about in large groups, going from one big work to another. They are the most skilled earthwork labour obtainable. The numbers of these classes are decreasing annually, due to increased irrigation and labour conditions in the Bikaner State.

The migratory labour comes from Afghanistan and the North-West Frontier Province, and from the dry districts of the Punjab, where rainfall is scanty and conditions bordering on famine frequently prevail. The labour from Afghanistan and the North-West Frontier Province will work only under contractors from their own tracts, and practically all return to their homes for the hot weather.

They form the largest body of migratory earthwork labour in the Punjab during the winter months. The amount of labour obtainable from the dry districts of the Punjab depends entirely on rainfall conditions in the monsoon; in a good monsoon they are hard to obtain.

Statistics of labour employed on open canals are not maintained; statistics maintained on canals under construction show that (a) in one circle the average number of men employed daily from 1st January, 1925, to 31st October, 1926, was 6,644; the maximum number was 12,414 in February, 1926, and the minimum 3,431

in October, 1925; (b) at a headworks now nearing completion the average number employed daily from beginning of November, 1926, to end of June, 1929, was 2,172 men, the maximum number being 5,448 in February, 1929, and the minimum 945 in August, 1927.

3. (ii) There appears to be no necessity for any change in methods of recruitment. It is usually the employer who seeks out the labour and not *vice versa*. "Local" labour is not dependent solely on works; contractors have to go from village to village seeking it out, and unless they treat it fairly and properly the labour just quits work. "Imported" labour has not only to be sought out but usually will not move out unless advances of money are given.

There is no unemployment in the labouring classes which work on canal works.

It is considered that public employment agencies would not be successful; they would not go from village to village to seek out labour, and the labour certainly would not go to them looking for work.

The present methods of recruitment work quite satisfactorily and are suited to local conditions.

4. There is no serious disturbance of family life in the case of labour imported for canal works, as the permanent labour bring their families with them and the other imported labour come only for short periods.

7. *Unemployment*.—The only unemployment of which I am aware is amongst the educated classes (men who have passed or failed to pass the matriculation examination), and whose one and only aim in life is to get into Government service of some kind.

## II.—Staff Organization.

10, 11, and 12. Appendix I shows the number of engineer officers and subordinates on each canal; each of these officers and subordinates has under his charge a certain portion of the tract served by the canal. The officers are trained at engineering colleges in England and India; the subordinates at the Thomason Civil Engineering College, Roorkee, and the Government School of Engineering, Rasul, mainly at the latter.

In addition each subordinate is allowed a certain number—dependent on the amount of work in hand—of "mistris" and "mates" for the immediate supervision of work.

"Mistris" are men of a little education who have learnt to read plans and drawings, and are frequently skilled workmen, e.g., masons, carpenters, etc.

"Mates" are usually illiterate and are selected from the ordinary labour for intelligence and force of character in getting work done. Both these classes are employed for the immediate supervision of works to ensure that orders are properly carried out and good sound work is done.

13. Relations between staff and labour are usually good.

15. Practically all work on canals is done through the agency of contractors, who are really only suppliers of labour; for instance, in the construction of masonry works Government supplies the materials and the supervising staff, the contractor supplies merely the masons and unskilled labour.

Regular contracts specifying rates, quantities and time limit are used only for brick manufacture.

All other works are carried out on "work orders" in which only rates and kinds of work are specified, quantities and time limits not being mentioned.

Under the "work order" system the contractor can stop work at any time if he is not satisfied and similarly the officer in charge can stop the work. This system has been found very satisfactory indeed and no change is necessary.

Relations between contractors and labour are generally very good; if anything, the labour has the upper hand, as it simply will not turn out if it is not treated well by a contractor. Contractors have to be and are very careful to treat their labour well.

Sub-contracting is not countenanced, but is carried on no doubt to a limited extent on large works.

In the case of large masonry works in particular, the masons are paid on piece-work and do not receive a fixed daily wage.

## III.—Housing.

16 and 18. Government provides housing for those of its employees who are required to live at particular sites for the proper performance of their duties. For unskilled labour the accommodation provided usually consists of one room 10 ft. by 10 ft., with a verandah for each man; a certain number of such quarters are provided

with small courtyards, these are for men who have their families with them. This accommodation is usually equal to and sometimes superior to what the men have in their own villages. As already stated, the labour generally employed on canals comes from neighbouring villages to which it returns at night.

Works on canals usually do not last long, the great majority do not last as long as six months. On big works which may last up to five years, "imported" labour is generally used and contractors are given an allowance for "hutting" this labour. The labour itself makes the walls, the contractors supplying the roofing materials.

19. The accommodation provided by Government is always utilized if three or four men or families are to live in close proximity; it is difficult to get isolated quarters occupied because of the prevalence of robbery.

20. Rent rates in various classes in cases of accommodation provided by Government.

*Skilled Labour.*—(a) Those drawing over Rs. 100 per mensem pay up to 10 per cent. of their salary as rent, or 6 per cent. of the capital cost of the building, whichever is less.

(b) Those drawing above Rs. 50 but under Rs. 100 per mensem pay up to 5 per cent. of their salary as rent.

(c) Those drawing less than Rs. 50 per mensem get rent-free quarters. No menial or coolie labour pay rent.

#### IV.—Health.

23. The labour employed on canals is usually very healthy; all work being done in the open air and therefore under very healthy conditions. Statistics of mortality are not maintained, but the figures must be very low.

(iii) (a) and (b) In the case of the subordinates, clerical and menial establishments on an up-to-date public work in India I am of opinion that outside of climate the working and housing conditions, combined with the medical aid easily obtainable free, and the general sanitation is such as should ensure a better standard of health than were they living at home if their home is in a town, while if their home is in a village there would not be such a marked superiority—the latter opinion is applicable to the permanent labour in even a great degree principally owing to medical aid.

(iv) In the case of the artificers and coolies I should think, from casual observation, that their food is plentiful, and unless the person concerned belongs to an entirely different and remote part of India he probably has no great difficulty in obtaining a diet according to his requirements.

(v) The physique of all classes of labour in Northern India is, of course, vastly superior to that of any other part of the country. The Baghri has not such a fine physique, but his output is correspondingly less. These are the natural characteristics of the races, and labour on public works should tend to improve rather than impair their physique.

24. Contractors provide no medical facilities—these are provided by Government. Generally in each assistant engineer's charge—known as a sub-division—a dispensary under the charge of a sub-assistant surgeon is provided at which medicines and attendances are given free of charge to labour and their families. The sub-assistant surgeon does not stay at headquarters only; he can be called out to attend to labour and Government employees by any subordinate, and for this purpose is provided with a travelling medicine chest. At canal headworks where large bodies of labour are employed, a large dispensary with a ward for two to four or more in-patients, under the charge of an assistant surgeon, is provided.

25. (i) The medical facilities provided by Government are freely used and much appreciated; most of the canal dispensaries on open canals have now been thrown open to the public and are used freely by villagers to whom no charge is made.

(ii) Women do avail themselves of medical aid, but I should say principally from the physician's rather than the surgeon's side, there being many obstacles in the way of the latter.

26. (i) Latrines and other sanitary arrangements do not exist in villages from which labour is drawn, and are not required where labour is employed only temporarily. Latrines, etc., are provided by Government at all canal headworks, inspection houses, etc., where labour is employed steadily.

#### VII.—Safety.

43. There is very little machinery used on canal works and accidents are very few and far between. As already stated, most of the work is done out in the open air.

### VIII.—Workmen's Compensation.

51. Where an accident does occur compensation is given as soon as possible in accordance with the Workmen's Compensation Act.

53. (ii) The granting of such compensation is a cumbersome process at present, and should be simplified so that actual payment can be made more quickly than is at present possible, especially as accidents are very few and far between.

### IX.—Hours.

#### D.—Other Establishments.

78-80. Hours and days of working are somewhat elastic, except in workshops, where definite hours must be adhered to in order to run the shops in a businesslike manner. Workshops are at work for about nine hours a day with a suitable interval in the middle of the day, the length of this interval varies with the time of the year. Outside the shops hours are elastic; labour usually works about nine hours a day, but there are no fixed hours. In the summer months the working hours are usually 6 a.m. to 10.30 or 11.0 a.m., and again from 3.30 or 4 p.m. till about sundown; in winter the hours are from about 9 a.m. till sundown with a suitable interval for food about mid-day. Offices are closed on Sundays, but this applies to clerical establishments only; in the ordinary canal officer's and subordinate's lives there are no fixed hours for work on any day and work goes on throughout the seven days of the week.

There are so many religious festivals during the year on which labour will not work, that having a fixed day of rest per week would very seriously affect the earnings of labour and progress of the work. There is no necessity for any regulations for labour employed on canal works, the labour is perfectly happy and contented under present conditions.

#### X.—Employment of Women.

92. Women and children are not employed in canal department workshops; in fact are not employed directly by the canal department at all.

Women, but not children, are found working in contractor's "imported" labour, not "local labour." They do not work as long hours as the men, and do not get the same wages.

There is no need for any regulations regarding their employment; usually work is not done during the night, and if ever done during the night women are not employed on night work.

### XII.—Wages.

96 and 97. Labour employed by Government is employed either on monthly wage or daily wage. The present sanctioned monthly wage for unskilled labour is Rs. 13 per mensem, while this is just sufficient for light work such as watchmen, it is not sufficient for men who are expected to patrol canal channels and keep them in order. For such a low wage only old and decrepit men are obtainable, men quite unsuited to the work required, but the canal department has not yet been able to persuade the Finance Department that this wage is inadequate, and that it is mere waste of money to employ men on such wage.

The daily wage demanded by unskilled labour varies greatly with the time of year and what agricultural operations are in hand; when agriculture requires no labour men can be obtained at 8 annas per diem each, but when Rabi is being harvested the daily wage rises to Re. 1 and over.

Generally speaking, daily wages may be taken as:—

	Rs.	a.	p.	Rs.	a.	p.	
Coolies (men)	0	8	0	to	1	0	0 per diem.
Coolies (women)	0	6	0	..	0	12	0
Carpenters	1	12	0	..	2	8	0
Blacksmiths	1	8	0	..	2	4	0
Masons	1	12	0	..	2	8	0
Tinsmiths	1	12	0	..	2	0	0
Turners	2	4	0	..	2	12	0
Fitter, first class	2	8	0	..	2	12	0
Fitters, second-class	2	0	0	..	2	4	0
Moulders	—	—	—	..	2	4	0
Hammerman and oilmen	—	—	—	..	1	0	0

100. In regard to labour employed by contractors labour employed on earthwork is usually paid on "piece-work," that employed on masonry and other works is paid daily wages as above.

101. Wages are fixed initially, partly on experience of recent work and partly on supply and demand; there is no real standardization of wages, and there is no real necessity for statutory establishment of minimum wages.

107. Wages are paid to labour employed by Government 10 daily or monthly and usually 10 to 15 days in arrears, this delay in payment is due to audit requirements. There appears to be no necessity for any further regulation. Unclaimed wages are treated strictly in accordance with code rules ; wages unclaimed for more than three months are credited to Government.

108. Fining is almost non-existent.

109. A system of bonus payments to contractors has been introduced on the Sutlej Valley canals now nearing completion of construction with considerable success ; such a system properly managed is bound to produce a considerable improvement in out-turn.

**XIV.—Trade Combination.**

117. On canal works there are no trade combinations of either employers or employed, and there have hitherto been no strikes or lock-outs. As already explained, labour generally has the upper hand and has to be treated properly and fairly by contractors. Contractors are usually far too keen on making profits and too jealous of each other to treat their labour in any but a fair manner.

**XV.—Industrial Disputes.**

123. As there have been no strikes or lock-outs there has been no necessity for any conciliation and arbitration machinery.

**XVI.—Law of Master and Servants.**

127. The effect of the repeal of the Workmen's Breach of Contract Act has been that contractors have to be more careful than they used to be in the treatment of labour, since they have had to give the labour advances of money to get it on to the works.

**APPENDIX I.**

Colonel H. M. MACKENZIE, M.B., I.M.S., INSPECTOR-GENERAL OF CIVIL HOSPITALS, PUNJAB.

The heads of the subject matter with which I am concerned are :—

**IV.—Health.**

24. Since the State provides all the necessary medical aid free of cost, it is probable that the need for providing medical aid by private employers has not been felt. Poor people, who include all labourers, receive free medical attendance, free medicines and free lying-in accommodation in hospitals and dispensaries maintained by Government and local bodies.

One of the greatest needs of this Province is the provision of medical aid for women by doctors of their own sex. The profession of medicine appeals to very few Indian women in spite of many inducements held out in the shape of scholarships, stipends, etc. Included in the scheme for the expansion of medical relief, to which reference will be made later, there is provision for (a) the building of good up-to-date hospitals for women under the charge of a lady assistant surgeon at the head-quarters of each district, and (b) the addition of a female section under the charge of a lady sub-assistant surgeon at the headquarters of selected Tahsils. This scheme is progressing steadily but its ultimate success depends entirely upon the women themselves.

Women are trained as Sub-assistant surgeons in the Punjab Medical School for Women, Ludhiana, which is a Government aided institution, and as midwives, dais, nurses, nurse dais and dispensers at that institution and at various centres scattered over the Province. Women, after completing their training, are employed in hospitals and dispensaries in the districts.

The conservatism of Indian women in the Punjab causes them to eye with suspicion any attempt at innovation or at drawing them away from established customs, and the untrained indigenous dai is an important factor in village life, and still carries on an extensive practice among the ignorant masses. The indigenous dai will continue to ply her trade and, until she can be successfully supplanted by a trained worker, she will continue to be a menace whose existence is, to a very large extent, responsible for the appalling infant mortality. The remedy for this state of affairs lies in educating public opinion.

There are in the Punjab 964 hospitals and dispensaries of all classes and these cater for the medical needs of the entire population. A scheme for the establishment of rural dispensaries was devised and received the sanction of the Punjab Government in the latter half of 1925. This scheme aims at the establishment of one dispensary for every 100 square miles of territory, or for every 30,000 of population, and it was found that, in order to attain this ideal, it would be necessary to open 375 dispensaries in rural areas. The entire cost was to be borne by Government in the shape of grants-in-aid and funds available for the purpose were necessarily limited. A standard plan was recommended to district boards and Government agreed to give a grant of Rs. 5,400 for the construction and Rs. 1,600 for the equipment of each dispensary. The following figures show the number of rural dispensaries opened during the years 1925-29 :—1925-26, 21 ; 1926-27, 86 ; 1927-28, 105 ; 1928-29, 88.

It is proposed to establish 55 more dispensaries during the current financial year, and the remaining during the next financial year, thus bringing the whole scheme into operation.

The Departments of Public Works, Forests, Surveys and Criminal Tribes are perhaps the largest Government employers of labour and in every place where these departments operate and employ labour there exist Government dispensaries maintained by the departments themselves, or by the Provincial Government or by local bodies, and these cater for the medical needs of the labour employed. There are 120 Canal, 2 Forest and Survey dispensaries and 20 other dispensaries, of which some are maintained by the Criminal Tribes Department, and others by the Buildings and Roads Branch of the Public Works Department. The number of hospitals and dispensaries of the various classes are given below :—

State public	..	..	..	..	..	..	65
Police	..	..	..	..	..	..	31
Forestry and Survey	..	..	..	..	..	..	2
Canal	..	..	..	..	..	..	120
Others	..	..	..	..	..	..	20
Local fund	..	..	..	..	..	..	354
Private non-aided	..	..	..	..	..	..	8
Railway	..	..	..	..	..	..	66
Rural	..	..	..	..	..	..	264
Private aided	..	..	..	..	..	..	34
Total	..	..	..	..	..	..	964

25. The medical facilities provided are utilized extensively by the public generally and the figures of attendance at hospitals and dispensaries go to show that the institutions are popular. There are 36 institutions where special arrangements exist : some of these are hospitals exclusively for women and some ordinary dispensaries where a special section is set apart for the treatment of women by women doctors.

30. No difficulty arises in this province from non-acceptability of scientific medicine and, so far as my information goes, Government employes rarely have recourse to the indigenous systems of medicine.

The committee formed to investigate and report found that there was much unemployment among medical graduates and that the only way in which the unemployment could be lessened was to subsidize private practitioners in order to induce them to practise in rural areas. This solution presented considerable practical difficulties and was not adopted.

Miss AHMAD SHAH, INSPECTRESS, CO-OPERATIVE SOCIETIES, PUNJAB.

### III.—Housing.

18. *Nature of Accommodation provided in each Class—(ii) in relation to the best type from health point of view.*—This point is not kept in view on the whole, while providing accommodation for the workers. The idea kept in mind is :—“ What kind of a house a man has been used to.”

There is a mistake in this, because a man can put up in all sorts of places, while he is free from the bondage of service, in such a free state there are many other things to make up for the lack of a good house.

On the other hand, especially in a hot country, with a depressing climate for most of the year, when a man comes into the bondage of service, he loses several advantages of a free life. He is pressed with the strain and anxieties of duty, and therefore needs a comfortable house where he can recoup and refresh his exhausted and strained body and mind and keep himself fit for work.

### IV.—Health.

29. *Disease.*—The health of the wives and children of the clerks and other low paid workers is steadily deteriorating ; as for the health of the men, it can be easily judged when these men expect to die at the age of 50 or 55 years, because the houses provided for or rented by them are small and crowded ; too hot and suffocating in summer, and badly ventilated in winter. In such houses tuberculosis is spreading by leaps and bounds and victims cannot afford to protect themselves.

30. *Sickness Insurance—(iii) how to meet difficulties arising from non-acceptability of western medicines.*—There is a misunderstanding here : because those who can afford to get the best western medicines prefer them to the eastern treatments. The cause of non-acceptability lies in the fact, that in most dispensaries the medicines given to the patients, especially to the poor, are mostly a watery mixture with only a part of the prescribed medicines. These sort of mixtures do no good, on the contrary the patients form a mistaken opinion of western medicines and begin to avoid them and tell others to do so also.

This can be remedied by providing large stocks of fresh and good medicines in the dispensaries and by employing conscientious dispensers and compounders in hospitals.

Mr. M. A. GHANI, BARRISTER-AT-LAW AND ADVOCATE, HIGH COURT, LAHORE.

### I.—Recruitment.

1. (i) In the absence of statistics, it is almost impossible to measure arithmetically the extent of the migration of labourers and workmen both skilled and unskilled into Punjab from the outside provinces and *vice versa*. As I have already said in section I, quite a good number of unskilled labourers hail from Kashmere, Rajputana, N.W. F. Province, and United Provinces, and some of the skilled labourers come from United Provinces, Bombay and Calcutta. From Punjab, both skilled and to some extent unskilled, also go to other provinces and even to Africa and Persian Gulf. So some labourers go from the Punjab and some come to it from outside. Both the streams run to and fro, and it is difficult to mark their velocity with any certainty and precision. It may be said, however, that emigration is far less than immigration.

2. *Causes of particular streams of Migration*—(a) *the Kashmere stream*.—The people of the Kashmere State are generally very poor. There are no industries worth the name there. On account of the mountaneous nature of the country, agriculture cannot be carried on on a grand scale there. The result is that there is much employment there. Hence a number of Kashmiris called "Hatoes" migrate into Punjab to work as labourers here. Being inhabitants of a cold country, they cannot stand the intense heat and scorching sun of the Punjab. They are therefore "birds of passage" only. They come in the beginning of winter and go back at its end. Being very poor indeed and being absolute simpletons, they are far cheaper than the local labourers, and work much harder than the local ones. They are therefore in great demand during the winter months. This is another reason of their streaming into Punjab in large numbers.

(b) *The Frontier Stream*.—The chief reason of the Pathan's migration in the Punjab is that some of the big Khans take big contracts from the North Western Railway and the Public Works Department, and so forth, and they bring their own Pathan labour from the frontier.

(c) *The Rajputana Stream*.—The Rajputana and the surrounding country is a vast sandy and rainless desert. The people are extremely poor. They therefore come to the Punjab to earn their livelihood. They are very meek, docile and obedient people, and never shirk from any hard work. Being residents of a hot country, they work in the Punjab in the hot weather without minding in the least its clemency. They seldom mix with the Punjabees. They never quarrel. They are generally cheap and of simple habits. They are, therefore, in great demand everywhere, particularly in the building industry. They come with their families. The women do as much work as the men and charge less than the men. Their children also work. It is therefore they come in large numbers to the Punjab, and get on very nicely here.

(d) *The United Province Stream*.—The United Provinces is undoubtedly a Landlord-ridden Province. There are big "Zemindaris" there. This being so, majority of the people are either tenants or labourers. Not finding enough employment in their own country, they resort to the Punjab. They are not very popular with the Punjabees, but on account of their comparative cheapness, they are employed in different factories in this Province.

(e) *The Punjab Stream*.—Some Punjabi labourers, mostly skilled, as has been already stated, go to Sind, Baluchistan, Bombay, Calcutta and to foreign countries like Africa, Strait Settlements and the Persian Gulf. The more adventurous naturally go to the foreign countries, for they are by far better paid there. Sind and Baluchistan lack in skilled labour. It is therefore imported there from the Punjab. The wages there are certainly higher than they are in the Punjab. Another class of skilled labourers, mostly motor drivers and motor mechanics, who got their training to serve in Mesopotamia during the Great War, find good business in the rich cities of Bombay and Calcutta. Fitters, engine drivers and mechanics find employment in Jamshedpur and Jharra on better wages. It is on account of these reasons that the Punjab labour, too, stream out in different directions in search of money and more money.

2. It has been said with singular felicity that towns are meant for rich people and the villages for the poor. The labourers being poor mostly hail from the villages. There are therefore naturally in intimate contact with them. Some of the labourers who belong to the agricultural classes have some land in their villages. Others have some other vested interests. Most of them have their houses there. They leave their families behind. They have therefore natural contact with their villages. Out of the Punjab rural labour, there are few labourers who have severed their connections with the villages of their origin.

(i) To my mind, 90 per cent. of the rural labour have a tendency, for reasons set forth above, to return to their villages when a suitable occasion affords itself to do so. Those who work in the seasonal factories usually return to their homes after the season is over. Again on domestic occurrences, ceremonial occasions, and religious festivals, the village labourers like to go to their villages. Again, in times of unemployment, adversity, illness and so forth, the labourer remembers his home and usually turns his face to it. There are some labourers too, who work for a short period, earn some money, and run home with the little money they have saved jingling in their pockets.

The above is mainly true of the unskilled labourers who work in factories not very far from their villages. The tendency of returning home frequently does not exist so much among the skilled labour as it does among the unskilled labour. When the home is very far, to reach which the labourer has to spend some money as railway fare, he thinks twice before returning home frequently. Again, if he is employed permanently in a factory and not on daily wages or on piecework system, he is not generally allowed to return home as frequently as he might like. Under these circumstances, he lives with his family in or near the factory and returns home once in a year or so.

(ii) It may be said at once that as the seasonal factories, e.g., cotton ginning and ice factories are not permanent, hence the labour working there is also not permanent. About half the labour employed in our factories is employed in these seasonal factories. Hence that is not permanent. In the perennial factories, it is more or less permanent. But the tendency of returning home as explained in sub-section (i) is always there. By "permanent" I do not mean that a particular labourer sticks to his job in a particular factory for ever. He often shifts from one factory to another. It is only in the big industrial undertakings that he sticks to his job for a fairly considerable long time. As for example, in the North-Western Railway Moghalpura workshops and in the other railway sheds, the labour employed there is more or less permanent. The same is true of the New Egerton Woollen Mills at Dhariwal and some of the factories in Amritsar, Lahore, Sialkot, Ludhiana and Lyallpur.

In this connection, it may be stated that the Punjab labourer and more particularly the rural labourer, has not yet developed the industrial proletariat mentality. Hence he seldom tries to stick to one particular industry. He would work as an agricultural labourer in the Canal Colonies for some time, and then would seek work in a flour mill and after some time you will find him working as a tonga driver in Lahore or Amritsar, and then perhaps in some factory again. The best permanent labour in the Punjab is in the salt mines at Khewra. They are hereditary labourers there, and they seldom leave the factory.

3. (i) The existing methods of recruitment of both skilled and unskilled labour are either (a) direct or (b) indirect. In most factories the labourer presents himself at the factory gate usually in the evening, and if he is required, he is engaged from the next day. This is what I call "direct method." In practice this method works through a Jamadar or the gatekeeper or the mistri, or some other man who is in charge of labour. Generally, the labourer goes to his house privately, flatters him and beseeches him for getting him employed in the factory. He pays to him an amount of money which may be settled between them. Out of this sum generally, he pays some share to his immediate officer, and thus the labourer gets an appointment. This may not be true about the smaller factories, but it is true about the bigger concerns, e.g., North-Western Railway workshops, Dhariwal Mills and so forth. Moreover, it may not be so much true about the unskilled labour, but it is mostly true about the skilled labour. Several cases have been brought to my notice as well where the chageman or the mistri had taken a good amount of money for having a labourer employed in the factory. The evil has taken such a deep root that it has now become almost customary to thus pay to the men who are in a position to get a person employed.

The other method is the "indirect method." The owner or the manager deputes some agents to recruit labour for the factory. Sometimes a requisition is made by the new factories to the gods of the old ones to send their surplus labour to them. The bigger concerns usually employ such an agent. He usually goes to the old established factories rather surreptitiously, and tries to fleece the men from there by holding out all sorts of promises to them. Again, generally, there is always a certain amount of unemployment everywhere. The unemployed flock to the agent, and thus get themselves employed. The agent also often charges some money provided there is sufficient supply of labour to meet his demand.

Another way of recruiting labour is to make a requisition to the Deputy Commissioner of the Criminal Tribes called "Sansis," who might allow a few of them to work in a particular factory. As these men have generally or supposed to have generally criminal propensities, hence very few requisitions are made, and the Deputy Commissioner, after due inquiries, allow the men to be thus employed.

It is only in the North-Western Railway workshops at Moghalpura that labour is now recruited through an employment officer, who is in charge of the Railway Labour Bureau. But in practice, after all, it is the mistri or the chageman who, after getting his usual tip, gets a labourer employed. A relative or an acquaintance or a friend of a mistri, chageman or some clerk or some other official in the factory or workshop gets a job there more easily than those who have no such friends there. This is natural, and it is so found everywhere.

(ii) and (iii) The methods of recruitment described in sub-section (i) are as old as the factories in the Punjab except the new method in North-Western Railway workshops at Moghalpura. The abuse of taking tips and bribery for getting a particular labourer employed is of recent growth. In the good old days the lower strata of our society was very honest, sincere, religious and sympathetic. It is only recently that on account of the economical stringency and the contact with the towns that the evil has crept in. Of course, there can be no judicial proof of such bribery. But the evil does exist, and something ought to be done to do away with it, and thus save the poor labourer from the burden of its ravages.

The only possible improvement that can be effected in this respect is to establish labour bureaus throughout the Punjab. These public employment agencies would be, in my opinion, of considerable help to the poor labourer. In the first place, the

evil of tips or bribery will surely be eradicated to a great extent. Secondly, the unemployed workers will be able to get up-to-date and authentic information as regards the demand for labour in a particular factory. Thirdly, they will come to know of their future prospectuses attaching to the particular job. Fourthly, the labourer will get a suitable post in accordance with his qualifications. The public employment agencies will thus prove a boon to the labourers and workmen. I have no doubt that by their establishment, much of the discontentment among labour will disappear.

From a study of the existing methods of recruitment described above, one can easily come to the conclusion that they are at once so unsatisfactory and so crude that some improvement is really called for. The recruitment ought to be regularized and put on some certain and satisfactory basis. No better possible method can be devised than the establishment of the labour bureaus or public employment agencies. So there is no question of the desirability of establishing them. The sooner they are established, the better it is.

If employers are wise, they should not, in their own interests, object to the establishment of these agencies. Through them, they can get the labour most suitable for their purposes. Now-a-days, on account of lack of information, they get whatever comes before them. Through the agencies they will get the best labourer most suitable for a particular job in the factory. We might in this respect follow the example of the various civil engineering colleges, motor training colleges, electrical colleges through which a number of skilled labourers are recruited as described in Section I (b) of this chapter. Recently an association called the Northern India Automobile Association has been started in Lahore. A number of the motor owners get their motor drivers or mechanics through it, and are quite satisfied. If this can be done as regards the supply of recruitment of motor drivers or motor mechanics or electricians or draftsmen or surveyors and other skilled labour to the great advantage of both the employer and the employed, I fail to see why the same method cannot be adopted as regards the unskilled labour and the other skilled labour. The example set by the North-Western Railway Employment Bureau should be followed throughout the Punjab.

I would therefore most humbly venture to suggest that in the well-known factory areas in the Punjab, and at those places where the more important industrial undertakings are situated, labour bureaus or public employment agencies should be established. They should be organized in close collaboration with the factory owners. Their office should not be in the factory itself. The bureau or agency should be independent of the factory influence. There may be three members of the bureau or agency—one representing the factory or a group of factories, in latter case he should be elected by them, the other representing the labour, usually a trade union official elected for the purpose and the third member should be a Government official.

If there is no properly organized trade union, the labourers should be asked to elect someone to represent them on the bureau or agency. The members may meet as often as there need be. All factory owners within the sphere of influence of a particular bureau or agency should be required to recruit their labour through it. At first there might be some trouble with some of the factory owners, but in the long run, as explained above, they are sure to realize that it is to their advantage to thus recruit their labour both skilled and unskilled. The bureau should keep a regular office and regular register of candidates with their full qualifications, age and other necessary particulars. Similarly, it should keep a register of requisitions. In this the needs of labour of a particular factory should be entered with the necessary particulars. The members then after judging the qualifications of and having a personal interview with the candidate, should decide whether he should be employed or not for a particular factory. The members should fix the wages of the candidate with due regard to all the interests concerned. In my opinion, the bureau should not be a mere recruiting agency, but it should also decide all questions arising between the employer and the employee. In other words it should act as a court of appeal of the master or servant. All questions incidental to the service conditions should be referred to it. For instance, dismissals, fines, bad workmanship and so forth, should be decided by the bureau or agency.

I need not go into greater details of the working of the bureau or agency than what I have described above. The details might be worked by a special committee appointed for the purpose. I would propose that a legislation for the establishment of labour bureaus or public employment agencies should be taken in hand, and thus the great problem of the relations of the employer and the employed might be solved.

One question remains to be discussed in this respect. That is the question of financing the bureau or agency. I think that as the establishment of such bureaus or agencies will be beneficial to both the employer and the employee, and they will be conducive not only to better relations their but also to promote order and peace, it should be the Government who should bear all the expenses. At any rate, the Government should do so till such time as the employer and the employee will get

used to the system, and will realize its advantages. The expenses will not be heavy. The three members of the bureau will be honorary. Not more than two clerks or so will be quite sufficient to do the work. After a few years' experience, the factory or the factories and then after some time, the trade unions may be required to share the expenses. To my mind, it is a practical scheme and is worth giving a trial.

4. If it is true and my experience is that it is true, that wealth is the source of all such evils as are referred to in the above subject, then I can state without any fear of contradiction that there is no question as a rule of the disturbance of family life whether the male labourer leaves his wife at home or whether she were to work as a labourer in an industrial undertaking along with other men. It is only in the richer strata of society that family life is disturbed generally by the abovementioned and other circumstances. Poverty tends to make one honest, pious and God-fearing. Among the labouring classes the cases of the disturbance of family life are very few and far between indeed. Apart from the above sentimental grounds, there are other reasons also for the non-disturbance of family life. The labourer generally, as explained in Section (1) of this chapter, works in a factory not far from his home, and therefore he frequently returns to his wife and children. Again, there is more or less joint family system in the Punjab. The wife lives with either the parents of the labourer or with other relatives. They look after her. Moreover, as in the villages, there is one compact brotherhood, therefore there is not so great a danger of leaving a young woman alone as there is in the towns where the population is of a cosmopolitan character. At home she does not remain idle. She either works on the fields or performs some other household duties. Thus her thoughts seldom go astray, and it is really seldom that we hear cases of her illicit connection with other men. Likewise, the labourer also lives a pious life, and never thinks of establishing illicit connections with other women. Again, the woman labourer in the factories if of pretty grown-up age, is generally married, and works along with her husband or some relatives. All this goes to show that the family life of a labourer is generally happy, and it is only very seldom that we hear of any disturbance of family life among this class of people.

7. *Unemployment.*—(i) A Punjabi is by nature a very hardy man. He is not fastidious or swanky as the people of the United Province, and some of other provinces are. He does not regard to do any work, however menial it may be, below his dignity. He is a very adventurous person also. If he cannot find work here in the Punjab, he would go to other provinces and countries to earn his livelihood. If he cannot find any work according to his taste or to his particular calling, he will do some other work. Idle he will never remain. So there can be no question of unemployment of a serious nature among the labourers and workmen of a nation of the above character.

I have already said that the Punjabi labourer whether skilled or unskilled, has not developed an industrial proletarian mentality. So if he cannot find work in a factory or in a workshop, he would go to the Canal Colonies of Lyallpur and Montgomery and work as an agricultural labourer there. In the Canal Colonies, labour is always required there. So it is mostly due to the Canal Colonies that the problem of unemployment in this province has not very seriously faced the authorities. Moreover, the industries in the Punjab are on the increase daily. Factories after factories are being opened every year. Thanks to the order and peace established so nobly by the British Government, the province is developing itself industrially very rapidly, and it is therefore that there is practically no unemployment among the labouring classes here. With the opening up of the Mandi Hydro-Electric works in the near future, there will be a net of industries throughout the country, and whatever unemployment there is, it will surely be done away with. So I can safely say that the problem of unemployment in this province need not worry us much.

The Punjab Government, sometime ago, appointed a committee to make an inquiry into the question of unemployment in the Punjab. The committee unanimously found that there was no unemployment worth the name among the labouring classes, by which term they meant the manual workers with whom we are here mostly concerned.

(ii) Whatever little unemployment there may be, it is all voluntary. Dismissal from his job seldom worries a Punjabi labourer. There is seldom any retrenchment in any industrial undertaking nowadays. These are days of development. We require more labour everywhere. The financial stringency and economic distress due to the aftermath of the Great War is over, and therefore the notorious "axe" of the Retrenchment Committee is dead and gone, and I hope for ever. Hence I say that no unemployment is caused nowadays to any appreciable extent by either dismissals or retrenchment.

As I have said, if there is any unemployment it is all voluntary. There are some labourers, although their number is very few, who work for a little while, then kick off their job and would not seek another employment until the last pie jingling in

their pockets has been spent. Similarly, there are some labourers who work in the seasonal factories and remain idle in the off season. They remain idle not because they cannot find work elsewhere, but on account of their apathy to do any other work than in the seasonal factories.

(iii) *Possible methods of alleviating and remedying distress.*—When there is practically no unemployment in the Punjab, it seems to me unnecessary to dilate upon this subject in any detail. Suffice it to say, that whatever little unemployment there is, it will automatically go away when the Mandi Hydro Electric Works will be in full working order. Again, the benign policy of the Government of developing the industries in the Punjab, has solved, and will I hope, further solve the problem of unemployment. The Government should vigorously carry on this policy and should see that the Mandi Hydro-Electric Works supply the electric current as soon as possible and at a cheap rate. Both from the industrial and labour point of views, much depends on the success of the Mandi scheme.

I have already suggested in Sub-sections (ii) and (iii) of Section (3) of this chapter the establishment of the public employment agencies or labour bureaus. If they are established, the question of unemployment will be reduced to a negligible point. At present there may be some labourers who may not know whether they are required somewhere or not. The bureau or agency can easily inform them of certain jobs waiting for them. So these are some of the possible methods of alleviating and remedying the distress caused by the unemployment among the labouring classes.

(iv) *Unemployment Insurance.*—There is no such system in vogue in the Punjab. In fact, its need has never been keenly felt, for as stated in the previous sub-sections, there is not much unemployment here. If such a system is introduced in this province, it will be all the more beneficial to poor labourers indeed. Although much labour spirit has not yet been created among the labourers, still with the growth of their organizations under the Indian Trade Unions Act, the benefits of the unemployment insurance can be brought home to them, and the scheme can succeed here to the advantage of the labouring classes of this province.

## II.—Staff Organization.

11. The selection of the managing staff of an industrial undertaking is the business of the capitalist. He will, therefore, be in a better position to speak on this subject than my humble self. All that I know is that in almost all the bigger factories and workshops in the Punjab, the managing staff is imported from England. As an example, I may quote the North-Western Railway Workshops, the Dhariwal Mills, Attock Oil Refinery, Portland Cement Works at Wah, and the Paper Factory at Jagadhri. It may be true in some cases that qualified Indians are not available for the particular posts, but where Indians are available they are generally not given an opportunity of showing their worth. Thanks to the slave mentality of the Indians, a foreigner is generally regarded as a better officer or manager than an Indian. It is, therefore, that in almost all the bigger factories, the chief manager, the works manager, and in some even the foremen are Europeans. In these factories, a European or Anglo-Indian or even an Indian Christian who has adopted European manners, dress and language, has a better chance of being selected as a member of the managing staff on account of his supposed superiority than an Indian, however better qualified he may be than his rival European or Anglo-Indian. Some of the graduates of the MacLagan Engineering College at Moghalpura, however, are now taken on the managing staff of the North-Western Railway workshops. It is generally the agent of the North Western Railway who selects the higher officers of the managing staff on the recommendation of the chief mechanical engineer. The other members of this staff are generally selected by the said engineer or the works manager who are generally appointed by the railway board.

In the second rate factories it all depends upon the whim and sweet will of either the owner or the directorate to appoint one or not on the managing staff. In these factories, it is generally the Indians who are appointed. There they do not look so much to the qualifications as to such considerations as the relationship between the candidate and the owner or some influential director. They do look to the experience of the man to run a factory and to control the labour.

Whether the industrial undertakings are big or small, no worker has ever risen to the managing staff. It is so not because of the incapacity of the worker to rise, but because no chance and no encouragement is given to him to rise.

12. No facilities whatsoever are given by the industrial undertakings for the training of workmen as supervisors or as some other officer. His practical training in a factory might have secured him a place on the supervising staff, but such cases are very few and far between indeed. A workman has, therefore, no incentive to

make any improvement. This is a most sorry state of affairs so far as labourers and workmen are concerned. I would, therefore, suggest that in at least the Government controlled factories and industrial undertakings some suitable facilities ought to be provided for the training and promotion of the workers. Night industrial schools ought to be opened near the factory or near the labourer's residential areas, and training should be given there.

13. *Relations between Staff and Rank and File*—(iii) *Works committees*.—No such committees exist in the Punjab. Their establishment will remove many hardships under which the labourers and workmen simply groan. There is no machinery provided except the ordinary courts which the poor labourer may move for compelling the employer to pay his wages. The result is that he often foregoes his wages and except wishing bad luck to his master, with a heavy heart, reposing his trust in God and hoping to get his dues on the Judgment Day he does nothing, and the poor man is made to suffer.

Under these circumstances I would strongly suggest that works committees should be established as soon as possible. The system of such committees is not entirely unknown to this country. We have already what we call punchayat system. All petty disputes in the villages are set at rest by these punchayats. The labourers, therefore, would simply welcome these committees and I see no reason why the employer should have any objection to their being constituted.

(iv) *Works councils and industrial councils*.—Nowhere in the Punjab, except I think in the North-Western Railway Workshops, works councils or industrial councils exist. I believe that if these councils are constituted they will be of immense advantage both to the employers and the employees. In order to take the latter into confidence it will be better to have their representatives on these bodies.

15. *Contractors as Intermediaries*.—For the majority of the ills of the poor labourer and workman in this province, these greedy contractors are certainly responsible. Nobody is so hard on the labourer as these contractors are. For their selfish ends they would overwork the labourer, would not pay their wages regularly and would treat them as slaves. I would suggest in this respect that the real employer i.e., the one who has engaged the contractor should be made responsible for the labour working under him.

### III.—Housing.

16. (i) I would suggest that a provision be inserted in the Indian Factories Act compelling owners of industrial undertakings to build suitable houses for the labourers and workmen after a plan sanctioned by the Public Works Department, Health Department and the Factories Department. No new factory should be allowed to be opened unless suitable accommodation is provided for the labour there. These houses should be free of rent. It should be provided that when there is an industrial dispute within the meaning of the Indian Trade Disputes Act, the employer is not entitled to have the houses vacated. They should be repaired annually at the expense of the employer and the factory inspector should see that the houses are in good condition.

(ii) The private landlords as shown in the next sub section, charge exorbitant rents which the poor labourer cannot afford to pay on account of the low wages. I would therefore suggest that either the Government itself or the municipalities and district boards should build houses for the labourers specially and should charge nominal rents for them.

(iii) No special houses have been built by the private landlords for the labourers and workmen. Anybody can rent them. There is no doubt that cheap and smaller houses are generally rented by the labourers. But the system of chawls, as said already, does not exist in the Punjab. Most of these houses are hopelessly insanitary and unhealthy and therefore unfit for human beings to live in. The municipal committees should be asked to prohibit the occupation of these houses and should insist on their being improved.

17. There are no special facilities provided for the acquisition of land for the workers' houses. No company and no society exist which might help a worker to acquire land for his building a house there. In my opinion, some such facility ought to be provided either by providing a special provision in the Land Acquisition Act or some such legislation as the proposed Punjab Acquisition of Land (Industrial) Bill with certain modifications. The principle of acquiring land by authority has already been established by the Land Acquisition Act. Under the Act, the Government is empowered to acquire any land for a Government purpose. Similarly,

land can be acquired for a railway, canal, and other public purposes mentioned in the Act. If to these purposes, the purpose of acquiring land for workers' houses is also added, then the difficulty of finding accommodation for workers can be minimised to a great extent.

In the Punjab Legislative Council in 1921, the Punjab Acquisition of Land (Industrial) Bill was introduced. The object of the Bill was to "facilitate the purchase of land voluntarily sold for industrial purposes." It had to be dropped on account of the opposition from the rural members of the Council. Had the bill not been confined to industrial purposes only but to the labour purposes also, e.g., acquisition of land for worker's houses, I am sure the bill would have never met the fate it did. The rural members would certainly never have opposed it for then they would have realized that the benefit of the Bill will also go to the agricultural classes from whom most of the workers in the industrial undertakings are drawn. If the Bill is again introduced in the form that I have suggested, it is sure to be passed.

18. Most of the houses in which labourers and workers live generally, are worse than dungeons. Even the dogs of the rich people live in better kennels than the houses the labourers pass their lives in. Most awfully dirty, most hopelessly insanitary, most thoroughly unhealthy and limited accommodation are the chief features of these houses. Generally they consist of one single room only in which the whole family of the labourer live. Even the railway quarters, the Dhariwal mill and other factories' quarters are not much better than the houses above described. Wherever newly built factories provide labour quarters they are better in every respect.

Worker's spirit has not yet been sufficiently aroused to demand a certain type of house. Their activities are yet confined more or less to the wage question. Whenever in the list of demands or grievances the housing question is also included, it is not pressed. Generally no particular attention is paid to the labourer's houses from the health, sanitary, lighting, conservancy and water supply points of view. The Health Officer or the Municipal Committee who sanction the plan of the factory passes it blindly so far as the quarters for labourers are concerned, for they consider it below their dignity to worry about the health sanitation, conservancy, and water supply of the labourers. The members and officers of the municipalities are capitalists and it is therefore they pay no heed to the requirements of the poor labourers and workmen.

21. (c) *Eviction.*—This is a rather serious matter and often very embarrassing to a worker. As soon as a labourer is dismissed or he leaves service on his own accord against the wishes of his employer, he is turned out at once bag and baggage from the house he was occupying. Again when there is a strike then the employer orders the labour to vacate the quarter. This is always done by the employer to break a strike. For instance when there was a strike in 1924 in the North-Western Railway Moghalpura workshops, all labourers were turned out of their quarters. The police broke open the locks and threw away the furniture and other belongings of the labourer on the road side. Similarly in the Dhariwal mill strike, the labourers were turned out of their quarters by police force. These forcible evictions are certainly a great hardship on the poor labourer. In case of his dismissal or his voluntarily leaving his job, some sufficient time ought to be given to him to clear out from the quarter. When there is a strike the labourer should not be evicted at all. So long as there is a strike, the labourer is in the eye of the law an employee and hence he cannot be evicted. Such was my argument in a case brought by one, Mr. Baker—a striker against the agent North-Western railway during the North-Western railway strike of 1924. I was successful in getting a temporary injunction but eventually the suit was dismissed, as was expected, on a technical point and the injunction was discharged. Mr. Baker was therefore evicted from his quarters all the same. If the power of eviction is taken away from the employers during a strike, it will strengthen the hands of labour immensely and strikes will not so often be failures.

#### IV.—Health.

23. (iii) (a) In the Government controlled and the bigger industrial undertakings, the working conditions are generally satisfactory. There is enough air and enough light in the factory. In the summer, however, on account of the tin-sheet roofs, heat inside the workshops is simply intolerable. At mid-day, when the sun is at its zenith, the workshop is worse than an oven. The poor labourers have to work there in the killing heat of the inside. In the smaller factories, and more particularly in the majority of the cotton ginning and flour mills, the air and light is not enough.

There too, the roofs are of tin sheets generally, so it becomes very hot indeed inside the factory. It is a most pitiable sight indeed to see a labourer working in summer inside the factory in such an atmosphere. Many workers faint on account of the most intense and intolerable heat. Something should really be done to better the working conditions inside the factories in summer. I would humbly suggest that the tin sheet roofs be thatched in the hot months and fans should be provided in every workroom. There should be some special arrangement for cold water for the labourers and for protecting them from the hot blasts. Anti-sunstroke methods should always be ready in the summer in the factory. I would further suggest in this respect that no one should be allowed to start a factory unless its plans were duly sanctioned by a competent authority as is already referred to in Chapter III. Again the factories should never be inside a town or city. They should always be some distance away from the habitation.

(iv) The usual diet of an average labourer is the same coarse and simple food which an average villager eats. They generally eat "dal and chapati." Sometimes he has to go without "dal" even and has to content himself with a little salt or sugar. His food generally is neither sufficient in quantity nor sufficiently nutritious in quality. He will buy the season's cheapest vegetables. Often he gets the worst vegetables available in the market for they are cheap and suit his poor pocket.

(v) The general health and general physique of the average labourer is generally good. This is due more to the congenial and invigorating climate of the Punjab than to the conditions in the factories. In the majority of the factories in the Punjab, the conditions obtaining there are not conducive to the general health of the labourers and workmen. Apart from the nature of the work which in most factories is directly against the principles of health and physique, the conditions in factories tell heavily on them. For example, there is too much dust, particularly in the cotton and ginning factories and there is too much heat not only in the engine rooms but in the places where the workmen have to work. Save the few bigger factories, most of the rest are awfully dirty. No heed is paid to cleanliness. No one cares to keep the place clean. The labourers also are not of clean habits. All these things have their own effect on the physique of the labourers and workmen. In order to avoid all these things, I would suggest that sanitary inspectors ought to be employed in the bigger factories. In the smaller ones, it ought to be the duty of the municipal committee to see that the factory is clean as required by the Factories Act and the rules thereunder.

25. (i) Speaking generally, medical facilities wherever provided are fully utilised. The labourers and workmen have not now any great prejudice against the Allopathic system of medicine provided they can get the treatment free. But if they have to pay, then they prefer to go to a hakim or vaid. The Bagaria labourer still hesitates to go to a hospital and prefers his own treatment.

(ii) For ordinary diseases, the women labourers generally do not care and hesitate to go to a hospital. If things have gone a bit too far, then they go to a doctor. For their peculiar diseases, they prefer their own dais to the lady doctor or the trained midwife. There is a reason for that. In the first place, they or their husbands or fathers cannot afford to engage a lady doctor or trained midwife. Secondly, they cannot afford the cost of the lady doctor or trained midwife's treatment. Thirdly, they do not get nice treatment from them. Fourthly, on account of the time-honoured custom and the natural shyness, they prefer the dai's treatment which is simpler and cheaper.

26. (a) (i) The conditions of latrines both at work places and at home are simply awful. Such bad smells emanate from these latrines that it is impossible to stand there. In some of the bigger factories, phenyle is used and the latrines are kept clean, but in other factories, the less said the better. On account of the most insanitary condition of the latrines, labourers generally go to the open as is the custom in the villages in this province.

Again at home in the cities the conditions of latrines are simply disgraceful. The scavenger comes but once in the 24 hours. No disinfectants are used. The attention of health officers of the municipal committees should be particularly drawn to this disgraceful state of affairs. At the work places, it should be insisted on the employer that suitable arrangements be made for the cleaning of the latrines according to the requirements of the Punjab factory rules.

28. So far as the present stage of development of industry in this province is concerned, the present Factories and Mines Acts and the rules made thereunder are, to my mind, quite suitable. There are however a few changes here and there required

but the pity is that no suitable machinery is provided for to enforce the provisions of the acts and rules with greater vigour. At present so far as the Punjab is concerned, there is only one Inspector of Factories and another additional has recently been added. And these two inspectors are expected to visit more than 600 factories in the Punjab, more than 60 in the Delhi province, about 25 in Ajmere and about 15 in Merwara and 24 in the North-West Frontier Province. That means to say that they must visit and inspect more than 725 factories throughout the year if the Factories Act is to be really complied with. This seems to me impossible. It is therefore that the Factories Act is so much avoided and is to all intents and purposes a mere dead letter. It is a mere show on the part of the Government. The Report of the Inspector of Factories for the year 1928 show that of the 559 factories, "409 were inspected once, 102 twice and 18 thrice" (vide page 3 of the Report). This shows how utterly impossible it is for the staff to see that the provisions of the Act are really complied with. One inspection in the year is practically no inspection at all. I would therefore suggest that at least half a dozen inspectors of factories with full powers ought to be appointed for the Punjab only.

Again, the penalties provided in the Act for the non-compliance of the provisions of the Act are too meagre: Mere fines will not do. It is no deterrent punishment for a rich capitalist to be fined a few rupees for a factory offence which entails no moral turpitude and which is not looked upon by the employers as an offence at all. Again the courts are also very lenient towards the factories' owners. The present Inspector of Factories who is a very able, sincere and honest officer told me that he prosecuted a factory owner for employing child labour and overworking his men. The man was fined only Rs. 10 by the court. Now such a small amount of fine is really a paying concern for him. Hence under these circumstances, I would suggest that Chapter VII of the Indian Factories Act should be thoroughly overhauled and the offenders should be punished with rigorous imprisonment of at least one year and a heavy fine of at least 1,000 rupees for each offence committed.

(i) By virtue of the Indian Factories Act, the Government exercises control over the factories so far as sanitation, ventilation, lighting, humidification, latrine and urinal accommodation, water supply opening out of doors, escape from fire, fencing, repairs, etc., are concerned. But it can exercise no control over the keeping down or keeping up the temperature in the factories. No provision is made as regards the control of temperature. As suggested in Chapter (IV), Section 23, Sub-section (iii) a provision ought to be added to the Indian Factories Act (Chapter III) to the effect that the tin roofs of the factories ought to be thatched in summer and the temperature ought to be kept below 90 degrees by artificial means in the workshops and work-houses where the labourers have to work. Again it ought to be provided that anti-sun-stroke methods ought to be kept ready in every factory in case of emergency in summer.

(ii) (a) According to Section 12 of the Indian Factories Act, it is incumbent on every factory owner to use pure water for producing humidity. I cannot say whether this provision is always complied with by the owners or not. Anyhow, the Punjab Government has now drafted rules with regard to the control of humidification in cotton spinning and weaving mills. If these rules are enforced then "the control of humidity by prohibiting the introduction of live steam into any room where the temperature is more than 85 degrees F. will assure comparatively comfortable conditions to operatives."

30. *Sickness Insurance.*—(i) *Suitability of International Labour Convention.*—The Punjab Government constituted a small committee in February last with the Director of Industries as its chairman to go into the problem and report accordingly. I had the honour to be a labour member of this committee.

To the Report of the Committee, I appended a Minute of Dissent.\* I was of opinion that the scope of the scheme was kept too limited by the committee and I suggested its application to other workers as well. Again I was of opinion that the contribution by the employer should be a little higher than the employee. I suggested that instead of equal contribution among the parties, it should be in the following proportion:—The State, one third; the employer, five-twelfths; the employee, one fourth. I also suggested that the scheme should be compulsory.

31. *Maternity Benefits.*—I think there is a possibility of legislation provided in the first place the scheme is not costly and secondly if the employer is not to pay a heavy premium.

\* Mr. Ghani's Minute of Dissent is printed in Appendix V to the Memorandum of the Government of India.

## V.—Welfare.

34. (i)—*Provision for Refreshments, Shelters and Creches.*—No such provisions are made anywhere in the Punjab. I think that at the present stage of development of the country in general and the labour movement in particular, a provision for refreshments and creches will not be a success for a long time to come. A labourer being a member of the lower strata of society is more caste-ridden and therefore more orthodox than most of those of higher strata. A Hindu labourer would not eat food cooked or even touched by a non-Hindu. Similarly a Mussalman labourer also would not cherish food cooked by a Hindu cook. If the refreshment system is introduced it would mean the engagement of as many cooks as there are castes or religions of the labourers. The employer will have to provide not only separate kitchens but separate places for the labourers to take their food. No employer can at present be induced to embark upon such a costly scheme.

The "creches" system will also be a failure. An Indian mother can hardly dare entrust her child or children to a nurse or some other keeper of a nursery. This is all the more true in the case of a woman labourer. Any such system, if introduced in the Punjab, much as I would like it to be introduced, will be doomed to failure.

Of the three things mentioned in this subsection, "shelters" ought to be introduced at once. In a number of factories, I have seen labourers without any shelter whatsoever and either taking shelter from the sun under some tree or running to a verandah when it is raining. Such shelters are badly needed by the tonga drivers and motor drivers throughout the Province. Even in the premier city of Lahore there is no shed for the motor drivers where they can park their motors or lorries. I approached the authorities some time ago to provide such shelters, but no result has so far come out of it. At my representation, the Simla Municipality has now agreed to provide more shelters for rickshaw drivers there.

(ii) *Provision for Physical Culture, Recreation and Amusements.*—Except in the cement factory at Wah, no such provision exists in any industrial undertaking in the Punjab for physical culture and amusements and recreation. If the provision is introduced it will be a great success indeed. A Punjabi is by nature very fond of wrestling. One can see thousands and thousands of people even from distant places rushing forth to see a wrestling match. If the "Akhara" system is introduced in the factories and other industrial undertakings, a number of labourers and workmen are sure to take part in it. Again if for the evening some recreation or amusements are provided, they will also be very popular. For instance, a singing party may be arranged or music party may be engaged now and then to provide amusements and recreation.

37. Some provision is certainly and necessarily desirable for not only old age retirements but for old age pensions too. Such a provision now exists in almost all the civilized countries. It is really unjust for any employer to take work from a labourer when he is young and to throw him overboard when he has become old. Nor is it justified in any sense to compel a labourer to work in his old age. So I would submit that in the Indian Factories Act a provision ought to be inserted providing old age retirements and old age pensions or provident funds and gratuities. In the Punjab, however, I think the system of provident fund would be more practicable and possible than the old age pensions. Here in this province the labourer is migratory. Industrial undertakings are on a small scale. Hence the system of old age pensions cannot work properly here. Let the employer deduct say one anna per rupee and add one anna himself together with compound interest and give this provident fund to the employee whenever he retires from his employ. Similarly, out of the profit made by an undertaking, some amount ought to be set apart for distribution among the employees as gratuity as suggested hereafter.

## VI.—Education.

40. To my mind, nothing but free and compulsory education will solve the great problem of education which is our greatest desideratum. Employers cannot be expected to provide good schools for the education of the workers and their children. I would therefore suggest that the Government should be approached to open schools in the industrial areas and promulgate a law whereby worker's children should be compulsorily sent for at least five years.

There is much talk in the country about free education. I am against education being made free for all. Those who can pay the fees of their children must pay it while those who cannot pay may be excused. Why should a rich man's son be educated free? Hence under these circumstances, I would suggest that the children of those whose income is less than Rs. 150 a month should be educated free up to

the highest standard of a college. Those having an income of less than Rs. 300 a month should pay one-half of the fees in the college and full fees of the school and so forth. In this way, a labourer's son will be educated and the state would not lose its income which it gets in the form of fees.

41. Except in the Government industrial schools, and the North-Western Railway's practical training to the graduates of the Moghalpura College, no facility is provided by any employer to give an industrial or vocational training. The result is that once an unskilled labourer—always an unskilled labourer. Even the skilled labourers seldom rise higher than a mistri. I would therefore suggest that along with the ordinary school in industrial areas, night industrial classes should be started by the Government. The employers should also be asked to contribute a little to the upkeep of these schools and classes, for, ultimately it is they who will be benefitted.

#### VII.—Safety.

43. (i) The regulations for safety in factories in the Punjab are contained in the Punjab Factory Rules made by the Punjab Government under Section 37 of the Indian Factories Act (XII of 1911). These rules are fairly exhaustive and very suitable indeed for the purpose they are made.

But they are paper provisions after all. Seldom are they followed and they are put in force only when the Inspector of Factories pays a surprise visit. These provisions will not to my mind be of much help to labour unless the number of inspectors of factories is increased as already submitted, and again unless a thorough "safety" propaganda is done among the factory workers. It is true that an abstract of these rules is posted at the outer gates of the factories, but as almost all the workers are illiterate, they seldom read them. It should be made compulsory for a manager or foreman of a factory to read these rules to the workers on the first of every month.

45. According to the report of the factories inspector for 1928, mill gearing shafts and pulleys claim the largest proportion of fatal and serious accidents. As the inspector shows, these accidents were invariably the result of the workers being entangled with the belting and consequently being drawn into the pulleys. This entanglement with the belting is mostly due to the loose clothing of the workers. The provision in the Factory Rules prohibiting the wearing of loose clothes should be rigorously enforced.

In some of the workshops, injuries to the eyes are most frequent. As the inspector of factories suggests, eye protectors ought to be given to the workers whose eyes are in danger of being hurt. In fact it will be far better if the provision of the eye-protectors is inserted in the Factory Rules. Again, most of the accidents are due to the worker's ignorance of the Factory Rules and the Factory Act.

Another cause of accidents is that new machinery is introduced with which the worker is not acquainted. A provision ought to be inserted in the Factory Rules that only that worker is to work a machine for which he has been declared fit by the inspector of factories. Often an unskilled and inexperienced worker is put to work machinery. This ought to be rigorously discouraged. Again, sometimes accidents are due to the carelessness, fatigue, sleeplessness, indisposition and general depression of the worker. It ought to be provided that it is incumbent on a manager to see that the worker is quite fit to handle the machinery before he is put there.

47. Accidents in non-regulated factories may be taken to be in the same proportion as in the regulated factories. If in the non-regulated factories, the machinery is not complicated, the safety measures also do not exist there in the same way as in the regulated factories. I think it will be far better if the factories employing five or more than five workers on any one day in the year are also brought under the Factories Act, and thus regulated in order to give the workers there the benefits of the provisions of the Indian Factories Act and the rules made thereunder.

48. "First Aid" as such is practically unknown in our Factories as yet. Among the workers there is none who could render "First Aid" in case of an accident. When an accident occurs, either the victim is sent straight to the Hospital or someone among the superior staff renders "First Aid." In the interest of the workers, it is necessary that "First Aid" methods ought to be taught to some of the workers who may be of some help in case of an accident. Some of the more advanced and clever skilled workers would surely volunteer to be trained in "First Aid."

49. (i) On account of the paucity of the inspectors of factories as already stated in chapter IV Section 28, very few inspections are made and it is therefore that the regulations contained in the Indian Factories Act and the Punjab Factory Rules cannot be properly enforced. For Punjab, N.W.F. Province, Delhi, Ajmere, and Marwara, there is one Inspector of Factories and one additional inspector. Even these two are not sufficient for the Punjab only. I would therefore suggest that for every one hundred factories, there ought to be at least one inspector as already submitted. It will be then and then only, that the regulations would be properly obeyed and adhered to. At present, they are not much cared for, and they are honoured more in their breach than in their obedience.

(ii) The remarks made above as regards the breach of the Factory Laws apply with great vengeance to the seasonal factories. They are the greatest breakers of the factory legislation. Being hard pressed for time to gin and bale the cotton within a short period, they cast aside the laws, take risks and do whatever they like. They play all sorts of dodges either to avoid inspection by the Inspector of Factories or get timely information of his visit and set things right to show him. If more inspectors are employed, there will be greater detection and the poor labourer will be saved many a hardship he has to bear in these so called seasonal factories.

### VIII.—Workmen's Compensation.

51. (i) *General remarks.*—The Workmen's Compensation Act came into force in India for the first time in its history in July, 1924. Although it was a boon for the workers, but on account of their illiteracy, the majority of the workers knew nothing about it for a good many months. Even during the early years of its working the number of claims were low as compared with the number of accidents. The labourers are now—thanks to the spread of the labour movement—gradually acquiring familiarity with the Act and are claiming compensation under it. The number of claims increase year after year. This is not due to the increase in accidents, but it is due to the putting in of claims in greater numbers. Even now every effort is being made by the employers either to deprive the victim of an accident altogether or to give a few rupees out of Court and thus avoid his applying to the Commissioner for full compensation.

*Causes of paucity of claims.*—Naturally the greatest and foremost cause of not taking full advantage afforded by the Act is the illiteracy of the workers. It is therefore that they are ignorant of its advantages and their rights. Their poverty also plays a great part in depriving them of the benefits of the Act. Again they find it most difficult to secure legal assistance, at a nominal cost. They cannot pay the high fees of the good lawyers. Then, it is most difficult for them to produce their fellow workers as eye-witness in a Court of Law. They do not appear for the fear of losing their jobs. The procedure of the Courts is also very lengthy and complicated. It is therefore that most of the labourers generally accept a small sum out of Court and avoid pressing their claims in the Court.

*Suggestions.*—In order to give to the workers full benefit of the Compensation Act, it is necessary to carry on a thorough propagananda among them about it. Just as an abstract of the Indian Factories Act and the Punjab Factory Rules is hung up at the gates of a factory both in Urdu and English, similarly it should be provided that an abstract of the Indian Workmen's Compensation Act should be put up there. Just as I have previously suggested about the Factory Rules, the salient features of the Act may also be read to all the workers on the 1st of every month by the manager or foreman of an industrial undertaking. Then it should be provided that every accident must be reported with full particulars to the inspector of factories. The breach of this provision should be made penal. The Commissioner appointed under the Act should take action *suo moto*. Every claim even if compromised out of Court must come before the Commissioner to see if the compensation claimed or is paid in accordance with the Act. No Court fee should be required in Compensation cases. Even the diet money of the witnesses should be paid by the Government. The Public Prosecutors should be ordered to appear free for the claimants and press their claim before the Court. If this is not desirable then special pleaders should be retained by the Government to conduct the compensation cases on behalf of the claimants. All compensation cases should be heard and decided at the factory where the accident has occurred. Other suggestions will be found in their proper places in the various sections of this chapter.

(v) It is very desirable indeed to make it compulsory for the employers to insure their workmen against all possible accidents. If it is not made compulsory, very few employers would come forward to insure their workmen and the results would not be good either for the employer or the worker. Insurance saves both the employer and the employee from many a botheration as stated above.

53. (i) The amount of compensation is most hopelessly inadequate and requires an immediate increase. I think the amounts were intentionally thus fixed. The Act was totally a new measure and it was not known how the employers would take it. Now that the Act has been in work for more than 5 years and no employer has felt any difficulty in complying with its provisions, I believe it is time now to double the amounts fixed by Section 4 and Schedule 1 of the Act.

(ii) As the Act stands at present, according to Section 3 (1), it is not every personal injury nor even every personal injury by accident which makes an employer liable for compensation. According to Section 4, the amount of compensation depends on whether the injury results in death, permanent total or partial disablement or temporary disablement whether total or partial. Again the employer is not liable where the injury does not result in the total or partial disablement of the workman for a period exceeding ten days or in the case of a workman employed in the construction, repair, or demolition of a building or bridge where the injury does not result in death or permanent total disablement. His liability does not extend to every case in which death or disablement follows a personal injury to a workman. His liability is limited by various considerations.

Some of them are very wholesome indeed others seems to be unnecessary and uncalled for. For example why a worker should be deprived of his compensation if his injury were to last for less than 10 days. Nor is there any reason for not providing for compensation where neither death or disablement results from the injury. The stringent provisions as regards notice and period of limitation for filing application for compensation are necessarily hard. The workers are illiterate and they cannot be expected to know the procedure. Many a claim has been dismissed for want of notice or limitation. Moreover as regards the "disregard" provisions, the onus should not be on the worker but on the employer. When an accident occurs, it must be presumed that the employer is liable unless he can prove it to the contrary.

(iii) No provision is made for the diseases arising out of smoke or gas or electricity and so forth. Again workers working in mines particularly in Salt Mines get all sorts of diseases. Some provision ought to be made about them also. Then workers working in lime factories ought also to be included in the list.

(iv) The machinery of administration as described above is not as good as it ought to be. The Senior Sub-Judges are after all Presidents of a Civil Court which has no jurisdiction under the Act (*vide* Section 19 (2)). Hence I think it was not the intention of the Legislature to appoint Civil Judges as Commissioners. These Judges are very busy with their Regular Court work, so they seldom care much for the compensation claims. They do not sufficiently apply their mind to this work. They consider it as a miscellaneous sort of a work and hence treat it as a matter of no consequence. The above criticism as regards the apathy of the Senior Sub-Judge applies with greater force to the Deputy Commissioners who have been appointed as Commissioners under the Act. They are Executive Officers and as such do not know civil law. Hence I do not consider these persons as suitable commissioners to administer the Act. I would suggest that a legal practitioner of good standing and having special knowledge of the Act ought to be appointed as Commissioner for the whole of the Punjab. He should be such a man who has got the sympathy of the labourers at heart and still not against the employers. If such a person is appointed, the Act will be administered to the satisfaction of all.

34. In view of the most satisfactory working of the Indian Workers' Compensation Act, I do not think it is necessary to embark on any other legislation on the lines of the Employers' Liability Act. Certain amendments may however be made in the Workmen's Compensation Act to fill up the gaps and thus the benefit of the Liability Act may be given to the workers.

## IX.—Hours.

### A.—Factories.

55. Hours have not yet been fully regularized in the Punjab, so far as all the industrial undertakings are concerned. There is no doubt that according to the Indian Factories Act, all the factories which have been brought under the Act, should have their hours regularized according to Section 21, but in practice, the provision is seldom acted upon particularly by the cotton ginning factories, flour mills, and by most of the smaller factories far away from Lahore. The employers are generally in the habit of making their labourers work for longer hours. If they are afraid of anybody it is the Inspector of Factories. So they make all sorts of arrangements for getting information of his visit beforehand and when he does come, everything in the factories is according to law. There are, therefore, very few prosecutions made for overworking the labour.

In the non-regularized factories, i.e., those not brought under the Factories Act, there is no time limit for taking the work from labour, I have known of cases in which a labourer has been made to work for 15 hours and even 18 hours a day. The labourer knows nothing about any International Convention or about the Factories Act. Like a dumb and mute animal he goes on working for as long as his master may like. He thinks he is a slave of his master and must do his will. In the bigger and better organized factories, the hours are of course regularized and the hours fixed are adhered to rigidly both by the employer and the employee.

(i) and (ii) In a good many industries, e.g., building industry, the carpenters, masons, and other unskilled labourers work from 8 in the morning to 6 in the evening, with one hour off for meals. These hours may now be regarded as fixed by custom. Similarly in the printing trade, the workers come at 9 and leave the work at 5. They have also an interval of one half hour in the mid-day for meals, etc. Similarly in the other minor factories, the hours are from 8 a.m. to 6 p.m. There is always one hour or half an hour as an interval for meals in the mid-day.

In the carpet factories at Amritsar not coming under the Factories Act the hours are very long indeed. The workers come soon after sunrise and work up to the sunset. They have one hour off as an interval as in other industries. Similar is the case of the hosiery workers of Ludhiana.

57. The effect of restriction of 60 hours a week on industry is very advantageous. It will be still more advantageous if the restriction is further brought down to 48 hours a week. It is common knowledge that a well paid worker would certainly do far more work than he would if he were to linger on half-heartedly for 10 or 12 hours a day. If my suggestion as to 48 hours is accepted, it will be beneficial to the masters as well as their servants.

59. There is a possibility of still further restriction. As I said in Section 57, the hours per week ought to be reduced to 48 hours a week, the daily limit being 8 hours. Out of these 8 hours, one hour or say one half hour as may be agreed upon should be given as an interval after 4 hours' work. Let the workers start the work at 8-30 a.m. in winter and continue it up to 12-30. Then there will be an interval of one hour. They are to begin to work again at 1-30 p.m. and finish their day's work at 4-30 p.m. This means to say that they are to work for 4 hours before the interval and 3 hours after the interval. Similarly some suitable hours may be fixed for the hot weather by mutual agreement between the employers and the employed.

60. (i) In the bigger and more advanced factories, an interval of one hour is generally given at 12 o'clock. During this interval, the workers generally take rest and have their meals. A loud whistle is blown from the engine room, at the appointed hour, the workers come out of the factory, some wash up and take their meals, others lie down and take rest. In the Moghalpura workshops meetings of the union of the workers are generally held during this hour. The speeches of the labour leaders refresh the brains of the workers, infuse new spirit into them and give them hope of their future betterment and amelioration. Thus, the worker is satisfied. On comes all of a sudden a low whistle once again, the worker with a gladdened heart hastens to the factory gate again, and again he is on his machine or crane.

## X.—Special Questions re Women, Young Adults and Children.

### A.—Factories.

82. There is no provision in the Indian Factories Act prohibiting the admission of infants to the factories in the Punjab. An Indian mother is too loving and too devoted to her child to keep him or her away even when God has so placed her as to compel her to work in a factory for her livelihood. She must take her child along with her when she enters a factory to work. She cannot bear to leave it behind. I remember the Inspector of Factories issued orders some time ago prohibiting the admission of infants to the factories. These orders have practically been a dead letter and they have been honoured more in their breach than compliance.

I admit that it is not desirable that infants should also accompany their mothers in the factories and thus be susceptible to the bad factory atmosphere from their very infancy but as our society is at present constituted, I think we cannot prohibit their admission by legislation. If we do that, the majority of mothers with children shall cease to work in a factory and thus not only the capitalists but the women labourers too would suffer. I think if orders are issued to the effect that a woman labourer taking her child with her in the factory would be paid a little less than the one not so doing, the evil of admission of infants to the factories would be greatly minimised.

83. Employing women for 11 hours a day is nothing but, to say the least, a gross cruelty. Even if we take 60 hours a week then for all labourers, a day is of 10 hours' duration. Even this is too much for the male labourers but what of the labourers of the weaker sex. I would therefore suggest that it ought to be provided that no woman is to work for more than six hours a day. If women are paid less than the men, they should therefore be required to work for less hours. Again every woman worker should be given one hour's interval after three hours' work. It should also be provided that no woman is to be employed on hard and dangerous work. It is not desirable that female workers should work along with the male workers. The work in the factory should be so arranged as to set apart a particular work or works and it should be provided that women should be employed on such work or works only.

84. (i) Children like to sleep in the morning. It is conducive to their health. Therefore I would suggest that the section should be so amended as to provide that no child shall be employed before 8 o'clock in the morning in the winter and before 7 o'clock in the morning in the summer and shall cease to work at or before 1 o'clock in the afternoon in winter and 12 o'clock in summer. He is to get one hour's interval after working for two hours as discussed in the next heading. Again in Section 23 (c) the word "Six" should be changed to four and this provision should be enforced rigorously. Four hours' work from a child is quite sufficient. To work him for longer hours would mean retarding his growth and depriving him of his education. As suggested elsewhere, after doing the work in the factory, a child should be compulsorily sent to a school to receive his ordinary or technical education there. It will be far better for him if he is imparted the ordinary education and is taught a particular profession from a practical point of view.

If my suggestion as regards the hours for children as explained above is accepted, then Section 21 (b) shall have to be changed accordingly as suggested above. Even if my suggestion *re* the hours is not accepted, then the interval of half an hour must be increased to one hour. This is very essential. Children like to play. On account of being young they become tired after three hours' work, therefore they require sufficiently long rest.

89. *Work of Women and Children in Factories not subject to Act.*—(ii) I have already suggested and I suggest with all the vehemence at my command once more that the provisions of Section 2 (3) (b) of the Indian Factories Act ought to be extended to all the factories in the Punjab and thus every factory should be brought under the Act and thus regularized. If the Local Government see it fit to apply the above section to certain cotton and ginning factories there is no reason why it should not be applied to other factories as well. I would therefore suggest the immediate application of this section to each and every blessed factory in the Punjab.

## XII.—Wages.

96 (i). In the Industrial Undertakings in the Punjab, the wages are frightfully and shamefully low. With these low wages, labourers live a very poor life indeed. In no other part of the world perhaps may people be living so poor a life as the labourers and workmen of the Punjab. The wages paid to them are even not sufficient to keep their body and soul together. They wear most scanty and dirty clothes. They live in most dirty and dark houses. They eat the coarse food. Life to them is no pleasure. With most of them it is simply a burden, but as it is naturally dear to every one, therefore they linger on, waiting eagerly for the time when death will relieve them of the misery and poverty which Providence has been pleased to reserve for them.

In most of the factories, the wages of unskilled labourers range from four annas a day to one rupee and four annas or so. Children are generally employed at four annas and even less than that. Adults usually begin from six annas a day and sometimes get eight and even twelve annas when there is a rush of work and labour is scarce. But in no case does a labourer get more than one rupee and eight annas per day at an average. The skilled labourer usually begins from twelve annas a day and can often get even one rupee and eight annas per diem. They often rise to four or five rupees per day when they have become quite experts in a particular calling.

Fortunately Punjab is an agricultural province. Most of the labourers have some land the produce of which goes a long way in supplementing their earnings, and thus they manage to support their families, otherwise if they were to depend on each of them singly starvation would surely be the result.

(ii) The prevailing rates of wages in the agricultural areas surrounding the industrial undertakings of the Punjab are even less than those prevailing in the factories. There the average rate of wage is never more than four to six annas a day. Generally the labourer gets his meals free. He has a free house in the village. He has not to pay the barber, the water carrier and the sweeper, as the labourers in the industries in the towns have to pay. Therefore it can be said that, taking all things into consideration, both the agricultural labourer and the industrial labourer are at an average in the same boat so far as the question of wages is concerned.

(iii) *Relation to Prices and Cost of Living.*—Although in the Punjab a cost of living index has never been prepared officially, still it can be said without any fear of contradiction that the cost of living is not less than double of what it was before 1914—the pre-war year. This can be easily judged from the price of the flour which is the staple food of the Punjabi. Before the war a bag of flour of 2 maunds cost from five to six rupees. At present it costs from ten to twelve rupees, or exactly double the pre-war price. The prices of the other articles generally follow suit with those of flour. Hence it can be safely asserted that the present cost of living is double the pre-war cost.

With this double cost of living, the employees were at an average given only 50 per cent. increase. Justice demands that even on the basis of the pre-war wages an increase of 50 per cent. is still due and is justly demanded. As a matter of fact, it is a misnomer to call it an increase. It is no increase at all. The workers demand to give them the same price of the money as the used to get before the war. Give them the same amount of flour, the same amount of ghee, dal, meat, and so forth, as they used to get before the war and they will be satisfied. If you cannot do it, then give them the money by which they can buy the same quantity as before the war. This can only be done by giving them 50 per cent. more increase. Then, and then only, will labour be satisfied, and then, and then only, justice will be meted out to them, and then, and then only, will their agitation cease; otherwise they are sure to resort to Bolshevik methods, which, I am afraid, will not only paralyse the Government but will also be the cause of disruption of the society.

102. Whenever a labourer is required to work "overtime" he is generally paid at the rate of one and a quarter times what he usually gets. The same is true about Sunday work. This rate has now become almost well recognized in all the more important industrial undertakings in this province. The same is the intention of Section 31 of the Indian Factories Act.

In the minor industrial undertakings, no "overtime" is paid. When there is a rush of work the poor labourer is made to work overtime, and even on the best of his festivals. If all factories, of whatever status or dimension, are brought under the hammer of the Act, the evil of working a labourer overtime without any payment will be greatly minimized. The "overtime" payment is not sufficient either. It ought to be one and a half times the usual rate. Section 31 does not say that the rate for overtime should be one and a quarter times. What it says is "at least one and a quarter times." It will be better to avoid any misunderstanding if for the above words "not less than one and a half times" is substituted.

104. Whether the wages change or not, or whether they increase or decrease, there is always enough supply of labour. So it can be said without any fear of contradiction that labour supply is not at all affected by the changes in wages. The extreme poverty of the poor labourer compels him to accept what the rich employer is pleased to give him.

105. *Minimum Wages.*—This is the dire necessity of labour to-day. Minimum wage ought to be fixed by legislation, which must be penal. Law must punish the one who gives as well as the one who takes less than the minimum wage fixed by the Statute. If minimum wage is fixed by law, it would mean end of labour troubles to a great extent.

By minimum wage I mean neither more nor less than the mere living wage. Let a standard of living of different labourers be fixed and then pay them in such a way so that they may be in a position to keep it up. At present there is no such standard fixed and no minimum wages are fixed even by custom or agreement. They are unknown in India. They ought to be fixed.

In no other country in the world are labourers paid far below the living wages than in India. The minimum wage paid to an adult labourer at an average, as already shown, is about six annas a day. That comes to about Rs. 1½ or say Rs. 12 a month. This is the very sum that is paid by the Punjab Government to the "Chaukidars," who are most lowly-paid Government servants. Now, can it be

honestly said that Rs. 12 a month, or say even Rs. 15 a month, are even barely sufficient for a labourer to live on. Apart from this, as shown in Sections 103 and 104 of this chapter, if there is more supply of labour, the wages become even less than the above minimum. Now it is not a question of supply and demand. Human labour can never be regarded as a mere chattel and therefore the laws of supply and demand are not to be made applicable to it. Labour is not to be paid less than the living wage. You have no right to semi-starve a man simply because you can get many to serve you. The law of the country ought to make it penal to semi-starve a man by paying him less than the living wage.

The real trouble in India is that the "fat" people get "fat" salaries and never care for the claims of labour as labour. Nowhere in the world are the Government officers so highly paid as they are in India. Hence it is the Government really who does not want the minimum wages fixed. For if they are fixed in the industrial undertakings they are sure to have their own effect on the low-paid Government employees. They will surely then agitate to be paid according to the standard fixed by the minimum wage legislation. This the Government does not want. Had this not been so, the Minimum Wage Act would be passed to-morrow. And even if the capitalist-ridden Legislative Assembly were to reject minimum wage legislation, the Viceroy can issue an ordinance under the Government of India Act.

I admit that it is very difficult to come to a certain conclusion and data to fix a living wage. The Royal Commission on Labour in Australia recommended the fixation of minimum wages and in their excellent Report, a copy of which I saw in the Government of India Labour Department Library, they set forth a very nice method, although very technical, of fixing the required minimum wage. We may again follow the example of the Commission on the Codification of the Labour Laws of Canada, who recommended that the minimum wage should be adopted nationally. For a model of legislation, I would suggest the Nova Scotia, Ontario, and Saskatchewan Acts on the subject. As a rule, they provide for the boards of five members who, when they find that the scale of wages fixed by legislation for any class of particular workers in a particular industry within the scope of the Act is inadequate, may summon representatives of employers and employees and proceed to the establishment of a minimum rate of wages for the occupation concerned. The same procedure is adopted in Great Britain and in many other countries. We may also well adopt it for India with advantage.

106. (i) I would suggest that the fines ought to be prohibited by legislation. The employer has his remedy in the ordinary Courts of Justice if a worker has not done good work or has done some other thing to harm the employer or damage his property.

(iii). Fines are generally utilized by the employer most selfishly and unjustly. In the majority of cases, they find their place in the very pocket of the employer for which they are really meant by him. In other cases, e.g., in the N.W.R. Moghalpura Workshops they are utilized to add to the fund of the officers' clubs, the officers' dancing halls and officers' dinner parties and so forth. Now this is nothing but robbing Peter to pamper Paul. This is mere cruelty and the height of injustice done to the workers. In the plenitude of their power and with the little brief contemptible authority which these officers arbitrarily exercise over their subordinates they resort to fining most cruelly just to add to the fund of their dinner parties or dancing halls where they enjoy and booth. These officers have no right whatsoever to utilize the amount of fines inflicted on the poor subordinates. Either the amount should go to the owner or a special fund should be created to pay prizes to those workers who have done good work. A part of it should also be reserved for paying a subsidy to the Workers' Union if they so desire. At any rate, the money of the workers should be utilized for the workers only in one form or the other. A legislation to provide for utilization of the fines, deductions, and so forth for the use of workers as desired by them should be immediately promulgated.

107. (ii) In the bigger industrial undertakings, generally, the wages are paid on the 7th, 9th, or 12th, of the month, following the month for which they are due. In the printing presses of Lahore, payments are made generally on the 15th of every month, i.e., a fortnight after the month in which the work was done. In some of the factories wages are not paid for months and months, notwithstanding the protests, entreaties and threats of the employees.

(iii) I am very strongly of opinion that the periods of payment of the wages should be regularized by strict legislation. I am also of opinion that delay in making payment should be penalized. The machinery for compelling the employer to make regular payment on the due date should be very simple and absolutely inexpensive and should admit of no delay.

(iv). There should be some suitable legislation about the payment of unclaimed wages too. In case the wages are not claimed by the worker or his legal representative, or in case he cannot be found or otherwise the amount should be handed over to the Trade Union of which the worker was a member, or in any other case, should be utilized in the Worker's Orphanage Fund. In the case of small and out of the way factories, the amount of the unclaimed wages of a worker there should be sent to some Labour organization of industrial workers.

(iii). I would certainly recommend the insertion of a Fair Wages Clause in the contracts mentioned above.

#### XIV.—Trade Combinations.

117. (i) Apart from the Punjab Chamber of Commerce, the Punjab Trades Association, the Punjab Merchants' Conference and the Punjab Stock Exchange which are general bodies of the capitalists and employers, no particular organization of the employers in the industrial undertakings has yet been formed in the Punjab. My friend, Sardar Gudial Singh Salaria, Bar-at-Law, and Chief Agent of the Dhariwal Woollen Mills called a meeting of the industrialists at Amritsar quite recently. I have not heard anything of it as yet. Probably nobody attended and the attempt to organize the industrialists has probably been given up.

(ii). There are a certain number of Trades Unions and labour organizations of the industrial workers in the Punjab. The following more or less represent the industrial workers in one sense or the other :—(1) N.W.R. Union, Lahore ; (2) The General Worker's Union, N.W.R., Lahore ; (3) The Punjab Motor Drivers' Union, Lahore ; (4) The Lahore Tonga Drivers' Union, Lahore ; (5) The Lahore Press Workers' Union, Lahore ; (6) The Dhariwal Textile Workers Union, Dhariwal. ; (7) The Motor Transport Workers' Union, Amritsar. ; (8) The Simla Rickshaw Coolies Union, Simla.

Of these the first four have been registered under the Indian Trade Unions Act and the other four have not yet been so registered. The registration of the Dhariwal Textile Workers' Union has been cancelled for want of any activity but the Union has again been resuscitated. But for the most inimical attitude of the employers, as will be explained in Section (120) Sub-section (iii) all industrial workers would certainly organize themselves into Unions.

118. (i) No adverse effect on industry has at all been experienced on account of the labour organizations. The production has not been adversely affected either. As a matter of fact industry as such has been immensely improved on account of these trade combinations.

(ii) The labour organizations have certainly been of immense help to the workers in securing better working conditions for them. It is on account of these organizations that we see the workers a bit better off than they were in the past, and it is on account of these organizations that a spirit of bettering their conditions has been infused in them and a general awakening has been brought about among them. All the little facilities, all the little increments and all the little amenities that have been given lately to the workers, have been the result of the agitation created by these combinations. The movement has been a God-sent boon to the workers and they know it.

119. The activities of the trade unions of industrial workers are varied and diverse. Chiefly their activities are naturally diverted to the increase of wages or rates. That is their chief demand. Over and above that they try to ventilate their all sorts of grievances peculiar to the services or the professions of their workers. The unions take up individual cases of the members as well and represent their cause to their respective authorities. None of these unions, has however started any mutual benefit scheme or unemployment sickness or old age insurance or strike pay fund. They are yet in their infancy and are gradually developing themselves to the great advantage of the class for whom they stand and fight.

120. (i) The history of the individual trade unions mentioned in Section 120 may be very briefly summarised thus :—

(a) *Railway Workers' Unions.*—About the time I was agitating for the betterment of the Revenue Patwaries of the Punjab at Hoshiarpur in 1918, there were signs of restlessness among the North Western Railway Employees. Two of its employees—Mr. J. B. Miller and Mr. M. A. Khan took a great part in the movement and managed to bring about a strike of the railway servants and particularly of those employed in the Moghalpura Workshops. The strike lasted for about two months. The result was, so far as this subject is concerned—the North Western Railway Union. It was recognised by the authorities and at one time claimed a membership of more than 20,000 members. The usual internal differences among its officers, however brought

about its fall. Mr. J. B. Miller and Mr. M. A. Khan were dismissed and expelled from the Union—the former for his certain unconstitutional behaviour and his bullying nature, while the latter for the alleged embezzlements of large amounts of money of the union. These two joined hands and started a different union chiefly consisting of the Moghalpura Workshop people. This union has changed many names and now it is called the General Workers' Union, North Western Railway. Both are registered under the Indian Trade Unions Act.

(b) *Motor Drivers' Unions*.—Soon after the Indian Trade Unions Act came into force in 1927, I organized the Motor Drivers of the Punjab and had this registered under the Act. It was the first union that was so registered. For a few months it worked very well under my presidency, but soon after, on account of my having gone to the Khairpur State as its legal adviser, it fell down and is at present not doing much at all. I opened its branch at Amritsar. It has now, however, become independent of the parent body and calls itself the Motor Transport Worker's Union, Amritsar.

(c) *Tonga Workers' Union*.—In 1922 or so, there was a great agitation among the Tonga drivers of Lahore. They struck work and their strike was very successful. The rates were increased and their other grievances were mostly done away with. Their union worked well for sometime, but on account of the usual differences among its officers, it came to naught in 1924 or so. In 1927 I organized the Tonga drivers again and had the union registered under the Indian Trade Unions Act. For a little while it worked well. When I went away to the Khairpur State, it came to almost a standstill. Now it is practically doing nothing and exists in name only.

(d) *Textile Workers' Union*.—The workers of the New Egerton Woollen Mills at Dhariwal were organized by Mr. J. B. Miller and D. Chaman Lal, M.L.A., and to my great pleasure a member of the Royal Commission on Labour, in 1928, into what they called the Dhariwal Textile Worker's Union, Dhariwal. They led their big strike which lasted for about three months but was a complete failure all the same. As a result of their failure, the union which was a registered body under the Indian Trade Unions Act, died out, and its registration was also cancelled on account of want of any activity. It has been, however, restarted by me and will be in full swing once more in the near future.

(e) *Press Workers' Union*.—This union was started sometime ago by certain Congress workers. It never worked well. It exists in name only and does not carry on any activity worth the name.

(f) *Simla Richshaw Coolies' Union*.—This was started by me this year and so far has been very successful indeed. If the notorious mischief makers in the trade union movement were to leave it alone, it is sure to do its work very nicely. On its representation, the Simla Municipal Committee appointed a Labour Enquiry Committee to enquire into their grievances most of which have been removed.

(ii) *Attitude of workers*.—It may be said at once that the majority of industrial workers do realize the benefits and advantages of their organizations and believe in their power and potency. The employers' iron grip however, still deters most of them and it is therefore that the unions are not so successful as they ought to be. The fear of being dismissed or being brow-beaten by his officer or employer and being victimized in some other way, does not allow a worker generally to take a keen interest in the movement—much as he would like to.

*Extent of their control*.—Generally speaking, the movement is practically controlled by the outsiders. The workers are generally illiterate and cannot carry on the movement themselves. There is no Union of the industrial workers of the Punjab which is entirely controlled by the workers themselves. There is no doubt that the executive committees of the unions are of the workers themselves but there is always some outsider as president, or general secretary, or union leader, whose will often prevails. In the present stage of the movement, it is only natural that the outsiders should guide and control it. When the workers will get enough training and experience then they are sure to control it themselves. It may be remarked in passing here that even according to the Indian Trade Unions Act, a certain number of outsiders can be executives of a union.

(iii) The attitude of employers is, in general, averse, if not inimical towards the workers combinations. The employers do not at all like their employees to be organized and united for their own amelioration. Circumstances however, may compel them to express a mere lip sympathy with the cause of the workers but inwardly they are decidedly against the movement and would kill it altogether if they could. Their relations with the unions are not friendly either. Every effort is being made to keep the movement down by avoiding the real issue or by white-washing certain affairs most vitally affecting the welfare of the poor workers.

121 *Trade Unions Act, 1926*.—(i) *Extent to which utilized*.—Out of the 13 unions of all sorts of workers that have been registered in the Punjab, there are four only which may be taken to be those of the industrial workers. If we leave out the

North Western Railway Union which is mainly constituted of the clerical staff of the North Western Railway, and if we again wash out the Motor Drivers Union and the Tonga Workers Union which, as I have already said, exist on the files of the Register of Trade Unions only, there is one union, namely, the General Workers' Union, North Western Railway, which may be said to be doing some work. Although it claims a large number of members, but its *bona-fides* are always doubted, on account of the thoroughly bad record of those who run it. It is not recognized by the Railway Administration and has practically done nothing for allaying the grievances of the workers who are quite illiterate and ignorant and are often led by certain of their leaders for their personal glorification and aggrandisement.

(ii). *Effects.*—The effect of the Indian Trade Unions Act on the workers' organizations has been, in general, very wholesome indeed. The mouths of the capitalists against the right of the workers to combine, have been shut once for all. The angle of vision towards the labour movement has decidedly been changed. They cannot now openly challenge the labour leaders—however much their blood might be boiling within themselves against the workers' combinations. The accounts are now regularly kept and audited, the registers of the unions are properly written. Meetings are held without any fear. The Act has certainly given a great impetus to the trade union movement in general. It is a boon to the worker and is certainly a Magna Charta of the proletariat.

(iii) *Possible amendments.*—The present Act is necessarily limited in its scope. It is the first Act of its kind in India. I feel it is suitable to a great extent so far as the present stage of the movement is concerned. Every one knows that the labour movement in this Province is still in its infancy and has not yet attained its teens even. It is about a decade old. The Act itself, is not more than about a couple of years old. I therefore, think that very many drastic changes in the Act will arouse great agitation among the capitalists who, on account of their power, may not stifle the noble movement. Let the Act grow with the growth of the movement. There lies the wisdom and there lies the statesmanship.

A few amendments here and there, are however necessary even at this stage of the movement. For instance, I would suggest that unions of workers and wage-earners must be registered under the Act. The registration under it ought to be thrown open to Government servants as well. It ought to be provided that if a member of a Trade Union were to desire in writing to have his subscription for membership sent to his union out of his pay or salary the employer shall be bound to do so. Again the Act ought to provide for greater facilities for starting the mutual benefit schemes, sickness, deaths, old age and orphan's funds, and for the utilization of the political fund and so forth.

122. *Miscellaneous questions regarding Trade Unions—Position of Employees in State Industrial Concerns.*—The Government employees cannot still have their Unions registered under the Indian Trade Unions Act. I have never been able to understand the position of the Government in this respect. I would strongly suggest that all Government servants should be expressly allowed to take full advantage of the Trade Union Act. It is really a very sorry state of affairs that professional people, servants, workers, employed by private individuals and quasi Government can have their unions registered, but Government servants cannot. The sooner this invidious distinction is done away with, the better will it be both for the Government and its employees.

#### XV.—Industrial Disputes.

123. Ever since the advent of the labour movement in this province and so far as the industrial workers are concerned, there have been two strikes of the North Western Railway employees out of which the second was a lock out. Another strike was of the Lahore Tonga Drivers, one of the Dhariwal Mill Workers and one of the Motor Drivers of Amritsar. Another strike was that of the workers in the Khewera Salt Mine. Quite recently there was a strike of the Mandi Hydro-Electric Power House Workers at Jogindarnagar, and that of the Rickshaw Coolie of Simla. Out of these the North Western Railway Employees Strike and the Dhariwal Workers' Strike were the most important. Although the Tonga Driver's Strike was a complete one, but the number of strikers was not a large one.

(i). Except the Amritsar Motor Driver's Strike, all the strikes of the other workers mentioned above were purely economical. If the North Western Railway employees struck twice, they did so for the increase of their wages, if the Dhariwal hands declared the strike, they also did on account of the most frightfully low wages, again if the Tonga Workers of Lahore struck, they also resorted to it to have their

rates increased. The economic cause was the main cause of all these strikes. Of course, with it, other grievances were also added. The Motor Drivers of Amritsar struck because the Government has not provided a free Motor stand for parking their lorries.

*Successes and failures and their causes.*—Of all these, the first strike of the railway employees, the Tonga Drivers strike and the Motor Drivers strike was successful. All others failed miserably. Again the first was successful to some extent. The second one also resulted in a partial victory. The third resulted in a promise by the authorities to provide stands. This promise has not yet been redeemed although it was given about two years ago.

(ii) Although the Canal Patwaris Strike was the first in the Punjab, the North Western Railway strike of 1919, was the biggest and the longest strike in the province. It lasted for about two months. The second strike taken to be a lock-out of the same employees of 1924, also lasted for about two months or so. Tonga Drivers strike lasted for three days only. The Motor Drivers for about a fortnight. Although all the strikes were merely trade disputes the employers did not hesitate to give them a political colour. Again the real cause of the failure of the strikes has been the most objectionable attitude of the Police towards the poor strikers. It was also the usual underhandedness and the third degree methods of the notorious Punjab Police that brought about the failures of the strikers. In the name of order and peace, these custodians of law and order threatened the workers, intimidated them by all sorts of means and put all sorts of pressures on them. Their dirty deeds were certainly a disgrace to the King's uniform they so proudly wear. The result was that the poor workers got frightened, lost heart and came down and had to accept the employers terms. If the police would not interfere, I can challenge that in the Punjab, no strike would be a failure. It is not the Government, let me be quite clear—who is responsible for this strange and most awful attitude of the police. It is the white silvery pieces with our dear King's picture engraved on them which the beastly capitalists have so unjustly and so immorally managed to hoard that are, as a matter of fact, responsible for killing the spirit of the workers.

124. *Conciliation and Arbitration Machinery.—Opportunity afforded for Labour representations.*—All employers do not afford suitable opportunities for making representations on behalf of labour. They have set up what they call "Recognition of a Union." No negotiations or correspondence is made with the union which is not "recognized." No office-bearer of an "unrecognized" union is even granted an interview even to represent the workers cause. A provision ought to be inserted in the Indian Trade Unions Act which may provide for the *ipso facto* recognition of a union however humble it may be. The shibboleth of "recognition" ought to be done away with at once. When there is a Union, the employer should not put artificial obstacles in the way of the representation of the cause of the employees.

125. The Indian Trades Disputes Act was passed by the Assembly on the memorable day when a bomb was thrown into it. It came into force on the 8th of May, 1929, although, quite contrary to practice, the rules to be prescribed under it have not yet been framed. It has been aptly described as a panicky sort of legislation chiefly designed to curb the spirit of the workers and to all intents and purposes, prohibiting their strikes and thus putting an end to launching an economic war upon the capitalists. The measure was passed by the Assembly in the teeth of the labourers' opposition. It is therefore a thoroughly unpopular law and it is time that it should be amended.

It penalizes the cessation of work by workers engaged in utility services without notice, but it does not penalize the employers who without notice, discharge, dismiss or punish otherwise an employee. It does not punish an employer who would give insufficient wages to his workers. "Black legs" have been protected. It allows the Tribunal to adjourn the proceedings. This adjournment for an indefinite time may be used as an instrument to starve the men out. The labour representatives are not necessarily members of a Tribunal or of a Board. No panel system is provided. The function of a Board of Conciliation and those of a Court of Inquiry overlap to some extent. The Inquiry may be held in camera. Lawyers are not to appear in the Court of Inquiry. No corresponding advantages are given to the utility services although they are put under certain disadvantages under the Act. Strikes under certain conditions are to be illegal. It virtually penalizes sympathetic strikes.

#### XVII.—Administration.

133. *Central and Provincial Legislatures.*—The labour legislation is a central subject and, therefore, all labour laws of All-India importance are enacted by the Legislative Assembly. This is as it should be. The conditions of labour are about

the same everywhere in India, therefore, all labour laws must be enacted by the All-India Legislature. In the Bombay Presidency, in Assam, and in Madras, certain labour problems have cropped up peculiar to those provinces, and, therefore, suitable provincial labour laws have been enacted there. In the Punjab, no particular necessity of any provincial importance has arisen to justify the enacting of a Punjab labour law, and, therefore, none has been passed by the Punjab Legislative Council so far. I do not know about the attitude of the provincial legislatures of other provinces towards the labour matters, but about the Punjab Legislative Council, of which I have been a labour member for about three years now, I can say with confidence that its attitude, on account of its being a communal and capitalistic body, has always been indifferent towards it. There are certainly reasons for it. In the first place, the Punjab is predominantly an agricultural province. Secondly, the labour problems of this province are not so wide, so acute and of political importance of such a magnitude as to attract the attention of the council often.

The attitude of the Central Legislature may be described as a "forced benevolent sympathetic" one. In the Assembly, the majority consists of big landlords and of big magnates of industry and commerce. It is an out and out capitalistic body. If it had its own way, it would certainly crush the labourers and workmen of India and reduce them to mere slaves. But thanks to the sympathetic attitude of the Government and some of the members of more advanced views based on far-sighted statesmanship, the Assembly generally takes a sympathetic attitude towards the labour problems and takes pretty keen interest in solving them. So far it has passed the Workmen's Compensation Act, the Trade Unions Act and the Trade Disputes Act. The Maternity Benefits Bill, of Mr. N. M. Joshi, and the Weekly Payment of Wage Bill, of D. Chaman Lall, have been rejected. Under these circumstances I would suggest that some more labour members ought to be provided for both the Assembly and the Councils, so that they may jointly do something for labour in their respective legislatures. One or two labour members cannot obviously carry the Council with them.

134. *International Labour Organisation.*—So far as I know, the Government always brings a resolution in the Legislative Assembly not to ratify conventions passed by the International Labour Conference at Geneva. All sorts of reasons are advanced by the Government for not ratifying it. I would submit that all conventions of the International Labour Conference should be ratified by the Government if they are not declared expressly by the conference itself that they would not apply to India. The conventions of the International Labour Organization have their own effect on the labour legislation in this country. The sympathetic attitude of the Government and the keen interest taken by it in the labour legislation and labour problem of this country are certainly due to a large extent to the International Labour Office at Geneva. A branch of this office has recently been opened in Delhi also.

137. *Effect of Differences in Law or Administration in British India and Indian States.*—In no Indian state, so far, has labour legislation been introduced. So backward and so antiquated are they. No restrictions as regards the employment of child and women labour, no fixation of hours, no provisions for compensation, no formation of trade unions, no fear of trade disputes, no rules for safety, and no labour leaders so far exist there. It is, therefore, that some of the most selfish and greedy capitalists have shifted to the Indian states from British India. But with my experience of Indian states, I can say that they never prosper there and they are sure to retrace their steps towards British India again. Under these circumstances the labour laws of the Government of India should by order also be introduced *pace facto* in all the Indian states.

#### XVIII.—Intelligence.

146. *Future Developments necessary.*—I have already stated that the Punjab is sure to develop its industries in the near future immensely, with the opening of the Mandi Hydro Electric Works at Jongindarnagar, and hence industrial labour in this province also will likewise become very important. It will, therefore, be necessary to set up all those labour machineries that have been set up by the industrially developed countries of the world. The establishment of a labour office with a labour commissioner in charge of it is very necessary indeed. All questions relating to labour should be entrusted to this office. A labour gazette should be issued by this office either monthly or quarterly as might be deemed necessary, giving all the statistical data after the labour gazette of Bombay. The Punjab is the nearest province to the Bolsheviki Russia, and in order to save the

labouring classes of this province from becoming militant, it is not only necessary to keep them satisfied but it is also necessary to watch them with a lynx eye. This can be done if my humble suggestions contained in this humble memorandum of mine are so kindly accepted to the best advantage of all parties concerned.

DAGMAR CURJEL WILSON, M.D. (GLASC.), D.P.H. (CAMB.), WOMEN'S  
MEDICAL SERVICE, INDIA (RETD.).

*Introductory.*—My experience in Bengal industries has been published by the Government of India in the Bulletins of Industries and Labour, No. 31, "Women's Labour in Bengal Industries."

What I learnt about conditions among women and children on the Bihar coal-fields has been incorporated in a report to the Jharia Mines Board of Health, Dhanbad, from whom it is obtainable.

My survey of conditions among women and children employees in the mills and tanneries of the British India Corporation, Cawnpore, was done at the request of that firm, and submitted to them.

This present note refers to experience gained in the Punjab in the course of my work, first as Woman Assistant to the Inspector-General of Civil Hospitals, Punjab, and latterly while working under the Indian Research Fund.

In the Punjab I have come in contact with women workers in the following industries:—(a) Cotton ginning; (b) women workers at Khewra salt mines; (c) women workers on Kangra tea estates; (d) women home workers at Amritsar.

III. 16. (a) *Cotton Ginning.*—The employment is seasonal, and the majority of workers come in daily from their neighbouring village homes.

IV. 23. No reliable mortality figures are available. Northern Indian women generally tend to marry early (at about 14 years) and go through a large number of pregnancies, so that the infant mortality rate is relatively high. The abortion rate is also high, as also the death rate between one and two years of age.

The atmosphere in a ginning factory is full of dust and any real ventilation is usually absent. In the districts where ginning factories are situated the people are accustomed to a fairly balanced diet, the amount only being limited by their economic condition.

Physique varies, on the whole, village women and children compare favourably with the poorer inhabitants of towns, and the yearly period of work in ginning factories is of short duration. These women, as is general in India, often suffer from the effect of prolonged lactation (reason: partly economic and partly due to the firm conviction that lactation prevents them becoming pregnant again). They are also like the rest of the population, frequent victims of malaria.

A recent survey which I made of Punjab children's teeth showed the presence of marked hypoplasia, co-related with clinical histories of fever.

24 and 25. *Medical Facilities.*—Village women who come into ginning factories know little of the medical relief which may be available at the town civil hospital. They would also plead that they have not the time to go and wait for treatment there. Female medical relief in the Punjab is advanced compared with many other Indian provinces; and in the towns where ginning factories are situated there is usually a woman sub-assistant surgeon attached to the civil hospital. Such women, however, though doing useful work in the town, suffer from the limits of their training, their knowledge of preventive medicine is very limited, and they usually come but little into contact with the woman workers in the ginning factories.

Often a trained midwife or dai is also attached to the women's department of the civil hospital. She may also carry on considerable practice among the better class town folk, but the village woman worker usually seeks the aid of her customary indigenous dai at the time of child birth.

If the management were willing to bear the expense, there seems no reason why the woman sub-assistant surgeon should not at least, one afternoon a week, attend at the ginning mill during the time women workers are employed there and the women workers be allowed to come to her for advice and treatment during their working hours. A medical woman, if tactful, has rarely any difficulty in attracting Indian women patients, who will not readily go to men doctors.

26. Sanitary arrangements are usually primitive, but those to which the workers themselves are still accustomed.

29. Malaria is the chief disease complained of, and anæmia is often present. The duration of employment in ginning mills is short, and there is no evidence to prove that these women's lungs are permanently affected. Tuberculosis in the Punjab is mostly a disease of the larger towns and cities.

V. I have no experience of any special welfare arrangements for women in ginning mills. Managers have told me they wished they could keep young children off the premises, but the short annual duration of the women's employment does not encourage the provision of creches or other amenities.

VI. There is but little literacy among the class of women who seek work in ginning factories.

IX and XVII. There is a general impression that during the cotton ginning season, women are worked overtime. The factory inspecting staff is very few in number, and millowners see no disgrace if possible in evading the law.

This question was brought up by me before a large audience of educated Indian women at the last meeting of the Punjab Provincial Women's Conference for Educational and Social Reform at Lahore, and it was decided that educated Indian ladies should try and create a public opinion against the evading of factory laws.

(b) *Khewra Salt Mines.*—The general observations made about Indian women workers under (a) apply also to the women workers at Khewra. Special points are that the facilities for medical relief are better, but there is ample scope for the provision of a trained woman health visitor to work among this special community.

As in many other Indian mines the least good condition are among the women surface workers.

(c) *Women Workers on Kanga Tea Estates.*—Women do coolie labour on tea estates a large part of the year, while living in their own village homes. They state their average earning as about 2 annas a day. For reasons which I am at present investigating in connection with my osteomalacia enquiry under the Indian Research Fund (aided by the Punjab Government), their diet is extremely unbalanced, and among them I have found conditions analogous to the "Hunger Osteomalacia" prevalent in Central Europe immediately after the war.

There is but little provision for female medical relief in the upper part of the Kangra valley, but where available the women eagerly seek treatment.

(d) *Women Home Workers in Amritsar City.*—In connection with my osteomalacia enquiry, I have been investigating the living conditions of women in Amritsar City. Women do not care to work among men in the carpet factories, but do a certain amount of joining together of small pieces in their own homes.

Amritsar is a damp town, the sub-soil water level being high with very narrow streets and high buildings.

Mahomedan women who observe *purdah* especially suffer from lack of sunlight, and the city is one of the centres of rickets and osteomalacia in the Punjab. There is also much tuberculosis.

There are efficient Government and mission hospitals for women, which are much used when the women and children are really ill; but of preventive medicine little is yet realized or practised, and there is a large scope for health education among the general population, especially through the schools.

---

## THE CENTRAL LABOUR FEDERATION, PUNJAB.

The leaders of the trade union movement in Punjab organized a central body by the name of the Punjab Labour Board in the year 1926 on the initiation of Mr. N. M. Joshi, General Secretary of the All India Trade Union Congress, who arranged a meeting of the different leaders in the Y.M.C.A. Hall. There existed before this three bodies claiming to be the central organizations for the Punjab, but actually they were not the real central organizations of the trade unions in Punjab. Mr. M. A. Ghani was made General Secretary of the Labour Board. In the year 1927, when election of the office bearers took place, Mr. S. D. Hasan was elected General Secretary and Mr. M. A. Khan as President, but unfortunately Mr. M. A. Ghani refused to hand over charge of his office to the new General Secretary, who was directed by other members of the Board to start a new office under the name of Punjab Labour Board. Meanwhile, the Trade Union Act came into operation, and an application duly signed by the members of the Board was presented for the registration of the Punjab Labour Board. Mr. M. A. Ghani also counteracted this application by presenting another application for the registration of the Punjab Labour Board, showing himself therein as General Secretary of that body. The

matter prolonged, and the Registrar had to take explanation from both sides. In the meantime, legal trick was played and Mr. M. A. Ghani got the certificate of registration of the Board. When we were asked by the Registrar to change the name of our central organization and, after some consideration, the members decided that the name of the Punjab Labour Board should be changed into that of the Central Labour Federation, Punjab. This having been done, a certificate of registration was also granted to this body by the Registrar.

*The present organization of this body.*—It is composed of the leaders of the different trade unions in Punjab. The strongest organization, viz., The General Workers' Union, North Western Railway, with other small organizations, are affiliated to this body.

*Activities of the Federation.*—This Federation co-operated with the Simon Commission, and submitted a memorandum and gave evidence, urging before the Commission certain demands of the Punjab labour, so far as its political rights were concerned. There was a strike of Dhariwal workers, and the Federation gave help of 200 hundred rupees to the strikers, and visited the mill manager with a view to settle the strike. After the deputation was led by Mr. M. A. Khan, President, and Mr. Hasan, General Secretary, and other members of the Board, the demands of the strikers were discussed for about three hours with the mill manager, Mr. Lewis. The settlement being unsatisfactory and disapproved by the strikers, they refused to go back to work.

Messrs. M. A. Khan and S. D. Hasan, President and General Secretary respectively of the Central Labour Federation, were very graciously granted an interview by His Excellency Sir Geoffrey de Montmorency, the Governor of the Punjab, on 26th October last year, when, after thanking His Excellency, it was submitted before His Excellency that the real trade union leaders have been ignored by the Government as to their appointment as Labour members in the Punjab Legislative Council. Also it was pointed out that no chance has been given to real labourists of this province to represent labour in the International Labour Conference of Geneva. His Excellency promised to give full consideration to the matter when time comes.

Another deputation of the Central Labour Federation met the Minister for Local Self Government, and urged the nomination of Labour members in the municipalities and district boards in different big towns like Lahore, Amritsar and Ludhiana, etc. It is yet to be seen whether the Government will nominate Labour members or not, but the Minister promised a consideration of the matter.

Steps have also been taken to help the re-organization of a union in Dhariwal, but due to the resistance of the employers, it seems to be very difficult unless the employers are compelled to recognize the registered trade unions, and are prepared to grant them the facilities for the organization of a union.

Mr. M. A. Khan, President of this Federation, has submitted a separate memorandum which deals with the terms of reference to the Commission, and a schedule of the subjects falling within them in connection with the General Workers' Union, North Western Railway, which is affiliated to this body, and most of the items to be replied by this Federation have been dealt with by him in that memorandum, and therefore it will be reiteration to discuss them again.

There are a few grievances of the Tonga Workers' Union. The main grievance being the operation by the traffic police. This can be ascertained from the number of the Tonga drivers having been fined during the last year. There will not be scarcely any Tonga driver in Lahore who would have escaped punishment from the Law Court. They are also treated by the police in a very contemptuous way, filthy and abusive language is a common thing. In the Law Court, they are not allowed even the chance of defence. Here it may be urged that the secretary of a registered trade union of Tonga workers or the general secretary of this Federation should be permitted to advocate their case in the Court whenever needed. There is another trouble regarding the recognition of its union by the Municipal Committee, even though it is a registered body.

The other unions affiliated to this body are Motor Drivers' Union, Laundry Workers' Union, Press Workers' Union, which are working on mutual benefit system.

## THE PUNJAB PROVINCIAL TRADES UNION CONGRESS, LAHORE.

### I.—Recruitment.

3. (i) There are numbers of existing methods of recruitment, but unfortunately some of them are condemnable. (a) A mate sometimes induces the poor labourer to follow him, and the former gets commission or remuneration from the employers.

for supplying the labour. That commission or remuneration for all intents and purposes constitutes a reduction in the wages of the labourer. Though it must be conceded that the services of a mate in collecting the labour for the employer are not valueless in all cases. (b) The labour contractors are very helpful in supplying the labour to the employer. (c) The agents in the service of the employer to import the labour. (d) In case of railway and some other industrial departments some officials are employed in particular to recruit labour.

(ii) The desired possible improvement could be made by training the labour to seek for employment for themselves without intervention of an agency. This improvement will go to create reciprocal benefit both to the employer and employee : (a) Organized union of labour ; (b) Appointment of bureau.

(iii) (a) On various grounds it appears to be desirable to establish public employment agencies. To our mind some defects in the subsisting methods will be removed.

(b) There is a possibility of practical schemes in this direction. Various trade unions can function in supplying, respectively the required and particular kind of labour to the employer subject to constitutionally fixed conditions advantageous to both the employer and employees. The aforesaid various unions may have a central controlling body to which the requisition for labour may be sent directly. The expenditure of maintaining such central controlling office will be borne by the Government, with some reasonable contribution to be made by the employers. The honest and constitutionally recognized labour procuring firms or offices may be opened on the approval of both the Government and central controlling body and the trade unions concerned.

7. (i) (a) So far as unskilled labour is concerned, it is idle to complain much on the ground of unemployment in the Punjab, excepting abnormal cases of retrenchment and dismissal.

(b) In case of skilled labour of some particular class the question of unemployment makes its appearance. In case of clerks the complaint respecting unemployment appears to be general and real.

(ii) (a) The retrenchments and dismissals both in case of unskilled and skilled labour are deeply felt, and the aggrieved persons have seriously been resenting since last few years, which gives sometimes birth to discontent and economic trouble.

(b) Voluntary retirement, unless it is virtually forced, does not create a trouble, nor does it give rise to the controversy centering round the questions of unemployment.

(c) There are many other causes, as for instance too much inclination for State service, which appears to be due to lack of national and industrial education.

The unsuitability of the modern system of education in many cases constitutes a cause for unemployment ; non-realization of dignity of labour ; lack of real encouragement to indigenous industry.

(iii) *Possible methods of alleviating and remedying distress.*—(a) Industrial development in the country and opening of such useful works which may go to invite the unemployed and other persons without embarrassing the country economically.

(b) The legislature may provide to fix the percentage of profits to the capitalist or employer, and the remaining profit to be distributed amongst the employees.

(c) True trade unionism and its chief principles should be respected.

(d) Free trade should be done away with, subject to suitable legislative measure to prevent the propensities of getting exorbitant profits on the part of the manufacturers and dealers.

(e) National and industrial education.

(f) Strict compliance with the Trade Unions Act without any direct or indirect interference on the Executives. Unemployment insurance will go along to meet the difficult problem of unemployment to a certain extent. By various methods the unemployment insurance, when properly and constitutionally guided, might prove a very good remedy. It can successfully work by the following methods :—

(iv) *Unemployment Insurance.*—(1) Securing service on the payment of a fixed and reasonable premium as it is done in life and fire insurance companies. (2) In case of retirement or dismissal, getting monetary aid on the payment of a certain fixed premium, as in the case of insurance companies. (3) Provident fund to be opened by the employer or by the union whose member he is. (4) Co-operation with a view to support each other. (5) Application of international conventions relating to unemployment. Application of international conventions relating to unemployment is a very useful scheme and method indeed to some extent.

## II.—Staff Organization.

13. (i) Relations between staff and rank and file ought to be harmonious, but unfortunately, in many cases, the relation is constrained, and the constraint of the relationships affects the production of the labour materially and reduces the labour efficiency.

(ii) Jobbers do not lead to efficiency nor does it render the labour advantageously productive; so far as the value of such employment is concerned, it is of temporary character and not much.

(iii) Works committees are very useful bodies, their constitution by a combination of both employers and employees will be of material help. They are sure to make industrial achievements in number of manners.

(iv) Works Councils and Industrial Councils by their good administration render the factories more productive and minimize the chances of strike.

15. (i) Most of the works are done by contracts. The contracts of such works are generally those in which highly scientific and technical knowledge is not required.

(ii) The practice of executing by subcontracts obtains in the Punjab, and it goes a long way in expediting the work.

(iii) The controlling authority of employer or departmental head supervises the work so done and acts as controller.

(iv) *Effects.*—The execution of works by contracts and sub-contracts is more rapid and economical, especially in Government departments.

## IV.—Health.

30. (i) The international labour convention concerning the question of sickness insurance is suitable on various grounds.

(ii) The other systems to secure insurance are possible and feasible.

(iii) The difficulties could be met by the introduction of homoeopathic medicine, which is the most cheapest and suitable to Indian temperament.

31. *Maternity benefits.*—(i) In the Punjab no such system subsists as far as we know, but the system will work very well, and ameliorate the constitution of labour if the maternity benefit is extended.

## VI.—Education.

40. To our mind nothing but free and compulsory education will solve the great problem which is our greatest desideratum, capitalists owning big factories should provide good schools severally or jointly for the education of the workmen and their children. When there is a group of small factories, the number of which employees is more than one hundred, the Government should be approached to open a school in such industrial area, and promulgate a law whereby workers and children should have obtained compulsory education, and where there a group of big factories the education should be compulsory to the high standard and the curriculum should provide training on industrial subjects. Night schools would be more preferable.

41. So far as we know, no facilities and vocational training is provided by any employer for the employees, which is a great drawback to the efficiency of labour. Of course, there are few Government industrial schools and Maclagan College of Moghalpura, but their accommodation is very limited, and competition is great and hard. Hardly 5 per cent. candidates are admitted.

42. The effects of education on standard of living and industrial efficiency of workers cannot be questioned, when the eating of a fruit of knowledge tree by Adam and Eve opened their eyes and made them wiser, so how it could possibly be expected that the labour with open eyes will not crave for better living. But it all depends upon the degree and sort of education imparted. Anyhow, education will have a healthy effect on the person who receives in increasing the industrial efficiency to the mutual gain of the employer and the employees and the country.

## VII.—Safety.

43. The Indian Factories Act, 12 of 1911, Section 37, with the regulations for safety in factories in the Punjab. These rules are fairly exhaustive, but are not strictly carried out as it ought to be. There must be a provision for compelling a factory owner to have a suitable fire extinguisher and apparatus sufficient to meet an emergency. The existing regulations in factories, railways, mines and docks are fairly well considered, but are not so strictly applied.

44. With the increase in the number of the factories brought under the Indian Factories Act, there was a deplorable increase in the accidents, too. In 1919 the total number of accidents was 241, with an average of .62 out of 100 operatives, but only nine years after, in 1928, the total number went up to 1,019, showing the average of 1.97 out of 100 operatives.

This increase really is very alarming, and must be checked at once through strict application of the law.

46. The following suggestions may be safely put forward as prophylactic measures for these accidents :—

- (a) Prosecution of the employees for the non-compliance with the safety rules.
  - (b) " Safety first " propaganda.
  - (c) Wearing of tight clothes during working hours.
  - (d) Changing of the pulleys in a safer manner.
  - (e) Use of eye protectors.
  - (f) To put competent workers on improved and newly imported machines.
  - (g) Strict application of the Compensation Act.
  - (h) And acquainting the workers with the " Safety rules."
- Other suggestions can also be made on the subject.

48. This first aid is one of the most important items, and should be given a special attention. Workers should be trained in " First Aid " and be supplied with first-aid books free of charge. Homoeopathic medicines being cheaper and better are preferable.

#### VIII.—Workmen's Compensation.

51. (i) (a) In July, 1924, the Workmen's Compensation Act came into force in India, but on account of their illiteracy was not fully availed of by the workers. The employers always try to suppress accidents by improper means or just to adjust the matter out of court with payment of a few rupees to the victim of accident or his bereaved family.

(b) Illiteracy, ignorance and poverty are the chief causes of paucity of claims.

(c) We would like to make the following suggestions :—(1) A written report of an accident should be submitted without further delay to the local police, and a copy thereof be forwarded to the proper authorities. The breach of this rule should be made penal ; (2) No cost of fees should be required in compensation case ; (3) The Commissioner appointed under the Act should take action *suo moto* ; (4) The legal aid should be given by the Government without charges ; (5) The enquiry should be held than and there ; (6) The evidence should be recorded immediately on the spot, without giving a chance to the employer to suppress it ; (7) No case should be compromised without the previous sanction of the Commissioner ; (8) The trade union of which he is a member should also be consulted in the matter.

#### IX.—Hours.

About 9 hours a day, or 60 hours a week is the ordinary period of work in factories, but 48 hours would be most useful for an effective work.

#### XII.—Wages.

Wages of the labourers have risen during the last ten years, but they are still inadequate in comparison to the rise in the cost of living. The scavengers are the most poorly paid labourers in the province.

The British Government is the largest employer, it should take the lead in enhancing the wages of the labourers, so that the private employers and quasi Government institutions may follow the suit.

#### XIV.—Trade Combination.

Trade unionism in the Punjab had been in the infancy. It requires encouragement at the hand of the Government. The instructions of the Punjab Government against the registration of the unions of the Government employees should be withdrawn.

**XV.—Industrial Disputes.**

There were several strikes in the province. They were chiefly due to inadequate wages and ill-treatment. They lasted at the most for six months. They concluded on the compromise of the employers and the employees. They ended generally to the detriment of the labourers. The failure was due to inefficient organization and deficiency of funds.

**XVII.—Administration.**

136. There should be a separate Ministry of Labour. All the mills, factories and industrial institutions should be under it. It should look towards the welfare of the labourers. The Government should provide legal help to the labourer in factories in the matter of accidents and recovery of wages.

There should be adequate representation of labour on all the local bodies and legislatures.

**THE EAST INDIA CARPET COMPANY, LIMITED, AMRITSAR.**

The East India Carpet Co., Ltd., have four factories in Amritsar :—

Hakeeman Gate	..	95	looms,	out	of	which	48	working.
Hall Bazaar	..	64	"	"	"	"	43	"
Sultanwind Gate	..	66	"	"	"	"	2	"
Mori Gunj	..	42	"	"	"	"	—	"

Total .. 267 looms, out of which 93 working.

The labour is paid on the piece-work basis.

The wages earned by a master-weaver or loom-holder vary from Rs. 30 to Rs. 50 per mensem, and even upwards, according to the ability of the weaver.

The factories are opened in the early morning. But the weavers do not generally start working as soon as the factories are opened. Even when they arrive at the factories when the gates are opened they avail of the washing facilities provided, and a considerable amount of time is lost before they settle to work.

The carpet weaving being given out on the contract system, no compulsion is enforced as regards working hours. The weavers are free to come into the factories and leave them as and when they please. The actual routine hours do not exceed 8 hours during the winter and 10 hours during the summer. The weavers' houses are quite near the factories and they naturally are continually passing to and fro.

Medical facilities are provided. A doctor visits the factories each fortnight and certifies the age of any new apprentice. No boy under nine years of age is admitted to apprenticeship. The weavers are at liberty to go to the doctor in case of need at any time. Medicines are provided free.

The health of the weavers and their general physique is good. The only complaint we have of our weavers is that they do not get sufficient work owing to the depression of trade and foreign competition, which has enforced us in the last eighteen months to reduce the number of our working looms from 267 to 93. But in a general way, and as long as there is work to give the weaver, he remains at his work in a permanent way and does not try for other employment.

One very unusual feature of this industry is the absence of indebtedness to money-lenders, as advances without interest are afforded by the Company when necessary.

Lieut.-Col. G. M. ROUTH, C.B.E., D.S.O., I.A.O.C., CHIEF ORDNANCE OFFICER, RAWALPINDI ARSENAL, OFFG. DEPUTY DIRECTOR OF ORDNANCE SERVICES, NORTHERN COMMAND, RAWALPINDI ARSENAL.

The total personnel employed, about 2,000, are made up as follows (nearly) :—

(a) Officers and other British Ranks	..	..	..	..	100
(b) Sepoys	..	..	..	..	300
(c) Clerks (Permanent)	..	..	..	..	100
(d) Artificers (Workshops)	..	..	..	..	500
(e) General Labour, for storekeeping, internal transport, etc.	..	..	..	..	1,000

Of these (a) and (b) are regular soldiers.

(c) are civilians.

(d) and (e) are on daily rates paid monthly.

2. (a) and (s) live in Rawalpindi and neighbouring villages. They are in every sense casual labour. They have no security of tenure, neither do they now lose anything but their job if they stay away (more than 6 days). They are subject to short time (5 days a week) if the reduced arsenal labour budget necessitates. They are recruited by mates and Mistris who, "bring them in." The arsenal has no concern with men out of working hours. No industrial dispute has arisen within my knowledge.

3. Efforts are made to keep the balance between castes, but these efforts are personal rather than statistical.

Men are employed from father to son if they so wish, but no efforts in this direction are made by the administration. When men become too old for work, they are usually, but not necessarily, put up for a bonus in proportion to their record, but any long period of absence often invalidates their claims. The bonus may vary from three months' pay to perhaps a monthly pension or grant of land in very special cases.

4. These men have no organization whatsoever. Economic causes and the absence of much other local employment mean that the Chief Ordnance Officer has no need, other than humanitarian or with a view to improving out-turn, to show the men any consideration at all. Speaking generally, in fact, none of the problems usually connected with labour arise in any form in this arsenal. It is a fact, however, that the absence of competitive spirit or incentive in selection has definitely reduced the standard of labour in the arsenal as compared with civil industries in the neighbourhood. It is hoped some form of bonus system may improve this.

5. Artificers of a sort are very easily obtainable. Trade testing, however, shows the local standard to be deplorable. Trade Testing in Rawalpindi Arsenal did not, as in Ferozepore Arsenal and Kirkee Arsenal, cause unrest partly because artificers are too easy to get and could not afford to complain, and partly because the arsenal standard in Rawalpindi Arsenal was not so noticeably below the local standard as in Ferozepore Arsenal and Kirkee Arsenal and did not thus lead to such a general reduction in wages.

. . . . .

**KHAN BAHADUR GUL MUHAMMAD KHAN, EXTRA ASSISTANT COMMISSIONER IN BALUCHISTAN.**

The industrial development of Baluchistan is still in the most primitive stage.

2. The total area of the province is 134,638 square miles of which only 46,960 square miles represents British Baluchistan and British administered territory, the remainder being under native states and tribal territory. The total population of the province including native states and tribal areas is 834,703 of which British Baluchistan and British administered territory represent only 379,646. The sub-joined table will show that according to the census of 1921, out of a population of 379,646, only 13,084 persons were employed in industrial undertakings of which 139 were females.

	Males.	Females.
1. Extraction of minerals, coal mines and petroleum ..	1,149	7
2. Textiles .. .. .	341	2
3. Hides and skins .. .. .	17	—
4. Wood workers .. .. .	689	—
5. Metals .. .. .	1,400	—
6. Potters and brick makers .. .. .	93	—
7. Food industries .. .. .	1,039	24
8. Industries of dress and the toilet .. .. .	2,031	102
9. Furniture makers .. .. .	36	1
10. Building industries .. .. .	1,027	1
11. Construction of means of transport .. .. .	25	—
12. Jewellers and printers .. .. .	417	2
13. Transport by road .. .. .	4,681	—
Total .. .. .	12,945	139

Strictly speaking, however, the majority of these 13,084 workers are not working in any organised industries. Taking the largest item in the table, i.e., "Transport by Road," all these 4,681 persons are pack animal drivers and owners. The next largest item of "Industries of dress and the toilet" includes largely washermen (dhobis), private tailors, and tailors employed by military contractors, private shoemakers and barbers. Similarly "Building Industries" includes largely private masons, contractors and irrigation channel excavators. Organized industrial institutions of a permanent nature are but few. According to the returns of establishments, industries and factories in which the average daily number of employees during the year 1928 was 30 or more, there were all-told five such establishments, industries and factories in British Baluchistan and the British administered territory besides coal and chromite mines, namely:—

	Average daily number of persons employed.
<b>1. Government and Local Fund Factories.</b>	
Engineering (general) .. .. .	106
Ordnance Department factories .. .. .	947
Railway workshop, including engine shed .. .. .	88
Total .. .. .	1,141
<b>2. All other factories.</b>	
The Quetta Murree brewery .. .. .	66
The St. John Steam Flour Mills .. .. .	34
Total .. .. .	100
Grand total .. .. .	1,241

Of these there were 26 juveniles employed in the Quetta arsenal. No female were employed in any of these industries.

	Open working.	Above ground.	Below ground.	Total.
<b>3. Mines.</b>				
(a) Coal mines .. .. .	—	33	122	155
(b) Chromite .. .. .	105	44	35	184
Totals .. .. .	105	77	157	339

It is clear from these facts and figures that Baluchistan can hardly boast of being more than an unknown entity in the field of industrial undertakings and I, therefore, feel diffident that I can furnish any information in respect of this province which will prove of any value for the purposes of the enquiry entrusted to the Royal Commission on Labour.

## CHIEF COMMISSIONER, DELHI.

### *Memorandum on Labour Conditions in Delhi Province.*

#### L.—Number of Industrial Labourers in Delhi.

In the absence of any Government agency or labour organizations it is difficult to form an accurate estimate of the number of non-factory labourers or to arrive at any accurate idea of the condition in which such labourers live. The difficulty is enhanced by the fact that non-factory labour is scattered all over the city except in the case of chamars, who are to be found living together in small colonies, or as they are called "bastis." It has only been possible to consult a few large employers of labour, the labourers themselves and certain social workers.

It is estimated that there are about 60,000 industrial workers in Delhi of whom, according to the last report on the working of the Factories Act, 10,448 are employed in factories registered under the Act. Without statistics for non-factory labour it is estimated that the labour may be classified approximately under the following heads :—

(1) Building trade .. .. .	20,000
(2) Textile .. .. .	8,000
(3) Gold and silver thread lameta work embroidery and thread ball making .. .. .	7,000
(4) Engineering, general .. .. .	6,000
(5) Tanneries and leather works .. .. .	4,000
(6) Iron and brass foundries and allied works, including trunk making .. .. .	3,500
(7) Printing .. .. .	1,500
(8) Biscuit manufactory, preserves and pickles, and aerated water factories .. .. .	1,500
(9) Woodwork .. .. .	1,500
(10) Soaps, chemicals, dyeing and printing .. .. .	1,200
(11) Gold and silver leaf, pottery and hosiery .. .. .	1,200
(12) Cap making, ivory and paints .. .. .	500
(13) Miscellaneous .. .. .	4,100

According to the factories report the labour employed in factories during the year 1928 was 9,990 men, 190 women and 263 children between 12 and 15 years of age. Of these 7,011 are employed in textile factories, 1,196 in the Public Works Department workshops, 357 in ironworks, 706 in printing presses and 1,173 in all other factories. Eighty per cent. of these workers are employed throughout the year. Work in iron foundries as well as in the cotton ginning departments attached to the three cotton weaving and spinning mills remains slack during the months of May to October each year. Ice factories remain closed during the period October to April. Of the total number of women and children 167 of the former and 228 of the latter are employed in the textile mills.

#### II.—Sources of Recruitment of Labour.

Recruitment of labour is not a serious problem for the factory owners. They attach little importance to references except in the case of the supervising and mechanical staff. The employer frequently takes a worker for a week or more on trial, during which period wages are not always paid.

Labour in textile mills was originally imported from Ahmedabad and Bombay, but little is now obtained from outside the province, the occupation being passed on from father to son.

The local labour market is unable to provide more than a small proportion of the labour required for large building works like the construction of New Delhi. The bulk of the labour, both skilled and unskilled, was imported from Rajputana and Northern and Central India. Most of these workers were agriculturists by origin, and even the artisans are more often than not small agriculturists who desire to supplement their income. The unskilled labour has now for the most part settled

down, but the stone masons, who are drawn from Northern and Central India return to their homes and lands at the busy agricultural seasons. As the amount of work in the Public Works Department has considerably decreased during the past two or three years it has caused a surplus of unskilled labour in Delhi.

The labour employed in small industries is scattered all over the city. The occupation is generally passed on from father to son. Those employed in iron foundries are recruited locally, and the industry having been one of the chief industries of Delhi for centuries, the workers have become highly skilled in this line. The province also possesses a number of skilled potters who are employed in the pottery works. This industry is, however, not as flourishing as it was twenty or thirty years ago. The total number of persons employed in the pottery works registered under the Factories Act was 123 during the year 1928.

### III.—Medical Relief, Health and Sanitation.

The city and suburbs are well provided with hospitals and indigenous dispensaries where free medical aid can be obtained. The Delhi Cloth Mills employ a compounder to render first-aid when necessary, but the location of an up-to-date municipal dispensary in the neighbourhood has saved the mills any further expenditure on medical relief. The Birla Mills have a qualified practitioner, who attends the mill premises morning and evening for two hours. The company also provides a sufficient supply of medicines. The Khalsa Spinning Mills give an allowance to one of the municipal doctors, who pays a weekly visit to the mill area and attends at other times when specially summoned.

The health of workers employed in small industries in the city is said to be fair on the whole, while in the larger factories it is generally good, but in the absence of statistics it is not possible to say what percentage stay away from work owing to sickness, as the factory registers merely indicate absence from work. The larger mills are mostly well ventilated and healthy to work in, but there is much room for improvement in smaller factories, specially those built in congested city areas. No occupational disease has yet been reported. Lead melting is carried on in two of the printing presses, but sufficient precautions are taken against lead poisoning.

The chief medical officer notes that chronic bronchitis has been noticed in some of the labourers, and general debility is appreciably present among the low-paid workers in the mills.

Coolie camps in New Delhi are a special feature, and a note on labour conditions at New Delhi by Major Webb, health officer, New Delhi, and assistant director of public health, Delhi Province, is appended.

As regards general sanitary conditions in the factories the Inspector of Factories writes :—

“ Sanitary conditions in the larger and well-organized factories on the whole are satisfactory; in case of smaller factories sanitation frequently leaves much to be desired owing partly to the ignorance of operatives and partly to the lack of interest on the part of the factory management.

“ Latrines are provided for workers according to rules laid down in the Delhi Factory Rules; they are flushed and kept clean by persons specially appointed for the purpose. The habits of the labouring classes being generally dirty, latrines are frequently found to be in a very insanitary condition, due more to the workers themselves than lack of provision and supervision. There is a tendency on the part of big millowners to instal flushed latrines where possible.”

The lack of proper nourishment, the insanitary conditions and surroundings in which the labourers live and the want of recreation and amusements places them in an unfavourable position for resisting disease.

As regards the health conditions of the boy labourers the certifying surgeon states as follows :—

“ The boys recruited for working in the mills and factories are brought to me for medical examination before being employed. Those that are found to be under the age of twelve, and those physically unfit are rejected, those between twelve and fifteen being employed for half-day work, and those of fifteen or over for full day. These boys between twelve and fifteen have no occasion to appear for examination again until they are fifteen. It is likely that some of them may develop such constitutional diseases as rheumatic fever, tuberculosis, chorea, etc., but being armed with a fitness certificate are allowed to return to work as soon as the acute symptoms of the disease have passed over, thus getting no rest for long periods to acquire a complete cure or compensatory development in their organs. Such cases are often met with in the out-patient departments. I beg to suggest that this class of boys should be brought up for medical inspection periodically before a Government medical officer.”

The Chief Medical Officer is of opinion that boys between fifteen and twenty should not be allowed to work long hours in steam-heated rooms, and he considers that medical officers should be appointed by Government, their pay being charged to the millowners. During the year 1928, 1,056 children were examined. Of these 168 were found under age, 10 were declared unfit on account of disease, 576 were found to be fit and between the ages of twelve to fifteen, while 302 were passed as fifteen or over.

#### IV.—Efficiency and Education.

As regards efficiency the industrial surveyor, Sardar Mehtab Singh, writes :—

"The efficiency of industrial labour is claimed to depend on the chief factors affecting the standard of comfort and general health. With the rendering of the conditions under which industrial classes live more healthy and consequently more attractive, the relative efficiency is expected to show a definite and substantial rise, particularly in the case of organized industries. From the point of view of economic development, the problem of improvement of efficiency of the industrial operative which is known to be less than that of the corresponding class of worker in western countries has to be solved in the interest of facilitating effective competition with foreign industries. There is ample evidence to show that the discomfort of working conditions has invariably tended to produce adverse effect on the output. The evils of intemperance among the labouring population also affect to an appreciable extent their efficiency."

The Inspector of Factories observes as follows :—

"I am of opinion that the efficiency of the highly paid workers has increased considerably during the past five or six years. The industrial educational institutions have, to a great extent, been responsible for this. But in the case of labouring classes no improvement has been noticed; in fact the efficiency of these workers has not kept pace with the advent of modern machinery in the factories. In my opinion health is one of the chief factors governing the efficiency of a worker. Unless the labouring classes are well fed by a corresponding increase in their wages it appears a difficult problem to effect any appreciable improvement in this behalf."

Practically all labourers are uneducated, and very few employers take any interest in providing educational facilities for their employees. The Birla Cotton Mills, however, maintain a primary school for the education of the children of their employees, while the Delhi Cloth Mills have provided rent-free accommodation in their premises for two municipal primary schools. There is also a night school for adults.

The introduction of compulsory primary education within municipal limits will gradually remove this defect among the working classes. It may, however, be noted that the working classes generally do not look favourably on primary education, and would prefer some more practical form, while unskilled workers cannot afford to keep their children at school as they count on their assistance in adding to the family earnings from an early age. Coolie labour is constantly changing so that continuity of education is difficult.

As regards technical education the industrial surveyor observes :—

"The introduction of some form of primary education supplemented with elementary technical training among the labouring population appears desirable from the point of view of the development of a practical industrial bias in the workers."

Industrial education is provided in the Government Industrial School which has 275 boys on the roll, 186 primary and 89 middle. The number of boys in the middle department is lower than it should be owing to the ease with which partly trained boys get work outside. The boys attending the school belong almost entirely to the artisan classes. The boys are mostly very poor. The school is not well situated to attract the boys of the working classes, and it seems probable that there is considerable room for the expansion of industrial education by the location of branch schools in those parts of the city which are more largely inhabited by artisans.

#### V.—Housing and Standard of Living.

On the subject of housing the industrial surveyor writes as follows :—

"The provision of housing accommodation for the industrial population employed by the industrial undertakings in the province is a voluntary act on the part of the employer. The industrial establishments employing a limited number of workmen or carrying on business operations during a part of the year have evidently no intention to house their labour. The enlightened employer in the organized industries, such as textile and flour milling industries, has however made a provision on a fairly appreciable scale for the accommodation of his operatives, either free or at a rate

from 30 to 50 per cent. below the economic rent. The dwellings provided consist usually of the single storey lines in single-room units, with either a small projecting verandah or in some cases a narrow enclosed courtyard. The new coolie quarters of the Delhi Cloth Mills, Delhi, are an improvement in the direction of better housing. In a city like Delhi the problem of sanitation is an all important one and deserves special attention from the employers as well as the local authorities concerned. There is room for improvement in the arrangements for the supply of water, latrine accommodation and provision of light and ventilation. The desirability to provide for the housing of industrial labour on an extended scale and to improve the slum property appears evident at this date."

The inspector of factories observes :—

"Quarters are generally provided for the permanent staff, such as managers, engineers, etc., and in the bigger factories such as textile mills, flour mills, etc., quarters are provided for a number of their labourers as well. Housing of all workers is aimed at by the mill authorities, and a great advance towards this end has been noticed during the past three or four years.

"Workers in the smaller factories are not provided with quarters to any great extent. There are temporary coolie lines erected adjoining the big workshops of the Public Works Department.

"Quarters where provided are cleaner, well built and sanitary, and are appreciated by the labourers as the same are rented by the mill authorities at a less cost than such accommodation could be obtained otherwise."

The chief medical officer notes :—

"In general the labouring classes dwell in one room tenements and in poor bastis of the city where the rents are very low. Overcrowding to a marked extent prevails in quarters inhabited by them. An attempt has been made by the three big mills of the city, viz., Khalsa Mills, Birla Mills and the Delhi Cloth and General Mills Co., Limited, to provide residential quarters for some of their labourers. The labourers' quarters, built at Qarol Bagh by the Delhi Cloth and General Mills Co., Limited, require special mention, as they are built on sanitary principles. The only defect therein is that the drainage system is defective. The management of the mills is anxious to provide sanitary drains as soon as a sewerage system is provided at Qarol Bagh."

As regard the standard of living, Rai Bahadur Mr. Sohan Lal, Secretary to the Municipal Committee, Delhi, writes as follows :—

"Except the textile and flour mills, which have provided quarters for about 25 per cent. of their workers, the labour is left to make its own arrangements in the city. Most of these men, and especially the chamars, who are engaged in the leather trade, live in overcrowded and insanitary houses. They are forced to do so as house rents are high in Delhi, and with their scanty savings these men find it difficult to keep soul and body together. They have, to a certain extent, to blame themselves for the position in which they find themselves. It is a well-known fact that an ordinary labourer on receiving his wages or after earning extra money by overtime, etc., must absent himself from his work for a few days till his ready cash is exhausted. He has not learned the habit of thrift and is not far sighted enough to collect anything for a rainy day. Sickness, marriages in the family and other religious observances forces him into the hands of the moneylender, and he is never able to get out of their clutches the whole of his life. It has to be admitted, however, that the employers of labour in Delhi are getting solicitous for the welfare of their workers and have begun to realize that their prosperity depends on the contentment and uplift of their employees. The worker also is getting out of his lethargy and is getting conscious of his strength. There is less drunkenness amongst them, and there is a desire to curtail their unnecessary expenses. At present their standard of living is low indeed."

The following note by the Inspector of Factories bears out the view taken by Mr. Sohan Lal :—

"The standard of living of the labouring classes is low : this is due on account of their poor earnings. Their wages are hardly sufficient to fetch for them and their families the bare necessities of life. The food of an average worker is far from being nourishing, and he is invariably found in dirty clothes. With a view to effect any improvement in the living of an average worker and consequently in his efficiency and earning capacity it is essential that he should be given compulsory elementary education."

Sardar Mehtab Singh, industrial surveyor, adds :—

"Speaking generally, the industrial labourer is content with a comparatively low standard of comfort and does not appear to possess power to increase his earning capacity by an enhanced efficiency. The food of an average worker is poor and his

clothing often dirty. There is practically no improvement possible in the standard of living of the industrial operative till such a time as a general policy of his betterment is adopted, a satisfactory scheme for his education is introduced and a suitable provision for housing him is made. With the provision of education for the children of industrial classes under tolerable conditions of life, a new generation of workers is expected to spring up which aim to regard industry as their fixed occupation. Any increase in the comfort of the industrial operative means a proportionate increase in his efficiency which adds to the interest of the employer while the factor contributing to the latter is expected to prevent loss from the economic aspect of the problem."

#### VI.—Relations between Employers and Employed.

So far as Delhi is concerned, the relations between the employers and the employed are generally satisfactory. Some of the larger factory owners have made deliberate efforts to foster cordial relations with satisfactory results, and as a result of the operation of the Workmen's Compensation Act the more intelligent employers have insured their labour against accident. A good deal, however, remains to be done in the way of provision for recreation, etc.

The general friendliness of the relations between the employers and the employed is, however, shown by the fact that Delhi has been free from industrial disputes for the past ten years, with the exception of one or two strikes of a very minor nature.

Up to the present labour in Delhi has been mostly unorganized, and trade unions are practically unknown. Efforts have been made recently to form trade unions of textile workers but met with little success.

There is a considerable amount of unemployment, especially among the unskilled workers, who have been prejudicially affected by the contraction of activities in the Public Works Department workshops. In the textile mills there has been very little unemployment of late. Labour troubles in Bombay and Ahmedabad have led to a great increase in output in Delhi. As a matter of fact, some of the workers from Bombay and Ahmedabad have come north to Delhi in order to get employment in the mills here.

#### NOTE ON LABOUR CONDITIONS AT NEW DELHI BY MAJOR J. R. D. WEBB, I.M.S., HEALTH OFFICER, NEW DELHI.

*Housing : During Construction.*—Originally Government spent Rs. 5 lakhs in providing quarters for coolie labour at New Delhi when the Imperial capital was started. Brick quarters were put up at selected sites. Water and other sanitary arrangements were made. These camps were given out to the labour under definite rules. Those relating to health were under the control of the health authorities and were laid down in printed pamphlet form.

*Present Times.*—Special plots of ground are now allotted for coolies. These coolies are not employed by Government. They are servants of the various contractors working in the area with the exception of the coolies employed by the Superintendent, Horticultural Operations.

The coolies build their own huts by digging the ground. The mud resulting is used for the construction of the walls, while thatch or odd pieces of iron sheeting form the roofs. Materials for roofing, etc., are provided by the contractors. These huts are thus partially underground and are about 5 ft. in height. Each hut houses about five people, making up one coolie family.

*Work.*—The coolies work in families, but children under twelve years of age are not allowed to work. Their hours are 6.30 a.m. to 6 p.m. in the summer, with two hours off in the middle of the day (12 to 2 p.m.). Winter 7.30 a.m. to 5 p.m.

Women do lighter work than men. Families are brought to the various works, i.e., infants and children. These children play about while their parents work.

*Wages.*—Coolies earn 8 to 12 annas per day.

*Food.*—Consists of inferior quality atta (flour) dal (pulses), rice, and some ghee or oil. It is of poor quality and this quantity is, roughly, about one seer (2 lb.) per adult per day. The food is bought from bunyas' shops which exist in the camps. The supplies are inspected by the health department to see that cleanliness is observed. The coolies are invariably in the debt of the bunyas.

*Education.*—No Government schools exist in the camps, yet one effort has been made of a very minor nature by private enterprise. As the labour is constantly changing, continuity of education would be difficult.

*Propaganda.*—This is done by the health department by means of cinema and lantern lectures relating particularly to disease and welfare conditions. It is much appreciated, and some good results have been obtained.

*Fuel.*—This is collected by the coolies and is stored in the camp in bundles. Bramble bushes are chiefly used as opposed to cow dung cakes, because animals (cows) are, generally speaking, not kept in the camps.

*Medical Aid.*—For the major diseases the coolies have facilities in the civil hospital, where they receive treatment. As, however, a visit to the hospital entails the loss of a day's wages, they do not readily avail themselves of treatment from this source, unless very seriously ill.

*First Aid, and Maternity and Child Welfare.*—In consequence the municipality opened first aid and maternity, and welfare posts at each camp. The coolies readily avail themselves of the advantages gained in this way. This work is now well established.

*Epidemics, other Diseases and Injuries.*—In ordinary years malaria affects this labour considerably. In dry years, such as 1928, this disease was conspicuous by its absence. The incidence of this disease has improved also with the general anti-malarial work which is being carried out in the area of the Imperial capital by the health department.

All coolies are regularly vaccinated against small-pox. In consequence the disease is conspicuous by its absence.

Plague has been unknown in these camps.

Cholera has occasionally appeared, but with prompt action, such as inoculation of coolies, purification of the water supplies, isolation at the isolation hospital, these outbreaks have been of a very minor nature with no cause for alarm.

Tuberculosis is not as common as might be expected under the overcrowded conditions of life. The outdoor life of the coolies may be responsible.

Injuries were at first common. There is a negligible number of injuries now.

*General Sanitation.*—This is carried out by a staff of sweepers employed and controlled by Government. Rubbish and sweepings are removed by motor lorry and are burnt or buried at distant places from the camps.

*Flies.*—Are generally conspicuous by their absence in the camps, except during the months of August and September.

*Roads in the Camps.*—These are kutchas, but are kept neat and clean by the sweeping staff.

*Latrine Accommodation.*—This is adequate. This is provided by Government, as in most cases the latrines are on the water-borne flush system. In some few instances there are dry latrines scavenged by a gang of sweepers to pail depots on the water-borne system.

*Drinking Water.*—This is by a piped purified water supply to the camps and is excellent. Coolies when in work in the area drink from any and every source, and a frequent sight is to see them drinking from the unfiltered water supply which is taken all over the area by pipes for horticultural purposes in the capital.

*Stoneyard Camp.*—This has, perhaps, been the largest in the world. Here labour is housed, but at present it is under private control, and is not a Government undertaking.

The picture given above is not a rosy one, yet is excellent in comparison with labour conditions as they exist at the brickfields at Shadara or Rajpur.

It might be interesting for the Commission to visit one or two of these camps while at Delhi.

---

### Mr. W. H. ABEL, INSPECTOR OF FACTORIES.

#### *Labour in the Factories in Delhi Province.*

As shown in the latest report the total number of persons employed in all factories in Delhi is 10,443, of which 9,990 are men, 190 women, and 263 children (between 12 and 15 years of age).

Of the total number, 7,011 are employed in textile mills, 1,196 in Public Works Department workshops, 357 in ironworks, 706 in printing presses, and 1,173 in all other factories. Eighty per cent. of these workers are employed throughout the years as most of the factories in Delhi are perennial.

Work in iron foundries as well as in the cotton ginning departments attached to the three cotton spinning and weaving mills remains slack during the months of May to October each year. Ice factories remain closed during the period October to April.

Of the total number of 190 women and 263 children, 167 and 228 are employed respectively in the textile mills.

### I.—Recruitment.

1 (i) When new factories are opened most of the skilled labour required is imported chiefly from places where similar concerns are already in progress. Labour in the textile mills was originally imported from Ahmedabad and Bombay, but of recent years it has practically become local as for the past many years the occupations are passed on from father to son and very little labour is now imported from other provinces.

Labour in the Public Works Department workshops employed in connection with the construction of New Delhi was to a great extent imported from Rajputana and Central India; it has now settled in Delhi. As the amount of work in Public Works Department factories has considerably decreased during the past two or three years, there is a surplus of unskilled workers in Delhi, resulting in labour being easily obtainable.

A number of Chinese wood workers were also brought to Delhi for employment in the Public Works Department wood workshops. A Chinese labour contractor was at one time engaged to recruit labour for these shops.

The workers employed in iron foundries are recruited locally. This industry being one of Delhi's chief industries for centuries, the workers have become highly skilled.

The province also possesses a number of skilled potters, who are working at present in the pottery works. This industry, however, is not so flourishing to-day as it was twenty or thirty years ago. The total number of persons employed in pottery works registered under the Act was 123 during the last year.

(iii) The only noticeable change during the recent years is the gradual inclination on the part of the workmen to take up factory work; this is probably due to the rise in wages paid by the employers: the change is, however, very slow.

3 (i) Recruitment in factories is usually carried out by a labour contractor, who can usually meet the supply. Much recruitment is also made by personal acquaintance. Most of the permanent workers, such as engineers, mechanics, and other skilled workers appear to have friends or relations looking for an improvement on their job, and references regarding ability and certificates not being of great value, changes of service frequently occur. Unskilled and casual labour is recruited through the labour contractor and mostly paid by him at the end of the day. There is no guarantee given by the contractor that work will be forthcoming the following day as it all depends on the amount of work that is then available.

(ii) I do not know of any improvement which can be effected with regard to the recruitment of unskilled labour; the existing method with regard to the recruitment of unskilled labour: the existing method is simple and effective. Labour being illiterate, would look with suspicion upon any change that might be contemplated in the present system.

7 (i) Unemployment is prevalent amongst the unskilled workers chiefly owing to the contraction of activities in the Public Works Department workshops.

In textile mills there has been very little unemployment during the past three or four years. This is due mainly to the fact that labour troubles in Bombay and Ahmedabad have increased the work in textile mills of Delhi, which have not only greatly expanded during the past four years, but have also worked at full pressure by day, and three of them have worked fairly regularly both day and night for the past two years. This has provided employment for all the textile workers available in Delhi, so much so that some of the workers from Bombay and Ahmedabad have travelled northwards and found employment in the Delhi mills.

A certain amount of unemployment prevails amongst the workers in iron foundries, in which the major work is that of manufacturing or repairing crushers used in the preparation of sugar. This industry depends to a great extent on the sugar crop, as a result of which employment is not very secure.

### II.—Staff Organization.

11. The managing staff in the textile mills in India throughout originated in Bombay or Ahmedabad whilst the managing director of the biggest mill is a local man. But in the case of smaller concerns the managing staff is recruited locally.

12 (i) Subordinate supervising staff is to some extent supplied from the various industrial and technical institutions. It is also imported to some extent from abroad. There is a marked difference between the unskilled and skilled workers, the former seldom, if ever, attain positions of skilled workers or supervisors.

13 (i) In well established mills, particularly those run by responsible companies, the relations between the employer and employed are good and compare favourably with other countries from what I have seen. In the case of smaller factories difficulties occasionally arise amongst the proprietors, managers, and workers chiefly on account of the non-payment of the wages.

15 (i) Recruitment of labour in factories is usually carried out by a labour contractor, who is generally able to meet the demand.

(ii) It is difficult to say to what extent sub-contracting is carried on, but since the labour contractor usually lives near the factory area and seldom undertakes to contract for more than two or three factories, it is unlikely that he would resort to sub-contracting.

(iii) The contractor has little or nothing to do with the working conditions of the labour he supplies. His duty finishes when he has supplied labour to the extent required by the factory manager.

#### IV.—Health.

28 (i) Exhaust and overhead fans are fitted in the workrooms of well-organized factories and workers themselves frequently fit up fans worked from a pulley of the power shaft. Stoves are provided in some factories during the winter months, but factories are usually kept warm enough by the power plant. Apart from this, little attempt is made to control the temperature of the factory rooms.

Two textile mills have installed elaborate cooling systems throughout their mills, considerably improving the conditions under which operatives work. The cooling plants have been expensive experiments, but the mill managers report that there has been an increase in the output as a result of better working conditions.

(ii) Special rules for the control of temperature and humidity came into force only last year. There are four cotton spinning and weaving mills in the province in which artificial humidity is being used at present, affecting about 7,011 operatives. The rules are still in an experimental stage and it is yet too early to report with regard to their suitability or otherwise.

29 (i) Up to this time no occupational disease has been reported or has come to my notice. Lead melting operations are carried out in one of the printing presses in the province, the fumes from the melting stove being taken away with the help of an exhaust fan, and there is no danger from lead-poisoning.

#### V.—Welfare (other than Health and Housing, but including Education).

32 (i) Welfare work in the textile mills includes the providing of recreation grounds, an annual fair in the case of one mill, free distribution of clothes and sweet meats and the provision of hot tea to the workers in the case of another mill during the rest interval at night for the purpose of keeping the labourers from sleeping. Whatever little is done for the welfare of workers is undoubtedly appreciated and the mill owners admit that they get a fair return from the workers in the shape of loyalty and increased production.

Factories other than textile mills take little interest in their labour so far as welfare work is concerned; except in the case of Delhi Iron Works, which is one of the largest and best of its kind in Delhi. In this factory the workmen are given many comforts, including a bonus in the profit at the end of the year. This factory is also outstanding as having in its shops many men who have been in the firm's continuous employ for twenty or thirty years.

43. Regulations with regard to the workers' safety are shown in rules made under the Indian Factories Act and are based on the workshop rules existing in Europe, altered where necessary to meet local conditions. An abstract of the principal rules relating to general safety is posted up at the entrance of all factories in English and in the language of the majority of the workers. Apart from the every year a circular letter is issued to all factories bringing their to notice the chief requirements relating to safety measures and to other requirements of the Factory Law relating to hours of work, etc. In this circular a special reference is made with regard to the guarding of the dangerous machines, and any other matter of importance which requires careful attention.

44. A reference to annual report on the working of the Indian Factories Act in the Delhi Province will show that accidents have increased in the recent years.

45. The increase in the number of accidents referred to in the preceding paragraph is attributable to the following causes:—(a) More accurate reporting of accidents by factory owners due to some extent to the strict administration of Factory Law. (b) Operatives are themselves becoming acquainted with the fact that accidents should be reported and they frequently report themselves to the Factory Inspector's office. (c) The introduction of the Workmen's Compensation Act has also had an effect on accident reporting as the injured persons think that by reporting they might get compensation. (d) Another reason is that since the war up-to-date machinery of entirely new patterns has been introduced into the country whilst the workmen have not had the proper training to keep pace with the new type of machinery. It is noticeable that accidents increase with the introduction of new types of machines. (e) Ignorance of the workers and a belief in fate rather than carefulness is also responsible for many accidents. After frequent demonstrations of how to handle a particular machine, workers with apparently full knowledge of the dangers still take frightful and unnecessary risks. (f) Frequent instances of serious accidents are reported where workers remove safety guards in order to clear a jam or fault and use their hands or feet to put the fault right. This is to a great extent due to ignorance, but much also is due to carelessness and disregard of known dangers.

49 (i) During the year 1928 112 inspections were made, resulting in 22 prosecutions to enforce factory regulations. The bigger and well-organized mills do consider it their duty to work to factory rules, and make an effort to do so.

### IX.—Hours.

#### A.—Factories.

55. Factory law permits working 11 hours a day but not exceeding 60 hours a week; this is taken full advantage of.

56. Factories work for six days a week and the seventh day, which is a Sunday, is observed as a complete holiday.

57 (i) So far as workers are concerned they have welcomed the 60-hour week since the change has not been accompanied by the reduction in wages.

59. A further reduction in the maximum hours per week is, I think, not advisable especially in the case of seasonal factories in which punctuality and consistent work are not noticeable amongst factory workers in this province; few factories have yet adopted the clocking in and out system; as a result a considerable amount of time is wasted in getting to and from the actual job. It is improbable that in a 10 hours day the average worker is on his job more than 8½ hours.

60 (i) (a) The break after putting in six hours' work is very useful and does go a long way in preventing undue fatigue. (b) The break after six hours' work is utilized chiefly as a rest. The workers do not generally take their meals at this time, their meal hour being earlier in the morning (9 to 10) and again after their work in the evening.

(ii) The existing law seems to have worked satisfactorily in this direction.

(iv) Ample holidays are given or taken by the workers, apart from the weekly holidays there are public holidays which are mostly given to workers either as extra holidays or substituted for the weekly holidays.

61 (i) The day of rest is usually Sunday except in the case of Muhammadan factories, which observe Friday as their day of rest. It is, however, possible to change the weekly rest day at any time by giving previous notice to the Inspector, and this is done whenever the necessity arises; public holidays are often substituted for Sundays.

(ii) The existing law seems to have worked satisfactorily in this direction.

### X.—Special Questions relating to Women, Young Adults and Children.

#### A.—Factories.

82. The admission of infants into factories is discouraged. It is, however, difficult to always keep them out because they are too young to be separated from their mothers.

83. The present regulations with regard to the employment of women in factories are quite suitable. Hours of employment for women are the same as for men except that the former may not be employed before 5.30 a.m. or after 7 p.m.

84. The present law with regard to the employment of children appears to have worked satisfactorily.

**XII.—Wages.**

96 (i) The prevailing rates of wages for the past five years are given below :-

Classification of labour.	Average per Month.				
	1924.	1925.	1926.	1927.	1928.
<b>I.—Skilled Labour.</b>					
Engine driver .. ..	Rs. 47 0 0	Rs. 50 0 0	Rs. 52 0 0	Rs. 52 0 0	Rs. 52 0 0
Carpenter .. ..	56 0 0	56 0 0	54 0 0	53 0 0	54 0 0
Blacksmith .. ..	55 0 0	50 0 0	50 0 0	50 0 0	50 0 0
Mochi .. ..	29 0 0	28 0 0	28 0 0	26 0 0	27 0 0

Press compositor .. ..	34 0 0	34 0 0	34 0 0	33 0 0	34 0 0
<b>2.—Unskilled Labour.</b>					
Coolie (man) .. ..	Rs. 0 10 0	Rs. 0 10 0	Rs. 0 10 0	Rs. 0 10 0	Rs. 0 10 0
Coolie (woman) .. ..	0 6 0	0 6 0	0 6 0	0 6 0	0 5 6

**XVII.—Administration.**

138. The average workman has little knowledge of factory legislation ; although copies of the abstracts of the Indian Factories Act and the Rules made thereunder both in English and in the language of the majority of workers are posted up in every factory, yet it is doubtful if the worker ever makes an effort to know what the posters really mean.

139 (i) In this province, which is one of the four provinces under my jurisdiction, namely, Punjab, North-West Frontier Province, Delhi and Ajmer-Merwara, the Factory Inspection Staff consists of :—

One full-time Inspector.

One Industrial Surveyor under the control of the Director of Industries, Punjab, stationed at Delhi, who is notified as additional Factory Inspector under certain sections of the Indian Factories Act for the province of Delhi.

The number of factories in this province under the operation of the Indian Factories Act at present is 61 and the staff is adequate. It may be noted here that the Local Government in the case of the Punjab have decided to appoint one full-time Inspector with effect from April 1, 1930, in the place of the five Industrial Surveyors of the Punjab under certain sections of the Indian Factories Act. Thus from April next there will be one Chief Inspector and one Inspector in the Punjab.

This advanced method of inspection has not yet been considered by the Delhi Government, but with the extension of modern machine methods in working factories the services of another Inspector qualified to be notified under all sections of the Act would be useful and is becoming necessary. The present method of inspection has worked fairly satisfactorily up to this time, but the duties of the Industrial Surveyor are fast increasing and the time he can devote to factory inspection is decreasing as a result.

(iii) Rigour and efficiency of administration of Factory Law depends on frequent inspections, instructions, prosecutions and finally on their results.

(iv) During the year 1928, 22 cases under the Factory Law were instituted against the occupiers and managers of five factories. Of the total number of cases 18 resulted in conviction.

## THE INDUSTRIAL SURVEYOR, DELHI.

## I.—Recruitment.

1. The bulk of the industrial labour in this province was originally imported from Ahmedabad, Bombay, Rajputana and Northern and Central India. Generally speaking, the recruits for the industrial labour market were provided from the agricultural classes, who were either uprooted from the soil or were left, under the baneful influence of fragmentation, small holdings not enough to support them and their families. The labour employed in the building trades, since the transference of the capital to Delhi, whose strength is considerable, was mostly recruited from the agricultural working classes from Rajputana and some from Northern India.

The agricultural population in rural areas in this province constitutes not a significant source of labour supply for industrial undertakings. The agriculturist generally finds attraction for industrial employment for short periods to supplement his earnings. The workers in the seasonal occupations are, however, recruited from agriculture, and to some extent from the artizan classes in the neighbouring villages, and they are therefore mostly migratory.

There are no available statistics showing the extent of migration of the industrial labour in this province. The seasonal occupations in industries are limited mostly to iron foundry and ice production, and the extent of migration is consequently not considerable. The skilled labour is mostly permanent, but the unskilled workmen are migratory to some extent.

The continued industrial depression combined with the contraction in the activities in the Public Works Department, New Delhi, has caused a surplus of industrial labour, particularly unskilled workers, in this province. The recruitment of labour is consequently not a problem for the industrial undertakings generally at present.

2. (i) The extent and frequency of return to his village of the industrial operative is mainly determined by the nature of his employment. The workers living with their family members are roughly estimated to constitute about 40 per cent. of the total strength of the labour employed in industrial undertakings in this province. The family members, particularly of unskilled workers, are also generally employed in industrial undertakings, and add to the family income. Such working classes are the last to return to their villages. In fact, a fairly important section of the industrial labour in this province has now practically settled down, and has either no village home or little family ties to serve as attractions for frequent returns.

(ii) There are no reliable statistics, but roughly speaking about 60 per cent. of the total labour force in this province is permanent.

3. (i) The employer often sends his agent, who generally belongs to the labouring classes and wields a certain amount of influence amongst them for purposes of recruitment of industrial labour in the surrounding districts. The recruit is paid his expenses incurred in journey and food from his village to the place of his destination. There is a labour contractor also whose services form an important factor, particularly in the building trades. He collects and supplies workpeople to the employer. The type of worker he supplies is, however, generally not a superior one.

(iii) The desirability of the establishment of public employment agencies for the collection and periodical publication of statistics deserves consideration. This is believed to operate to the advantage of the employer and the employee equally.

4. The bulk of the industrial population is now settled down in Delhi, and there is therefore very little disturbance of family life. There does not appear to be any appreciable disturbance in the case of migratory labour, whose work is mostly of a seasonal character. A section of the labour who has got his home in the neighbouring districts returns to his family at every possible opportunity.

7. (i) The extent of unemployment is not known.

(ii) I am not aware of any appreciable degree of dismissals nor of any voluntary retirements. There has been retrenchment in some industries owing to several causes. In order to minimize the cost of production, there is a general tendency for the introduction of labour-saving appliances and high-speed machinery in the industrial undertakings generally. The iron foundry industry, which was once known for its principal product in sugar-cane crusher or *hokhs*, and enjoyed a considerable export trade as far as the North-West Frontier Province on the one side and Bihar and Orissa on the other is in a depressed condition owing mainly to the reported poverty of the yield of sugar-cane crop in the surrounding districts coupled with increased external competition in recent years. The manufacture of gold and silver threads and lametta, which is the premier cottage industry of the capital city, has suffered a set-back by the continued chaotic political conditions of the frontier territory—one of the important consuming markets for the varied products of the industry.

The oil-milling industry is in a moribund condition. The internal suicidal competition is too patent in the thread-ball industry. The continued diminished activity in the building trades has already adversely affected the employment of labour, particularly unskilled operatives. The flour milling industry is passing through a trying period. The leather-tanning and leather-working industries are in a depressed condition.

(iii) In spite of the adverse conditions prevailing, there is no marked distress noticeable amongst the industrial population in this province. Yet it appears that employment in cottage industries is perhaps the best solution to alleviate such economic stress.

The development of home industries is known to play an important role in the national welfare of a country. The population being mainly agricultural, cannot afford to overlook the economic value of the home industries in periods of forced idleness. The solution of the problem of economic salvation of the masses fundamentally lies in the organization and development of home industries. The village can hardly remain a sound economic unit in the absence of the provision of alternative occupations suited to the existing conditions. The rural population forms the backbone of the people of the province, and in order to ameliorate conditions, an endeavour has to be made to inaugurate and develop home industries as well as secondary seasonal occupations for the agriculturist.

(iv) There is no unemployment insurance known in this province.

8. (i) and (ii) The small extent of the shifting composition of the industrial population generally renders the average duration of employment fairly long in the organized industries. The recruitment of labouring classes locally as feed for industries in other parts of the country is practically not known. The extent of casual employment is roughly estimated at 5 to 10 per cent., though no reliable figures are available.

(iii) The chief causes of absenteeism are malarial sickness and ceremonial observances and fairs. The extent of absenteeism due to sickness is calculated at 10 per cent. for a period of about two months in a year, between August and October, when malaria breaks out in the province. The casual illness and observance of religious ceremonies and attendance at marriages and fairs are responsible for about 5 per cent. of absentees, throughout the year.

The average wage earned by an industrial worker in the industry in this province is calculated at ten annas a day, as will appear from the statement of wages of workers in industries in this province under XII.—Wages. Six thousand workers lose 60 working days, while 3,000 workers lose 320 working days, on an average, during the year. The aggregate loss of wages therefore approximates to eight lacs and twenty-five thousand rupees.

## II.—Staff Organization.

15. (i) The intermediary contractors are practically not known in the establishments under the Factories Act, but in the building trades they are not uncommon.

The piece-wage and contract systems of work are gaining popularity with the industrial undertakings generally, as they are regarded to lead to economy and efficiency. The employer is saved any strict supervision, and the worker puts in an increased effort to augment his earnings.

(ii) The system of sub-contract is looked upon with disfavour by the industrial undertakings generally, except in the building trades.

(iii) Generally speaking, there is little control exercised by the contractor over working conditions in an industrial undertaking in this province. In the building trades, however, the contractor exercises sufficient control over working conditions.

(iv) The effects of contract work appear to be generally satisfactory to the parties concerned.

## III.—Housing.

17. The industrial employer is given facilities for the grant of Government land on favourable terms for purposes of building workers' houses. The provision of facilities in the matter of acquisition of land by the employer for housing his labour appears desirable.

18. The quarters provided to house the superior staff, such as managers, engineers, etc., are generally satisfactory from the health point of view. There is provision for lighting, conservancy and water-supply.

The dwellings provided in the organized industries for the accommodation of the workers consist usually of the single-storey lines in single-room units, with either a small projecting verandah or in some cases a narrow enclosed courtyard. The provision made for lighting, conservancy and water supply is on a restricted scale. The new coolie quarters of the Delhi Cloth Mills, Delhi, are an improvement in the direction

of better housing from the point of view of sanitation. The Birla Mills, Delhi, are now engaged in making an extended provision of water-flushed latrines in their coolie lines. In a city like Delhi the problem of sanitation is an all-important one, and deserves special attention from the employers as well as the local authorities concerned. There is room for improvement in the arrangements for the supply of water, latrine accommodation, and provision of light and ventilation generally. The coolie camps housing the industrial operatives employed in the building trades in New Delhi present not a pleasant spectacle and suffer by comparison.

The huts constituting a coolie-camp in New Delhi are built of mud dug from the ground covering them, with thatched roofs. Each hut, which is partially underground and measures about 5 feet in height, houses one family consisting of about five members. The general sanitation of the coolie-camps is controlled by Government with an adequate provision of fairly suitable latrine accommodation and water-supply for drinking purposes.

There is no demand made on the part of the working classes in regard to the standard of accommodation provided by the industrial employer. The housing accommodation provided is generally satisfactory, and in some cases superior to that to which the average worker is accustomed in his own village. This refers to the permanent housing accommodation provided by the employer in the organized industries.

19. The workers have never failed to take advantage of the accommodation offered for the purposes of housing them, by the industrial undertakings in this province.

20. The quarters provided for the superior staff, such as managers, engineers, etc., are generally rent free. The accommodation to house the workers is provided at a rate from 30 to 50 per cent. below the economic rent.

#### IV.—Health.

23. The general health conditions of workers employed in industrial undertakings under the Indian Factories Act and Mines Act in this province are on the whole satisfactory. The conditions obtaining in the industrial establishments not covered by the provisions of Factories or Mines Acts under which working classes have to work for sufficiently long hours in a day as well as to live, can hardly be described as conducive to general health of the operatives. The working conditions in the well-organized factory establishments on the other hand are fairly satisfactory from the point of view of general health, though there is room for improvement in small-scale concerns, particularly those built in congested areas in the city of Delhi.

Broadly speaking, the food of an average worker is poor and mostly consists of inferior quality of flour, pulses, rice and oil or ghee. He often shows a poor physique, and appears contented with a low standard of comfort. His clothing is often dirty.

24. The city of Delhi and the suburbs are fairly well provided with hospitals and indigenous dispensaries where free medical aid is available. The institutions are maintained by Government and local bodies.

The provision of medical facilities by the employer generally is on a restricted scale. The importance of the creation and maintenance of a healthy and contented labour force is, however, recognized by the intelligent section of the employer. The Birla Mills, Delhi, employ a whole-time qualified physician and surgeon with four compounders, and maintain a hospital where free medical aid is made available to their employees. A maternity home is also recently started under the charge of a trained midwife employed by the mills. The Delhi Cloth Mills, Delhi, maintain a compounder to render first-aid, if necessary. The mills are served by the Municipal Bara Hindu Rao Dispensary situated in their close proximity. The secretary of the mills donated a sum of rupees, ten thousand, towards the building of the dispensary for the purpose. The Ayurvedic and Unani Tibbi College Hospital is also close to the coolie-quarters of the mills. The Lady Reading Health School serves the female workers employed in the mills. The Khalsa Mills and the Delhi Flour Mills have engaged one of the local sub-assistant surgeons to render periodical free medical attendance to their employees on a monthly allowance. The Delhi Electric Tramways and Traction Company, Limited, Delhi, have also engaged the part-time services of one of the local assistant surgeons, for the purpose. A provision also exists on a small scale for the free supply of more common medicines in well-organized industrial establishments.

30. *Sickness insurance.*—There does not appear to be any general dislike towards the acceptance of Western medicine. The difficulty, if any, might however possibly be met by, the provision of a substituted recognized indigenous system of medicine.

In so far as the distribution of industrial regions in this province is concerned, there appears to be no real difficulty in securing qualified medical men in sufficient numbers willing to undertake the work.

The migration of labour in this province does not appear to affect the problem of sickness insurance to any great extent. The grant of medical attendance or pecuniary accident or sick benefit, funeral benefit and confinement and maternity benefit in case of sickness, accident, death or child-birth is realized to dispel the uncertainty of livelihood from the mind of the insured worker, making him more contented and perhaps less migratory than at present.

The financial resources required for the establishment of the institution may be provided from contributions partly by the insured worker and partly by his employer, together with a contribution by the State.

31. Amongst the industrial undertakings in this province, the Birla Mills, Delhi, have recently made a provision for maternity benefits with an allowance of three months' wages to be given two months before and one month after child-birth.

The employers of this province who were consulted in the matter were generally sympathetic towards the provisions of Mr. Joshi's Maternity Benefit Bill. The desirability of such a legislation is recognized, and the security which a woman-worker must feel if she knows beforehand what her fate is to be on such occasions must be a source of strength and a great consolation to her.

#### V.—Welfare (other than Health and Housing, but including Education).

33. The Birla Mills, Delhi, have employed a labour secretary, whose principal functions are to look after the general welfare of their labour, housed in their coolie lines. To increase his interest in life and consequent efficiency of the industrial operative, the desirability of the employment of welfare officers and workers in industrial areas deserves consideration.

34. The Birla Mills, Delhi, provide cinema displays periodically, and maintain a small library for the use of their staff. There is a provision for refreshments on payment. A *dai* is employed to take care of and feed babies with milk in a separate enclosure within the mill premises, when their mothers are at work in the departments. An *Akhara* (wrestling ground) is also provided for the physical exercise of the labourers. The organization of an annual labourers' *mela* (fair) is a special feature of the Delhi Cloth Mills, Delhi. A variety of entertainments in the shape of dramatic representations, cinema shows, laughing galleries, distribution of sweets and prizes is provided on the occasion. There is a provision for refreshments, on payment. There is a certain amount of propagandist work carried by the mills on the evils of intemperance by means of lectures amongst the working classes. It seems desirable to make a provision for open spaces with facilities for recreation, including sports and athletics, libraries, reading-rooms and cinema displays as means of instruction and amusement, and liberal medical assistance for the industrial population, on an extended scale.

35. The welfare activities have resulted in the contentment of the labour force, to some extent. There are also some signs of decline in drunkenness amongst the industrial population.

36. Broadly speaking, little or no serious attempt seems to have been made by the employer generally to provide for the education of the labouring classes in industrial undertakings. The ignorance coupled with conservatism of the uneducated workman is felt to tend to delay the progress of industrial development. The advantages of education among the working classes are, however, recognized by the enlightened employers and schools are provided for the education of the employees and their children in the Birla Mills and the Delhi Cloth Mills, Delhi. The Birla Mills maintain their own schools, including a night school for adults at their expense, while the Delhi Cloth Mills contribute rent-free buildings towards the maintenance of the schools opened by the Delhi municipality in their premises. The schools are used by the workers and their children to a fair extent. There are about 30 adult workers, 50 half-time workers and 300 workers' children receiving education in the Birla Mills' schools. The Delhi Cloth Mills' schools provide education to about 150 workers' children.

A section of the working classes does not view with favour the education of children who are the earning members of the family.

37. There is no provision for old age and premature retirement except that of a provident fund established in the Delhi Cloth and General Mills, Delhi. The desirability of such a provision is, however, recognized.

38. There is no co-operative organization amongst the industrial population in this province. The provision of co-operative societies with a view primarily to reducing his indebtedness is expected to improve the economic condition of the industrial operative. The industrial worker is generally in debt to the money-lender, who charges interest at exorbitant rates.

#### VI.—Education.

40. The introduction of compulsory primary education within the municipal limits is hoped to gradually assist in the removal of illiteracy among the industrial population.

The introduction of some form of primary education supplemented with elementary technical training among the labouring population appears desirable from the point of view of the development of a practical industrial bias in the workers.

41. The Government Industrial Middle School is the only Government institution in existence in Delhi in which facilities are provided for industrial education. There is room for ready expansion in industrial education, which is regarded as an essential investment for the production of intelligent and efficient workmen from the point of view of industrial development of the province. The establishment of a properly equipped technical school appears desirable to ensure successful recruitment to industry of the province.

#### VIII.—Workmen's Compensation.

51. *Workmen's Compensation Act.*—With the extension of the Workmen's Compensation Act to organized industries, the intelligent employer has insured his labour against accident and the measure has proved of great benefit to the working classes covered by the Act.

The introduction of a scheme of compulsory insurance will be rendered necessary consequent on the extension of the Act to workers in unorganized industries with a view to placing the employer in a position to be able to pay compensation due in the event of a serious accident. The compulsory insurance by the employer is regarded to restore to the workman the security against his inability for payment of compensation.

52. The desirability of the extension of the scope of the Act deserves consideration. In the intricate modern industrial system, it is realized that there is hardly any justification for the exclusion of persons employed in branches of industry other than organized and hazardous from the operations of the Act. The complex machinery and intensive production of the industrial world of to-day are claimed to lead to frequent accidents, and a sufferer in an unorganized industry may be equally affected in the absence of relief by way of compensation as one engaged in an organized industry. The mere hazardous character of an occupation is regarded hardly sufficient justification for depriving those who suffer from the hardships involved in the rare accidents from the benefits conferred by the Act. The scope of the Act might be widened to include all classes of permanent workmen employed in both organized and unorganized industries.

53. (i) The desirability of raising the minimum scales of compensation resulting from the application of Schedule IV of the Act deserves consideration. The existing practice of lump sum payments in the award of compensation appears both sound and safe.

(ii) The present waiting period is admitted to be too long, and to result in hardship, as no compensation is payable in respect of the first ten days of disablement. The reduction of the waiting period by three days is considered advisable to minimize the effect.

The proof of dependence by the claimant claiming compensation to the satisfaction of the Commissioner under the Act is considered essential, not only to afford protection to the employer from fraudulent claims, but to secure relief to the dependants of a workman incapacitated to earn a livelihood to fulfil the intention of the Act.

(iv) The undesirable effect of enabling a workman to decide in a particular case for the ultimate liability for compensation to lie on the principal or the sub-contractor directly employing him as provided under sub-section (2) of Section 12 of the Act is recognized beyond dispute. The amendment of the existing section in accord with its general principle is accordingly suggested in such a manner as to make the employer directly engaging a workman liable for compensation in the event of an accident.

In order to enable Government to determine the extent to which injured workmen succeed in securing compensation, it appears desirable that the provisions of section 16 of the Act be so amended as to make the employer to submit returns in respect of all accidents irrespective of the payment of compensation.

The desirability to amend the provisions of section 22 of the Act in such a manner as to relieve the dependant of a deceased workman claiming compensation of the necessity of approaching the employer for the settlement of the claim, and to enable him to apply to the Commissioner in the first instance is considered obvious.

### IX.—Hours.

#### A.—Factories.

59. There appears to be no possibility of reduction in maxima as was indicated in the recent speech delivered by the employers' delegate from this country at the last International Labour Conference, when Mr. N. M. Joshi, the Labour's delegate suggested such reduction.

60. In the existing practice, the interval relates to the worker's meal time and fatigue during the same hour. The working hours during which the factory is at work are suitable.

There are other holidays mostly of religious character, in addition to the prescribed factory holidays observed in the various industrial establishments. The number of such holidays varies from establishment to establishment.

61. In the existing practice, Sundays as well as week-days are observed as holidays.

#### B.—Mines.

63. The working hours of the operatives in mines averaged to 36 a week, as shown in the Annual Report on the working of mines, in this province, for the year 1928.

The total number of mines subject to the control of the Indian Mines Act in this province is six only, comprising kaolin mines. The mining operations were conducted for 61 days during the past year.

#### D.—Other Establishments.

80. (c) *Other industrial establishments.*—The desirability of regulating the working of industrial establishments, employing a large number of persons and working with or without motive power deserves consideration. In many of the non-regulated industrial undertakings, the lighting and ventilation arrangements are defective, no restrictions are observed as to the working hours, long hours being the rule and holidays are seldom given. A large number of women and children are indiscriminately employed, machinery is often badly fenced or left unguarded, and even elementary sanitary requirements such as latrine accommodation and proper drainage are not satisfactorily provided. The consequence is that not only the health of operatives under such working conditions is endangered by disregard of the fundamental and cardinal essentials, but the industries themselves suffer by the impairment of efficiency of the operatives consequent on the deterioration of their health.

### X.—Special Questions relating to Women, Young Adults and Children.

#### A.—Factories.

88. The night work of women and children is prohibited by the provisions of the Factories Act. The textile mills employing an appreciable number of women and children work by double shift and engage them during the day. The young adults are, however, employed at night, but there are no statistics to show the adverse effect of such employment on their health.

### XII.—Wages.

96. (i) There are no accurate statistics available with regard to industrial wages in Delhi Province in the absence of any authorized agency for the collection of such data. From the enquiries conducted within the short time at my disposal, however, the existing average wages earned by the workmen in industrial undertakings in the province are shown to the last column of Appendix C.

(ii) The payment of wages in the surrounding agricultural areas is generally in kind. The average wage earned by a worker is calculated to approximate 4 annas a day. The piece-wage system is the rule.

(iii) It is difficult to ascertain the extent of difference between money wages and money value of earnings. The money value of earnings is, however, much less than the money wages.

97. (i) There has been practically no movement in the average rates of wages in recent years.

A statement showing the fluctuations in the purchasing power of money in Delhi, since the basic period, i.e., the pre-war period of 1912-14, is attached as Appendix A. The general trend of prices will be seen from the index numbers expressed in the different years as percentages of the retail prices of the commodities in the basic period.

(iii) There are no accurate statistics available to show the extent of relation between the wages and the prices and cost of living. The rates of wages, however, has fluctuated to some extent with the oscillations in prices and cost of living as will appear from the Statement at Appendix C.

(iv) There is no relation between the rate of wages and the amount of profits of the industrial undertaking generally. The bonus earned by the worker is, however, mainly determined by the profit made by the employer during the year.

104. The enhancement of wages, even to a slight extent, generally acts as an attraction for the labour and a similar reduction repels it.

105. In order to arrive at some satisfactory conclusion with regard to the minimum living wage, a detailed examination of the family budgets appears necessary for the two classes of industrial workers. Taking a representative family consisting of five souls as a basis for the purpose, the family budgets are drawn below :—

I.—*Family Budget of the Skilled Worker.*

Item.	Existing monthly expenditure (average).			Modified monthly expenditure (possible).		
	Rs.	a.	p.	Rs.	a.	p.
Food .. .. .	18	0	0	17	0	0
Clothing .. .. .	10	0	0	8	0	0
Shelter (rent) .. .. .	3	0	0	2	8	0
Thirst (water and other drinks) .. .. .	2	0	0	1	0	0
Medical aid (attendance and maternity) .. .. .	2	0	0	2	0	0
Education .. .. .	2	0	0	2	0	0
Luxuries (cinema, etc., and ornaments) .. .. .	3	0	0	2	0	0
Miscellaneous (ceremonies like marriage, kaj, etc.) .. .. .	4	0	0	3	8	0
<b>Total .. .. .</b>	<b>44</b>	<b>0</b>	<b>0</b>	<b>38</b>	<b>0</b>	<b>0</b>

Average daily existing expenditure, Re. 1-7-6 pies.

Modified daily expenditure, Re. 1-4-3 pies.

II.—*Family Budget of the Unskilled Worker.*

Average daily income—						Rs.	a.	p.
Man .. .. .	..	..	..	..	..	0	10	6
Woman .. .. .	..	..	..	..	..	0	7	0
Child .. .. .	..	..	..	..	..	0	4	0
<b>Total .. .. .</b>	<b>..</b>	<b>..</b>	<b>..</b>	<b>..</b>	<b>..</b>	<b>1</b>	<b>5</b>	<b>6</b>

Average daily expenditure—

Item.	Existing monthly expenditure (average).			Modified monthly expenditure (possible).		
	Rs.	a.	p.	Rs.	a.	p.
Food .. .. .	17	0	0	16	8	0
Clothing .. .. .	9	0	0	8	0	0
Shelter (rent) .. .. .	2	0	0	2	0	0
Thirst (water and other drinks) .. .. .	2	0	0	1	0	0
Medical aid (attendance and maternity) .. .. .	1	8	0	1	0	0

Luxuries (cinema, etc., and ornaments) .. .. .	2	0	0	1	0	0
Miscellaneous (ceremonies like marriage, kaj, etc.) .. .. .	3	0	0	2	0	0
<b>Total .. .. .</b>	<b>37</b>	<b>0</b>	<b>0</b>	<b>32</b>	<b>0</b>	<b>0</b>

Average daily existing expenditure, Re. 1-9-9 pies.

Modified daily expenditure, Re. 1-1-0 pies.

The conditions affecting skilled and unskilled industrial labour are different from the economic point of view. The earnings of a skilled operative are generally limited to the wages of the man whereas the income of a family of the unskilled workman is frequently supplemented by wages earned by the woman and children. This important economic factor necessitates separate analytical treatment of the family budget of two groups of industrial workers.

*Family Budget of the Skilled Worker.*—The average daily expenditure of the family works out at Rs. 1-7-6 pies, which is higher than the average earnings of Rs. 1-2 annas. From a consideration of the various existing factors contributing towards the depression in the level of the actual wages earned by the industrial operative, it is no wonder that most of the families are hardly able to make both ends meet.

To ascertain the minimum living wage, an elimination or reduction in the items of the schedule of consumption in the budget may be possible but the degree of such a modification appears to be restricted in view of the present concise regulation of the expenditure of the family. The modified expenditure as against the existing budget will indicate that there is left practically little or no scope for further reduction below the figures of Rs. 1-4-3 a day. The possibility for the reduction is likely to be too narrow if the curtailment of efficiency is not desired. Any further reduction in the scale of wages may tell not only upon the inclination and capacity of the industrial operative but it may also operate unfairly on the industry generally.

*Family Budget of the Unskilled Worker.*—The figures lead to the conclusion that the average daily expenditure of a family of the unskilled labourer composed of the man, woman and a child as earning members, is slightly lower than the average income. But owing to the fact that such a sight is not very common and that the actual wages earned by the family are generally depressed by voluntary and involuntary unemployment, the unskilled workers do not present a picture of contentment and enthusiasm. The margin of curtailment of the average daily expenditure of Rs. 1-3-9 pies of the family appears to be meagre because of their proverbial hand-to-mouth mode of living. The extent of possibility for the reduction in the items of consumption in the family budget seems evidently small and the modified expenditure as against the existing schedule may be made to stand at Rs. 1-1 anna a day, involving the sacrifice of efficiency.

In the light of the above circumstances, the existing level of earnings of the workmen in industrial undertakings appears to approximate to the living wage. The presence of this economic factor above all others is believed to explain the existence of harmonious relations between the employer and the employed, and the absence of strikes of any significant character in the industrial undertakings in their present stage of development in this province.

106. (i) The imposition of fines is almost universal. The deductions in respect of fines for breaches of discipline and for bad or negligent work or injury to the materials or other property of the employer are prevalent in the industrial establishments in this province. The deductions based on absence from work are also not uncommon. The amount of fines inflicted varies generally from a day's wages to a week's deductions in extreme cases.

(iii) The sums collected as fines are suggested to be credited to funds devoted for the welfare of the labour.

(iv) The legislative measures to regulate fines and deductions do not seem to be inopportune or premature at the present stage.

107. (i) and (ii) The system of monthly payment of wages is common with the industrial undertakings in this province. The contractor's employees are, however, paid on a fortnightly basis. In the existing practice, the payment of wages earned in one month is made in or about the middle of the succeeding month.

(iii) The desirability of legislation to remedy the evil of deferred payment of wages deserves consideration. The provision of payment of wages within a week where the system of monthly payment or any longer basis is in vogue, within four days in the case of fortnightly payments, within two days in the case of weekly wages, and within a day in the case of daily wages is hoped to dispel the uncertainty from the mind of the industrial operative and to tend to diminish his economic difficulties.

108. The industrial operative is generally in monetary difficulty. In the absence of receipt of his wages at the close of the month, he begins borrowing money at exorbitant rates of interest. In some instances, workers do not succeed in clearing themselves of the burden of debt they incurred first in taking up work in an industrial establishment.

109. The bonuses are acquired by stipulation on the basis of either increased production or profit made by the employer in the organized industries on a limited scale.

110. The workmen generally are not allowed any leave during the year. They are generally not paid their wages for the period of absence. The supervising staff in some of the industries is, however, given leave for varying periods during the year with pay.

There is no adverse effect on back-lying wages owing to absence from work. The payment of such wages is made to workers on their resumption of work.

#### XIV.—Trade Combinations.

117. *Employers and Employed.*—(i) The following are the more important combinations of employers, with their headquarters established in Delhi :—(1) Punjab Chamber of Commerce ; (2) Delhi Factory Owners' Federation ; (3) Delhi Piece-Goods Association ; (4) Delhi Hindustani Mercantile Association ; (5) Delhi Cloth Market Company ; (6) Kirana Association ; (7) Bankers' Association ; (8) Iron Merchants' Association.

(ii) So far as the organizations of the employees are concerned, the Delhi Provincial Postal and R.M.S. Association, Khadi Association and Postal Audit Office Union are the important combinations in the Delhi province.

The industrial labour in this province is generally speaking, unorganized, ignorant and unable to voice its own opinion. The endeavours of the local labour union, called Mazdoor Sabhha, formed in the year 1928, so far as I am aware, met with no success in the matter of organization of industrial classes generally.

119. The Delhi Provincial Postal and R.M.S. Association aims at amongst others in organizing the Post Office and R.M.S. workers with a view to securing a voice in the administration of the Post Office, promoting brotherhood amongst members, promoting and safeguarding the interests, rights and privileges of the Post Office and R.M.S. employees, and obtaining redress of such grievances as may be brought to its notice by all constitutional means. The Khadi Weavers' Association was formed during September, 1927, with the object of regulating the relations amongst the members and of popularizing the use of pure hand-spun, hand-woven cloths through various means, such as hawking, delivering magic lantern lectures, publishing pamphlets, writing articles in the press and holding exhibitions. The Postal Audit Office Union is the organ of the employees for securing redress of their grievances by constitutional methods.

The Delhi Mazdoor Sabha or Labour Union, Delhi, came into existence in the year 1928, with the main objects to organize industrial workmen for their economic, mental, social, moral and material welfare, to secure fair and equitable conditions of life and work, to provide for sickness, maternity, death, accident, old age and other benefits ; to secure compensation under the Workmen's Compensation Act, to redress grievances, to provide for education, to work for the establishment of cordial relations between the employer and the employee ; to settle industrial disputes by mutual negotiations, if possible, and to relieve the distress of its members in cases of strikes or lock-outs.

121. The All-India Postal and R.M.S. Association, Delhi branch, is the only union recently registered under the Trade Unions Act, 1926, in this province.

#### XV.—Industrial Disputes.

123. This province is free from industrial disputes of any significant magnitude. During the year 1928-29 there have been two strikes in this province. The aggregate time loss amounted to 1,302 working days.

#### XVII.—Administration.

137. There is undue competition in industry from the Indian states not under the purview of the Indian Factories Act.

138. The working classes, being illiterate, are generally ignorant of the provisions of the factory legislation.

APPENDIX A.

Variation in the Cost of Living in Delhi.

Basic Period—1912 to July, 1914.

Year.	Rice.	Wheat.	Jowar.	Bajra.	Barley.	Gram.	Salt.	Sugar.	House rent.	Social functions.	Cotton piece-goods.	Average.

1926 .. ..	194·0	146·0	163·0	170·0	148·0	160·0	140·0	344·0	120·0	135·0	155·0	170·0
1927 .. ..	201·0	136·0	150·0	136·0	134·0	151·0	133·0	320·0	120·0	135·0	150·0	160·0
1928 .. ..	220·0	136·0	160·0	159·0	138·0	165·0	133·0	301·0	130·0	135·0	145·0	166·0

*Note.*—The sources of statistics of prices of commodities in the above statement are the official records of Government. As regards rentage, social functions and piece-goods statistics, it may be mentioned that although they give a fairly adequate indication of the variations covering the period, they cannot be taken as representing wholly the extent to which standard of living has been subject to those factors. Every attempt, has however, been made to cover as large a ground as possible to the best of the resources at my disposal.

**APPENDIX C.**

MAJOR J. R. D. WEBB, O.B.E., I.M.S., ASSISTANT DIRECTOR OF PUBLIC HEALTH, DELHI PROVINCE.

This Note deals with The Imperial Capital (New Delhi).

*Brief History of Coolie Labour.*—At the maximum period of construction some 30,000 labourers were employed at New Delhi. This number has now been much reduced and to-day about 13,000 labourers reside in the area. At first a very large number of the labourers were housed in an area, known as the Brickfields South to South-west of the New City. To-day the labour is housed in four distinct camps while a few labourers live near the site of their activities. The labour is imported from Rajputana, Northern and Central India and there is much fluctuation amongst the coolies which depends very largely on their agricultural activities in their homes.

A small proportion of the labour is skilled; these are chiefly connected with stone work, masonry, carpentry, blacksmiths and painters while the larger proportion can be termed unskilled. In this latter class come a large section employed on the manufacture of bricks. In the earlier days the labour was entirely controlled by the P.W.D. (Government). A large proportion of the labour was housed in barrack-lines. The barracks were constructed with bricks in mud with thatched roofs. The coolies did not pay rent for this accommodation.

A minor proportion of the labour was housed on camps, in huts built by themselves, made in mud with thatched roofs. In several of the camps Government provided a piped-pure-water supply, water flush latrines and set aside a recurring cost for the maintenance of an adequate sanitary staff (see costs later), while in a few camps the

labourer had to depend on a well water supply and dry latrines. Otherwise sanitary arrangements were similar to those already quoted. The remains of some of these permanent camps can still be seen in the area. Government maintained dispensaries and S.A.S. doctors to attend to the minor ailments of labour, while a creche was started for the infants of women workers.

This creche did not meet with as great a measure of success as was hoped and was closed at a later date. A welfare centre was opened about that time, under the auspices of the Delhi Health and Baby Week Committee. The labour arriving at New Delhi, especially at the brickfield area, was medically inspected and segregated for two weeks from existing labour, to avoid epidemic outbreaks. Plague never occurred. Minor epidemics of cholera occurred, these were always promptly brought under control. Small-pox occurred in small proportion but due to the satisfactory system of vaccination introduced by Government this disease did not spread.

*Malaria* was a disease which affected the labour in the spring and the autumn months and greatly incapacitated them, especially in malarious years. (See further).

*Present Conditions.*—The P.W.D. (Government) to-day employ their labour through the agency of contractors.

A clause exists in the contract whereby contractors are held responsible for the proper housing of their labour. There are two types of labour camps:—(1) those which are still partly maintained at Government expense and which represent the old camping grounds already referred to above; and (2) those maintained entirely by contractors.

*No. 1 Type of Camps.*—There are three camps in which the larger proportion of present day labour is housed in these camps. This labour may be divided into two categories; (1) some directly employed by Government on horticultural work at New Delhi (931 souls); (2) the largest proportion of labour working on Government works for numerous contractors; (3) labour working for contractors on private works.

In this last mentioned category is some labour employed outside the imperial capital, for instance on work at Delhi City. The total number of labourers housed in these three camps is 12,000.

*Housing.*—The housing in these camps is (1) partly in the barrack lines which were originally built by Government and have in some cases been added to by the contractors and (2) in huts built by the labour themselves. In the former case, the labour does not have to spend any money on constructing their homes. In the latter case the home costs them anything between Rs. 8 and Rs. 30. to construct. The huts are made by the labourer, who digs a hole in the ground, the resulting mud forms the walls of the hut, while the roof is thatched. The roof is not weather-proof. In this case the contractors have not paid for these huts. The conditions have grown as a transitional stage between the period when Government controlled the labour and the present control by contractors.

*No. 2 Type of Camps.*—There is one such large camp at present situated at the brickfields. The contractors have supplied housing, dry latrines and maintain two sweepers for general sanitation. Rubbish is dumped away from the camp and night soil is trenched. There is one tap water supply but the labourers usually drink well water. The camp is generally vacated during the wet weather months when the labourers return to their homes for their agricultural work. Labourers at this camp receive first-aid care and maternity care from the welfare unit situated at a neighbouring camp. (See further). A few other minor collections of labourers are housed at the site of their works, but these are in small numbers. The total number of labourers housed in this camp is about 1,000.

The present housing presents a difficulty, because as the land where a camp is situated is sold for the extension of the capital, so the labour must be moved to another site.

*Wages.—Present day.*—(a) The labouring male coolies earn 9 annas per day; (b) the labouring female coolie earn 7 annas per day; (c) the child (of 12 to 15 years) earn 4 annas per day.

An average family will earn about Rs. 30 to Rs. 40 per month collectively.

A mate or supervisor is paid at a rate of Rs. 20 to Rs. 40 per mensem according to his class of work. The raj or bricklayer is paid Re. 1-8 annas to Rs. 2 per day. The santraj or stone mason earns Re. 1-3 annas to Rs. 3 per day.

*Formerly, i.e., 1912-14.*—The male labouring coolie received a wage of 6 annas per day. The female 4 annas per day. The working child 2 annas per day. A mate or supervisor received Rs. 10 to Rs. 20 per mensem, bricklayers received 14 annas to

Re. 1-2 annas per day. Stonemasons received Re. 1 to Re. 1-4 annas per day. There has thus been a rise of 30 per cent. to 50 per cent. on the old wages as compared with present day.

*Receipt of Wages.*—The contractors pay their labour rather irregularly, generally once in two or three months.

*Diet*—This consists of:—*Vegetables*, i.e., onions, carrots, peas, radish, green gram tender shoots of the leaves of grain and peas; *grains*—palak, dal, wheat, bajra, hawar, maize, barley, rice.

*Meat.*—Some is eaten only in certain classes.

Taking into account the cost of cooking, the daily average cost of food for a family of five persons is 5 annas 3 pies. An adult eats on an average five chappaties per day and a child three chappaties. If to this is added other expenditure of living, such as clothing, simple luxuries, etc., the daily figure of expenditure for a family of five would be Re. 1-1 annas to Re. 1-4 annas.

A demonstration of the diet, in the said state, being cooked and being eaten can be given. At one time a general grain-grinding machine operated at one camp, this does not exist now. Each camp possesses its shopping centre which is carefully supervised. The average living cost for a family of five is therefore Rs. 31-14 annas to Rs. 37-8 annas. per mensem. This does not leave much in the nature of a saving when the income is considered (see above).

Since 1912-14.—Wages have risen by about 30 per cent. to 50 per cent. as shown above. Yet living has risen out of proportion. Whereas the chappatie cost 3 pies in 1912-14 to-day the same chappati costs 9 pies. The rise would be in the region of about 70 per cent.

*Clothing.*—A labourer lives in the clothes he has on his back. The outfit costs Rs. 10 per annum per man, Rs. 8 per annum per woman and Rs. 2 per annum per child. The extra winter clothing consists of a dohar or sheet costing Rs. 5.

*Savings.*—Generally speaking, the coolie labour is in the hands of the moneylender. From personal enquiries I find that on an average the labouring family is indebted to the moneylender (buniya) to the extent of about Rs. 80 per annum which includes the heavy interest of 37.5 per cent. per annum. Some fortunate labourer, who happens to save some money, spends it in buying jewellery or land and cattle in his own home. Much money is spent on ceremonies. The average coolie wedding costs Rs. 200 to Rs. 400. and about Rs. 200 for death.

*Hours of Work.*—From October to March the hours of labour are 7 a.m. to 6 p.m. with an interval of half an hour mid-day.

From April to September the labour hours are 6 a.m. to 6 p.m., with an interval of one hour mid-day. Much care is exercised in getting the muster-roll taken in the early morning.

*General Sanitation of Camps.*—As already mentioned above, Government pay for sanitation in the majority of camps at New Delhi.

The initial cost for installing latrines and water in the three existing camps was, approximately, Rs. 15,000, while the annual recurring cost of refuse removal, staff and sanitation generally is Rs. 18,000 per annum. (Detailed figures can be given if necessary.)

*Diseases: Malaria.*—In past years the most noticeable disease was malaria. Malaria eradication is essentially a labour problem of the first importance.

In India, out of a population of 320 millions (one-fifth of the total world population), well over one million deaths occur annually from malaria. Carter says: "It is not in the death-rate, however, that the gravest injury of malaria lies, it is in its sick rate; in the loss of efficiency which it causes rather than in the loss of life."

An estimate based on Van Dine's figures show that there is a loss of over 300 million working days per annum in India apart from the loss due to the million deaths per annum.

Carter calculates that a death from pneumonia corresponds to 125 sick days or work days lost. Working on this basis, a death from malaria corresponds to 2,000 to 4,000 sick days. This estimate can be doubted, because the man infected with malaria is half sick all the time. On this estimate the number of days lost to India by malaria would average 3,000 million, if we take the deaths at one million. This corresponds to a loss to India of 1,500 million of rupees per annum, or over £100 million sterling. Whenever malaria prevails the population is generally subnormal physically, mentally and economically.

Delhi has always been regarded as very malarious. The reasons cannot be discussed here.

Christopher, in his report on malaria at Delhi, 1926-27, shows that epidemics recur with considerable regularity at some years interval, e.g., 1884, 1890, 1892, 1897, 1900, 1908, and minor epidemics in other years. Christopher, in his report, gives a tabular statement showing the mortality rates per mille per annum for the month at which malaria epidemics were at their highest, which figures are striking in relation to the appalling damage done by malaria at Delhi.

Christopher's report shows that in 1926 the imperial capital was heavily infected with malaria. He says cases of malaria treated were as follows :—

1924	..	..	..	..	..	1,047
1925	..	..	..	..	..	1,546
1926	..	..	..	..	..	2,270

Christopher, in his report, pays particular attention to the labour camps, then situated at New Delhi, and gives map and table showing the spleen rates then found in the area. These spleen indices ranged from 13 to 75 per cent. These figures are an indication of the serious damage to coolie labour, and its economic position at New Delhi.

Following on Christopher's investigation came an exhaustive investigation by Senior-White, which dealt with the many aspects of the case. Since 1928 weather conditions have not been favourable for malaria, while a considerable amount of work for the control of malaria has been carried out. The results obtained to-day are so far satisfactory. To quote an example : whereas in 1926 one of the largest camps at New Delhi gave a spleen index of 54 per cent., to-day the same camp shows a spleen index of 7.5 per cent. This year all possible mosquito breeding-places in the new capital were under control. Those who are interested might wish to see the practical application of mosquito and malaria control at New Delhi. We cannot claim that this malarial problem is by any means solved, and much major engineering and minor malarial control work remains to be done, and for which money is essential. So far the money still remains to be secured.

*Cholera.*—Unlike malaria, cholera on appearing in a community generally causes a panic. Cholera, small-pox and plague produces a dramatic element which generally assists towards securing money for necessary public health action. Cholera has occasionally appeared in our labour camps. This disease is imported into the camps. The brickfield area is generally the first to be infected. The last epidemic appeared in May, 1929, when three deaths occurred before the disease was brought under control with mass inoculation and other public health measures.

*Small-pox.*—Vaccination against the disease is most strictly observed amongst our labour, resulting in comparative complete control of the disease.

*Plague.*—Is fortunately a disease which has not so far affected the labour at New Delhi.

*Hookworm.*—This disease is not found.

*Veneral Diseases.*—The welfare workers state that this is by no means a common disease amongst our labour, while alcohol (country spirit) is not much indulged in.

*Leprosy.*—An investigation is now in progress.

*Other Diseases and Accidents.*—Trachoma of the eyes is fairly common. Minor ailments are dealt with at the camps, while severe diseases are attended to at the hospital at New Delhi. An infectious diseases hospital exists at New Delhi. It is well used by the labourers in times of need.

*Education of Labour.*—At one time a standard size cinema was employed at one of the camps. This is not now used. It was closed down with the reduction in labour. Miniature cinema displays and lantern lectures are given by the public health staff. No Government educational schools exist in the camps. In one camp a private school has been started through the agency of the labourers themselves. There is only a small attendance, while a fee of Rs. 2 per month is charged per child.

*Sickness Insurance.*—I do not believe that an insurance scheme against sickness could be successfully introduced at present. My reasons are as follows :—Such insurance schemes cannot successfully operate until we have reduced the incidence of disease to a reasonable figure. This is unfortunately not the case.

*Maternity Child Welfare and First-aid.*—As already mentioned, when Government controlled the labour at New Delhi, camp dispensaries and male doctors were employed. One creche was tried at the secretariat. The details relating to this

can be given verbally. At a later date one welfare centre was opened to serve the whole of New Delhi, under the auspices of the Delhi Health and Baby Week. In early 1928 a considerable expansion of maternity, child welfare and first-aid work for the labour was made. The existing work was taken over by the New Delhi Municipality and the costs were borne by that body.

Each camp now possesses its small maternity and child welfare centre and first-aid post in immediate charge of a trained and qualified nurse-dai. At the largest camp a lady sub-assistant doctor is also in attendance. Her duties are chiefly in association with this camp, but in addition she regularly visits the other camps in the area and deals with technical medical matters, particularly concerning the women workers and their children. This lady doctor also conducts school medical examination and treatment of girls attending the schools at New Delhi. In charge of the whole organization is a lady superintendent (Miss Weller), whose duty it is to supervise the six maternity and welfare centres which now exist and have come into operation since August, 1928, in the New Delhi area. The temporary buildings for two of the camp centres were provided by contractors. The total budget estimate for all maternity and child welfare and first-aid work at New Delhi was estimated to cost Rs. 50,000, spread over a period of five years. The initial cost for starting one camp centre amounted to about Rs. 400, while the recurring cost is Rs. 1,500 per annum for one centre.

A system of maternity fees for the better-paid employees of Government has been recently introduced, as it is our intention that free maternity benefits can only be given to the poorer classes. This system is an interesting one.

For those interested in this subject I attach a copy of the 1928 annual report.\* The work has progressed considerably during 1929. There is no possibility of introducing legal maternal enactments for midwives in our present state at Delhi. Maternity benefits for pregnant women might be considered.

*Clerical Labour : Housing and General Sanitation.*—This labour is housed in excellently constructed quarters. Public health sanitation is good, and all their needs have been provided for by Government. More and more quarters are being erected. There is some scarcity of quarters, which no doubt will right itself as the imperial capital grows to maturity.

*Education and Welfare.*—Schools exist for the education of children. At these schools a careful system of school medical examination and treatment exists. School medical inspection is a work which has been especially organized in the Delhi Province at a cost of Rs. 11,000 per annum. Its extension is desirable. Welfare institutions exist under our above-mentioned scheme for maternal and child benefits, while the medical care in this area is in charge of the civil surgeon and his medical staff.

*Foodstuffs.*—A shopping centre exists, which is under the charge of the New Delhi Municipality.

*Epidemics.*—A few cases of major epidemic diseases occur annually, but these have always been promptly eradicated. Malaria is the chief disease which attacked clerks in former years, just in the same way as I have related above in connection with coolie labour.

## SUPPLEMENTARY STATEMENT OF MAJOR J. R. D. WEBB.

### *Notified Area Civil Lines.*

1. *An Ordinary Coolie.*—(a) Daily income, 8 annas per diem. (b) Average family, four to five members. (c) One average meal for an adult.

Article.	Quantity. Ounces.	Cost. Ra. a. p.
(1) Wheat flour mixed with gram flour or barley flour or maize flour (sample) .. .. .	12	0 1 3
(2) Salt, onions, chillies, mint and tamarind (crushed together) or onion is taken separately .. .. .	—	0 0 6
(3) Cowdung cakes to serve as a fuel .. .. .	—	0 0 3
<b>Total .. .. .</b>	<b>12</b>	<b>0 2 0</b>
Weekly, Re. 1-12 annas.		
Monthly, Ra. 7-8 annas.		Total, two annas.

\* Not printed.

1. *An Ordinary Coolie.*—contd.

Extras—	Article.	Quantity.	Cost.		
			Ounces.	Rs.	a. p.
(a) (1)	Cheapest kind of vegetable or pulse .. .. .	—	0	0	3
(2)	Gur (raw sugar) .. .. .	2	0	0	3
(3)	Parched grams .. . . .	2	0	0	3
(4)	Oil .. .. .	1	0	0	3

One anna only.					
Family of five per month .. .. .			26	4	0
Including extras .. .. .			13	2	0
			39 6 0		

i.e., say, Rs. 40 per family of five with extras.

2. *A Better-off Labour.*—(a) Daily income, Re. 1 to Re. 1-4 annas per diem.  
(b) Average family, four to five members. (c) One average meal for an adult :—

	Article.	Quantity.	Cost.		
			Ounces.	Rs.	a. p.
(1)	Rice .. .. .	4	0	0	6
(2)	Wheat flour .. .. .	8	0	1	0
(3)	Pulses .. .. .	2	0	0	3
(4)	Ghee .. .. .	$\frac{1}{2}$	0	0	6
(5)	Oil .. .. .	1	0	0	3
(6)	Onion, salt, chillies, spices, turmeric .. .. .	—	0	0	6
(7)	Fuel (cowdung cakes and firewood) .. .. .	—	0	0	6
Total .. .. .			0	3	6

Three annas and six pies only.

Weekly, Rs. 3-1 anna.

Monthly, Rs. 13-2 annas.

Extras—

(a) (1)	Potatoes or other vegetables .. .. .	4	0	0	6
(2)	Tea (sugar and milk included) .. .. .	—	0	0	9
(3)	Curd .. .. .	—	0	0	6
Total .. .. .			0	1	9

One anna and nine pies.

3. *Bathing and Washing.*—Providing common bathing and washing-places for the coolies and ventilators in their quarters is a dire necessity (on no account a luxury), and should be met by the employers at any rate.

The bathing and washing arrangements as prevalent at present with these people, especially their womenfolk, is extremely deplorable (demonstrated at the Chandrawal Exhibit, Old Delhi). A kind of clay (multani) takes the place of soap. The only reason is cheapness.

Similarly, there is no sense in building huts and providing no ventilator, even ; there is no extra cost involved.

4. *Clothing and Bedding* are usually very poor, as seen at to-day's exhibit.

The meagre wages are hardly enough to provide two square meals for the family, and there is no saving to buy dresses and bedding. Dirtiness of the clothes is due to (1) lack of sense of cleanliness, (2) poverty, (3) lack of facilities for bathing and washing, (4) want of leisure.

5. Unemployment is now becoming very acute. Idleness of women is due to (1) unemployment, (2) pre-occupation in looking after house and children, (3) nervousness among certain classes of women to work with male labourers, (4) hatred for manual labour and in some cases caste prejudices. The last-named cause is wearing out.

6. In cases where both male and female members of a family work, that family is far better off than a middle-class labourer whose female family members do not do any work to supplement the male breadwinners' income. At any rate, the middle-class man is hard hit.

i.e., say Rs. 40 per family of five.

## THE GOVERNMENT OF INDIA PRESS, DELHI, PRESS UNION AFFILIATED TO THE CALCUTTA PRESS WORKERS UNIONS.

*General Health and Climate of Delhi.*—Our pay is hardly sufficient for our subsistence only. We are unable to incur the heavy expenses of proper medical treatment of our wife and children even in cases of urgent necessity. It is, perhaps, not an unknown fact that the health of Delhi is notoriously bad and that besides frequent cases of pneumonia, typhoid and other serious maladies, no family can escape the attacks of malaria of a serious type during the period of July to December each year.

2. That due to the extreme climate of Delhi we can ill afford to provide the necessary clothing to save ourselves and our family from the inclemencies of the weather, to which we are more or less exposed and we are thus unable to take any precaution against the maladies set forth in the previous paragraph. In this connection, we beg to point out, that there is no medical aid from the office.

3. That we having hailed from outside Delhi, have to maintain double establishments one at our native place and the other here in Delhi. Because due to our poor pay we do not dare bring our entire families out and live a miserable life altogether in a foreign and unhealthy place. We have to go to our native place not to enjoy a holiday but to attend urgent and unavoidable family calls whenever we are compelled to do so. This entails a deal of expenditure which we are unable to meet.

4. *Leave and Holidays.*—The privileges of leave, which are granted by the Fundamental Rule have been restricted to the industrial employees generally and thereby to the salaried hands when under the Fundamental Rules every 11 months of service caused one month of privilege leave and one month medical leave. But the new industrial leave rules give one month of privilege leave and any medical leave taken will be on half pay.

5. That the local holidays, which are enjoyed by the employees of other local offices are denied to us. As such, we do not get the much desired rest after periods of hard labour. We therefore, work continuously without occasional rest and thus run or are rather compelled to run the risk of contracting some disease due to overwork and insufficient nourishment and of becoming inefficient and being invalidated prematurely.

6. *Education of Children.*—The Government affords no facilities for the education of the children of the poor press employees generally the press workers have a number of children each, but the Government has not instituted any school for their free education. It is a pity to note that in these days of compulsory secondary education, the Government is so heedless about the education of the children of its hard and faithful labourers.

Since the introduction of piece system in Government presses no inconvenience was felt by Government as regards speedy out-turn of work and smooth working under single controller of printing, stationery and stamps with a small staff of his own. But by the instalment of various machineries and hereby creating a huge office of the present Controller with fat salaried hands has snatched away bread from our many poor countrymen out of the Press Grant in the Government of India Budget—it will be seen if all the old, and new records are examined.

In the end we beg to approach the Commission in very simple wordings for justice and sympathy. We are fallen victims to the venomous vexations and our hearts are wounded to see that a poor labourer under the benign Government is so badly pinched and squeezed among narrow circumstances that he cannot spare even a pie for the coffin of his dearest and nearest when unfortunately one pays the debt of nature in his family and which is only done through subscriptions.

We hope the Holy Commission will prove themselves to be an antidote for us for which we shall sincerely pray before His Almighty.

(Signed) LALA SHANKAR LALL,  
*Secretary.*

N. M. JOSHI,  
*Member, Legislative Assembly.*  
*President.*

[The general observations given above were accompanied by a number of specific requests submitted by the various classes of press employees. The following is printed as an example :—]

#### **Binders.**

1. That the best portion of our lives and energy have been spent in serving Government honestly and loyally, and in spite of whole-hearted devotion we were allowed a small fixed pay in 1927 as a result of the reorganisation. But to our utter misfortune we have been losers by this arrangement inasmuch as our present pay happens to be less than that we were getting under the piece-working system.

2. That while most of the employees of the office or of other Government offices enjoy a time-scale rate of pay, the same has been denied to us with the result that after doing faithful work throughout the year, there is no improvement in our wages, either in the shape of increment or in any other way.

3. That we have to work 8½ solid hours a day and have to be in an office for 9½ hours, besides our overtime which is not counted towards pension at all and have to do arduous work throughout the whole day long with the result that our tiffin period is excluded of our working period.

4. That we have been memorialising to the Government regularly for our confirmation on the posts while having served the Government loyally and faithfully for the considerable period of 15 and 16 years but to our utter disappointment our prayer was not acceded to, and being temporary hands for so long a period we have not been given any sort of privileges either temporary or permanent during the said existing period. Notwithstanding the fact that we have all been in service from 1 to 16 years, been confirmed together in 1922 with the result that both juniors and seniors have been brought on to the same platform of rights under the same rules without any regard for service.

5. That we have been allowed only 10 days casual leave up till June, 1929, but to our utter misfortune, the leave is disallowed on the adoption of the new leave rules under which only a month's leave on average pay and medical leave on half average pay in a year is all that we can get. There are persons who having long service of 24 years with 17 years permanent service, having been treated under the same new rules. A notification was circulated in September, 1929, that we are brought under ministerial service instead of industrial under the Fundamental Rule 9 (17) without any beneficial result.

6. That we have been provided with quarters the rent of which is deducted 5 per cent. of over pay. The quarters which we are living in bear some accommodation but the new quarters under construction for the press employees especially the daftries quarters are too small in which a bachelor will have to suffer many difficulties whereas we poor people having big families will be required to reside.

7. Under these circumstances mentioned above we earnestly pray :—(a) that our pay may kindly be revised to the time-scale of pay in order to enable us to enjoy a pension of the last grade at the time of our retirement ; (b) that the tiffin time may kindly be included within 8½ hours' duty ; (c) that casual leave may kindly be allowed to us along with other respective leave ; (d) that we may kindly be allowed the same concession of holidays as are given to other offices located at Delhi ; (e) that we may kindly be provided with quarters bearing sufficient accommodation so that we may not have to undergo any hardships and difficulty to reside with our families.

THE HONORARY SECRETARY, THE DELHI FACTORY OWNERS'  
FEDERATION, DELHI; AND RAI BAHADUR BSAISAKHA SINGH,  
CONTRACTOR, NEW DELHI.

**I.—Recruitment.**

1. (i) Industrial workers are generally recruited from amongst the ranks of those uprooted from the soil whose ancestral land has under the baneful influence of fragmentation dwindled to point at which it will no longer support its owner and his family, and from those in debits to the village moneylender.

(ii) Migration has been accelerated to a great extent in modern times on account of an extraordinary increase of the means of communications and transport.

(ii) Clauses of particular streams of migrations are (a) wages and (b) investment of capital ; for an increase in the supply of capital, leads to the demand for labour. An increase in the supply of capital means in other words an increase in the supply of appliances for production and consequently cheaper goods, and hence their greater demand, which would lead to an increase in the demand of labour.

3. *Change of Fashion and Taste.*—The modern industrial system labour-saving machinery, which depends upon the growth of capital, signifies an increase in the productive power of the country, for if the demand for the commodity is elastic, displaced labour might be employed in the making of fashion and taste.

(iii) Changes in recent years are due to the increasing facilities of the means of communication and extended knowledge possessed by the working classes of life in parts outstanding their immediate localities.

2. (i) On account of the far more increasing facilities of communications, there is a greater frequency of return and still more so is expected in times yet to come.

(ii) Permanent labour force is in an insufficient proportion in India as compared to her enormous population of well over 300,000,000. The industrial development in India is still in its infancy and only a very small proportion of her people is found concentrated in specially industrial areas, working in textile mills, iron works, or any other of the typical units of modern industry.

3. (i) India is above all an agricultural country and it is only in cases of bad harvest, scarcity of cultivation, that recruits for the industrial labour market are generally available direct to the employers.

(ii) Improvements are possible, if labour exchanges, i.e., States bureau similar to those of Great Britain by the Act of 1909, are established, where unemployed persons can register their names and occupations and to which the employers in need of labour may apply. These may also be instrumental in transferring labours from districts when no labour is wanted to the districts, when there is a shortage of them.

(iii) Public employment agencies should be discouraged, as these would be harmful, considering the present labour condition in India.

4. Socialities, peculiarities of national character in respect of language, religion, political institutions and mode of life do in a fair measure affect the mobility of labour, but these are now for the most parts crossed over and the effect is not very unwholesome.

7. The question of unemployment is not very much pressing to the skilled as well as unskilled labouring classes.

(ii) (a and b) It is comparatively less due to the voluntary retirement than due to the retrenchments and dismissal.

(iii) Employment bureaux and workhouses should be established (although there is not much difficulty in the way of the labourers to get themselves employed), where a fair measure of trading should be given to the unskilled workmen and where they may get themselves registered for future employment.

(iv) Unemployment insurance should also be encouraged.

(v) The application of international conventions is not very much desirable to safeguard against any possibility of unemployment, in howsoever insignificant a degree it might be.

## II.—Staff Organization.

11. Selection of managing staff is generally not at all based on any sound principle whatsoever, for technical training, both in its theoretical and practical aspect, is not made the sole criterion in this respect.

12. (i) As to the recruitment and training of supervising staff in its superior and inferior grades, the methods in force are not at all very hopeful for there are not institutions solely designed to impart industrial training in any particular line out of its multifarious ramifications. Apprenticeship is the only way of acquiring some insight into the technique of any particular type of industry.

(ii) Apprenticeships, guild system and trade unions, are the only means for affording greater facilities in the way of training.

13. (i) Relations between the staff and the rank and file are not at all very encouraging.

14. (i) The manager is to keep time-keeping, piece-work contractor, and attendance registers, which are to be checked regularly by the factory inspectors.

(ii) The wages are paid to the workmen either by the manager or by the employer or through a responsible officer of the staff.

15. (i) Most of the work of ordinary type is given on contract.

(ii) Such sub-letting is also witnessed in certain cases.

(iii) Contractors and sub-contractors fully control the working conditions.

(iv) The general effect is fairly satisfactory.

## IV.—Health.

23. General health of the workers is not very good. Birth-rate is less and infant mortality is comparatively great. Working conditions at workplaces are good. At home they are absolutely bad and unsatisfactory. Directory is generally very poor. Physique is generally very weak. There is a general decrease of birth-rate amongst labour as the result of the disturbances of sex ratio in the industrial cities. The general increase in mortality is due to the bad system of housing and general ignorance prevailing amongst the workers.

24. Medical facilities are partly provided by the employers and partly by the Government. It is rarely done by other agencies, such as municipal bodies and corporations as well. Provisions for women doctors and trained midwives are very poor.

25. Medical facilities are generally not very much utilized. Women are as a whole too superstitious to avail themselves of the medical practitioners provided.

26. Sanitary arrangements with regard to latrines, drinking water, bathing and washing are fairly good at workplaces, but comparatively less at home.

27. Proper official supervision is generally lacking. Boards of health are too few and far between. Inspection is very irregular at mills and other industrial areas.

## XV.—Industrial Disputes.

123. India is at the present moment suffering more severely from labour troubles than probably any other country in the world. For about a year and a half, strikes, particularly in the Bombay cotton mills, have been going on, as well as at Calcutta, which is the seat of the jute industry.

The causes of the troubles are (i) communist agitation and (ii) the growing feeling of unrest amongst the Indian labourers. The scope of the welfare activities is very limited and hence have accumulated the conditions of poverty, squalor and ignorance, which make the industrial population of India an easily worked field for the communist agitators and others. The shifting conditions of Indian labour are mainly responsible for the difficulty experienced; industrial conditions are fairly satisfactory, but in the smaller workshops and factories much more is yet to be desired. Of late

years much more is done by the provincial departments towards the fostering of the cottage and village industries in which the workpeople can have the advantage of living and this is a highly fruitful line of effort. The interest of India and her people would be better served by the development of village industries in their own homes, amidst the conditions best suited to them, side by side with being able to compete with goods brought from abroad or from other parts of their own country.

Mr. C. D. DIDWANI, MANAGER, Messrs. BIRLA BROTHERS, LTD., DELHI.

#### I.—Recruitment.

1 (i) In the beginning of the textile industry in this city, trained labour for spinning, weaving and other departments of the mill had to be imported from those centres where trained labour could be found, namely, Cawnpore, Ahmedabad, and Bombay. Later on, when local and provincial labour got trained and took to mill work, migration of labour was considerably stopped. Some of the immigrants settled here and they have been here for the last twenty years or more. At present the immigration of labour from other provinces is very nominal, but the immigration from neighbouring villages and districts still continues.

(ii) These villagers generally depend on agriculture, but there are naturally slack seasons and times of bad harvest, and at such times the villagers come out of their respective villages and seek employment in the mills and factories. Moreover, the surplus population of the province also migrates and seeks work in mills. Also the holdings of the villagers are very small and the land also has to remain uncultivated for long periods and consequently the villagers have to migrate.

(iii) There has been no appreciable change in the forms of migration during recent years.

2. About 75 per cent. of our mill workers have settled in Delhi, and they seldom visit their native place. The remaining 25 per cent. go home once a year and stay there for a month or two. Thus the extent of our permanent labour force is about 75 per cent.

3. (i) The existing method of recruitment is mostly through jobbers. Sometimes a little malpractice is seen in this system on the part of the recruiting officer, who makes some money out of the business.

(ii) It is hoped that if suitable public agencies are opened for the purpose the work may be done more economically and even conveniently. It may prove a practical proposition if organized on proper lines. Such an agency should keep itself in touch with all the industrial centres and should keep statistical data, showing the surplus labour which could be available at the required time. The mill owners should make known to them their requirements, which should be met by such agencies.

I might also mention here that such agencies should only act as intermediaries between the employers and the employees so far as the question of their employment is concerned. These agencies should not interfere with the work of the management, as thereby more harm than good will be done. Agencies of this nature have proved quite successful here as well as at other places, so far as the employment of clerks and officers is concerned, and there seems to be no reason why this will not prove successful in the case of labour.

7. (i) Factory employment being more attractive in these days, people are rushing in this direction, and every month the number of trained workers increases, which, as a result, brings unemployment. Unskilled villagers come out of their villages with a view to enter the mill service, but they do not get employment so conveniently. A skilled labourer who has worked on a particular job for a few years seldom remains unemployed. It is generally the unskilled and newly-trained labour which suffers from unemployment.

(ii) It is difficult to give the extent of unemployment due to the lack of statistical data in this respect. The main causes of unemployment are :—(a) More men are entering mill life every month than required ; (b) new labour-saving devices and machinery improvements displace a lot of mill labour, such as high speed warping, automatic loom, etc.

A few years back one weaver used to attend to only one loom, whereas now every weaver attends to at least two looms, and in some cases even more. The labour, therefore, being more skilled can manage to attend to more machines than what they could do before. This improvement on the part of the workers, although desirable for the healthy growth of the industry, automatically results in unemployment.

(iii) Out of the many possible methods of alleviating or even minimizing this increasing unemployment in this country, I may particularly lay stress on a few methods :—(a) About 80 per cent. of the Indian population depend on agriculture, but as the condition of agriculture has been deteriorating the agriculturists have to painfully give up this ancestral occupation and look for some other job. If the condition of the agriculturists is improved, which can only be done by the help of the Government, this increasing unemployment will certainly be minimized to a considerable extent as the unemployed might again revert to their respective villages; (b) new and necessary industries should be organized in the country; (c) cottage industry should be freely introduced among all classes of people. This is, in my opinion, the most important item, which should be thoroughly considered. The Indian agriculturists are idle for a few months every year, during which time they can add something to their income by the cottage industry. It is said that Japan has made remarkable progress in respect of its cottage industries, and it can safely be said that India needs it for improving its economic condition.

(iv) The Unemployment Insurance question does not seem to me to be a practical proposition at the present time.

8. (i) The average duration of employment of a worker in our mill is about five to six years. In some departments it is more, whereas in the weaving shed the duration period of employment is somewhat less.

(ii) The approximate figure of the casual employment of our workers may be 10 per cent.

(iii) The average percentage of absentees in our mill is about five to six. The workers generally absent themselves from work for a short period which varies from two to three days. They prefer taking their discharge notes to remaining absent for long periods. The reasons for their absence are various :—(a) Due to illness of themselves or their relatives; (b) due to marriage or other religious ceremonies; (c) for a day or two after their monthly pay is distributed, etc.

(b) The absenteeism is generally seasonal in character. During the monsoon, when malaria prevails, workers generally suffer from it, and this is the period when the number of absentees increases. In particular months of the year marriage ceremonies take place, and during this season also the number of absentees increases.

(c) In monthly wages as well as piece-work system the workers have to lose their pay. When the worker has no money and needs it he might take it in advance against his work, or, on the recommendation of the doctor, he receives from our mills some financial help for his food and other expenses during the period of illness.

## II.—Staff Organization.

12. (i) In our mill we generally keep some educated apprentices whom we train for some particular departments, and when vacancies occur we give them a chance.

(ii) So far as labourers' training is concerned, we allow the workers to train their relatives, and in some cases we also allow them a scholarship of Rs. 10 to Rs. 15 per mensem. After they have learnt the work, their stipend is stopped and they are given work. The ordinary workers who show their competency of work are promoted to jobbers, etc.

13. (i) Except in some rare incidents, the relationship between the management and labour is smooth.

(ii) I do not find any defect in employing jobbers. It is rather necessary to employ them to control and look after the work of a small unit of labour.

(iii) There are no Work Committees here at present to look after the condition of the workers, give them technical training, improve their efficiency, and guide them. It does not seem desirable to start them now, unless the labourers understand their respective duties in this connection.

14. (i) Labourers in our mill are engaged in two ways :—(a) On monthly wages system; (b) piece-work system. The time-keeper takes attendance of the workers who are engaged on monthly wages system, and work is registered of those workers who work on the piece-work system. Checkers are kept to check the work of time-keepers.

## III.—Housing.

16. (i) About 60 to 70 per cent. of our workers have been provided with quarters by the mills. In these houses, about 50 per cent. are our own and 50 per cent. are rented by the mills. A nominal rent, i.e., 30 per cent. below the economic rent, is charged for the workers.

(ii) Nothing has been so far done for the housing of our labour by either the Government or any other public agency.

(iii) The remaining 30 per cent. of our workers take advantage of the houses made for the purpose by private landlords.

(iv) The workers do not have their own quarters.

17. The industrial surveyor sometimes recommends to the Government regarding the want of land required for the housing situation of some indigenous industrial concerns, and the Government generally allow "Nazul" land for this purpose on a lease.

18. (i) Our workers are quite satisfied with the quarters provided for them. They sometimes like a shaded verandah in front of their quarters, which, due to want of accommodation, could not be arranged in old quarters. In those quarters, which are under construction at present, verandah, kitchen, and bath have been added.

(ii) From the health point of view I can say that they are quite good. There are three windows and one door and one roof ventilator in each quarter. Thus the room is very airy and allows a good deal of daylight. There is pucca floor in front of the houses, which the workers utilize. The drainage system, in our opinion, is very sanitary, and there is scientific septic tank and flush system latrine.

(iii) Electric light is supplied in each quarter. Many hand pumps have been fitted in the lines for the supply of water. Great care is taken about the sanitation of the lines.

19. The workers utilize wholeheartedly the accommodation given to them.

20. Generally the scale of rents is based about 30 per cent. below the economic rent.

21. Sub-letting of quarters is not allowed. Also workers working in other factories are not allowed to put up in quarters provided for by our mills. About a fortnight's time is given to those workers who are asked to vacate their quarters. Labourers working in the mills are not asked to vacate their quarters unless they either leave their job or are dismissed.

22. In my opinion, the housing condition in industrial areas often affords a chance to men of a bad type to spread some vices.

The labourers often think that some liquor, after the day's work, helps them to remove fatigue, and therefore they get addicted to it. As their earning capacity is little and they spend a good deal on drinks, their family life becomes much worse. The children, too, try to copy their parents in this respect.

Due to their illiteracy, they cannot understand things well. We tried temperance measures and were remarkably successful in our efforts. The majority of our labourers have discarded this vice, as a result of which they now realize that their private life has considerably improved. So far as illiteracy is concerned, we are trying to educate them, and have opened day and night schools also for them.

#### IV.—Health.

24. (i) One assistant surgeon is kept in our mill, with four compounders and two dressers. We have got a dispensary as well as arrangements for the indoor patient. Medicine is distributed amongst the workers and their relatives free of charge. Our doctor visits the workers' quarters twice a day, and looks after the sanitation of the line and about the health of the workers. We have also engaged a trained midwife for our maternity ward.

(ii) The municipality has got some dispensaries in different parts of the town, as well as some hospitals, and the workers are to some extent benefited by these. In the case of an accident, we generally send the patient to the Civil Hospital.

(iii) So far as I am aware, there is no other public agency which gives medical facilities to the workers.

(iv) We have one trained midwife and a dai for the women workers as well as for the ladies of these workers who serve in the mills. The female workers get three months' leave, with pay, at the time of pregnancy. The period is 1½ or 2 months' before delivery and 1 or 1½ months' after that period. During their delivery time they are looked after by the midwife.

25. (i) About 95 per cent. of our workers take medicine from our dispensary and want to get themselves treated by our doctor at the time of their illness.

(ii) Special medical facilities for women have only been started recently, and they all welcome our newly-made arrangements.

28. The control of temperature is effected to some extent automatically by proper humidification, for which great pains are taken in our mill. Apart from humidification in other departments, we have in our spinning department the carrier system of cooling arrangement.

30. Some provision should be made for the sick workers, who have generally to lose their income for the days they remain ill. In this scheme I think the employers, the employees and the State all should participate. I think it is specially necessary for those workers whose income is not more than Rs. 25 a month.

31. We have got a small maternity ward where a midwife and a dai are kept to attend to the females at the time of their delivery. The midwife also looks after the sanitary condition in the labourers' quarters. The female workers are allowed three months' leave, with full pay, at the time of delivery.

#### V.—Welfare.

32. (i) We have established a Welfare Fund to which the workers contribute to the extent of 1 per cent. from their income every month, and the mill contributes an equal amount. The fund is managed by Birla Mills Labour Welfare Committee, on which labour finds greater representation than management. This Committee has been doing a good work and its expenses will steadily increase.

The main activities of the Welfare Committee have so far been as follows :—  
 (a) Day school for boys, in which about 300 boys are receiving education ;  
 (b) one girls' school, in which 35/40 girls are receiving training ; (c) a night school, in which about 50/60 adults receive education ; (d) arrangement has been made for small children to be kept at a particular spot where they are attended to by the dais ; (e) a cinema show is arranged on every holiday, and lectures are given for their uplift ; (f) a restaurant is maintained inside the mills where useful articles are kept and sold at very reasonable prices ; (g) a shop is opened at the workers' line, where all good provisions are available at reasonable prices ; (h) a Scoutmaster gives training to the boys. Thus all the welfare work is done by the employers and the employees jointly.

(ii) Nothing is done in this respect by other Agencies.

33. A secretary has been appointed to look after the work of the Welfare Committee. There are teachers under him.

34. (i) A refreshment hall has been organized in the mill premises where the workers can get good refreshments at very reasonable prices. A shop is opened in the lines where workers can have good stuff at very reasonable prices. Creches system in our mills is in its infancy, although we have a mind to make it very decent in the near future. The dais are kept to look after the babies, who are put there by their mothers. There are some Indian-fashioned "jhulas," where the boys get some milk, etc., during the day.

(ii) So far as the provision for physical culture and amusements are concerned, we have got one "Akhara" (wrestling place), parallel bars, etc., in our compound which are open for the workers. The workers are shown cinema on every holiday.

35. The effect of the welfare work has been very satisfactory. The workmen's social life has been uplifted. They have generally given up liquors and other bad habits. They have known the importance of sanitation, and now they live in a far better way than they used to do before. They get mutual sympathy among themselves, as well as from their masters and officers.

36. (i) For adult workers we have opened a night school, but at present the attendance is rather poor, i.e., it ranges between 50/75. It seems that the adult workers are not inclined to receive educational training.

(ii) For half timers we have arranged a school in the afternoon, but they are not inclined to attend it. They generally try to come in the night school in a smaller number. We are trying to increase the number shortly.

(iii) For workers' children we have got a day school wherein about 300 boys receive training. It has six classes and is running satisfactorily.

37. I would certainly wish to see some scheme adopted for the provision for old age of the factory workers, and I think a good way to do this is to open a Provident Fund Institution wherein the workers should be made to deposit a fixed percentage of their income and get a similar contribution from the employers deposited in that institution. Thus they will get a decent sum at the time of retiring after some years.

#### VIII.—Workmen's Compensation.

51. I have nothing to say against the Workmen's Compensation Act. I would rather say that this Act removes, to some extent, the fear of factory life from the workmen's hearts. We have got all our workers insured on our behalf in accordance

with the Workmen's Compensation Rules, and whenever an accident occurs the injured person gets a decent sum from the insurance company. The scale of compensation, in my opinion, is low, and there is room for increasing this amount to a certain extent.

#### IX.—Hours.

It is necessary, or desirable, to reduce the daily hours of work. A ten hours working day is most essential in Indian textile mills, and at the same time reasonable. The period of interval during working days is one hour after five hours' work. This is also quite reasonable. The number of holidays in a month is four/five, and holidays are observed in accordance with the Indian Factories Act.

#### XII.—Wages.

96. The rates of wages in different departments vary. They range between Rs. 22 to Rs. 60 per month. It is generally said that the wages in factories are comparatively much better than what is earned in the surrounding agricultural areas.

97. There has been some movement during recent years in connection with wages of workers, and it resulted in the increase of their income to some extent. In my opinion, the scale of wages in the different departments of the textile mills is rather peculiar. A labourer working in the spinning department, where he has to work for the same period of 10 hours and has to stand in an atmosphere full of cotton fibres, cannot get more than Rs. 25 a month, whereas a weaver generally earns more than Rs. 50 a month. One, therefore, cannot get spinning workers so conveniently as he can get weavers. Some scale ought to be made wherein this volume of difference in the wages of the spinning and weaving departments may be eliminated. In countries like Japan the scale of wages in the spinning and weaving departments are nearly the same.

99. Payments of wages are made in cash.

102. The basis of payment for overtime work is 25 per cent. more than their ordinary wages.

106. (iii) In our mills, the amount of fines realized from the workers is credited to the Workers' Relief Fund Account, and this amount is only spent for the help of the workers when they need it.

107. The period of wage payment in our mills is monthly, but I would prefer a fortnightly system of payment. The workers would also like to have fortnightly payments. Although they get money in advance against their pay, still when they stand in need of money they have sometimes to wait for a month to receive their wages, but if they receive their wages every fifteenth day they would arrange matters more conveniently. The month's wages are given to the workers by the 15th of the next month. Their wages have no relation to the profit made by the factory in which they are employed.

109. Bonus is given to all the workers on production exceeding a certain quantity. This is very essential for better efficiency, because on account of temptation of bonus the labourer works wholeheartedly.

There is no hard and fast rule for bonus to the workers on profits earned by the mill, but when the mill shows a profit the workers generally get half their monthly wages in the form of annual bonus.

110. The ordinary workers are not allowed their wages for the days they remain absent from their work.

The efficiency of the Indian workers has, no doubt, increased to a considerable extent, due to their long experience in the line, but they cannot, however, compete as yet with the foreign workers.

114. This is perhaps due to there being all conditions more favourable in foreign countries than in India.

---

### THE DELHI MUNICIPAL COMMITTEE.

#### Introductory.

The Delhi Municipal Committee is not an employer of industrial labour to any large extent. Its works, involving capital expenditure, are executed through contractors, and it keeps only a small supervising staff. It has a small workshop for

repairs of plants and tools, and a gang of beldars for the maintenance of roads. This memorandum therefore deals particularly with questions relating to housing, health, welfare and education of workers, and gives only general remarks on some of the other questions.

### I.—Recruitment.

Delhi is by no means an industrial city. Its population, according to the census of 1921, was below 3 lacs, and may be taken to be well over 4 lacs by now; the transfer of the capital of India to Delhi having attracted an appreciable number of persons to the city for various reasons.

In the absence of any reliable agency for the collection of labour statistics, it is difficult to give any accurate information as to the exact number of persons engaged in industrial undertakings, but the best opinions available take them to be in the neighbourhood of 60,000.

(1) The construction of the New City is responsible for a major portion of workers engaged in the building trade. The unskilled labour is drawn chiefly from Bikanir and other Rajputana States, with a sprinkling of the agricultural class residing in the surrounding villages. The skilled labour is provided by Northern India, to which the prominent contractors belong.

The textile labour came originally from Ahmedabad, Bombay and Central India, but it has already been replaced to a large extent by local labour reinforced by labour drawn from villages.

The other permanent industries find no difficulty to secure labour in the local market.

(i) and (ii) The extent of migration of industrial labour is not serious. It is more or less confined to textile labour in the lower grades. A worker of that class earns about Rs. 17 a month, and if he can earn that rate of wage, under less irksome conditions, there is no strong incentive for him to stick to the work that he has in hand. There are no particular streams of migration.

(iii) In recent years there has been a decided change for the better. Labour is getting more stable. A general awakening is discernible amongst them. It is not so simple and ignorant as it used to be. Its outlook is being broadened. It has begun to feel that it is not being treated fairly, and is trying to assert itself and make its presence felt.

(2) Out of the 60,000 labourers hardly 5,000 are drawn from villages, and as most of them have come here with their families they have little cause to pay any frequent visits to their village homes. Moreover, all the circumstances are tending towards the relaxation of family ties. The contact of the city with villages through industrial labour is not very strong.

4. As a major portion of industrial labour is permanently settled down in Delhi there is very little disturbance of family life. The section of labour which is drawn from outside has to a large extent moved to Delhi with its family members, and the remaining portion does create sufficient opportunities for itself to frequently visit their home.

7. No reliable information is available as to the extent of unemployment, but that it does exist at present to a considerable extent cannot be denied. The reasons which have led to this unfortunate position are :—

(a) The general slump in trade throughout India which has persisted for the last four or five years.

(b) The building of the New City is nearing completion, and a large number of workers of the building trade are being thrown out of work. These men have made Delhi their home permanently. The city is thus face to face with an acute problem as the wages of labour has already been affected and brought down.

(c) Some of the hand industries are fast dying out, as they are unable to withstand competition with machinery.

(d) No serious systematic effort has been made so far in Delhi to foster and protect small industries, and the cities which have better organized themselves in this respect are capturing Delhi market to the disadvantage of local labour. Attention is particularly drawn to Lameta embroidery, gold and silver thread works, which were once a very flourishing industry of the city, but Surat and Bangalore, where these works have been introduced as a cottage industry, have hit Delhi workers hard.

(e) In the absence of any demand due to general poverty, spread of materialism and westernization, persons who were engaged in fine arts, such as hand painting and handwriting, have lost their occupation.

8. Except in undertakings under the Factories Act the average duration of employment is from 9 to 10 hours, with no holidays. In a good number of trades a labourer is a piece worker, and has to work longer hours to earn sufficient bread for himself and his family members.

A worker absents himself from his work on account of sickness, to observe religious ceremonies, marriages in the family, and very often for no valid reason at all. For a certain section the payment of wages in a lump sum at the end of a month has a bad effect. A worker of that class has no care for the morrow, and wastes his time and his money for the first two or three days in drunkenness and gambling.

The average pay of an industrial worker may be taken at 12 annas a day, and he absents himself for five days in a month. As the estimated number of workers is 60,000, the loss to the city through absenteeism is estimated at Rs. 27,00,000 a year.

### III.—Housing.

16. An industrial labourer is expected as a rule to arrange for his accommodation. The textile mills, however, have built fairly decent quarters for 25 per cent. of their employees. The houses are built in single storied long lines, with some times a shed in front. One room is allotted to one family, consisting at an average of three or four persons. The room is generally of the size 10 ft. by 10 ft., but never more than 12 ft. by 10 ft. There are common latrines and common water taps. The rent recovered is below the rate prevailing in the locality for similar houses. With all their defects and shortcomings these quarters are decidedly more sanitary than the houses to which the workers living in them are accustomed.

The coolies working at the construction of New Delhi live in a specified area in huts made of mud with thatched roofs. These huts are unfit for human habitation, and it is a wonder that they were ever allowed. These huts belong to the various contractors, and the only saving grace about them is that they are situated in an open space with plenty of sunlight and air, and the conservancy arrangements which are under the Health Officer of that locality are satisfactory.

The industrial workers live in rented buildings, and only a few of them own their houses. In building these houses the landlord has looked to his own interest than to the convenience of his tenants.

A few years ago the houses of Rahgars in a certain locality of the city were compulsorily acquired, and they were given land in Western Extensions, where a number of houses built by them have sprung up. This quarter is known as Basti Rahgar. This Basti has not developed so rapidly as it was expected to do, for the reason that it is a little out of the way place, and is still lacking in certain amenities of life.

There is a big alum area in Saddar Bazar inhabited by Rahgars and Chamars. This place is known as Harphool Singh-ki-Basti. The land belongs to one Harphool Singh, a Jat, and the residents thereon are his tenants. This area has been a standing reproach to us, and is the plague spot of Delhi. Most of the epidemics are known to have originated from this place. The Committee has, at last, with the money generously provided by the Government of India, decided to acquire 55,000 sq. yds. of this land, pull down all the houses and make a proper lay-out. A fair-sized plot of land in the vicinity at Shidipura is being acquired on which model dwelling houses will be constructed for some of them. A portion of Harphool Singh-ki-Basti will be vacated, and the men thus dislodged will be brought to Shidipura. The improvement of the land thus vacated will be taken in hand at once, and as soon as it is ready for occupation it will be possible to have another portion of the acquired land thus treated. Both the bastis will be provided with proper drainage, electric lights and water supply. Provision is also being made for a school and a welfare centre.

This is the first serious effort made by the Municipal Committee for the clearance of slum areas from the city, and on the success of the experiment will depend the treatment of other small sized slum areas scattered all over the city, which are particularly inhabited by industrial labour belonging to the depressed classes.

Harphool Singh-ki-Basti gives a fair idea of the conditions under which industrial labour lives, and it is hoped that the Commission will find time to see things for themselves.

17. No special facilities have been provided for the acquisition of land by the workers. Land inside the city is fairly expensive, and is beyond the means of an ordinary person. The city proper has been unfortunately placed, and is hemmed in by all sides. To the north is the Notified Area Committee, Civil Lines, which under no circumstances would allow houses of Indian type to spring up, to the east is the river and the Fort zone, and to the south is the New Delhi with its high ideas and ambitions. The west is the only outlet to which we can cast our eyes. Here most of the available lands belong to Government, which has its own scheme known as the Western Extensions Scheme. The lands are given out on long lease to anyone who cares to have them. The rate varies between 8 annas and Rs. 5 per month per 100 sq. yards, according to its locality. All have an equal chance. There is a certain class which is shy to invest money on a land which is leased. We think that these extensions will have a better chance of development if a clause is added in the lease that the occupier may purchase the land outright by paying a specified sum.

## IV.—Health.

23. (i) Though separate figures of mortality amongst workers are not available, yet there is no reason to believe that they have a higher mortality rate as compared to other classes in the city. As explained under the head Education, there are only a few small areas inhabited by the persons engaged in leather trade which may be called industrial areas. The workers are as a rule mixed up with the general population, and live wherever they can find accommodation according to their means. To find out the health conditions of workers therefore, one has to look to the general mortality rate of the city.

(ii) The population of the city proper was 2,47,935 according to the census of 1921, and calculated on the bases of births over deaths since then it should be 267,193 in 1928.

There were 13,457 births, excluding still-births, during 1928, and of those 6,998 were males and 6,459 females. The number of still births was 280.

The total number of deaths, excluding still-births, during the same period was 8,535. The number of deaths excluding still-births of children under one year of age was 210.45 per 1,000 of infants born.

A study of the figures of infant mortality excluding still-births, shows that in ten years ending 1922, the rate gradually fell from 346.40 to 187.46 per 1,000. In 1923 it rose to 226.42 and fell again the next year to 174.02. In 1925 it was 182.56, and jumped to 237.51 in 1926. In 1927 it dropped again to 200.51, and has gone up to 210.45 in 1928.

The general death rate has been as follows during the last few years :—1924, 30.54; 1925, 29.37; 1926, 43.58; 1927, 32.78; 1928, 34.54.

Out of 8,535 deaths recorded, only 5,952 were verified for want of sufficient staff.

The statement below gives the percentages attributed to the various diseases :

1. Pneumonia and broncho-pneumonia .. .. .	1,857 deaths	30.1 per cent.
2. Phthisis .. .. .	759 "	12.8 "
3. Small pox .. .. .	395 "	6.6 "
4. Infantile diarrhoea .. .. .	390 "	6.6 "
5. Typhoid fever .. .. .	366 "	6.5 "
6. Premature births .. .. .	265 "	4.5 "
7. Malarial fever .. .. .	233 "	4.1 "
8. Asthma .. .. .	227 "	3.9 "
9. Senile debility .. .. .	207 "	3.6 "
10. Infantile debility .. .. .	199 "	3.6 "
11. Other diseases combined .. .. .	1,054 "	17.7 "
	5,952	100 per cent.

The method of registration of births and deaths is simple, and is working fairly satisfactorily. Under the municipal bye-laws the head of a family is held responsible to notify to the Municipal Health Department the birth or death of any member of his family within 24 hours of its occurrence. This report is checked by the daily information supplied under the rules by sweepers of the various localities. As houses in the city are not provided with water-flushed system, a sweeper has to visit each house twice a day. As the sweeper has a customary right to serve that house, he is more or less a permanent feature, and is well acquainted with all important happenings in that house. In the case of a death a sub-assistant surgeon employed by the Municipal Committee visits the house to verify the cause of death.

(iii) The working conditions of persons employed in undertakings under the Indian Factories Act are satisfactory on the whole, but the conditions under which certain classes of labour are obliged to work and live is really deplorable.

We do feel strongly that there should be some legal provision, municipal or provincial, by which all buildings used as working places should be required to be licensed as to their suitability in respect of light and air, conservancy arrangements and the maximum number of persons to be allowed to work therein should be specified.

The real difficult problem for us to solve, however, is the working condition at home of certain trades, particularly the shoe making. The workers engaged in this trade belong to the depressed classes. They live in small wretched houses which are overcrowded, ill ventilated and ill lighted, and hardly 8 ft. high. Seven or eight persons live in one or two-room tenements. The size of each room is hardly 12 ft. by 10 ft. The same rooms serve as kitchen, sleeping and sitting rooms and work house. Their earnings are so low that they cannot afford to move into better lodgings, and in many cases, even if they had the means, it is doubtful if with their stum minds they would prefer any change.

(iv) Their food is simple and far from nourishing. Milk and ghee, which once formed the chief portion of their diet, are no longer used, as their price has been doubled during the last 25 years, and these articles are being adulterated to an extent which is unbelievable.

24. (i) The city is well provided with medical facilities. The Birla Mills have a full time qualified medical practitioner, who lives on the premises. A dispensary is located within the mill compound.

The Delhi Cloth and General Mills have a compounder to render first aid. The services of a better qualified man was not considered to be necessary as a municipal dispensary is situated within a stone's throw of the mill.

The Khalsa Mills has a part-time qualified person in its employ, who comes to the mill on an emergency and makes a weekly round.

(ii) The Municipal Committee maintains a large up-to-date hospital with nine branch dispensaries. It has also four indigenous dispensaries, in which Unani and Ayurvedic treatment is given. It contributed over a lac of rupees towards the construction of Dr. Shroff's Charitable Eye Hospital, and gives it a grant-in-aid of Rs. 6,000 a year. The Committee also supports a Homeopathic dispensary, and contributes Rs. 5,000 a year to the Tibbia and Unani College, which is doing a yeoman's service towards popularizing the Indian system of medicine. Lord Hardings performed the opening ceremony of this college in 1912. The cost of medical department of the municipality during 1928 was Rs. 2,81,297.

(iii) In addition to these the city is full of private practitioners, Hakims and Vails, who treat the poor free.

(iv) The city is equipped with three up-to-date hospitals (1) Victoria Zenana Hospital, which has practically been taken over by the Municipality; (2) St. Stephen's Hospital, which receives a grant in aid from Municipal funds; (3) Lady Hardinge College and Hospital. These hospitals have won so much confidence, that they are always full to its utmost capacity, and admissions have to be refused. They are so admirably situated that there is no chance of their overlapping the activities of each other. Schemes for the establishment of a separate maternity hospital and a large infectious diseases hospital are under consideration.

25. The industrial class takes full advantage of the medical facilities provided for them. The following figures for 1928 show the popularity of the various Municipal medical institutions :—

	Indoor patients.	Outdoor patients.
Civil hospital and its dispensaries ..	9,000	3,11,796
Unani dispensaries .. .. .	—	1,44,477
Vedic .. .. .	—	1,51,919

To our welfare centres are attached classes for the training of midwives. They prepare for the examination of Punjab Central Midwives Board. The indigenous dais are paid a fixed fee per case from municipal funds, whenever they requisition the services of a trained midwife in municipal employ. It is admitted that there is yet a great need for the training of an increasing number of midwives.

26. Adequate arrangements do exist for water supply and latrines in the larger concerns, though some of the mills will be well advised to give their workers a filtered supply of water instead of making them use well water. In smaller concerns there is room for a good deal of improvement in both these directions. In the case of undertakings under the Indian Factories Act at least, we would recommend that the employers be required to provide bathing places for their men.

The labourers at present use the same clothes at work and at home. We recommend that the textile mills be made to give their men sets of clothes to be used while at work. A man when leaving the mill should have a wash and get into his private clothes while going out. A privately scavenged latrine which is often cleaned once a day in a small house is neither pleasant nor conducive to health. In poorer quarters therefore the provision of latrines are being discouraged, and are being generally replaced by public water borne latrines centrally situated.

A number of public bathing places were provided in the city, but they were closed on account of scarcity of water. The city mains are being re-modelled and enlarged at a cost of Rupees twenty lacs, and it will be possible in the near future to re-open these bathing places.

27. No special arrangement has been made for the supervision of industrial areas where they exist. The *chamars* as a rule live in Bastis, owned by private landlords, who are responsible for their sanitary condition. We are afraid that these landlords are negligent in their duties.

In the mill areas the local Inspector of Factories is the only supervising authority and he is overworked with other branches of work. We suggest that as in jails a number of non-official visitors be appointed. It also seems advisable to make some arrangements for the periodical inspection of small concerns which are not under the Factories Act, and in which more than 10 persons are employed.

31. The women workers are on daily wages, and have to forego their pay for absence during child-birth. We are of opinion that a woman who has been in the service of a concern under the Factories Act for six months or over should be granted 20 days maternity leave with full allowances, and that this concession be allowed by legislation. The textile mills should also be made to provide maternity beds in co-operation of the Municipal Committee.

#### V.—Welfare.

32 Till recent years no serious interest was taken by employers in welfare work. A beginning has, however, been made by two textile mills, but it falls far short of actual requirements. The Delhi Cloth and General Mills were first in the field, but they have simply confined themselves to the provision of occasional cinema shows and the organization of an annual workers' day, which is much appreciated and has proved a success. The Birla Mills have started on the right lines, but have still far to go. Like the Delhi Cloth Mills, they have their cinema shows. They have provided a wrestling ground, and have made a special enclosure within the mill premises, where women workers can leave their babies to be looked after by a Dai. In our opinion the latter idea should be further developed in all concerns where women are employed in large numbers, and they should be encouraged to bring their children below the age of 6 years with them; special arrangements should be made, and a qualified staff kept to amuse these children and teach them the habits of cleanliness, service and discipline. In all other concerns an employer leaves its workers to their fate after working hours.

The Municipal Committee and the Baby Week Committee are the only other agencies which are trying to do something for the workers. The child welfare scheme was first introduced into the city as an experimental measure in 1918, and has now been placed on a permanent footing. It was intended for all classes, but experience has shown that predominantly Chamar women have taken advantage of it. There are now seven welfare centres in working order under the charge of a fully qualified lady doctor. The cost of the scheme is 27,000 rupees a year, and half of it comes from general revenues.

33. It is only the Birla Mill which has employed a labour secretary, who gives his whole time to look after the welfare of the workers living in its coolie lines. What is required is a systematic effort for the physical and moral development of the workers. Playgrounds should be attached to the mill area, and the workers should be taught the value of spending their spare time more profitably.

34. Both the Delhi Cloth and Birla Mills have arranged for sweetmeat and provision shops in the mill premises. A worker is enabled to take things on credit up to a certain amount, and his bill is adjusted at the close of the month when he receives his wages. In our opinion these shops should be on a co-operative basis.

We also suggest that the provision of a provident fund in concerns which keep 20 persons or more should be made compulsory. One anna in the rupee should be deducted from the pay of every worker, and a similar amount be paid by the management.

The fines inflicted, the undisbursed pay and the amount of provident fund withheld be formed into a fund for the help of the families of workers who die in straitened circumstances. The administration of this fund should be in the hands of a joint committee of workers and the employers themselves.

We also advocate the payment of weekly instead of monthly wages.

#### VI.—Education.

40. As industrial labour, with few exceptions, is scattered all over the city, the children of the labouring class share the same facilities for general education as are open to the other members of the public. The Delhi city is well provided with schools which are situated at convenient places within an easy reach of a boy's home. In no case has a boy to walk more than half a mile at the outside to get to a public school.

The Municipal Committee, aided by a liberal grant in aid from Government, maintains 51 primary schools for boys and 20 schools for girls. In addition to this it gives a generous financial help to recognized boys and girls' schools.

The interest of the children of the labour classes who are to be found in large numbers in any particular industrial area, has received special consideration. Schools have been opened in their midst. The number of such schools in non-mills areas is six.

brandum is based mainly on the official records of the Govern- Department of Industries and Labour; but the Government of India should not be understood as accepting responsibility for every particular statement of fact or expression of opinion in it.

S. LALL.

### Chapter I.—Development of Indian Industries and the Emergence of the Labour Problem.

India is, and has always been, pre-eminently an agricultural country. The most striking characteristic of the economic structure of the country is the overwhelming importance of agriculture over all other occupations. More than 70 per cent. of the adult male population derive their livelihood from land and most of the workers in other industries also have agriculture as a subsidiary occupation. The preponderance of agriculture did not, however, mean that other industries did not exist till recently or were of no importance. Before the advent of British rule in India, Indian workmanship reached a high water-mark of excellence and the products of Indian industry enjoyed a world-wide reputation. The Indian section of the Great Exhibition of 1851 drew forth the compliment from a Frenchman, M. Blanqui, "Les Indiens sont les Français de l'Orient pour le génie industriel."<sup>2</sup>

Before 1880 the industries in India were essentially cottage industries as opposed to the large-scale industries of the modern age. The vast majority of the industrial population of India lived in villages and each individual craftsman worked independently on his own account. The capitalist and the *entrepreneur* of modern times had not then come into existence. Under such an organization there was no room

\* Gadgil, Industrial Evolution of India, page 36.

for specialization, or division of labour, and the essential feature of the modern industrial system, viz., the concentration of workers in factories, was absent. The latter half of the 19th century, however, saw the rapid decline of the indigenous handicraft industry. It is not necessary here to examine the causes which produced this result, but the point which it is important to bear in mind is that this decay had set in before modern industrialism had been established to any appreciable extent, with the result that the population of the country was to an increasing extent thrown back on the land. In spite of its inherent weakness the older type of industrial organization has not, however, disappeared from India, and there are, even at the present time a certain number of cottage industries, e.g., hand-weaving, which are able to compete successfully with modern industry. The cottage industry is more suited to the habits and customs of the people, and secures a happier existence for the craftsman who works under comparatively healthy conditions in his own home in the midst of his family.

The factory industry, which has been steadily displacing the older handicrafts of India, was not established without considerable difficulty. The earlier pioneering attempts of the East India Company were almost all failures. The cotton and the jute industries, the two foremost among modern Indian industries, were started by about the middle of the 19th century. Their progress in the beginning was slow and uncertain, but since 1879 a steady progress has been maintained. In 1880 the total number of cotton mills was 58, employing about 40,000 persons, but in 1914 the number of mills was 264 and the total number of persons employed in them about 260,000. Similarly, the number of jute mills rose from 22 in 1880 to 64 in 1914, and the number of persons employed in them from 27,000 to 216,000. Similar progress was maintained in other industries, e.g., coal mining and the petroleum industry. The result of this steady progress of large-scale production was the growth of factory towns like Bombay, Calcutta, Ahmedabad, Sholapur, Nagpur, Madras, Jamshedpur, etc., where modern labour problems, as understood in the west, are slowly but surely coming into prominence. Owing to the fact that the industrialization of the country has proceeded very slowly, there was not the rapid growth of a landless proletariat class in factory towns solely dependent upon industrial employment, as in England, where the industrial revolution was responsible for the creation of a large class of factory workmen permanently divorced from the land. The industrial development of the country was, however, greatly accelerated during the war and immediately after, during which period imports from abroad had of necessity to be restricted. This gave Indian manufacturers a degree of protection from foreign competition which in normal times would only have been secured by a high tariff. In 1922 India obtained recognition by the League of Nations as one of the Eight States of Chief Industrial importance. The grounds on which this claim was based are stated in the memorandum prepared by the India Office, which gave the following salient figures to illustrate the industrial importance of the country:—"28,000,000 agricultural workers (excluding peasant proprietors), 141,000 maritime workers, lascars, etc., a figure second only to that for the United Kingdom; over 20,000,000 workers in industries, including cottage industries, mines and transport; railway mileage in excess of that in every country except the United States."

But in spite of this impressive progress it is still true to say that the greater part of the labour force in industrial employment retains its agricultural connection, and, except perhaps in Ahmedabad, Jamshedpur and Sholapur, where a settled factory population is gradually springing up, the Indian industrial labour army consists of very few regulars.

#### Chapter II.—Industrial Labour—its Origin, Extent of Migration and Methods of Recruitment.

*Scarcity of Industrial Labour.*—From the brief account of the development of Indian industries it will be apparent that industrial labour must of necessity be drawn from the villages which are to be found dotted all over the face of the country. The vast majority of the industrial labourers belong to the poorer classes of peasants who have been driven by adverse circumstances from the fields in their native villages to seek employment in a factory. In the preceding chapter reference has been made to the increasing pressure of the population on the land owing to the decay of the Indian handicraft industry. In 1880 the Famine Commission observed that "the numbers who have no other employment than agriculture are greatly in excess of what is really required for the thorough cultivation of the land." The Agricultural Commission, after a study of the figures of the increase since that date of the urban and rural population of India, came to the conclusion that "the observations of the Famine Commission were even more pertinent to-day than when they were made in 1880."\* Owing to this increasing pressure of the population on the

\* Para. 506 of the Report.

land there should be a plentiful supply of cheap labour for industrial undertakings. But the Indian industrialist is quick to deny that labour in India is either plentiful or cheap. The Industrial Commission in 1918 referred to the "growing scarcity of labour in most parts of the country" \* and in the United Provinces Census Report of 1921 it is stated that the success of the factory organized on modern lines "is limited in one and that a vital respect—by the difficulty of obtaining and retaining labour" † The scarcity of labour in India is due not to any deficiency in numbers but to the various factors which prevent potential labourers from being drawn into industrial areas. The true explanation of the scarcity of labour is to be found chiefly in the unattractive conditions of employment and also partly in the conservatism of the labourer, who is always reluctant to wrench himself away from his fixtures. There is greater difficulty in finding skilled than ordinary labour, and this is due to the fact that facilities for training labour for modern industry are inadequate.

*Migration of Labour.*—The industrial centres in India are able to supply only a very small proportion of the labour force required, and there is consequently a considerable migration from other parts of India to these centres. The extent and nature of this migration is given in detail in Chapter III of Volume I of the Census of India, 1921, and the position is briefly stated in the following extract from the report:—"The labour reserves are found chiefly among the lower classes of the centre and south of the country. The centre supplies the tea plantations and mining industries of the eastern provinces, the south meets the southern industrial demand and the bulk of the Burma and overseas demand, while the more technical industries in the cities of the Western Provinces are supplied chiefly from the neighbouring agricultural tracts."

The table on page 167, which is taken from the Census Report of 1921, shows the principal provinces which gain and which lose on the balance of migration and compares the statistics with those of 1911 in each respect.

It will be observed that the provinces which contribute most largely to the streams of migrants are Bihar and Orissa (about 1½ million), the United Provinces (about one million), and Madras (about three-fourths of a million). On the other hand, Assam contains the highest percentage of foreigners. Inter-provincial migration is mostly either periodic, i.e., due to seasonal demands for labour, or semi-permanent, i.e., when the inhabitants of one place earn their livelihood in another but maintain connection with their own homes and ultimately settle there. The only province to which migration is largely of a permanent character is Assam, where the tea gardens and the cultivable waste land in the Brahmaputra Valley are the two main attractions for the poorer classes of villagers in Bihar and Orissa, Bengal, the Central Provinces, the United Provinces, and Madras. It would be difficult to analyse within the brief space of this memorandum the causes of particular streams of migration, but, generally speaking, it may be stated that the men who migrate belong to the lowest stratum of village society. They are either landless labourers, generally of the lowest castes, or petty cultivating ryots who, owing to the smallness of the family holding or the weight of the debt incurred on account of illness, bad monsoon or the performance of a costly religious ceremony which is necessary on the occasion of a birth, marriage or death in the family, are driven to the industrial areas in search of a supplementary source of income. The lot of the former class in their villages is not a happy one, and, as the isolation of the Indian village is steadily breaking down, the landless agricultural labourers and the village menials are now able to better their position by migrating to the towns. The latter class, which is by far the more numerous, consists of agriculturists, pure and simple, whose hearts are in their villages to which they return at intervals more or less frequent.

*Changes in Recent Years.*—A comparison of the census figures of 1921 with those of 1911 shows that there have been no important changes in the main streams of migration during the course of the ten years. Assam and Burma have gained both in immigration and in emigration, while the United Provinces have lost in both. In Bengal, Bihar and Orissa, Madras and the Central Provinces the number of immigrants has decreased, whilst the number of emigrants has increased. On the other hand, in the Bombay Presidency and the Punjab the number of immigrants has increased while the number of emigrants has decreased. Amongst the most notable changes may be mentioned an increase of nearly 400,000 immigrants into Assam, and an increase of 132,000 emigrants from Bengal and of nearly 100,000 emigrants from Madras.

*The Sources of Labour Supply.*—A brief analysis may now be made of the supply of labour on which some of the more important industries depend:—

(i) *Bombay City.*—The cotton mill industry is by far the most important industry in this centre. The other industries are connected with railway workshops and

\* Para. 7 of the Report.

† Census Report, Volume XVI, Part I, page 164.

engineering shops, dockyards, oil and flour mills, tanneries, iron and brass foundries, chemical factories, electric works, printing presses, etc. Bombay is very largely dependent on imported labour, and in the 1921 census no less than 84 per cent. of its inhabitants were returned as having been born outside the city. The Deccan and the Konkan, especially Ratnagiri district, are the chief sources from which labour is obtained. But there is also a steadily increasing stream of migration from the Punjab, the United Provinces, Madras and the French and Portuguese Settlements. Most of the migration, particularly from the distant parts, is of a semi-permanent nature as will be apparent from the sex ratio which is 525 females to 1,000 males.\*

(ii) *Ahmedabad and Sholapur*.—The other centres of the cotton mill industry have a more permanent labour force than Bombay. In Ahmedabad 60 per cent. of the population are born in the city itself. Sholapur is even less heterogeneous. Nearly 64 per cent. of the population are actually born there and only 27 per cent. come from outside the province, mostly from the neighbouring State of Hyderabad.

(iii) *Calcutta*, the home of the jute industry, is the other most important industrial centre of India. Like Bombay, it relies on imported labour, but, in addition, depends much more than almost any other centre on labour from other provinces. This is attributed to the fertility of the land and the dislike of the Bengali for factory work. The largest number of immigrants come from Bihar and Orissa, which supplies nearly a fifth of the Calcutta population. Most of them are employed in some form of manual labour, and the ratio† of women to men is less than one in five. The United Provinces supply nearly a tenth of the Calcutta population. The men from this province have the advantage over Biharis and Oriyas, in that more of them are able to find regular employment in mills and factories, and the number of casual labourers is comparatively small. Madras and the Central Provinces also send a stream of emigrants to Calcutta.

(iv) *Bihar and Orissa*.—While Bihar and Orissa pours out its labouring population eastwards, its iron and coal industries in the Singhbhum and Manbhum districts are attracting a considerable number of skilled and unskilled workers from outside. In Singhbhum the number of immigrants from non-contiguous parts of other provinces is 34,000, whilst in Manbhum it is 32,000. Skilled workers come chiefly from the United Provinces, Bombay and Bengal, and unskilled workers from the Central Provinces and Madras.

(v) *Cawnpore* is the principal industrial town of the United Provinces. The textile industry is the chief industry of the place, but there are also tanneries, leather factories, engineering works, oil, flour and rice mills, chemical works, sugar factories, etc. Labour is freely drawn from the densely populated districts, which surround Cawnpore. But the case of Cawnpore‡ itself is curious: though having to import labour it also exports it.

(vi) *Madras*.—Owing to the deficiency of coal, Madras has not gained the same degree of industrial importance as Calcutta or Bombay. It has a few large cotton mills and tanneries and leather factories. There is a plentiful supply of labour in the locality, and in fact the presidency exports labour in large numbers to other industrial centres and to Burma and Ceylon. No less than 95 per cent. of the inhabitants of Madras City were born in the province itself, and of these two-thirds were born in Madras city. The proportion of the sexes is also fairly equal. The labour force in Madras is, therefore, considerably more stable than in Bombay or Calcutta.

*Methods of Recruitment*.—The methods of recruitment in India have received general condemnation, even from the employers. But the excuse for the continuance of these methods is the difficulty of obtaining an adequate supply of labour. Apart from the casual employment of itinerant labour, which is governed by the laws of supply and demand, the usual methods of recruitment for industrial undertakings are:—(i) recruitment through contractors; (ii) recruitment through sardars; (iii) recruitment at the mill gates.

Before considering each of these methods, it is necessary to bear in mind that a stable labour force does not generally exist in Indian towns. When the first factory was started there was a sufficient supply of labour in the neighbourhood. But as industries developed and became concentrated at convenient centres, where raw material was at hand and transport facilities were available, the necessity arose of obtaining labour from some distance. Owing to the illiteracy of the workers and the variety of languages spoken by them, employers in India find it almost

\* Pages 18–21, Census of India, 1921, Volume IX, Part I.

† Census Report, 1921, Volume VI, Part I, pages 20 *et seq.*

‡ Census of India, 1921, Vol. XVI, Part I, page 45.

impossible to maintain any direct touch with their workpeople. This accounts for the presence of intermediaries, who are largely responsible for the abuses which have sprung up in connection with recruitment.

(i) *Recruitment through Contractors.*—This is the earliest method of recruitment and is still commonly used for obtaining labour for construction works and for industries and mines situated at some distance from the source of supply of labour. This system is also to be found in certain seasonal factories, particularly in cotton-ginning and pressing factories, although there is generally a plentiful supply of labour for such factories owing to the fact that work commences after the harvesting season.

The contractor is sent out to overcome the innate conservatism of the Indian peasant. He is helped in his work by the poverty and indebtedness of the peasant and also by occasional bad harvests, but in addition he not infrequently indulges in fraud and misrepresentation by painting a rosy picture of the future that awaits the peasant in a town with its crowded bazaars and other amusements, which are conspicuously absent in the village. The essence of the system is the payment of an advance to the prospective labourer in order to enable him to free himself from his pecuniary difficulties. The contractor retains some form of control over his recruits and takes good care to recover the amount of the advance together with the interest, which is generally calculated at an exorbitant rate. Generally, the employers do not deal directly with the labourers recruited by a contractor. The latter is paid a lump sum, from which he pays his men and retains a portion for himself. In the Central Provinces, however, it is reported that labour is actually purchased\* from private contractors at so much per head. The system of recruitment by contractors is most in use in Burma† owing to the scarcity of labour in that province and the necessity of recruitment from distant places. Practically all the unskilled labourers in most of the mills in Burma are *maistry coolies*, i.e., coolies who are recruited and paid by the employers' labour contractors or maistries. The general practice is for the employer to enter into a contract with a maistry for the supply of unskilled labour for the various operations carried on in the mills. In most contracts no mention is made of the number of workmen required; the maistry agrees to supply labour as and when required at the piece-rates laid down in the contract. Sometimes the contractor sublets his contract to another person, who may even be unknown to the employer. The person who arranges for the supply of labour at the mills is known as the head maistry, and the work is executed through sub-maistries, who pay premia to the head maistry for the privilege of getting the work. It is the sub-maistries who either themselves come to India or send their agents to negotiate with prospective recruits. They make the necessary advances and on arrival in Burma their recruits are made to sign promissory notes for sums never less than the total amount spent on them.

The payment of advances has become somewhat risky since the repeal of the Workmen's Breach of Contract Act and the system of recruitment through contractors is, therefore, gradually losing its importance. An increasing number of Indians come to Burma on their own and seek employment independently of maistries. Generally, they form themselves into gangs, each of which nominates a leader from among its members. The gang moves about in search of work and its leader usually arrives at an arrangement with a head maistry by which the latter secures work for the gang and pays what is known as *bucksheesh*, which is first given as a loan but is eventually treated as a gift if the gang remains in service under the head maistry until the close of the busy season. These *bucksheesh* coolies are paid at the same rates as the coolies recruited from India.

(ii) *Recruitment through Sardars.*—This method of recruitment is also dependent on the payment of advances, which, however, are made at the cost of the employer. The Sardar is an operative already on work in the mill or plantation and is sent out to recruit labour from among his relations, acquaintances or neighbours. He is drawn, therefore, from the same class as the recruits themselves and can therefore be relied on to deal more fairly with them. Another advantage of this system of recruitment is that the men recruited are insured against unemployment and find work waiting for them at their destination. It is, however, only in plantations that this form of recruitment has been used to any appreciable extent.

(iii) *Recruitment at the mill-gate.*—The recruitment of labour at the mill-gate or at the surface of mines is the form of recruitment which is gradually gaining in importance over the other two methods. The news of the very much higher rates of wages paid in towns (which to the villager sounds fabulous as he has no idea of the higher cost of living) spreads throughout the countryside and draws large crowds

\* Census Report, Vol. XI, Part I, pages 173–174.

† Report of an enquiry into the standard and cost of living of the working classes in Rangoon, by J. J. Bennison, B.A., I.C.S., pages 74 *et seq.*

of would-be workers. They are to be found at convenient gathering places on the thoroughfares waiting to be picked up for employment. The older hands also return from their village with groups of friends, relations and neighbours, who come in the hope of finding employment in the mills. But the ignorance, simplicity and poverty of the Indian peasant renders his exploitation an easy matter. The employer does not recruit himself the men required for his establishment but holds the overseer, jobber or mukadam responsible for the adequate supply of labour in the department. The latter takes the place of the contractor and exacts bribes from the new recruits. He also acts as a money lender and thereby reaps a double harvest from the needy labourer. It would appear, therefore, that education and organization are the only means by which Indian workers can escape from the clutches of intermediaries who, like harpies, are ever ready to prey on them.

*Absenteeism and Labour Turnover.*—A complaint which has been made against Indian workers ever since the rise of the factory system is their frequent absence from work and their high turnover rate. The migratory character of Indian labour is no doubt largely responsible for this, but sickness and the unhealthy conditions in which the workers live also play an important part. The Factory Labour Commission of 1907 made an enquiry into the number of absent workers and came to the conclusion that the average worker took two days off every month and a further holiday of from three to seven weeks every year. In addition, he receives the weekly holiday and from four to ten Indian holidays during the year. The only recent figures of absence from work are those given in the Bombay Labour Gazette for the textile mills in Bombay Presidency, in Bombay City, Ahmedabad and Sholapur. These figures are shown in the statement on page 168, and it will be observed that there are no signs of improvement in the regularity of attendance of the mill hands. The percentage of absenteeism shows a seasonal variation and is, generally speaking, highest in the monsoon months and the festival and marriage seasons. The very much smaller percentage of absenteeism in Ahmedabad is due to the fact that the mill operatives are mostly drawn from an industrial population which has been settled in the city for generations. The high percentage of absenteeism in Bombay necessitates the employment of an inefficient substitute who is known as a "badli." The Textile Tariff Board dealt with the question of absenteeism in Bombay and suggested the employment of spare hands in each department except the weaving department.\*

No statistical or other data are available regarding the extent of the labour turnover in Indian industries, but there can be no doubt that the rate of labour turnover in India is considerably higher than in other industrial countries. In his evidence before the Factory Labour Commission of 1907 the Manager of an Ahmedabad Mill stated—

"Hands are continually changing. Out of 450 one year only 50 remained in the mill during the second year."

The remedy would appear to lie not only in the proper selection of employees and their proper placement, but also in the improvement of the conditions of employment, as unhealthy surroundings combined with low wages and a low standard of living undoubtedly levy a heavy toll from the Indian industrial population.

*The Main Characteristics of Indian Labour.*—It may be convenient here to summarise the main characteristics of the average Indian worker. He is an agriculturist who is compelled by circumstances to forsake agriculture and to take to industrial employment. He is unwilling to sever his agricultural connection and is therefore migratory in his habits. When he enters industrial employment the Indian workman is the proverbial square peg in a round hole and finds it difficult to adapt himself to his new surroundings. He is illiterate and badly organized and, living from hand to mouth, has an extremely low power of resistance. As he is recruited from the lower castes he is also generally meek and submissive, but an important change has come over him in this respect since the Great War. The increasing contact between villages and towns and the return of the soldiers from the battlefields of the West has disturbed the placid contentment of the Indian peasant. The Indian worker has not escaped from the economic and the political influences which have come into play since the War, and he has now learnt to realize the importance of the weapon of the strike. His wages and his standard of living are still very low, at least according to Western standards, and it is generally believed that, owing to his inefficiency, his labour is not in the long run cheap. But as against this view is the recent statement made by the Manager of General Motors, Limited, Bombay, that "the average Indian workman's ability and intelligence is as good as in other countries and that he can adapt himself to any new methods and conditions of work."

\* Para. 60 of the Report.

**Note on the Apprentices Act, 1850.**

As early as 1850 an Act was passed "for better enabling children, and especially orphans and poor children brought up by public charity, to learn trades, crafts and employments, by which, when they come to full age, they may gain a livelihood." This Act was originally intended to apply to European orphans from military orphanages and the like. Some of its provisions are hardly applicable to modern conditions and in 1922, when the Indian Merchant Shipping Act (XXI of 1923) was under consideration, an enquiry was made from local governments as to whether any useful purpose was being served by this Act. Excluding the Government of Bombay, all local governments were in favour of its repeal on the ground that the Act had become an obsolete measure. The Government of Bombay, however, objected to its repeal as it was being used for the apprenticeship of seamen and for the purposes of reformatory institutions and was likely to be availed of for child welfare work. The Government of the Punjab, whilst agreeing to the repeal of the Act, pointed out that with the development of Indian industries it may be necessary in the near future to enact some similar law. In view of the opposition of the Government of Bombay, the Act was not repealed, but the Indian Merchant Shipping Act (XXI of 1923) repealed the provisions relating to the apprenticing of boys for sea service.

† Owing to an industrial dispute no figures are available.

‡ Owing to the general strike in the cotton mills in Bombay no figures are available for these months.

### Chapter III. Recruitment for Assam.

It has been shown in the preceding chapter that there is a considerable flow of labour from distant parts of the country to the industrial centres and plantations. The mobility of labour is of considerable advantage to the agricultural population, as it helps to relieve the increasing pressure on the land. In India the movement of labour between province and province is entirely unrestricted by Government with the solitary exception of the movement of labour from certain provinces to eight districts in Assam, viz., Lakhimpur, Sibsagar, Nowgong, Darrang, Kamrup, Goalpara, Cachar and Sylhet. These districts are known as labour districts and under the Assam Labour and Emigration Act No. VI of 1901, as amended by Act. VI. of 1908 and Act VIII of 1915, the provinces of Madras, Bengal, the United Provinces, Bihar and Orissa, the Central Provinces and Assam can, by notification in the local official Gazette, "prohibit all persons from recruiting, engaging, inducing or assisting any native of India, or any specified class of natives of India, to emigrate from the whole or any specified part of the province to any labour-district or any specified portion of any labour-district, either absolutely or otherwise than in accordance with such of the provisions of the Act as may be specified."\* Other local Governments can also, subject to the control of the Governor-General in Council, extend the provisions of the Act to the whole or any specified portion of their territories. Any person who knowingly recruits, engages, induces, or assists, or attempts to recruit, engage, induce or assist any person to emigrate in contravention of any of the provisions of this Act or of any notification for the time being in force thereunder, is punishable with imprisonment or fine or with both. There are two points in connection with this Act which it is necessary to bear in mind. In the first place, the restrictions imposed by the Act apply to *all* labour migrating to the labour-districts and not only to labour migrating to the tea gardens in the labour districts. It is true that most of the immigration into Assam is to the tea gardens, but it would be a mistake to suppose that other industries are not affected. In 1924 a protest was received from a sugar factory in Kamrap against the "strangling" of the industry by the Act. In the second place, the Act does not impose any restriction on the movement of labour to the labour-districts without outside assistance or inducement: it deals with "assisted" emigration and also with inducement to emigrate otherwise than in accordance with the provisions of the Act or any notification for the time being in force thereunder.

*Extent to which restrictions have been imposed in the Provinces.*—The chief provinces from which labourers are recruited for the Assam gardens are Bengal, Bihar and Orissa, the Central Provinces, the United Provinces and Madras. In Bengal and the Central Provinces no areas have been closed to recruitment. In Bihar and Orissa recruitment has been prohibited only in the Khondmals sub-division of the Angul District, but in the rest of the province recruitment is permissible only in accordance with the provisions of the Act. In the United Provinces, recruitment under the Act is permitted only in five divisions, viz., Gorakhpur, Benares, Fyzabad, Jhansi and Allahabad (excluding the districts of Etawah and Farrukhabad). The remainder of the province is entirely closed to recruitment for Assam. The Royal Commission on Agriculture† was unable to find any justification for this prohibition and recommended its immediate withdrawal, but no action has yet been taken by the local Government. In Madras the agency tracts of Ganjam, Vizagapatam and Godavari were closed to recruitment up to the year 1915 and recruitment in accordance with the provisions of the Act was allowed in six districts, viz., Kistna, Guntur, Nellore and the non-agency tracts of Ganjam, Vizagapatam and Godavari. The Act did not apply to the rest of the presidency. Early in 1916 the local Government extended the Act to the other districts and prohibited absolutely the recruitment for Assam from those districts. In 1923, however, the local Government changed its policy altogether and removed all restrictions as regards castes and areas. The result is that since that date the whole province has been thrown open to recruitment in accordance with the provisions of the Act. A part of the labour force for the labour-districts in Assam is also recruited from the Feudatory States in Bihar and Orissa and the Central Provinces, but in some cases (e.g., Bastar in the Central Provinces) recruitment is totally prohibited by the Chief. In this connection, it may be mentioned that the restrictions imposed by the Act are applicable to emigrants who proceed from an Indian State into a territory in British India to which the Act has been applied and depart therefrom for Assam. Recently efforts have also been made by the tea industry to obtain recruits from the Bombay Presidency. As the Act has not been extended to this province, there are no restrictions on recruitment, but the efforts of the tea industry have so far met with little success.

\* Section 3 of the Act.

† Para. 508 of the Report.

*The Changes made in Act VI of 1901.*—The policy underlying Act VI of 1901 was to prevent fraud and misrepresentation in recruitment, to provide for adequate facilities during transport, and also to secure satisfactory conditions of employment in the labour-districts. But the enforcement of this policy, without compensatory advantages, would have been resented by the tea industry as it would undoubtedly have raised the cost of importing labour to Assam. Government therefore decided that, in return for the protection afforded to the labourer, legislation should also protect the employer against loss caused by the desertion of the labourer. Thus the law, whilst providing for a minimum wage for the labourer and securing him other facilities, e.g., medical attendance, housing, water-supply, sanitary arrangements and the supply of rice at cheap rates, also provided for criminal penalties for desertion and gave the employer the right to arrest an absconder without warrant. Service in Assam, was, however, becoming increasingly unpopular and it was soon apparent that the main cause of this unpopularity was the penal contract and the right of private arrest which was enjoyed by the employers. An important feature of Act VI of 1901 was that it contained within itself the seeds of its own decay. Under Section 221 of the Act the Government of Assam, subject to the control of the Governor-General in Council, can, by notification, declare that any labour-district or local area shall cease to be subject to all the provisions or any specified provision of the Act, whilst under Section 91 any local Government can, by notification, dispense with or relax, on such conditions as it may prescribe, any of the requirements of the Act relating to recruitment. In accordance with the recommendation of a Committee of Enquiry which submitted its report in 1906, the Government of Assam in January, 1908, issued a notification the main effect of which was the withdrawal of the right of private arrest. In the same year the penal provisions for breach of contract were also withdrawn by notification from four out of the eight labour-districts, viz., Goalpara, Kamrup, Cachar and Sylhet. In 1915 the penal provisions were withdrawn from the remaining four labour-districts, and an Amending Act was passed under which the system of recruitment by contractors and uncertified garden sardars was abolished, and a Labour Board for the supervision of local agents and of the recruitment, engagement and emigration to labour-districts of natives of India under the Act was constituted. It will thus be seen that, in addition to the radical changes made by the amending Act of 1915, important provisions of Act VI of 1901 have become inoperative by means of notification. The Act now contains much "dead wood" and its provisions are so disjointed as to be almost impossible of comprehension or interpretation.

*The existing System of Recruitment.*—Since 1915 the only recognized method of recruitment is through the agency of garden sardars, who must be persons employed on an estate and deputed by their employer to engage recruits. A dual control is exercised over their activities. In the first place, the control is local and is exercised by the district authorities of the recruiting districts. The garden sardar has to obtain a certificate from his employer which must be officially countersigned in the district of employment. The Act also requires the countersignature of this certificate by the district magistrate in the recruiting districts, but all the local governments concerned have, by notification, dispensed with this requirement of the law. The local governments have, however, made it a condition that in the recruiting district garden sardars must work under the control of local agents, who are the representatives of the employers but licensed under the Act. There are detailed provisions in the Act governing the procedure to be adopted in recruiting and forwarding labourers but most of these provisions, e.g., the production of labourers before a registering officer, have been dispensed with by local governments in exercise of their powers under Section 91 of the Act. The local governments concerned have also framed rules under this section relating generally to the supervision of recruitment, provision of accommodation and maintenance of registers by local agents, production by them on demand of emigrants before magistrates or police officers, reporting of cases in which objections have been raised to the emigration of a recruit by the husband or wife, parent or lawful guardian of the recruit. The penalty for failure to comply with the effective provisions of the Act or the rules framed thereunder and for inadequate supervision is the cancellation of the licence of the local agent. A garden sardar can also be prosecuted and imprisoned if he recruits emigrants without a proper certificate or independently of a local agent. Further, any person taking part in recruiting in contravention of the Act is liable to imprisonment. The local control over recruitment cannot, however, be regarded as an absolute safeguard against abuses. Every recruit is not required to be produced before the official authority in the recruiting district, and for the discovery of cases of illegal recruitment reliance has to be placed on local agents, who are not officials but representatives of the employers. The local agent has, in fact, to serve two masters; he is required to look after the interests of his employer, but he is also responsible for his actions to the district magistrate who can cancel his licence. The amending Act of 1915

supplemented this local control by a central control which was exercised by the newly constituted Assam Labour Board. The composition and working of this Board are dealt with in the following paragraph.

*Composition and Working of the Assam Labour Board.*—The Assam Labour Board consists of an official chairman and 15 representatives of the tea industry, who are elected as follows:—(a) Eight by the Indian Tea Association, Calcutta, as representatives of that Association, and of the Indian Tea Association, London; (b) four by the Assam Branch, Indian Tea Association; and (c) three by the Surma Valley Branch, Indian Tea Association.

The Board has an executive committee, consisting of the chairman and four members representing the Indian Tea Association, Calcutta, the Indian Tea Association, London, the Assam Branch of the Indian Tea Association and the Surma Valley Branch of the Indian Tea Association, respectively. Under the Board there are supervisors, whose powers and duties are laid down in the Assam Labour Board Rules, framed under Section 116F (2) (e) of the Act. At present, there are three supervisors who are stationed at Ranchi, Raipur, and Waltair. The expenses of the Board and its supervisors are met out of a cess payable on garden sardars and emigrants. The main feature of the Board is that it is predominantly an employers' organization maintained almost entirely by a cess levied from employers. Although the Act covers various industries in the labour districts, representation on the Board is confined to the tea industry. The main function of the Board is to supervise the whole system of recruitment with a view to the prevention of irregularities. It is also responsible for the supervision of local agents. The function of the Board is merely to bring the irregularities to the notice of the local authority for necessary action, and neither the Board nor its supervisors can undertake the prosecution of an offender. All the members of the Board, excluding the chairman, are directly interested in seeing that the industry does not suffer from lack of labour, and the chairman must be under considerable pressure to adopt the same point of view. It is not, therefore, surprising to find that there exists in the minds of some people the mistaken impression that the Board is a recruiting agency. The Board is also not directly concerned with the conditions of labour in Assam. The provisions of the Act dealing with a minimum wage, housing and hospital accommodation, etc., though still unrepealed, are now inoperative owing to the withdrawal by notification of the provisions relating to labour contracts.

*Defects of the Existing System.*—Doubts have been expressed as to the validity of the provisions of the existing Act, and in 1926 it was necessary to undertake the amendment of Section 116E in order to validate the imposition of the cess. The main difficulty with the Act arises out of the fact that most of its provisions refer to "labourers," i.e., persons bound by a labour contract, although such contracts are no longer in existence. Nevertheless, it may be stated that the Act has on the whole been successful in holding in check the grave abuses which were formerly associated with the recruitment of labour for the tea gardens in Assam. The *arkhatti* of old (i.e., the professional recruiter), though he frequently raises his head, is promptly suppressed. The credit for this is undoubtedly due to the tea industry, which is genuinely endeavouring to set its house in order. The successful working of the Act depends on co-operation between the central and local control, i.e., between the Assam Labour Board and the District Magistrates of the recruiting districts. The link between the two forms of control is the local agent who is, as has been stated previously, the representative of the employer and not an official. It is the co-operation of the industry which has strengthened this link and made it an efficient factor in the suppression of the abuses connected with recruitment.

So long as no difficulty was experienced in securing recruits for Assam no complaint was raised by the industry, but the recruiting areas are gradually becoming dry owing to the competition for labour by other industries, e.g., the coal and steel industry in Bihar and Orissa, the jute and other industries in Bengal, and the textile industry in the United Provinces and the Central Provinces. The wages paid in the tea gardens are not attractive enough when compared with the wages paid by other industries, and it is very difficult to convince intending emigrants of the value of the concessions which are allowed in the Assam gardens. Another difficulty in connection with the recruitment for Assam is the uncertainty whether a labourer will ever be able to return to his home. The difficulties which have arisen in connection with recruitment have led the tea industry to protest against the restrictions imposed by the Act which have no parallel in other parts of India. It has been pointed out that the sardari system of recruitment, which is the only system of recruitment recognized by the Act, is not suitable for newly opened areas. This was a real difficulty when the whole of Madras was opened to recruitment under the Act. There were then very few Madrasis in employment in the tea estates, and it was, therefore, exceedingly

difficult to find suitable garden sardars who could be sent to this province for recruitment. In order to promote recruitment, managers of tea gardens have sometimes visited the recruiting areas and carried on an extensive propaganda in the villages. But one local government has drawn the attention of the industry to the fact that such propaganda would come within the mischief of Section 164 of the Act. The complaint of the industry against the restrictions imposed by the Act would have been very much louder but for the fear that if a revision of the Act comes before the Legislature it is more probable that additional restrictions would be imposed than greater facilities given. Recruitment for Assam has always been regarded with disfavour by Indian public opinion and the attitude of the Legislature has been anything but friendly towards the industry.\* This is partly due to the mystery which generally surrounds the tea gardens in Assam which are difficult of access and also partly to the low wages paid.

*Need for the Retention of Control.*—"Free emigration" from one province to another has always been the ideal which the Government of India have kept in view and the whole position in connection with the recruitment for Assam was reviewed in 1928. Assam was no longer the inaccessible country which it used to be and it was difficult to justify its being treated differently to the Dooars, where no restrictions are imposed. Further, there is a large volume of "assisted" emigration from India to Burma which is entirely uncontrolled by Government. In a circular letter which was addressed to local governments, the question was put to them whether it was still necessary to maintain any form of control over recruitment for Assam. It was pointed out that, with the abolition of penal contracts, the growth of public opinion, the greater sophistication of the labourers themselves and the improvement of communications resulting in the reduction in duration of the journey to Assam, the restrictions imposed by the Act might now be withdrawn without the risk of the recrudescence of the abuses which had made legislation necessary. All the local governments concerned, including the Government of Assam, were, however, unanimously of opinion that the time had not yet come for the withdrawal of control. This view was shared by the chairman of the Assam Labour Board, and was also acquiesced in by the Indian Tea Association, which, however, pleaded for the relaxation of control. The replies of the local governments indicated that the persons who were recruited were still unsophisticated, that in spite of the improvement of the communications to Assam they were still liable to be left stranded in a strange country, unless measures were taken to prevent fraud and misrepresentation, and that in spite of the abolition of penal contracts, labour in Assam was weak and helpless. The chairman of the Assam Labour Board recently, in order to support the view that the retention of central as well as local control was necessary, cited a case in which a boy had disappeared suddenly from his home in Gaya district (Bihar) and was discovered in a tea garden in Sylhet.† An investigation into this case led to the revelation that illegal recruitment was being carried on by *arkatis*, whose policy, as was apparent from papers in their possession, was to take young unmarried girls to Assam and to pair them with single male labourers in order that the latter may settle down permanently in the tea gardens.

*The Provisional Proposals of the Government of India.*—In view of this unanimity of opinion, the Government of India came to the conclusion that it would not be wise to remove all control over recruitment for Assam. But they were satisfied that the existing restrictions by which recruitment was limited to only one method, viz., through the agency of garden sardars, placed an unduly heavy burden on the industry. They, therefore, considered that it would be necessary to repeal the existing Act and to replace it by a comparatively simpler measure. Their proposals were embodied in a draft bill‡ which was circulated to local governments with letter No. L.1266, dated the 3rd December, 1928. The main principles underlying these proposals are briefly as follows:—

- (i) Recruitment may be made either through garden sardars (as at present) or through licensed recruiters.
- (ii) Both garden sardars and recruiters to be subject to local control, i.e., the control exercised by the district authorities in the recruiting districts.
- (iii) The extent of local control to be left to the discretion of the local governments concerned.
- (iv) Local governments are not to be empowered to prohibit recruitment absolutely.

† The case is at present *sub judice*.

‡ Appendix I.

(v) Where necessary and subject to the previous sanction of the Governor-General in Council, a local government may, by notification in respect of the whole province or of particular areas, prohibit recruitment through recruiters. In such cases the only recognized method of recruitment would be through the agency of garden sardars.

(vi) No control to be exercised over the transport of emigrants.

(vii) The restrictions to apply only to the tea plantations in Assam, but the Governor-General in Council may extend these restrictions to other industries.

(viii) No penalty to be imposed for mere inducement to emigrate, if no tangible assistance has been given.

(ix) Central control to be exercised by the Assam Labour Board as at present, but the constitution of the Board to be revised so as to give the employers and labourers equal representation. The Board would consist of an official chairman, four representatives of the tea industry, and four persons nominated by the Governments of Madras, the United Provinces, Bihar and Orissa, and the Central Provinces, to represent the interests of the labourers.

The measure proposed by the Government was a recruiting measure pure and simple. It did not attempt to regulate the conditions of employment in Assam. The proposals of the Government of India, except with regard to the revision of the constitution of the Assam Labour Board, were generally accepted both by the tea industry and by the local governments concerned. The proposal for the revision of the constitution of the Assam Labour Board was, however, regarded "with feelings of dismay" by the Indian Tea Association, and the Government of Bihar and Orissa (which is the province most concerned with the recruitment for Assam) was also strongly of opinion that the representation of labour would "quite probably paralyse the united working of the Board." The Government of the Central Provinces was the only local government which accepted the proposed revision of the constitution of the Board without demur. The possible courses open to Government were:—(1) To continue the Board as at present (this was desired by the tea industry); (2) to include official representatives of the local governments mainly concerned (this was suggested by the Government of Bihar and Orissa and not objected to by the industry); (3) to include representatives of labour on the Board, as suggested by the Government of India; (4) to abolish the Board altogether and to retain no central control (this is what the industry would desire if (1) or (2) is unacceptable); (5) to abolish the Board and to establish a purely official authority in its place, which would preserve central control over recruitment and insure co-ordination between the different local authorities.

It is very doubtful if the first or the second course would commend itself to the Legislature, and it would be difficult to find valid reasons to justify the exclusion of the representatives of labourers from the Board. On the other hand, as the successful working of the Board depends on the whole-hearted co-operation of the industry, it is hardly feasible to adopt the third alternative in the teeth of the opposition from the industry. In the opinion of the chairman of the Assam Labour Board, the adoption of the fourth alternative would be dangerous as local control is not by itself adequate to prevent abuses. In view of the attitude taken by the tea industry, it appears that the only feasible course would be to abolish the Board and to set up a purely official executive agency in its place. This, however, is not regarded with favour by the Government of Bihar and Orissa, which considers that it would be a definitely retrograde step, as it would not admit of progressive delegation of control to the industry, and would thus postpone indefinitely the ultimate removal of all restrictions, which has all along been the ideal aimed at by the Government of India.

In view of the fact that the conditions of labour in the tea gardens, including problems connected with the recruitment, will come within the purview of the Royal Commission on Labour, the Government of India have decided not to proceed with their proposals for the revision of the Assam Labour and Emigration Act, until the matter has been investigated by the Commission. Act VI of 1901 has thus received a slightly longer lease of life.

#### Chapter IV.—Unemployment.

*The Nature of the Problem in India.*—The problem of unemployment in India is in its main features quite different from the problem which has arisen in western countries since the post-war depression in industry. Seventy per cent. of the population of this country is entirely dependent on agriculture, and, as has been shown in a previous chapter, the majority of industrial workers regard work in a factory or mine as a supplementary occupation, which is taken up during the slack agricultural season. In India the number of landless labourers, who rely solely on industrial employment for their means of livelihood, is comparatively small and, in view of the scarcity of labour to which reference has already been made, it may be stated as a general proposition that unemployment, as it is understood in the west, does not exist.

It would, however, be a mistake to suppose that there is no unemployment in India. Owing to the increasing pressure of the population on the land and also to the nature of agricultural operations, there are periods during which the bulk of the population in most parts of the country have no employment, either agricultural or industrial. The average cultivator does not work on his land throughout the year, and it has been estimated that the total number of his working days in the year is seldom more than 190. The problem in India is, therefore, to find suitable spare-time occupation for the bulk of the population. As stated by Mr. Darling, "the only way in which a small farmer can keep himself out of debt is by being frugal and industrious and by having a second string to his bow."\* Depression in trade and industry does, therefore, deprive the agriculturist of an opportunity of finding a spare-time occupation and thus increases the pressure on the land, which is already unable to support the growing population of the country. Fortunately for India the demand for labour in industries and plantations is still considerably in excess of the supply and industrial depression has not, therefore, the same terrors for the Indian worker as it has for the worker in the west.

By far the most serious form of unemployment to which India is liable is that which arises out of a partial or total failure of the monsoon. The scarcity or famine which is caused thereby deprives the population of wide areas of their principal source of living. Formerly a famine meant an absolute lack of food, but, with the improvement of the means of communication and transport, a famine is now more a temporary dislocation of employment due to the failure of the crops than a food famine. The solution of the famine problem is, therefore, to provide employment for those against whom nature has declared a temporary lock-out. The seriousness of famines was fully recognized by Government, and no less than three Commissions were appointed to consider the action which should be taken. It is not necessary here to refer to the nature of the organization which has been set up by Government for famine relief, but it may be stated that these visitations of nature have now been brought more effectively under human control than ever before in the history of India. The efficacy of this organization was proved by the comparative ease with which the people were able to stand the strain of the severe famine conditions of 1918.

*India and the Washington Convention.*—The consideration of the question of industrial unemployment was thrust upon the Government of India by the Washington Convention, which was adopted by the First International Labour Conference in 1919. Each member ratifying this Convention was required (i) to communicate to the International Labour Office all information, statistical or otherwise, concerning unemployment, including reports on measures taken or contemplated to combat unemployment; (ii) to establish a system of free public employment agencies under the control of the central authority, and to appoint committees, including representatives of employers and workers, to advise on matters concerning the operation of these agencies; (iii) where systems of insurance against unemployment have been established, to make arrangements, upon terms to be agreed upon between the members concerned, whereby workers belonging to one member and working in the territory of another shall be admitted to the same rates of benefit of such insurance as those of the latter.

In addition to this Convention the First International Labour Conference also adopted a recommendation, which advocated (a) the abolition of employment agencies which charge fees or which carry on their business for profit; (b) the establishment of an effective system of unemployment insurance; and (c) the execution of public works as far as practicable during periods of unemployment and in districts most affected by it.

The Draft Convention was ratified by India but, in communicating this ratification, the Secretary of State for India found it necessary "in order to avoid subsequent misunderstanding" to explain at some length the peculiar position of India in this matter as given in the following extract from the despatch† which was received from the Government of India:—

"The provisions included in the Draft Convention concerning unemployment require the regular furnishing of all available information regarding unemployment and the creation of free public employment agencies with representatives of employers and of workers to advise regarding their operation. In the present unorganized state of Indian labour it would be impossible to furnish returns of the kind expected in western countries, where labour is fully organized; though information of a general nature could doubtless be given regarding wages and demand for labour, and regarding famine measures. The creation of free public employment agencies

\* "The Punjab Peasant in Prosperity and Debt," by M. L. Darling, page 280.

† Despatch to H.M.'s Secretary of State for India, No. 16—Industries, dated the 25th November, 1920.

in India has hitherto been thought unnecessary, since the demand for industrial labour has for long exceeded the supply, and the unemployment of agricultural labour is unknown in ordinary seasons, although in a few congested areas wages remain relatively low owing to the outside demand for industrial labour failing to reach these areas effectively. Here we think that the institution of unemployment agencies might facilitate migration to areas where the demand for industrial labour is never fully met. But when serious injury is caused to agriculture by seasonal calamities, we find it necessary to go much further than merely giving applicants information of existing openings for employment; we provide actual employment or other suitable relief for those who need it and provide an agency for searching them out. Our famine organization, as is well known, is devised to deal with unemployment on a most extensive scale. Although this organization is only called into active operation when the need arises, and works for the most part through the agency of Government officials who are entrusted also with other duties, yet every province of India has an elaborate famine code, which has been progressively improved in the light of past experience; the officers who have to work under it, should need arise, are familiar with its provisions, and the experience of many years past has shown that this organization is capable of dealing economically with unemployment on a scale for which few western countries could show a parallel. It is true that unemployment in the strict sense in India under any conditions that can be foreseen must arise only from one cause, that of serious and widespread injury to agriculture; and when this occurs, ordinary unemployment agencies would not meet the emergency. But our famine organization deals not only with the agriculturist and the agricultural labourer, but with the village artisan whose livelihood depends on the custom of the agriculturists. We not only provide employment for labourers thrown out of work, but for the small cultivator who has been deprived of the crops of the season; and so far as possible, we place him in a position by an extensive system of loans on specially easy terms and, if necessary, by other measures, to cultivate his fields when the famine season closes. The organization is thus in effect a famine prevention system designed to prevent shortage in the year following actual failure of the crops. In view of the fact that our industrial labour is almost entirely recruited from rural tracts, the only circumstance that is likely to overstock the industrial labour market at any time is the agricultural unemployment due to famine, and our machinery for the relief of famine thus largely helps to maintain the relatively favourable position in which industrial labour stands at present, and so far is in accordance with the policy indicated in the Convention. As we have indicated above, however, it is desirable to encourage the migration of agricultural labour from certain congested areas; and we have under consideration the desirability of creating regular public employment agencies in such cases. We have, moreover, no objection to associating these agencies, when created, with advisory bodies representative of employers and workers; and we are undertaking an examination of the possibility of collecting further information regarding unemployment. In the belief that the measures which, as explained above, we are either taking or propose to take, will constitute an effective compliance with the provisions of the Convention, we propose to recommend it to the Legislature for permission to ratify it."

The Government of India addressed local Governments and asked for their views on the following points arising out of the Draft Convention and Recommendation adopted by the First International Labour Conference:—(i) Advisability of creating public employment agencies in congested areas to facilitate the migration of surplus labour to industrial areas where there is a shortage of labour. (ii) Advisability of utilizing public employment agencies in connection with recruitment for Assam. (iii) Advisability of establishing public employment agencies for the dissemination of information regarding employment during times of famine and scarcity to those in search of employment. (iv) Advisability of appointing committees representing employers and workers to advise on matters concerning the operation of public employment agencies. (v) Advisability of abolishing or controlling employment agencies which charge fees or which carry on their business for profit.

The replies of the local Governments indicated that in most provinces the demand for labour exceeded the supply, that, even in provinces from which there was a large migration of labour, no difficulty had been experienced in obtaining information with regard to the areas where labour was in demand, that the establishment of public employment agencies would serve no useful purpose, and (that such agencies might excite suspicion and be liable to be misunderstood by the people. With regard to the recruitment of labour for Assam, the local Governments concerned were agreed that any experiment on the lines suggested would be risky. On the question of the abolition of control of employment agencies which charge fees or which carry on their business for profit, the replies of the local Governments indicated that employment agencies of this character were practically unknown in India. In the circumstances, the Government of India decided to take no further action on the draft exist.

Recommendation concerning unemployment.

*The Growth of Middle-class Unemployment.*—In recent years unemployment among the educated middle classes has been assuming alarming proportions and has attracted widespread public attention. In January, 1926, a Resolution was passed by the Legislative Assembly in the following terms :—

" This Assembly recommends to the Governor-General in Council that he may be pleased to appoint a committee with a non-official majority to investigate into the problem of unemployment in general, and among the educated classes in particular, and devise suitable remedies, whether by a system of industrial and technical education, or by a revision of the existing system of education, or by offering encouragement to the starting of new industries, or by opening new avenues of employment, or by the establishment of employment bureaux, or by all these or any other means ; and that the said committee do make a report on the latter problem as early as possible."

Similar Resolutions were also passed in some of the local Legislative Councils. The Government of India did not consider that the appointment of a Central Committee would serve any useful purpose, but in their circular letter No. L.1373, dated 26th May, 1926,\* they drew the attention of the local Governments to the gravity of the problem of middle-class unemployment in India. As a result of the Resolutions passed by the local Councils, committees were appointed by some of the local governments. The reports of most of these committees refer almost exclusively to middle-class unemployment, but the Punjab and the Bengal committees also dealt with general unemployment. The Punjab Committee came to the conclusion that " there was no unemployment worthy of mention among the uneducated classes " ; whilst the Bengal Committee observed as follows :—

" The labourer, if we may use the term, has not yet been divorced completely from the land, and he frequently possesses or has an interest in a small plot of land in his native place on the cultivation of which he can fall back in times of depression. Added to this, is the fact that industrial labour is still comparatively scarce in Bengal and in fact has to be imported from other provinces. The effect, therefore, of trade depressions on the industrial labourer in Bengal is so far very small."

*Further Consideration of the Question of the Establishment of Public Employment Agencies.*—In 1926, the International Labour Office, at the instance of the Committee of Experts appointed to examine the reports furnished by the States under Article 408 of the Treaty of Versailles, made an enquiry from the Government of India as to whether " the recent industrial developments of India had not been such as to modify to some extent the situation which had led the Government of India in 1921 to decide in the negative the question of the establishment of employment exchanges." The local Governments were again addressed by the Government of India and they were specifically asked to furnish information as to the extent to which unemployment occurs sporadically among particular classes of workers or is a permanent feature of any of the industries of the province. The local Governments were unanimous in the view that there had been no change in the situation since 1921, and that the necessity for the establishment of public employment agencies had not yet arisen. The Governments of Burma and Assam pointed out that the problem with them was not one of unemployment but the shortage of labour. The Government of the United Provinces pointed out that " industry merely provides an outlet for the surplus agricultural population. It absorbs as much as it needs from the land, and in periods of trade depression returns to the land those whom it no longer requires." The Government of Bengal referred to the reduction in the total number of employees in the jute mills due to the change from the multiple to the single-shift system, and to the depression in the coal industry. In the former case it was reported that the workers were absorbed in other industries or returned to agriculture, whilst in the coal industry the absence of unemployment was explained by the fact that only a very small percentage of miners depend solely on mining for their livelihood. In Bombay, too, the continued depression in the textile industry had resulted in the return to the land of the surplus labour population. The seasonal factories in Bombay and the Central Provinces do not give rise to any unemployment, as the workers returned to their agricultural occupations during the slack season. The importance of the agricultural connection will be apparent from the fact that, even in an important and specialized industry like the steel industry in Jamshedpur the bulk of the workers returned to the land during the prolonged strike in 1928. In Madras the retrenchment in the railways led to a certain amount of unemployment, but the local Government did not consider that the volume of this unemployment was large enough to justify the establishment of public employment agencies. Recently the Commissioner of Labour for Madras tried the experiment of maintaining

a register of persons desiring industrial employment and another of employers looking for skilled labour. Applications were invited by advertisement in the leading papers but very few were received, and these were mostly from persons possessing few, if any, industrial qualifications.

#### Chapter V.—Housing.

*The problem of Industrial Housing.*—The conditions of housing and sanitation are largely responsible for the instability of Indian labour and its low efficiency. The housing conditions in an ordinary Indian village are far from satisfactory, but there is generally no overcrowding, and there are vast open spaces around. The strong sunshine in the daytime is nature's disinfectant, which saves the agricultural population to a large extent from the ravages of sickness and disease which, owing to the lack of proper sanitation, even now levy a heavy toll of human life in India. In the larger towns there is neither space nor sunshine between the buildings, and in the absence of adequate arrangements for sanitation, the home of the worker is apt to become a veritable death-trap from which it is only natural that he should endeavour to escape by returning whenever possible to his village. Overcrowding combined with the complete ignorance on the part of the workers of all ideas of sanitation makes the housing problem in India far more complicated than it is in the West. The conditions which prevail in various parts of the country are widely different. Where factories have been established at a distance from towns the workers are housed in surrounding villages in much the same way as agricultural labour. Here conditions approximate to those of ordinary village life, except that as a rule the small garden plot owned by villagers in many parts of India is absent. If necessary, the employer can acquire land without much difficulty, and erect dwellings which take the form of single-story lines, consisting of single-room units, with either a verandah or, in some cases, a small enclosed courtyard. The second stage of development, and consequently of congestion, is seen in cities such as Madras, Cawnpore, Nagpur, Ahmedabad, and in a very large proportion of the industrial areas round Calcutta. Here land is far cheaper than in Bombay or Calcutta, and accommodation usually consists of single-storey huts in groups known as *bustis*, erected by persons other than the owners of mills and rented by millhands on fairly reasonable terms. Housing conditions here are no longer as easy as in the villages, and require close supervision either by the millowners or by the local authority. In some cases, as at Ahmedabad and Cawnpore, the more enlightened factory owners have found it advisable to supply proper housing accommodation to the employees in the hope of commanding the "pick of the labour market."\* The accommodation provided is usually of the single-storey type, and is almost invariably in single-room units. Employers have been encouraged to provide accommodation for two reasons, first the relative cheapness of land as compared with Calcutta or Bombay, and secondly the fairly long distances between the mills, which prevents workmen accommodated in buildings belonging to one mill from working in another mill. The worst examples of congestion are to be found in parts of Calcutta and particularly in Bombay, where the evils of overcrowding and insanitary housing are to be seen in their extreme form.

*The evil effects of bad Housing in Bombay.*—Bombay affords a significant example of the evils which must inevitably arise if the problem of housing is not taken in hand during the earlier stages of industrial development. The extent of overcrowding in the mill area will be apparent from the fact that 97 per cent. of the working class families live in single rooms, and the average number of persons living in a single room is 4.03. These figures are in striking contrast with the figures for London, where only 6 per cent. of the total population live in one room tenements with an average of 1.92 persons per room.† Overcrowding in Bombay is greatly aggravated by the practice of sub-letting which is common among the industrial workers. According to the census of 1921 there were 3,125 one-room tenements in Bombay containing two families and more. Of these 1,955 contained two families, 658 three, 242 four, 136 five, 42 six, 34 seven and 58 eight families and over.

The importance of decent housing cannot be too strongly emphasized. "Good houses mean the possibility of home life, happiness and health; bad houses spell squalor, drink, disease, immorality and crime, and in the end demand hospitals, prisons and asylums in which we seek to hide away the human derelicts of society that are largely the results of society's own neglect."‡ The appalling conditions of life in the chawls make family life impossible, and have a very unsettling effect on the labour force in Bombay. Bad housing is undoubtedly one of the factors responsible

\* Report of the Indian Industrial Commission, paragraph 238.

† Report on an Enquiry into Working Class Budgets in Bombay, by G. Findlay Shirras, page 24.

‡ Quoted from "The Great Opportunity" in the Working Class Budgets, Bombay, page 25.

for industrial unrest. But the gravest and most striking evil is the heavy infant mortality in the slum areas of Bombay City. This is greatest in one-room tenements where, according to the census of 1921, it was as high as 828.5 per 1,000 registered births as against the average rate of 666.7 for Bombay and 178 for the whole Presidency. The heavy infant mortality is due to a great variety of causes such as early marriage, maternal ignorance, lack of medical care and nursing, habit of drugging the child with opium, prevalence of venereal disease, etc., but these causes operate throughout India and the exceptionally heavy death roll among infants in Bombay must be directly attributed to overcrowding and effective sanitation.\*

*Attempts to improve Housing conditions in Bombay.*—The first attempt to improve the housing conditions of the city was made after the great plague of 1896, when the heavy mortality and the great exodus which followed, paralysed the trade and industry of Bombay. The Bombay Improvement Trust was established in 1898 "for the work of making new streets, opening out crowded localities, reclaiming lands from the sea to provide room for the expansion of the city and constructing sanitary dwellings for the poor and the police."† Owing to its limited powers and funds, the want of co-operation with the Corporation and its inevitable unpopularity on account of the compulsory acquisition of property and demolition of buildings, the Improvement Trust had to content itself with "slum-patching," the development of a few building sites, the construction of a few *chawls* and the development of main thoroughfares. Still, it was able to do some useful work and provided 21,387 new tenements as against 24,428 tenements demolished. It constructed a number of broad thoroughfares which serve incidentally the purpose of main air channels for congested areas. The Municipality and the Port Trust also relieved, to some extent the congestion of the city by constructing a large number of quarters for their employees. But the population of Bombay was increasing so rapidly that the combined efforts of these bodies were unable to cope with the situation, particularly as very little was being done by the millowners for the housing of their employees. The Industrial Commission reviewed the position in 1918 and urged that, in addition to the scheme followed by the Improvement Trust, other measures should be adopted such as the refusal of permission, with a few exceptions, to fresh industrial concerns to be established, the setting up of a special area for industrial development, the removal of the existing railway workshops from the city, supply of housing accommodation to their employees by railways, Government departments and public bodies, improved communications with a view to creating industrial suburbs, and a definite programme of construction to be taken up by local authorities.‡ It was not, however, till the end of the war that a bold and comprehensive scheme was drawn up by the Government of Bombay under the personal inspiration of His Excellency Sir George Lloyd, for dealing with the problem. The Development Directorate was formed in November, 1920, to co-ordinate the activities of the various bodies. The programme of the Directorate was an ambitious one, and contemplated the construction of 625 *chawls* or 50,000 tenements for the working classes between 1921 and 1929. The cost was then estimated at 5.5 crores, and under the City of Bombay Municipal and Improvement Act, XX of 1920, a "town duty" of one rupee per bale of cotton was imposed on all cotton entering Bombay. This scheme was conceived during the boom period when labour conditions in Bombay were abnormal. By the end of December, 1927, the Directorate had constructed 207 *chawls* with 16,524 tenements, but only 123 *chawls* with 8,234 rooms were occupied.§ The failure of these newly constructed tenements to attract workers is attributed to the distance of the *chawls* from the mills, the absence of bazaar facilities, the cement construction, which makes the rooms warm in the hot weather and cold in the cold weather, and the high level of rents. The average economic rent works out to Rs. 16 per month per tenement, but the rents have now been reduced considerably, and vary from Rs. 5 per month at Worli to Rs. 7 at De Lisle Road.\*\* The Government of Bombay have also declared their willingness to lower the rents still further if whole *chawls* are taken up by large employers of labour. By 1927 only the B., B. and C.I. Railway had availed themselves of this offer and had rented five *chawls* at Worli for housing the employees of the loco-shops, at Parel. The Indian Postal and Telegraph Department have made several attempts to provide better housing for their postmen and other subordinate employees by hiring some of these *chawls*, but their efforts have been frustrated by the extreme reluctance of the staff to avail themselves of the accommodation offered. The annual loss incurred by the Directorate is estimated at Rs. 20 lakhs,

\* For further details regarding the housing conditions in Bombay, see Labour and Housing in Bombay, by Burnett-Hurst.

† Burnett-Hurst; Labour and Housing in Bombay, page 31.

and the Government of Bombay have decided that, until the tenements now provided are fully occupied, no additional land is to be taken up for industrial housing. The Municipality, Improvement Trust and Port Trust are, however, still carrying on their programme of development.

*Housing facilities provided by Employers in Bombay.*—So far very little has been done by the millowners to provide housing accommodation for their employees. This is due to the difficulty of procuring land on moderate terms in the vicinity of the mills and the difficulty of ensuring that the tenements provided by a mill will continue to be occupied by its own employees. Further, the operatives themselves prefer to be housed in a building which is not owned by their employer; they want what has been described as a "strike-free" house, that is to say a house from which they are not likely to be ejected in the event of a strike. It is not therefore surprising that the millowners have not availed themselves of the offer of the Improvement Trust which would enable them to acquire chawls constructed by the Trust for their employees by annual payments in 50 years. In 1926 an enquiry was made by the Government of India through local governments as to the extent of the housing accommodation provided by employers. Out of the 76 textile mills in Bombay, which furnished information for the purposes of this enquiry, only 28 mills reported that housing accommodation had been provided for their workers. Seven out of the 28 mills provided residential accommodation only for their gatekeepers and night watchmen. No rent was charged, but the total number accommodated was only 147. Twenty-two mills provided partial housing for their operatives. The total number of employees working in these mills was 64,720, but the number of workers who lived in the tenements provided by the mills was only 12,149. Full economic rent was charged in two cases, and one mill let their rooms partly at a favourable and partly at the full economic rent. Fifteen mills charged favourable rent and four mills gave some tenements free and let the remainder at rents which were less than the economic rent. Sixteen mills supplied information with regard to the percentages of the rents charged to economic rents. In three cases 30 to 40 per cent. was charged, in 9 cases 40 to 50 per cent., in 3 cases 50 to 75 per cent., and in one case above 75 per cent.

*Housing in other industrial centres in Bombay Presidency.*—Ahmedabad and Sholapur are the other two important centres of the cotton mill industry in the Bombay Presidency. In the matter of industrial housing both these centres are a distinct improvement on Bombay, although cases of overcrowding are by no means rare. In Ahmedabad the total number of cotton mills is 77, employing about 60,000 workmen, but only 37 mills provide housing accommodation for their employees. Out of these, two mills give free accommodation to their gatekeepers and night watchmen. The number of persons taking advantage of the housing provided is about 16 per cent. of the total number employed by these mills. The majority of the workers live in tenements owned or taken on lease by private landlords, and some of them live in dwellings built by themselves on sites for which they pay rents. Nearly 73 per cent. of the working class families live in one-room tenements. This percentage compares favourably with that of Bombay City (97), but very unfavourably with the percentage for Sholapur, where it is only 33. The monthly rent paid by the majority of employees varies from Rs. 3 to Rs. 6.\* The continued depression in the cotton mill industry has hindered the activities of the employers in the direction of providing improved housing for their employees, but it was reported in 1928 that two mills had undertaken the construction of 450 additional tenements of a suitable type † for their workpeople.

The housing conditions of workers in Sholapur are in many ways superior to those of workers in Bombay and Ahmedabad. There is less congestion and the rents charged are also very much lower. The majority of the operatives live in two and three-room tenements. All the five textile mills in Sholapur city provide housing for their employees, but only about 12 per cent. of the employees are housed in the buildings provided by the mills.‡

*Housing in Bengal (excluding coal mines).*—The industries of Bengal centre round Calcutta in the adjacent districts of Hooghly, Howrah and the 24-Parganas. The factories in this area employ about 483,000 persons, or about 86 per cent. of the total factory population of Bengal. Jute is the most important industry of Bengal, employing 326,000 persons, or nearly 58 per cent. of the total factory population of the province. The jute mills near Calcutta depend almost entirely on imported labour,

\* Report on an Enquiry into Working Class Family Budgets in Ahmedabad, 1928, pages 17-19..

† Report of the Chief Inspector of Factories, Bombay, for 1927, page 20.

‡ For further details regarding the housing conditions in Sholapur, see pages 9-24 of the Report of an Enquiry into family Budgets of Cotton Mill Workers in Sholapur City, 1928.

and the management have for some time realized the importance of proper housing for the stability of their labour force. The mills are situated in a semi-rural area round Calcutta, and unless housing is provided by the management, the employees have to fall back upon the very unsatisfactory accommodation available in the hastily constructed *bustis* round the mills. In some of the quarters which were built in the early days of the industry, the ventilation is unsatisfactory, but the newer dwellings are built on comparatively modern lines. In the congested areas the activities of the jute mills in the matter of housing have been considerably hampered by the difficulty of acquiring land.\*

In 1926 an enquiry was made through the local Government as to the extent of the housing accommodation provided by employers in the jute and other industries. The information which was then obtained from the employers is summarized in the following table.†

It will be observed that more than a third of the employees in jute mills and presses live in quarters provided by the employer. The majority of the concerns charge a concessional rent, but in many cases no charge is made for the accommodation provided. In very few cases are the workers charged the full economic rent. The cotton mills also provide houses for over 45 per cent. of their employees either rent free or on nominal rent. Shipbuilding and general engineering works are mostly situated in or close to Calcutta, and find it difficult to provide houses for their employees owing to the high cost of acquiring land.

*Jamshedpur.*—Jamshedpur represents one of the finest attempts made by an industrial concern for the housing of its employees. The town is the creation of the Tata Iron and Steel Company, Limited, the company owning the land on which it is built. The entire area has been laid out as a model city with up-to-date sanitary, lighting and water arrangements. In 1926 the town had 275 bungalows and 3,988 *pucca* quarters to house the European and Indian employees. Approximately 10,000 out of a total of 30,000 employees of the Company live in these quarters. In some cases free quarters are provided, but generally a concessional rent is charged, which is 30 to 60 per cent. below the full economic rent. The company encourages the building by its employees of their own houses and advances money to them up to a maximum of two-thirds of the cost of building the house. Interest at the rate of 3 per cent. is charged on the loan which is repayable in easy instalments. At the close of the year 1926, the total number of houses built by the employees in the company's area was about 3,000, out of which 800 houses were built on the loan system; the total amount advanced by the Company by the end of that period exceeded a lakh and a quarter rupees.

*Cawnpore.*—At the close of the year 1927 there were 65 factories in Cawnpore employing over 32,500 persons. Of these, 10 were cotton mills employing nearly 19,000 persons. The British India Corporation, which controls five large mills in Cawnpore employing about 9,000 persons, has set a fine example to other employers of labour in the matter of housing, and other welfare work. It has provided suitable housing accommodation for about 5,800 of its employees and their families. The rent charged is only nominal, being approximately 6 per cent. of the economic rent. The Corporation controls two important settlements, one of which is known as Allanganj, and the other as McRobertganj. The layout and the arrangements for living in both these settlements, particularly the latter, are excellent. The houses are all grouped round central courtyards; each house has in addition a little courtyard of its own at the back. The lanes between the houses are rendered shady and attractive by trees and a large playground has been provided for the workers. The main feature of these settlements is that life in them approximates as nearly as possible to the life in a village to which the workers are accustomed. Proper attention is also paid to sanitation and the Corporation maintains at its own expense an adequate conservancy staff and also a few gardeners. Both the settlements are under the management of a welfare superintendent who has done much to bring about a sense of corporate life. A Panchayat has been set up to discuss all matters connected with the settlement.‡

Apart from the activities of the British India Corporation no housing accommodation is provided by employers except on a very small scale. The extent of the congestion in Cawnpore will be apparent from the fact that 64 per cent. of the population live in one-room tenements and the average number of persons per room in these tenements is 3.2. It is not, therefore, surprising that the infant

\* In this connection, see the recommendation of the Indian Industrial Commission in paragraph 239 of its Report with regard to the compulsory acquisition of land for housing purposes.

† Not reproduced. An abstract of the information supplied in respect of Bengal will be found in the Memorandum of the Government of Bengal.

‡ Labour in Indian Industries, by Miss Broughton, page 139.

mortality of Cawnpore is almost as high as that of Bombay. A scheme for the provision of housing accommodation for 20,000 employees at Cawnpore was recently under consideration of the representatives of the mills, the Improvement Trust, the Municipal Board, and the Upper India Chamber of Commerce. Under this scheme the Improvement Trust is to build a suitable number of quarters on land to be provided by the trust as cheaply as possible; the Municipal Board is to undertake the layout of roads and to provide water, lighting and drainage, while the millowners are to purchase the houses by a series of equated annual payments extending over a number of years.\* The scheme, if carried out, would not only improve the existing congestion in Cawnpore city, but would also ensure a more contented and healthy factory population.

*Nagpur.*—There were 66 factories in Nagpur at the close of the year 1927, employing over 15,500 persons. Of these 41 are seasonal factories (cotton ginning and baling presses) employing about 3,000 persons. Nagpur is an important centre of the textile industry in India and there are five cotton mills employing over 10,000 persons. Most of the larger perennial factories provide suitable houses for their operatives, but the seasonal factories confine their attention to the mechanical staff and leave the rest of their operatives to shift for themselves. The activities of the Model Mills and the Empress Mills, Nagpur, deserve special mention. The former has constructed 13 chawls containing 600 rooms built on up-to-date sanitary principles. In these buildings about 800, or a little over 25 per cent., of the employees of the mill are housed at a nominal rent of Re. 1 per room. The Empress Mills have recently acquired a large piece of land measuring about 209 acres on a twenty-seven years' lease for the establishment of a settlement for their workpeople. Model houses and quarters for the welfare staff have been built, and the management propose to continue their building programme according to the demand.

*Madras.*—The total number of factories in Madras at the close of the year 1927 was 118, employing about 25,500 persons. The Buckingham and Carnatic Mills, employing over 9,000 persons, are the only mills which provide housing accommodation for their employees on any large scale. Houses are provided in three mill villages for the workers in this mill earning less than Rs. 30 a month. The total number of workmen residing in these two villages is about 460, and the rent charged is about 25 per cent. of the full economic rent. Recently the management have obtained sites for two more settlements.

*Rangoon.*—In 1927 there were 167 factories in Rangoon employing over 34,000 persons. Of these 48 were rice mills employing over 11,000 persons, and 33 sawmills, employing nearly 7,000 persons. In the large mills and factories some sort of housing is provided for the majority of workers. The accommodation provided is usually in the form of barracks, which are suitable only for single men. In most of the rice mills married workers are employed, but in practically all of them married quarters are not provided. These families usually obtain quarters in buildings registered in the municipal books as lodging-houses. More than one family is often housed in a single room and improvised gunny, plank, or mat partitions are erected to secure a certain amount of privacy. The officer-in-charge of the Labour Statistics Bureau, Burma, states in his report† that "it is not unusual to find a tenement room 12½ ft. by 40 ft. occupied by as many as forty or fifty people."

*Housing arrangements in the Coalfields (Bengal and Bihar and Orissa).*—There are three classes of workers employed in the coalfields. The first class consists of agriculturists who belong to the neighbouring villages within a radius of five to eight miles of the mine in which they work; they live in their own home in the village and come daily to the mine when they have no field work to do. The second class consists of workers who come from greater distances. They work in the coal mines only for a portion of the year, and return to their villages during the cultivating and harvesting seasons. The third class consists of the permanently settled labourers who remain on a particular colliery all their lives. There is no necessity to provide housing accommodation for the workers belonging to the first class, and the third class, consisting of permanently settled labourers, have, in most cases, been assisted to build their own houses on the collieries. The problem of housing arises only in connection with the second class of labourers, and is particularly acute during the busy season (November to May).

Most of the workers in the Jharia coalfield belong to the second of the three categories mentioned above, and it is for this reason that the housing problem soon attracted the attention of the local government. In 1917, as the result of a resolution passed by the Legislative Council, the Government of Bihar and Orissa appointed

\* Report of the Chief Inspector of Factories, United Provinces, for 1927, pages 10-11.

† of an Enquiry into the Standard and Cost of Living of Working classes.

... I. T. Bennison. B.A., I.C.S., pages 89-90.

a committee to enquire into the housing conditions of labour in the coalfields of that province. The committee\* found that there was a real scarcity of accommodation throughout the Jharia coalfield in the busy season, and that on certain collieries there was overcrowding all the year round. In some cases the companies had not acquired surface rights, and it was not easy to find a suitable site for constructing houses on or near the colliery as the surface was congested and broken up by goafing. The sites chosen for the houses (known as dhauras) were in many cases unsatisfactory from the sanitary point of view; the layout and the drainage was bad; in some cases the floors of the rooms were not more than 5 ft. square, and the walls only 3 ft. or 4 ft. high; no doors were provided; the houses were inadequately ventilated, and there were no arrangements for the disposal of night soil or kitchen refuse. The committee recommended that Section 50 of the Chota Nagpur Tenancy Act should be amended so as to enable mineowners to acquire surface rights for colliery purposes on payment of a reasonable sum, and that provision should be made in the Bihar and Orissa Mining Settlements Act (then under preparation) conferring power on the Mines Board of Health to frame bye-laws prescribing the measures to be taken for the provision of decent, comfortable and sanitary housing for the workers on the coalfields. A Bill to give effect to the first recommendation was introduced in the local Council but has not yet been passed. The second recommendation has been given effect to and the Bihar and Orissa Mining Settlements Act (IV of 1920) requires every owner of a mine within a mining settlement to provide for labourers employed in the mine such house accommodation, water supply and sanitary arrangements as the Mines Board of Health may, by bye-law, require.† The bye-laws framed by the Jharia Mines Board of Health, which came into force in March, 1922, provide for the licensing of all houses in the Jharia coalfield and prescribe the minimum standards for houses constructed after the coming into force of the bye-laws. In the event of the refusal of the Board to grant a licence a house must either be demolished or reconstructed so as to conform to the prescribed standard. To prevent overcrowding the bye-laws also provide that no more persons shall be accommodated in any room than will allow to each adult the minimum air and floor spaces laid down in the bye-laws. The colliery labourer is also liable to a fine if he "causes any room provided for his habitation to cease to meet the requirements laid down in the bye-laws by blocking the ventilation holes or by closing in the verandah or by any other means whatsoever."‡ He is also prevented from building a cattleshed or a pigsty within 50 ft. of a room provided for the habitation of colliery labourers or within 50 ft. of a well or tank used for domestic purposes. Further, the Board is empowered to proceed against any person who causes overcrowding by occupying a room which has not been assigned to him by the owner, agent, or manager of a mine. The Board is thus vested with adequate control over the housing conditions in the Jharia coalfield.

The question of housing in the Raniganj coalfield in Bengal does not present the same difficulty as in the Jharia coalfield. Here the labourers in most cases come from the neighbouring villages and prefer to return to their homes for the night. A number of labourers are also permanently settled in the coalfield, but they have either been provided with accommodation or have been assisted to construct their own houses on the coalfield. The Raniganj area is not so congested as Jharia, and the provision of houses for the permanently settled labour force does not, therefore, give rise to any great difficulty. In 1926, 104 out of a total of 189 coal mines in Bengal reported that housing accommodation was being provided free of rent for over 55 per cent. of their miners. Some of the houses are reported to be badly ventilated, but the houses constructed by the workers themselves and particularly by the Santals are much more satisfactory. The Bengal Mining Settlements Act (II of 1912) does not contain any provision with regard to the housing of miners corresponding to Section 16 of the Bihar and Orissa Mining Settlements Act. In 1927 a Bill was introduced in the local Council to amend and consolidate the law relating to the control and sanitation of mining settlements in Bengal, which contained a similar provision, but this Bill has not yet passed into law.

*Housing in the Plantations.*—In the Assam tea gardens houses are provided for imported labourers on all the estates. There is considerable diversity in the systems of housing on tea estates, but, broadly speaking, there are two systems, the system of barrack lines and that of the busti, or small village.§ Barrack lines are to be found where the location of a large labour force in a small area is more or less obligatory, but when more space is available the labourers live in bustis, or groups of houses constituting a scattered hamlet or village. Barrack lines, especially in the

§ Report of the Assam Labour Enquiry Committee, 1921-22, paragraph 56.

Assam Valley, are usually substantial structures, often having iron roofs and brick walls. Most labourers, particularly those belonging to aboriginal races, prefer to live in detached houses built by themselves and like to live with people of their own race or community.

In the tea gardens of the Jalpaiguri and Darjeeling districts of Bengal houses are also provided free of rent by practically every estate. In the tea and coffee plantations of Southern India housing accommodation is provided for the labourer except those belonging to the jungle tribes, in brick, stone or laterite building roofed with tiles or iron. In the rubber plantations in Malabar very few labourers live on the estate. As they are recruited locally, they prefer to return each day to their own villages.

### Chapter VI.—Health.

*The Health Problem and its difficulties.*—The change from a rural to an industrial environment has undoubtedly an adverse effect on the health of the Indian worker and renders him an easier victim to sickness and disease. This was pointed out forcibly by Major F. Norman White, the Sanitary Commissioner with the Government of India, in the following extract from a note\* written by him for the Indian Industrial Commission in 1918 :—

" Living an outdoor life, engaged in agricultural pursuits, the ryot is able to put up with the considerable degree of parasitic infestation so commonly seen ; malaria and hookworm infection, for example, is not incompatible with a fair output of agricultural work in such circumstances. Transference to large industrial centres however, involves a change of environment which, apart from other considerations connotes increased liability to disease. A more confined atmosphere, crowded insanitary dwellings, lack of outdoor recreation are certain to exercise a baneful influence and render the factory employee more liable to fresh infections and to upset the compromise that his body has been able to effect with the parasites that it harbours. Had the large employer of labour a plentiful supply of really healthy material to start with he would still be under an obligation to secure for his operatives an environment above reproach ; how much greater is the present need for hygienic environment, when in most cases cure has to precede the conservation of health ? "

The Indian Industrial Commission emphasised the importance of the problem of the health of workers in Indian industries and remarked that " no industrial edifice can be permanent which is built on such unsound foundations as those afforded by Indian labour under its present conditions."† The problem does not, however admit of any easy solution. In the first place, the Indian worker clings to his habits of the village, and it is exceedingly difficult to teach him to observe the elementary principles of sanitation which are so necessary in a congested area. The incentive for the provision of up-to-date sanitary arrangements does not also exist, because the employer is by no means certain that the expenditure on them will result in his premises being kept clean by his employees. In the second place the migratory character of Indian labour makes it very difficult to keep any satisfactory record of the health of the worker. When illness or disease makes further labour impossible the Indian operative creeps back to his village and is lost to observation. Statistics dealing with the health of industrial workers are not, therefore, available, and the problem of the health of the worker in Indian industries is merged in the larger problem of public health.

*Sanitation and Health in Factories.*—The provisions of the Indian Factories Act relating to sanitation and health are contained in Sections 9-14 and 19-A, which are supplemented by the rules framed by local governments and administration under Section 37 of the Act. The provisions contained in these rules are, briefly, as follows :—

In every factory all the inside walls of the rooms (except such rooms as are used only for the storage of articles or for the manufacture of gas, chemicals, cement, or for pressing forage ; engineering workshops or foundries in which the prescribed air space is provided for each person employed ; walls and roofs made of galvanised iron tiles or glazed bricks ; walls in oil mills below a height of 5 ft. from the ground ; factories or parts thereof exempted by the local government from the requirements of Section 9 (a) of the Act) and all the ceilings and tops of such rooms and all the passages and staircases shall be limewashed at stated intervals. Beams, doors, rafters and other woodwork shall either be limewashed once a year or painted or varnished once in every seven years. No rubbish or filth shall be allowed to accumulate or remain in such a position that effluvia therefrom can arise within a factory.

\* Appendix L. to the Report of the Indian Industrial Commission, page 460.

† Paragraph 236 of the Report.

All drains shall be properly constructed and regularly flushed. The compound surrounding a factory shall be kept in a clean condition. There shall be provided a floor area of at least 36 square feet and a breathing space of at least 500 cubic feet (700 cubic feet in rooms where mechanical or electrical power is used) for each person employed. Every part of a factory where persons are employed shall be adequately ventilated, and all practical measures shall be taken to protect the workers against the inhalation of any noxious gas, dust or other impurity. Except factories which are provided with septic tanks or with water-flushed latrines and except such factories as are specially exempted by the inspector, every factory shall be provided with latrine accommodation according to a prescribed scale in a place detached from other buildings, and the latrines and urinals shall be kept in a clean and sanitary condition. Separate latrines shall be provided for female workers. In every factory an adequate supply of water fit for drinking shall be provided daily free of cost. Proper arrangements shall be made for draining and maintaining in a clean condition the area round the place where the drinking water is distributed. In Bengal, where the installation of septic tank latrines has made much progress, elaborate rules have been framed regarding their construction and maintenance.

From the annual provincial reports on the working of the Indian Factories Act it appears that the inspectors of factories are insisting on as high a standard of sanitation as is possible in the varying circumstances. The rules framed by local governments are being generally observed and the improvements suggested by the inspectors are also being given effect to by the factory owners. The Chief Inspector of Factories, Bengal,\* has, however, pointed out that progress in this direction must of necessity be slow as the efficacy of the improvements is, to a large extent, dependent on the efficiency of the municipality. Latrines sanctioned by municipalities as meeting their requirements and rules do not always comply with the standard design of the Bengal Factory Inspection Department, and in some cases the principles in the latrine design of the two authorities are diametrically opposed to each other. Hand service latrines are generally not of much utility in congested areas, and satisfactory progress has been made in the industrial areas around Calcutta in the provision of septic tank latrines. The Chief Inspector of Factories, Bengal, considers that in such areas the installation of septic tank latrines should in the absence of a sewerage system be made compulsory for all factories having a large number of employees. In Bombay, the report of the Chief Inspector of Factories also refers to the lack of the necessary municipal facilities and to the ignorance and indifference on the part of the operatives, which makes it difficult to maintain decent sanitary conditions in factories. In the Punjab report it is stated that, although the latrine accommodation provided by the factories was adequate, they were seldom utilized by the operatives, particularly when the factories are situated near open fields. As regards the health of the operatives the information contained in the provincial reports on the working of the Indian Factories Act is very scanty, and in the absence of reliable statistics any generalisation would be risky.

*Ventilation and Humidification in Cotton Mills.*—The question of ventilation and humidification presents special difficulties in cotton mills in which a humid atmosphere is required for the spinning and weaving of cotton. To avoid breakage of thread and loss of material, artificial humidification of factories is necessary, particularly in the hot season. Such humidification, especially when effected by the letting in of steam when the temperature of the factory is high, produces very trying conditions of work which affect the efficiency and probably also the health of the operatives. The question of humidification is one which has for many years engaged the attention of Government, and its importance was emphasised both by the Textile Factories Labour Committee in 1907 and the Factory Labour Commission in 1908. In 1911 a Factory Ventilation Committee was appointed by the Government of Bombay, but its terms of reference referred chiefly to the chemical purity of the atmosphere, whereas the report of a similar enquiry in England stressed the importance of humidity and discountenanced the importance of chemical purity of the atmosphere in factories. Progress was thus rendered impossible owing to the lack of scientific data relating to health and the effects of work in hot and moist atmospheres. Soon after the war the Government of India instituted a special technical enquiry on the subject, which was entrusted to Mr. T. Maloney, M.C., A.M.C.T., an expert who was brought out from England in June, 1921. The objects of this enquiry were—

- (1) To obtain accurate observations regarding the methods of humidification and ventilation employed in cotton mills and their effect on working conditions; and
- (2) to evolve recommendations designed to effect a marked amelioration in conditions without serious detriment to the industry."

---

\* Annual Report for the year 1927, pages 6-7.

The enquiry continued till December, 1922, and extended to all important centres in which cotton manufacture was being carried on. In the same year, but before the enquiry was completed, an amendment was made in the Indian Factories Act which provided that in any factory "the atmosphere shall not be rendered so humid by artificial means as to be injurious to the health of the persons employed therein," and local governments were empowered to prescribe by rules the standards of artificial humidification and the methods to be adopted to secure their observance. Mr. Maloney's report gave for the first time a detailed and accurate survey of the conditions in all the important centres and the Government of India in their letter\* No. L.843, dated 26th April, 1924, addressed the local governments and administrations concerned and invited their views on recommendations made in this report. The replies received indicated complete unanimity in regard to the suggestion that the use of steam should be prohibited when the temperature in a department of a factory exceeded 85° F. The importance of effecting improvements in the conditions of work was also generally recognized, but there was in many quarters some reluctance to adopt any definite standards of humidification as suggested by Mr. Maloney without further investigation. In addressing the local governments again on the subject in December, 1925,\* the Government of India suggested that a rule should be framed by local Governments under the Factories Act prohibiting the use of live steam at temperatures beyond 85° F. Such a rule has now been issued in Bengal, Madras, the United Provinces, the Punjab, the Central Provinces and in Ajmer-Merwara. In Delhi it is expected that the rule will be issued shortly, but the Government of Bombay, which is the only other province concerned with the question of humidification in cotton factories, has not issued any such rule, as it considers that it would be *ultra vires* of the provisions of the Indian Factories Act. Section 9 (d) of the Act prohibits artificial humidification only when it is injurious to the health of the operatives, and the local government holds the view that it has not yet been established beyond doubt that the use of steam at high temperatures is injurious to the health of the operatives. The local government is, however, in favour of such a rule, and has accordingly suggested an amendment of the Act to get over this technical difficulty. It appears, however, from the reports of the inspectors of factories that the millowners in the Presidency are themselves discontinuing the practice of using steam for the purpose of humidification when the temperature is above 85° F.

As regards the fixing of definite standards of ventilation and humidification, the Government of India agreed to the suggestion that further enquiries and experiments should be made before this is attempted. But they pointed out to local governments that in their opinion the maintenance of humidity registers in the more important mills would be essential for the purposes of this enquiry, and that in most cases it would be necessary to introduce intermediate standards, as recommended by Mr. Maloney, before final standards can suitably be prescribed. The local governments concerned were asked to report the results of their investigations and their final conclusions. Rules were accordingly framed by local governments requiring the millowners to maintain hygrometers of a pattern to be approved by the inspector in all departments of cotton mills where artificial humidification is used. The latter were also required to record the wet and dry bulb temperatures thrice daily and to take daily readings of the kata-thermometer. Owing to the difficulty experienced by the mills in securing kata-thermometers and hygrometers the investigation was delayed, but with the exception of Bengal† the reports have now been received and the conclusions of the local governments are summarized below :—

(i) *Punjab, Delhi and Ajmer-Merwara.*—The experiments were conducted from November, 1927, till March, 1928, in the Punjab and from November, 1927, till July, 1928, in Delhi and Ajmer-Merwara. The observations in the Punjab were confined to two mills only, one of which worked intermittently while the other stopped work in March. In Delhi and Ajmer-Merwara observations were recorded in eleven mills. The conclusions reached by the local government and the two administrations are as follows :—

(a) The proposal that the cooling power as measured by the kata-thermometer should be adopted as the most satisfactory basis for the ultimate control of the humidification and ventilation of cotton mills does not seem to be open to question.

(b) The standard suggested by Mr. Maloney in respect of the maintenance of the kata cooling power of eleven millicalories per square centimetre per second is suitable and is just sufficient to prevent visible perspiration of the workers employed on heavy manual labour in the textile mills, particularly throughout the summer and monsoon months. This standard can be achieved by an acceleration of the air circulation in the department.

\* Appendix III.

† The Bengal Report is being printed and it is hoped will be received shortly.

(c) The provisional rules in regard to the enforcement of the above standard may be tried as an experiment for a period of one year before they are finally adopted.

(d) The intermediate standards suggested by Mr. Maloney in draft rules 1 and 2 on pages 87 and 88 of his Report may be adopted. Rules under the Factory Act prescribing the standards suggested by Mr. Maloney have been issued in the Punjab and Ajmer-Merwara and are about to issue in Delhi.

(ii) *Central Provinces and Berar*.—The observations in this province were made from July, 1927, till June, 1928. The conclusions reached by the local government are as follows :—

(a) The standard determined by the kata-thermometer is not satisfactory in this province, as the basis for the ultimate control of humidification and ventilation in cotton mills. In the first place, the instrument requires greater care and delicacy in handling than is likely to be met with in many mills if accurate readings are to be obtained. Secondly, in the Central Provinces and Berar the climatic conditions are so variable that it would be impossible to fix a standard based on this method. In June the records show a figure as low as 6.1 and the highest did not exceed 9.8 as against the minimum of 11 suggested by Mr. Maloney, in spite of every endeavour being made to effect frequent changes of air. The climate of the province is dry; the shade temperature is often 116° F., and the natural humidity 25 per cent. Humidification by artificial means is accordingly necessary in all departments of cotton mills except during the rains. The standard suggested by Mr. Maloney, although a low one can never be maintained continuously during the months from April to July.

(b) If any standard is to be adopted it should only be made applicable to new buildings.

(c) The intermediate standards suggested by Mr. Maloney in draft rules 1 and 2 on pages 87-88 of his report may be tried tentatively for a period of two years.

(iii) *United Provinces*.—Here, too, owing to the very high shade temperature during summer the minimum standard of 11 millicalories suggested by Mr. Maloney has not been attained in most of the mills, particularly in the weaving sheds. The Chief Inspector of Factories considers that the only way in which this standard can be attained is by the installation of a central cooling and humidifying system capable of renewing the air in the various departments eight to ten times in an hour. The intermediate standards suggested by Mr. Maloney have, however, already been enforced in this province.

(iv) *Madras*.—There are six cotton mills in the Presidency, three of which are situated in Madras city. The intermediate standards suggested by Mr. Maloney have been brought into force by the local government and it is reported that five out of the six mills have complied with these standards. In the case of the sixth mill, the Chief Inspector of Factories is of opinion that the contravention can be rectified by slightly increasing the ventilation.

(v) *Bombay*.—An interesting report on temperature, ventilation and humidification with special reference to wet kata-thermometer cooling powers was published by the Chief Inspector of Factories, Bombay, in 1928. The local government have issued rules prescribing the intermediate standards suggested by Mr. Maloney. The results of their investigations showed that, apart from Ahmedabad, the mills generally did not exceed the permitted humidity to any great extent. The mills in Ahmedabad exceeded the permitted humidity on a large number of occasions in 1927, but further enquiry in 1928 showed that considerable progress had been made in complying with the schedule, particularly in the carding and spinning departments. Progress was also made in the weaving departments, but it was clear that the schedule could not easily be complied with and that some relaxation would be necessary in Ahmedabad. The climatic conditions of Sholapur are about the same as in Ahmedabad, but humidity is forced to a much greater extent in Ahmedabad than Sholapur, owing to the fact that many mills in the former centre heavily size the yarn and thus require more humidity for weaving processes. Wet kata readings in a large number of mills in Ahmedabad are very much lower in the hot weather than the minimum of 11 suggested by Mr. Maloney. Fortunately, a large number of weaving mills in Ahmedabad have either installed a special ventilating, cooling and humidifying plant or else have improved the "gutter" system of humidification which is installed in several of them. It is reported, however, that a number of mills are reluctant to effect improvements unless they are compelled to do so by legislation.

The Government of Bombay have made the suggestion that the Indian Factories Act should be amended so as to enable the local government to prescribe a standard of humidity, and the methods to be adopted to secure its observance, while inspectors

should be authorized to grant exemption from the standard in any department if ventilation is adopted so that a reasonable cooling power is maintained. The local government further suggests that in cotton weaving factories of the ordinary shed or the saw-tooth type, in which reasonable cooling powers are not maintained, inspectors should be granted powers, subject to appeal, to order measures for the reduction of temperature by means other than the provision of cooling combined with ventilation when the outside shade temperature exceeds a temperature to be prescribed by the local government. The problem of humidification affects the Bombay Presidency more than any other province in India, but it is also in this Presidency that the progress has been most marked. The extent of this progress and the good results achieved will be apparent from the following extract from the Report of the Chief Inspector of Factories for 1927 :—

“ During the year a greater advance in the provision of comfortable working conditions in textile factories has been made than in any previous year in the history of the department. Particularly has this been the case in Ahmedabad, where, in the weaving department of mills, working conditions have been very trying. It is hoped that by the end of the present year nine mills there will have installed special humidifying, cooling and ventilating plants in their weaving sheds and three in their spinning departments. In addition, 14 other weaving sheds will have improved their gutter systems with increased ventilation. The new mills being erected in Ahmedabad will be satisfactorily ventilated, cooled and humidified on modern lines. By the end of this year, 33 mills will have either more efficient plant than formerly, or have experimental plant under test. At last, Ahmedabad has generally recognized the need of efficient ventilating and cooling arrangements to neutralize the trying climatic conditions of that centre which result in unduly high temperatures and low cooling powers in the departments. It is thought that the agents in Ahmedabad now realize that improvements are necessary to secure a more contented labour force and it seems to have been abundantly demonstrated that an outlay on efficient ventilation, combined with cooling, is reflected in increased production. In this connection it is worth recording that in one weaving shed an increased production of 4.6 per cent. was solely attributed to the improvement in working conditions consequent on the improvement in the ventilating arrangements. The agent reported that whereas in one of his sheds the production was constantly lower than in the other, it has, since the installation of the ventilating and cooling plant, been consistently higher. A second mill reported an increase of practically 9 per cent. in the weaving production after a similar installation. A third agent has been so impressed with the results obtained in his weaving shed by increased production which benefits him and his employees alike, that he is contemplating ventilating and cooling his spinning departments on modern lines. The writer was considerably impressed with the change in a number of Ahmedabad mills effected by the adoption of decent ventilating and cooling systems. The usual practice of slacking for several hours of the day has been almost stopped. Operatives pay much closer attention to work, earn more, and are certainly more contented.

“ The mills in Sholapur have installed several special ventilating, cooling and humidifying plants that have almost revolutionized the working conditions from the point of view of comfort. Plants suitable for the hot and dry climates of Ahmedabad and Sholapur will not be so effective in Bombay. Two mills have, however, recently adopted somewhat similar systems. It is hoped to effect material improvements in weaving sheds in Bombay by means of air movement created by fans attached to looms, and several managers are experimenting with these.”

*Control of Temperature in Factories.*—Connected with the question of ventilation and humidification is the question of the control of excessive temperatures in factories. Mr. Maloney, in his report on Humidification in Indian Cotton Mills, suggested\* certain inexpensive methods (e.g., whitewashing and roof spraying, etc.) for the reduction of excessive temperatures in factories, and in 1924 the Chief Inspector of Factories, Bengal, speaking on behalf of the Government of Bengal at a conference convened by the Government of India to review the working of the Indian Factories Act, as amended in 1922, made the suggestion that a clause should be inserted in the Act on the lines of Section 6 of the British Factory and Workshop Act, 1901, giving the inspector the power to control temperature in factories. This proposal, which was similar to the one made by Mr. Maloney in his report, was accepted by the Government of India, and in the Bill further to amend the Indian Factories Act, which was introduced in the Legislative Assembly in September, 1925, a clause was inserted for the addition of the following section after Section 9 of the Act :—

“ 9A. (1) In every factory a reasonable temperature shall be maintained ; (2) in the case of any factory in which, in the opinion of the inspector, a reasonable temperature is not maintained, the inspector may serve on the manager of the factory

\* Section 27 of the Report.

an order in writing specifying the measures which he considers necessary to maintain a reasonable temperature, and requiring him to carry them out before a specified date."

The Bill was circulated for opinion and, though local governments were all agreed as to the desirability of the control of temperature in factories, there was considerable difference of opinion as to the most suitable method of exercising this control. It was pointed out that the reduction of excessive temperatures in the hot weather would not be an easy matter and that there are obvious dangers in leaving it to inspectors to decide what constitutes a reasonable temperature. The Select Committee to which the Bill was referred, decided by a majority to eliminate this clause as it was of opinion that "a provision of this kind or even a provision which would enable the local government by rules to lay down standards of temperatures suitable for various localities and various classes of factories would, until technical investigation and research in regard to this very difficult problem has been completed on a far more thorough scale than heretofore, impose a real burden upon employers with only a problematical advantage to the employee." When the Bill as amended by the Select Committee came up for consideration in the Legislative Assembly, Mr. Joshi moved an amendment for the restoration of the clause excised by the majority of the Select Committee. This amendment was defeated, but it was clear from the discussion that a number of members considered that the Factories Act should contain some provision enabling control to be exercised over temperatures in factories. The Government of India were unable to support Mr. Joshi's amendment because they recognized the force of the criticisms directed against the original clause which was deleted by the Select Committee, but they gave an assurance that the proposal would again be brought up for discussion at the next Session of the Assembly. A second Bill was accordingly prepared in which the Government of India put forward a different proposal. They now proposed to add the following clause after Clause (d) of Section 9 of the Indian Factories Act:—"(e) The temperature in any part in which any manufacturing process is being carried on shall not be such as to be injurious to the health of the persons employed therein."

It was also proposed to vest local governments with powers to prescribe standards of temperature. Thus it was now proposed that two criteria should be laid down for the determination of excessive temperature in factories, viz. :—(i) The temperature must not exceed certain prescribed standards; and (ii) it must not be injurious to the health of the employees.

The Bill was introduced in the Autumn Session of the Legislative Assembly in 1926 and circulated for opinion, but it lapsed in the same year with the dissolution of the Assembly. In circulating the Bill for opinion, the Government of India pointed out that the measure proposed was of "a tentative nature" which was "put forward as a basis for discussion." An alternative scheme was also discussed in accordance with which inspectors of factories would be required by law to make recommendations to the local government for remedial measures in respect of such premises in which the temperature in their opinion was likely to be injurious to the health of the persons employed therein. The local government could, if they accepted the recommendation, authorize the inspector to issue a provisional order calling on the manager of a factory to carry out before a specified date any measures (e.g., roof spraying, whitewashing, etc.) specified in the order and calculated to reduce the temperature in a factory or a part of a factory, or to state any objections which he may have to the confirmation of the order. In the absence of any valid objections, the order could be made final with the approval of the local government. The alternative scheme referred to above met with little support and objections were also raised to the proposals which were embodied in the Bill. It was pointed out that suitable standards of temperature could only be prescribed after a careful and thorough examination by experts of the whole question of temperatures in factories. Some of the replies indicated that, owing to the varying climatic conditions from place to place and from season to season, to the varying nature of the processes, and to the varying character of the buildings in which factory work is carried on, it would be impossible, without a very general dislocation of industry, to enforce anything in the nature of a "standard of temperature." The Governments of Burma and Bengal suggested that it would be more feasible to lay down standards of cooling power than standards of absolute temperature. The absolute temperature is no adequate measure of comfort or of injury to health whereas Mr. Maloney's Report\* indicated that the measure afforded by the kata-thermometer is ordinarily a much more reliable one. A further difficulty arose in connection with the adoption of the criterion of injury to the health of the employees. This criterion was intended as a safeguard to ensure that employers would not be harassed where there was no genuine necessity for interference, but it would in effect make the proposed clause inoperative. Injury to health is not easy

\* "Humidification in Indian Cotton Mills" by T. Maloney, M.C., A.M.C.T., pages 30-39 and 85.

to prove and it is significant that Mr. Maloney after 18 months research, covering some of the worst mills in India had, in spite of medical assistance, to record a very guarded opinion regarding the effect on health of conditions which were, from the point of view of comfort, almost intolerable.\*

In view of the above objections, the Government of India decided to hold over the consideration of this difficult question until they had received and considered the reports of the local governments on the proposals regarding the control of ventilation and humidification in cotton factories.

*Control of Construction of Factories.*—This was another question which arose out of the report submitted by Mr. Maloney on the Humidification and Ventilation in Cotton Mills. It was pointed out in that report that a considerable amount of discomfort was suffered by the operatives owing to the faulty construction of the mills. Municipalities have usually the power to control the construction of new buildings, but the considerations which weigh with such authorities do not take into account the internal temperatures which are likely to prevail in the mill after it has been built. In addressing local governments in April, 1924,† on the recommendations made by Mr. Maloney, the Government of India expressed the view that, subject to the control of the local government, the sanction of the factory inspector should be necessary to the construction of a new factory or the conversion into a factory of an existing building used for some other purpose. The factory inspector would then be able to prevent the erection of mills in which, by reason of the details of their construction, the operatives would be unable to work under humane conditions. Here, too, the local governments, while in general agreement with the principle underlying the proposal, expressed divergent views as to the manner in which the control should be exercised. In the circumstances, the Government of India considered that it would not be possible for them to frame a measure containing any detailed provisions which would take account of the different conditions and the difficulties in the various provinces. They accordingly addressed local governments in 1926, and left it to them to introduce whatever measures they might consider necessary in the local legislative councils. The Government of Burma is the only local government which has taken any action in the matter, but the measure which the local government proposed to enact for the purpose has not yet been passed into law. The Government of Bombay at first expressed the view that legislation on the subject should be central, but when the Government of India adhered to their original conclusions that legislation should be provincial, the local government replied that it was "not desirable to undertake any legislation in the local legislative council in this connection."<sup>6</sup> In Bengal the only progress achieved is due to the co-operation of the Howrah Municipality with the Factory Inspection Department. The Municipality has adopted the practice of obtaining the advice of the Chief Inspector of Factories on the plans for the construction of new factory buildings which are submitted for its sanction.

*Sanitation in Mines.*—The provisions in the Indian Mines Act regarding sanitation are contained in Section 17 of the Act and local governments are vested under Section 30 (c) with powers to prescribe the scale of latrines and urinal accommodation to be provided at mines and for the supply of drinking water. The regulations made by the Governor-General in Council under Section 29 provide, in addition, for the ventilation of mines and for the action to be taken in respect of dust and noxious gases. These regulations provide for the adequate ventilation of every mine to clear away the smoke and to dilute and render harmless inflammable and noxious gases. The rules made by local governments provide for the adequate supply of drinking water, for the cleanliness of the underground workings and roads, and for the provision of latrines and urinals which have to be kept in a sanitary condition. In addition, the Governments of Bengal and Bihar and Orissa have each passed a Mining Settlement Act‡ for the control and sanitation of mining settlements and to make better provision for preventing the outbreak and spread in such settlements of epidemic diseases." Under these Acts a Mines Board of Health has been set up in Jharia and in Asansol for carrying out the purposes of these local Acts. As regards the work done by these two Boards of Health the following extract from the Report of the Chief Inspector of Mines for the year 1927 is of interest:—

"The beneficial results of the work carried out by the Asansol and Jharia Mines Boards of Health and by the Jharia Water Board are well known. From the public health point of view the settlements are bright spots in the two provinces, and within the settlements it is remarkable how much less disease there is at the collieries

† Paragraph 18 of letter No. L.843, dated 26th April, 1924, Appendix III.

‡ *Vide* the B. and O. Mining Settlements Act, 1920, and the Bengal Mining Settlements Act of 1912. The revision of the latter Act is under consideration.

than in the surrounding villages. One of the major improvements effected in the Jharia coalfield has been the provision of a pure water supply. From the Topchanchi reservoir, 16 miles distant, 1,250,000 gallons of water are supplied daily to all collieries of importance."

*Health and Sanitation in Plantations.*—Elaborate provisions for water supply, sanitary arrangements, hospital accommodation and medical attendance are contained in the Assam Labour and Emigration Act, VI of 1901, but these provisions relate to "labourers," i.e., persons who are bound by a contract penally enforceable under the Act. With the abolition of penal contracts\* these provisions are now inoperative though they have not yet been formally repealed. The Government of Assam have, however, under sections 113 and 122 (i) of the Act framed rules for the submission of monthly returns of vital statistics and vaccination. These rules also require Deputy Commissioners to classify the estates in their districts in one of the following three categories:—(i) healthy or first-class estates; (ii) second-class estates; (iii) unhealthy estates. The last class comprises estates in which the average mortality for the preceding year exceeded 7 per cent. of the population of the estate as a whole, while the first category includes only such estates as have not been on the unhealthy list for the last three years. All other estates are included in the second category. Unhealthy estates are to be inspected once by the Civil Surgeon and thereafter annually by the Deputy Commissioner or their authorized subordinates until they are placed in the class of healthy estates. But neither the Deputy Commissioner nor the Civil Surgeon can legally order the Manager of an estate to take any steps for the improvement of the health or sanitation of the estate, though their periodical visits do undoubtedly stimulate some action in this direction on the part of the employer. In the year 1928 only one garden in the whole of Assam, situated in the Goalpara District, was classified as unhealthy.† The nature of the sanitary arrangements provided by the tea gardens in Assam was examined by the Assam Labour Enquiry Committee of 1922 and the observations of the Committee are given in Chapter VI of the Report.

Most of the tea gardens in Bengal are situated in the Jalpaiguri district. The Dooars, like Assam, are malarial and unhealthy but labour has always been "free," and the Dooars have all along had the advantage over Assam in the matter of recruitment. The Dooars Labour Committee, which was appointed by the local government in 1910 to report on the health and conditions of employment in the tea gardens in the Dooars, expressed itself strongly in favour of the continuance of the system of "free" labour and was opposed to any legislation for the protection of labour which, as in Assam, was then invariably associated with the system of penally enforceable contracts. The Committee found a general disposition among employers to effect improvements in the conditions of the life of their labourers, but made certain suggestions for their consideration, e.g., the establishment of one or more central hospitals and of branch dispensaries, the appointment of qualified men as resident garden doctors, the adoption of a system of quinine prophylaxis on all gardens to protect the men from attacks of malaria. But the Committee also made the suggestion that the Government should take steps to obtain vital statistics of the tea gardens in the Dooars. This suggestion led to the passing of the Jalpaiguri Labour Act of 1912, which requires employers to maintain registers and to submit returns relating to vital statistics. Inspectors are also appointed under the Act to check the accuracy of the entries in the registers and returns. In 1923 the late Sir Surendra Nath Banerjee, then the Minister for Local Self-Government in Bengal, introduced a measure called "The Bengal Tea Gardens Public Health Bill," the object of which was to create a new local authority in the form of a statutory Board of Health, similar to the Boards of Health already existing for mines in Asansol and Jharia, to exercise wide powers for the control and sanitation of tea-garden areas in Bengal. The Bill was circulated for opinion but was not further proceeded with.

In Madras the Madras Planters' Labour Act of 1903 contained provisions regarding the health and sanitation of the plantations in the Nilgiris and in the Wynaad Taluk of the Malabar District. But along with these provisions the Act also contained provisions for penal contracts. The Act has been repealed with effect from the 1st January, 1929, and the plantations are no longer subject to official control in the matter of health and sanitation. In Coorg a temporary legislation known as the Coorg Labour Act was passed in 1926 to keep alive the system of penal labour contracts for a period of five years only. In return for this benefit which the Act confers on employers it imposes the obligation of providing suitable house accommodation, water supply, sanitary arrangements and medical treatment for the

\* See Chapter III, page 170, *supra*.

† See Reports on Immigrant Labour in the Province of Assam for the year ending 30th June, 1928.

labourers. The inspection of the estates is entrusted to the Commissioner, the District Magistrate and the Civil Surgeon of Coorg. The Chief Commissioner can declare an estate to be unfit for the residence of any workmen, and so long as this declaration remains in force no penal action can be taken against a labourer for a breach of a contract of service.

*Industrial Diseases.*—Little information is available about the prevalence of industrial diseases in India. In 1919 the Washington Conference adopted two recommendations concerning industrial diseases; the first suggested that arrangements should be made for the disinfection of wool infected with anthrax, whilst the second advocated the exclusion of women and young persons from certain processes in lead manufacture and the regulation of employment of women and young persons in processes involving the use of salts of lead. There was no evidence that the handling of wool in India causes infection to those employed in the process, but the Government of India did not consider it safe to assume its absence. A provision was accordingly made in the Indian Factories Act (Section 38A) which gives the Governor-General in Council the power to frame rules for the adequate disinfection of wool used in factories which may be infected with anthrax spores. So far no rules have been framed by the Governor-General in Council. As regards the second recommendation of the Washington Conference, the Government of India did not consider that there was any immediate need for legislation in view of the fact that the industries in question had not developed to any appreciable extent in the country. But a provision was inserted in the Factories Act (Section 19B) in accordance with the Recommendations of the Conference "in order to obtain without opposition protection against a danger that might become real in years to come." Recently the Government of Bihar and Orissa, when revising the rules framed by the local government under the Indian Factories Act, made the suggestion that this provision of the Act should be amended so as to require the medical examination and certification of all persons employed on processes involving the use of lead or its compounds.

The Washington Labour Conference adopted a further Recommendation suggesting the establishment of a government service for safeguarding the health of the workers. This Recommendation had apparently a strictly limited application relating as it did only to the protection of workers in the unhealthy trades, e.g., in factories and workshops where lead, arsenic or other poisonous substance is used, or those in which grinding, glazing or polishing on a wheel is carried on by which dust, or any gas vapour or other impurity is generated or inhaled by the workers to an injurious extent. As industries of this nature were few in India, the Government of India did not consider it necessary to establish a special medical service for the purpose, but they pointed out to local governments the desirability of strengthening the medical services of the country in areas where many unhealthy industries are situated.

The Third International Labour Conference adopted a Draft Convention in 1921 relating to the regulation of the use of white lead in painting. The object of this Convention was to minimize the dangers of lead poisoning which experience had shown to be prevalent in certain countries. The Government of India, after consultation with local governments, came to the conclusion that it would not be practicable to ratify this Convention as the use of white lead was relatively small and a disproportionately large staff would be required to enforce the Convention. At the same time, the Government of India have by means of executive instructions enforced the compliance of the principles underlying the Convention so far as their own departments, e.g., the Public Works, Railways and Military Works, are concerned and have requested local governments to take similar action and to recommend for adoption the provisions of the Convention to such other public and quasi-public bodies situated in their territories as make use of white lead pigments.

*Sex Ratio in Industrial Centres.*—In his note for the Indian Industrial Commission, to which reference has been made earlier in this Chapter, Major F. Norman White, Sanitary Commissioner with the Government of India, stated\* as follows:—

"Another less obvious danger to our present large industrial centres would appear to lie in the great disturbance of the natural sex ratio. Thus in Calcutta there are 365,000 males and only 131,000 females between the ages of 15 and 40. A certain disproportion is possibly unavoidable but a disparity of the extent quoted would appear to be a direct health danger. It would be interesting to learn, among other things, what effect such a state of affairs has on the prevalence of venereal disease."

\* Appendix L to the Report of the Indian Industrial Commission, page 463.

The number of women per 1,000 males in 1921 in some of the important industrial centres was as follows\* :—Calcutta and Suburbs, 500 ; Bombay, 524 ; Ahmedabad, 763 ; Sholapur, 894 ; Cawnpore, 667 ; Delhi, 672 ; Nagpur, 864 ; Rangoon, 444 ; Karachi, 629. The proportion of women to men must be considerably less among the industrial population. The disparity between the sexes in these centres is largely due to the migratory character of labour and to the fact that the workers are generally disinclined to bring their families with them to towns where the conditions of life are less attractive than in the villages. The overwhelming preponderance of the male sex in these industrial centres has an important effect on the social life of the workers. Dr. Curjel in her Report on Women's Labour in Bengal Industries† refers to the frequency of irregular liaisons and the prevalence among the millhands in Bengal of venereal disease. The evil is aggravated by want of privacy in most of the quarters in which the millhands live. In dealing with this question, Dr. Curjel states "from enquiries through Indian and English sources, and from personal knowledge of living conditions among the poorer classes in other parts of India, one must conclude that such irregular family life as is found among mill women in Bengal is not customary in the districts from which the majority of mill labour is recruited." Conditions in Rangoon and Bombay can hardly be expected to be more satisfactory than in Bengal.

*Medical Facilities provided by Employers.*—The economic importance of health is recognized by the employers in India and in a number of cases special medical facilities are provided for the workers. In connection with an enquiry into welfare work which was made in 1926, employers were requested to furnish particulars regarding the medical facilities provided by them for their employees and the following statement is based on the returns obtained from them :—

In most cases it is reported that medical treatment is provided free of charge to the employees and their families, but in some of the cotton mills in Bombay a nominal charge of one or two annas a month is made from each worker. Medicines have generally to be purchased by the employees but in some cases ordinary medicines are supplied free of charge.

*Sickness Insurance.*—The possibility of introducing a scheme of sickness insurance in India was considered by the Government of India in connection with the Draft Conventions and Recommendation adopted by the Tenth International Labour Conference in 1927. Owing to the migratory character of industrial labour, the want of qualified medical practitioners in sufficient numbers, the existence of indigenous systems of medicine, and the opposition of the workers to any system involving compulsory deductions from pay, the Government of India considered that it would not be practicable to introduce a comprehensive scheme of sickness insurance on the lines of the Conventions of the International Labour Conference. But they realized that the question was one of some importance for the country. The general level of wages in India is low and in the case of the majority of workers the margin between income and expenditure is so small that it is impossible for them to make any effective savings for any unforeseen contingency, such as illness. The enquiry into working-class family budgets in Bombay City disclosed that 47 per cent. of the working class families are in debt, while a similar enquiry in Ahmedabad showed that the worker at that place is also generally heavily indebted. An interruption of income owing to illness in such cases undoubtedly involves considerable hardship. The Government of India accordingly decided to consult provincial Governments as to whether it would be feasible to introduce a limited scheme of sickness insurance, either on the lines indicated in the Draft Conventions or on other practicable lines. In their letter\* No. L-1518, dated the 20th September, 1928, they invited the views of local Governments in the matter and also made the suggestion that the examination of this question might suitably be entrusted to a small and informal committee, including a few representatives of employers and employees. Such Committees were, however, appointed in only five provinces, namely, the Punjab, Madras, Burma, the United Provinces, and the Central Provinces. Generally speaking, all major local Governments expressed the opinion that the introduction of any scheme of sickness insurance would be premature and impracticable in present conditions. It was pointed out that the Indian worker, owing to his illiteracy, would not be in a position to appreciate the advantages of a scheme of sickness insurance and that he would object to the payment of any contributions, particularly as he receives in most cases medical treatment free of charge. Some of the local Governments also referred to the fact that the workmen are reluctant to be treated by the allopathic system of medicine. But the main difficulty with local Governments was the question of finance. Thus the Government of Madras expressed the opinion that there were other more urgent services, such as elementary education, increased medical facilities, etc., which had a prior claim on their resources, while the Governments of the Punjab, the United Provinces, and Bihar and Orissa, expressed their inability to undertake any liability in the matter. The Government of Bombay stated that they were unable at present to make any financial contribution towards a scheme of sickness insurance, but, if the Labour Commission came to the conclusion that such a scheme is desirable and practicable, the local Government would give it their support "to the extent of the resources which may be made available." The Government of the Central Provinces also expressed the opinion that the State should bear only the cost of administration as the large and growing liability of a scheme of sickness insurance may prove to be too heavy a burden on its finances.

*Maternity Benefits.*—The question of the provision of maternity benefits for women workers was also raised by a Draft Convention adopted by the Washington Conference in 1919. This Convention was not intended to be ratified by India, but the Conference passed a resolution inviting the Government of India "to make a study of the question of the employment of women before and after confinement, and of maternity benefits, and to report on these matters to the next Conference." Enquiries were instituted on the subject, and the conclusion reached was that the introduction of a compulsory scheme of maternity benefits would be premature but that employers should be encouraged to start voluntary schemes. A report was accordingly presented to the International Labour Conference which met at Geneva in 1921. In pursuance of certain suggestions put forward in the Legislative Assembly, enquiries were made by the Government of India in June, 1924, regarding the extent to which maternity benefit schemes were in force in India. The results of this enquiry were published in 1925 in Bulletin No. 35 of Indian Industries and Labour. Since that date maternity benefit schemes have been introduced by various employers,

\* A copy of this letter, together with copies of the replies thereto, will be found in Appendix V.

an important scheme being started at Jamshedpur by the Tata Iron and Steel Company. In a communication to the press, the Company announced that it would pay maternity benefits from the 1st January, 1929, to its female employees on weekly wages. The benefit is the equivalent of six weeks' wages which will be paid on the condition that the woman shall have been in the continuous employment of the Company for not less than twelve months prior to the date of confinement, and shall give an undertaking not to do any work outside her own home during the period of six weeks following confinement. She must also notify the birth of the child to the Company's main hospital within three days of its occurrence. Employees who wish to take advantage of this benefit must register their claim at the Employment Bureau, which will then arrange for the examination of the woman in order that the probable date of birth may be ascertained. If the claim is in order the Employment Bureau will issue a permit for leave of absence for six weeks and payment will then be made of three weeks' wages. On receipt of notification of birth, the Chief Medical Officer will arrange for verification, noting the date on the certificate issued by him. The certificate will be handed in at the Employment Bureau, and payment will then be made of the second three weeks' wages. Before resuming work the woman must report at the Employment Bureau, when a fresh weekly ticket will be issued.

An attempt at legislation was first made by Mr. Joshi in September, 1924, when he introduced in the Legislative Assembly a Bill\* designed to make provision for the payment of maternity benefit in certain industries. This Bill, after circulation, was thrown out by the Legislative Assembly in August, 1925.† The cue, however, was taken up by the provincial legislatures and in August, 1926, the Bihar and Orissa Council passed the following resolution:—

"This Council recommends to Government that early steps be taken to protect female labour employed in the coalfields and all industrial plants of the province—

"(a) by protecting their employment during their advanced state of pregnancy, and three weeks after childbirth has taken place; (b) and that such companies or firms in this province that have in their employment such labour, provided that a period of six months' service has been given prior to the event, be directed to pay to such persons in the way of maternity benefit a sum of money equal to payment lost during that period."

The Central Provinces Legislative Council has on the anvil a Maternity Benefit Bill which was introduced by Mr. R. W. Fulay, a non-official member, on the 22nd January, 1929. The only province in which legislation has been passed is Bombay, where a Maternity Benefit Act was passed early this year, and came into force from the 1st July, 1929. Here, too, the measure was introduced by a non-official member. It differs from Mr. Joshi's Bill in one important respect. The payment of maternity benefit is an obligation which is imposed directly on the employer, whereas under Mr. Joshi's Bill it would have fallen on the local Government to set up a Maternity Benefit Fund and to make payments out of this fund.

## Chapter VII.—Welfare.

*Nature of Welfare Work. Its importance in India.*—The definition of "Welfare Work" presents some difficulty, as there is some difference of opinion as to the nature of the activities which should legitimately be included within its scope. One definition would confine welfare work "to the voluntary efforts on the part of employers to improve, within the existing industrial system, the conditions of employment in their own factories." But another definition, which is more generally accepted, would extend its scope "to all efforts which have for their object the improvement of the health, safety, and general well-being and the industrial efficiency of the worker."‡ The necessity for welfare work arises out of the modern system of production which destroys all personal touch between the employer and the employee. In cottage industries the employee works directly under the eye of the master, and is often a relation in whose welfare the master is directly interested. But under the modern system of large scale production it is impossible for the employer to pay individual attention to the numerous employees who are working in his factory. The worker is known by his number rather than by his name, and his personal needs and rights are apt to be disregarded. It is not therefore surprising that the growth of the factory system has given rise to grave industrial unrest which threatens to destroy its very foundations. If this system is to be preserved the importance of the

\* Appendix VI.

† *Vide* Assembly Debates, Volume VI, Nos. 5 and 6, dated the 26th and 27th August, 1925.

‡ *Vide* the Presidential Address of Mr. (now Sir) Atul Chatterjee at the All-India Industrial Welfare Conference, 1922.

part played by labour in production must be recognized, and every effort must be made to develop a sense of responsibility and of dignity among the working classes. The basis of welfare work is therefore the recognition of the human element of labour as a factor in production. But welfare work has another aspect ; it has a direct bearing on the efficiency of the worker. "Welfare work at its best is the voluntary expression on the part of the employer of his recognition that the employees in the firm are his fellow-workers in an undertaking for the service of the community, and at its worst it is merely a business proposition." But it would be a mistake to lay too much stress on the financial aspect of welfare work which can never be a success if it is instituted with that end only in view.

The importance of welfare work is greater in India than in the West. The worker in this country regards employment in a factory or a mine as a necessary evil from which he is only too glad to escape when circumstances permit. Separated from his community and in strange surroundings, he is almost irresistibly drawn to the liquor-shops, which invariably make for his demoralization and ruin. If the employer desires a more stable and efficient labour force, it is obvious that he must endeavour, by every means in his power, to effect an improvement in the conditions of employment of his workpeople, and to secure for them a happier existence.

*Difficulties of Welfare Work in India.*—Education, or rather the lack of it, is the stumbling block to all progress in India, and welfare work suffers from this blight. The vast majority of Indian workers are illiterate, and it is unfortunately impossible for them to understand or to appreciate the importance of any scheme which may be intended for their ultimate benefit. Welfare activities, such as are to be found in the highly organized factories of Europe and America, presuppose a certain standard of education which is entirely absent in India. Welfare work therefore depends for its success on the energy of the employer or an outside agency working, in the beginning, at any rate, without the co-operation of the employees. But the illiteracy of the worker is not the only obstacle. The labour force is, in most cases, of a temporary and floating character and heterogeneous in composition. Men from different provinces, speaking different languages and of different religions, are to be found working in the same factory : workers of one community naturally tend to form groups within their own community, and this renders the working of any general scheme of welfare work somewhat complicated. These difficulties, though serious, have not proved to be insuperable, and in recent years satisfactory progress has been achieved both by individual employers and by private organizations, such as the Social Service League in Bombay and the Young Men's Christian Association in Nagpur. In 1922 an All-India Industrial Welfare Conference was convened at Bombay by the Social Service League, which had since 1918 been entrusted with the organization and management of two workmen's institutes for the benefit of operatives employed in mills under the agencies of Messrs. Currimbhoy Ibrahim & Sons and Messrs. Tata & Sons. The Conference was attended by the representatives of the Central Government and of some of the provincial Governments, and was presided over by Mr. (now Sir) Atul Chatterjee, who was then Secretary to the Government of India in the Department of Industries. The object of the Conference was to discuss several problems connected with welfare work, and to secure some co-ordination between the activities of the various agencies at the different centres.

*Classes of Welfare Work.*—Welfare work falls into two broad classes, viz., activities inside the factory or *intra-mural* welfare work, and activities outside the factory or *extra-mural* welfare work. *Intra-mural* welfare work includes such items as improvement of sanitary and hygienic conditions in factories, ventilation and temperature in factory buildings, etc. An account has already been given of the action taken by Government and by employers to improve working conditions within the factory. The other important items of welfare work which are connected with the working conditions inside a factory are :—(i) Medical attendance ; (ii) Maternity benefits ; (iii) Education ; (iv) Recreation ; (v) Provision of creches ; (vi) Co-operation ; (vii) Housing.

Of these, (i), (ii) and (vii) have been dealt with elsewhere in this memorandum, and an account will now be given of the progress achieved in respect of the remaining items.

*Education.*—The importance of this item does not need to be specially stressed. Education is required for the children employed in factories, i.e., the half-timers, for the children of the adult employees and also, where possible, for the adult workers themselves who are for the most part illiterate. The question of the education of half-timers was the subject of some controversy when the Indian Factories Act of 1911 was under consideration.\* The late Mr. Gokhale moved an amendment designed to compel all factory-owners employing not less than 20 children to provide for their

\* *Vide* Indian Factory Legislation, by A. G. Clow, page 50.

free education for not less than three hours a day. The amendment was opposed by the employers on the ground that it would place on them a burden which was not imposed on employers in other countries, a point of view which later received support from the Indian Industrial Commission.\* This amendment was eventually withdrawn by Mr. Gokhale, and the question of the education of the children employed in factories has lost much of its importance since the amendment of the Factories Act in 1922, which raised the minimum age of admission of children into factories from 9 to 12. The problem of the education of the children of the workers is now gaining in importance as it ensures a future supply of efficient workmen, but the worker does not generally bring his family with him, and progress in this direction must necessarily be slow. The education of the adult worker presents still greater difficulties. Apart from the indifference of the average worker to education, the hours of work are generally so long that it cannot reasonably be expected that after a full day's work in a factory he will willingly spend the little spare time that is available to him in a school. Illiteracy is, however, a serious handicap to the Indian worker, and without education any attempt to improve his efficiency is doomed to failure. Some of the enlightened employers in the country have therefore recognized it as their duty to take whatever measures are possible to promote education not only among their workers, but also among the children of their employees, whom they hope in time to attract to their mills. A brief account of the nature of the special facilities which are being provided in each province for the education of the workers and their children is given below † :—

(a) *Bengal*.—Attempts have been made by some mills to set up day and night schools, but it is reported that the great majority of such schools have been closed owing to the lack of interest shown by employees. Some of the engineering concerns provide for the training of artisans, and it is reported that one concern encourages promising youths to take up recognized professional courses. The progress made in this province is, however, most disappointing.

(b) *Bombay*.—There are special schools for half-timers employed in some of the mills, and night schools have also been established by the Social Service League, which is being subsidized for this purpose by the more enlightened millowners. In Ahmedabad the Millowners' Association makes an annual donation of Rs. 15,000 to the Ahmedabad Labour Union for the maintenance of schools for the children employed in the mills, and for the children of the employees. In Sholapur all the five textile mills provide free education. The railways generally provide schools at the more important stations for the children of their employees.

(c) *Bihar and Orissa*.—The Tata Iron and Steel Company has established a Technical Institute at Jamshedpur, in which theoretical and practical training in metallurgy is given. In addition, the Company maintains twenty ordinary schools for the education of the children of its employees. The Jamalpur Mechanical Department Workshops of the East Indian Railway also maintain a well-equipped technical school. Facilities for education are provided by only a few of the collieries. The Giridih Collieries of the E. I. Railway are, however, doing excellent work for the education of their employees. They maintain 27 elementary schools and one upper primary school. The total number of children attending these schools is reported to be 1,200. An industrial school has also been established where mechanics, drawing, mathematics, etc., are taught.

(d) *Madras*.—The most notable progress has been made by the Buckingham and Carnatic Mills ‡ which maintain a day as well as a night school. In 1926-27 there were 1,426 children in the day school and 333 men in the night school. The day school is an elementary school with five standards, and has as many as 34 teachers and 8 technical instructors on the staff. In the technical section attached to the school, carpentry, tailoring, tinsmithy, turning, fitting, and weaving, are taught. The night school has eight standards, and commercial instruction is also given in English and typewriting.

(e) *Burma*.—Very few firms provide facilities for education. The Burma Oil Company maintains schools in the Yenangyaung Oilfield for about 800 children, and is proposing to start a night school for their employees. The Burma Corporation makes an annual donation of Rs. 1,000 for the maintenance of the Anglo-Vernacular Middle School at Namtu, and is also constructing a school at Bawdwin for the education of the children of its employees.

\* *Vide* paragraph 142 of the Report.

† For further details a reference is invited to the pamphlet entitled "The Education of Factory Children in India," published in 1918 by the Bureau of Education and to the Quinquennial Review on the Progress of Education in India.

‡ *Vide* Quinquennial Review on the Progress of Education in India for 1922-27.

(f) *United Provinces.*—The British India Corporation (which is a congregation of five large mills in Cawnpore and two outside Cawnpore) maintains six schools for children and industrial classes for its employees. The only other concerns which take any interest in the promotion of education are the Elgin Mills at Cawnpore, the United Agra Mills, Agra, and the B.N.W. Railway Workshops at Gorakhpur, which provide for the education of the children of the employees.

(g) *Punjab.*—No facilities are provided for the education of adult workers. The New Egerton Woollen Mills Company, Dhariwal, maintains a school in which the daily attendance is reported to be about 400.

(h) *Central Provinces.*—The mills in Nagpur have entrusted their welfare work to the Young Men's Christian Association, which has established nine centres where the millworkers reside, and in each centre there is a school. The average daily attendance in these schools, which are run by the Young Men's Christian Association on contributions raised from the mills, is reported to be about 420.

(i) *Assam.*—Some of the tea gardens maintain schools for children, but these schools are not popular, as the labourers are generally recruited from the aboriginal tribes with whom education is at a discount, particularly as it interferes with the earnings of their children who find employment in the gardens. The Assam Oil Company maintains a Middle English School, and the Assam Railways and Trading Company provides a Middle English School and a Primary School for the children of their employees.

*Recreation.*—The lot of the Indian worker is by no means a happy one and, if he is to be kept contented, every possible attempt should be made to add a little colour to the drab life in industrial employment. It is also most important that he should be encouraged to spend his spare time in healthy recreation, so that he may be saved from the attractions of the liquor shop. Though employers are beginning to recognize the value of recreation, the facilities so far provided are on a very small scale. In Bombay\* it is reported that playgrounds for the benefit of the employees are provided by only four mills, and that very few employees take advantage of them. The management of the Kohinoor Mills, Limited, regularly arranges for dramatic performances, cinema shows, and open air lectures, and it is stated that the average attendance at the open-air lectures is about 2,000. The Alexander and E. D. Sassoon Mills also provide for lectures and magic-lantern shows, etc. The Currimbhoy Ebrahim Workmen's Institute, which is run by the Social Service League, provides a gymnasium, a social club, a cricket club, and makes periodic arrangements for sports and excursions. At Ahmedabad only one mill provides an open ground for sports, whilst only one or two others provide for periodic entertainments. The mills in Sholapur appear to be more advanced in this respect. Three out of the five cotton mills at that place provide facilities for outdoor sports. One mill has started a boy-scout movement, and the troop strength is reported to be 120. The same mill distributes sweets to the children on the playground in order to encourage them to take healthy exercise.

In Bengal very little is being done for the promotion of healthy recreation among the employees. Attempts have been made to encourage sports and games, but the response has been poor. A few mills make special arrangements for cinema and gramophone entertainments.

In Bihar and Orissa the Tata Iron and Steel Company maintains libraries and reading rooms for its employees. Special facilities are also provided on a generous scale for games, sports and other forms of recreation. The only other concerns in the province which provide facilities for recreation on any appreciable scale are the Giridih Collieries and the Jamalpur Workshops under the East Indian Railway.

In Madras the only concerns, whose activities in this direction are worthy of mention, are the Buckingham and Carnatic Mills, the Madras and Southern Mahratta Railway Company, and the South Indian Railway Company. The Buckingham and Carnatic Mills have organized their welfare work on an extensive scale, and a Welfare Committee consisting of the management and the workpeople has been constituted to take charge of these activities. The railway administrations make grants-in-aid to sports clubs at important centres.

In the United Provinces, apart from the activities of the British India Corporation, practically nothing is being done to promote this class of welfare work among the employees. The British India Corporation provides large playgrounds for hockey, football, cricket, etc., and gives a grant-in-aid to the workers' clubs in their settlements.

---

\* *Vide* Article on Welfare Work in the Bombay Presidency on pages 432-442 of the Bombay Labour Gazette for January, 1927.

In the Central Provinces grounds for outdoor sports are provided in seven textile mills, one match factory and in some of the mines, collieries and cement and pottery works. The Young Men's Christian Association is also carrying on very useful work at Nagpur.

In the Punjab very little is being done.

In Burma, facilities for recreation are provided only by the Burma Corporation at Namtu and Bawdwin and by the Burma Oil Company at Yenangyaung.

In Assam, cinema and other entertainments are provided occasionally in most gardens, and in a number of them football and playing fields are also provided for the employees. The Assam Oil Company and the Assam Railways and Trading Company provide football and cricket grounds for their employees and occasionally make arrangements for cinema shows and other entertainments.

*Creches.*—The provision of creches is of great importance in factories where women are employed in large numbers. In most cases women workers find it exceedingly difficult to find any responsible person to take charge of their young children whilst they are at work in the mills. This difficulty is in part responsible for the prevalence in Bombay of the habit of drugging children with opium in order to keep them quiet. From the point of view of employers these creches are valuable in securing more regular work from the women operatives. Here, too, the ignorance of the worker has made progress difficult. There still exists a certain amount of prejudice in the minds of the women workers against these creches and great difficulty has been experienced in persuading them to leave their children in the charge of nurses. Much tact is necessary to overcome the suspicions of mothers, and the success of a creche is dependent largely on the personality of the lady supervisor. The greatest progress has been achieved in Bombay, where creches are now being provided in a number of textile mills. These creches are becoming increasingly popular with the female employees. The lady supervisors have in many instances been able to persuade mothers to give up the practice of administering opium to their children and to teach them the elementary principles of child welfare. Creches have also been provided in a number of mills in Ahmedabad and in all the five textile mills in Sholapur. In the Central Provinces and Berar, creches have been provided in six textile mills, which employ a large number of women. In other provinces the progress is negligible and creches have been provided only in a few isolated cases.

*Co-operation.*—The co-operative movement has as yet hardly touched the fringe of the industrial population. The Social Service League, Bombay, has organized several co-operative credit societies among the millhands in Bombay, whilst the Tata Iron and Steel Company at Jamshedpur and the Empress Mills at Nagpur appear to be the only two concerns which have made any serious attempt to promote co-operation among their employees. The organization of co-operative societies among industrial workers has not made much progress owing to their general illiteracy and migratory habits, but the movement is undoubtedly one of considerable importance, as it is calculated to promote thrift and to save the worker from falling into the clutches of the moneylender.

#### Chapter VIII.—Safety.

*Industrial Accidents in India.*—An American writer in referring to industrial accidents observed as follows:—"While the bread of the labourer is earned in the sweat of his brow, it is eaten in the peril of his life. Whether he works upon the sea, upon the earth, or in the mines underneath the earth, the labourer constantly faces imminent death; and his danger increases with the progress of the age. With each new invention the number of killed and injured rises."

As in other countries, the industrial progress of India has been accompanied by an alarming increase in the number of industrial accidents. The seriousness of the problem will be apparent from the fact that the total accident rate per 100,000 employees in factories rose from 520 in 1904 to 1,025 in 1927; whilst in mines the total accident rate per 100,000 operatives also rose from 146 in 1904 to 357 in 1927. The death rate per 1,000 persons employed in mines rose from 0.63 in 1902 to 0.92 in 1927. Even after making due allowance for the fact that the reporting of accidents was not altogether satisfactory in the earlier years, it is clear that the growing industrialization of the country has increased to a considerable extent the risk of injury to which the workers are exposed.

The detailed statistics of accidents in factories and mines from 1904 to 1927 are given in the table at the end of this chapter. The accident rate in factories is highest in Bihar and Orissa, where in 1927 it was 2,875 per 100,000 operatives. This is due to the steel industry, which was alone responsible for 75 per cent. of the total number

of accidents in the whole province. The accident rate in factories in other provinces for the same year is shown as follows:—Burma, 1,433; Punjab, 1,412; United Provinces, 1,388; Bombay, 1,257; Madras, 920; Bengal, 634; Central Provinces, 427; Assam, 138. In the Punjab, the United Provinces, Bombay and Madras a large proportion of the accidents occurred in the railway workshops, but, as the result of an investigation made by the Railway Board it was discovered that the railway workshops were reporting a number of very trivial accidents which do not require to be reported under the Act. In mines the death rate is highest in coal mines where the average death rate per 1,000 workers during the ten years ending with, and including 1926, was 1.22 as compared with 0.98 for all mines under the Coal Mines Act in Great Britain. Statistics cannot, however, measure the sacrifice and suffering caused to the workers and their families. The problem of checking the waste of human life incident to the production of wealth is the direct concern of society, and the State cannot leave entirely to the employers the important business of safeguarding the workers in industry.

*Safety Regulations in Factories.*—The provisions relating to safety in factories are contained in Sections 15-20 of the Indian Factories Act. The powers vested in the inspectors of factories under Sections 16, 18, 18 A and 19 A are subject to an appeal to the local government, or to such authority as it may appoint in this behalf, and the appeal must be heard with the aid of assessors if the applicants so desire.\* Except in the case of an appeal against an order under Section 19 A (prohibition of the presence of children in factories) the appellate authority may, on the application of the appellant, suspend the operation of an order of the inspector pending the decision of the appeal. Rules have been framed by local governments under the Indian Factories Act, which lay down in greater detail the measures which have to be taken for the safety of the operatives. These rules provide for the precautions to be taken against fire and for the proper fencing of machinery. The rules regarding precautions against fire are briefly as follows:—Every building of more than one storey shall be provided with at least two sets of stairs, and such stairs shall be provided with a suitable and efficient hand-rail. In factories of more than one storey every window or door giving access to an external staircase shall be so arranged as to open immediately from inside. Ginning factories shall be provided with at least two flights of stairs made of brickwork or other fire-resisting material. The manager shall cause notices to be exhibited prohibiting smoking and the use of naked lights in all places where they would be dangerous, or where the inspectors may so require. In any factory where the process of manufacture necessitates the use of inflammable materials, efficient means of subduing outbreaks of fire shall be kept ready for immediate use.

With regard to the fencing of machinery the provisions contained in the provincial rules may be summarised as follows:—In every factory all moving parts of machinery shall be securely fenced, unless they are so situated that in the opinion of the inspector they are incapable of causing injury to the workers. Fencing shall be so designed as to give protection to a person oiling, cleaning or otherwise attending to the machinery, and to all persons who may be in the neighbourhood of a moving part whilst it is in motion. All electrical circuits or parts of such, or any objects electrically connected with them, which by reason of their position could cause injury to any person, shall be adequately protected and in such a manner as to remove danger of injury. Every hoist and teagle, and every place where material of sufficient weight is raised or lowered, shall, where practicable, be so fenced as to prevent injury to any person in its descent. Every opening in the ground or in a floor which, owing to its situation or otherwise could cause personal injury, shall be so fenced as to prevent any such injury. There are also some additional and special provisions relating to textile and ginning factories. In Burma, which is the home of the timber industry, additional safeguards are provided for the fencing of circular saws.

The provincial rules also prescribe measures for the protection of persons attending to machinery or boilers. These are briefly as follows:—All important pulleys shall be provided with belt hangers or perches. Suitable string gear shall be provided and used to move driving shafts on all fast and loose pulleys. Lubrication of bearing or gear-wheels or replacing or adjusting of belts shall be done only by an experienced and specially trained person. Service platforms and gangways shall be provided for overhead shafting and, where required by the inspector, shall be securely fenced with guard rails and toe boards. No transmission machinery in motion shall be cleaned by cotton waste, rags or similar material held in the hand. Every shafting ladder shall be fitted with hooks or some other effective non-skid device. No person engaged

\* *Vide* Section 50 of the Indian Factories Act.

in oiling or adjusting belts or in any other work within reach of unfenced transmission machinery shall be allowed to wear loosely fitting clothing. No women or child shall be allowed to clean machinery in motion. Safe and convenient access is to be provided to all bearings. All water gauge glasses of boilers working under high pressure shall be securely guarded. Efficient measures are to be taken for securing and maintaining sufficient and suitable lighting in every part of a factory in which persons are working or passing.

In the United Provinces, the Punjab, Burma, Bihar and Orissa and Assam, a provision is made in the rules which requires the occupier or manager of a factory, if called upon to do so by the Chief Inspector of Factories, "to supply such drawings, specifications or particulars, and to carry out such examination or tests as may, in the opinion of the Chief Inspector of Factories, be necessary in order to determine whether any part of the machinery or plant is in such a condition that it can be used without danger to human life or safety." The Bengal Government have issued a rule to the effect that the operation of all railways or other electrical or mechanical means of transport within the precincts of a factory shall be such as to satisfy the Inspector that there is no danger to human life and safety. Recently the Government of Bihar and Orissa have also stressed the importance of control over the operation of factory railways. In the Tata Iron and Steel Works at Jamshedpur there are over one hundred miles of railway line, and from the report of the Chief Inspector of Factories, Bihar and Orissa, it appears that the rules framed by the company for the operation of their railways are inadequate for the safety of the workers in the crowded parts of the factory and that even these rules are not always being observed. The company has been somewhat slow to accept suggestions for improving its traffic operation, and the local government consider greater control is necessary than is provided for by the Indian Factories Act. The only section of the Act which can be held to be applicable to factory railways is Section 18 A, but this only empowers the inspector to issue orders in a case in which he is satisfied that locomotives or rolling stock are in a dangerous condition, or in which he considers that some part of the permanent way is defective. But it is not only the condition of the plant, etc., which may be a source of danger to the operatives but also the method of operation, particularly in places where there are large numbers of workers. In order to secure adequate safety the local government considers that it should be empowered to frame rules which will (a) prescribe speed limits, subject to exceptions where there is no danger; (b) prescribe that a flagman should precede all trains except in localities which may be exempted; (c) prevent unauthorized persons from riding on trains; and (d) provide general standards for brakes on rolling stock.

The Government of India suggested to the local government that if the Inspector of Factories was unable to secure adequate safety by means of instructions under Section 18 A of the Act an application may be made to the Governor-General in Council for the delegation of the necessary powers to the local government under Section 144 of the Indian Railways Act.

*Safety Regulations in Mines.*—The Indian Mines Act of 1923 empowers the Governor-General in Council to frame regulations for the safety of persons employed in mines, under Section 29, clauses (h) to (p). Local governments are also empowered to frame rules under the Act to ensure the proper fencing of a mine for the protection of the public. In addition, the Chief Inspector of Mines may call upon the owner, agent or manager of a mine to frame bye-laws which are not inconsistent with the provisions of the Act, regulations or rules to prevent accidents and to provide for the safety, health, and discipline of the persons employed in the mine (Section 32). The bye-laws, when approved by the local government, have effect as if enacted under the Act. Further, Section 19 of the Act gives special powers to the Inspector of Mines in any case when any danger is apprehended which is not expressly provided for in the Act, regulations, rules and the bye-laws. The Governor-General in Council may increase the number of two sets of regulations, viz., the Indian Coal Mines Regulations, 1923, which apply only to coal mines, and the Indian Metalliferous Mines Regulations, 1923, which apply to all other mines. These regulations provide for the proper maintenance of shafts and outlets, roads and working places, haulage arrangements, fencing of materials; for the restrictions which have to be observed in raising or lowering materials; for the precautions to be taken in the use of explosives; and for adequate ventilation and lighting.

*Reporting of Accidents in Factories and Mines.*—Both the Indian Factories Act and the Indian Mines Act provide for the prompt reporting of accidents. Section 34 of the Indian Factories Act requires the manager to report all accidents which cause death or bodily injury whereby the person injured is prevented from returning to his work in the factory during the 48 hours next after the occurrence of the accident.

Accidents in factories are divided into three classes, viz., fatal accidents, serious accidents, i.e., accidents which prevent a person from returning to work for 21 days or more, and minor accidents. All three classes of accidents are to be reported to the Inspector of Factories and to the district magistrate, and, in case of any accident resulting in death, to the officer-in-charge of the police station. It is the duty of the Inspector of Factories to make an investigation as soon as possible into the cause of and the responsibility for a fatal or serious accident, and to take steps for the prosecution of the person concerned if it is found that the death or serious injury resulted from any infringement of the provisions of the Act or of the rules framed under the Act. Section 34 of the Act also requires notice to be given of an accident which is due to any cause that has been notified in this behalf by a local government, even though no injury may have resulted therefrom to any person. So far notifications have been issued under this section only in Bombay, Bengal and Burma.\* Section 20 of the Indian Mines Act, 1923, requires the owner, agent or manager to report any accident causing loss of life or serious bodily injury and also any accidental explosion, ignition, outbreak of fire or irruption of water in or about a mine. The Inspector of Mines has to be informed immediately by telephone or telegram, and a notice in the prescribed form has to be sent within 24 hours to the district or sub-divisional magistrate. Section 21 of the Act empowers the local government to appoint a court of inquiry in cases of accidents.

*Causes of Accidents in Factories and Mines.*—Provincial reports on the working of the Indian Factories Act frequently refer to the ignorance and carelessness of the workers, which are responsible for a great many of the accidents. The fact is that the education of the operative has not kept pace with the increase in the complexity of the plant and processes consequent on the growing industrialization of the country. The inspectors of factories are doing all they can to encourage the managements with which they deal to give due attention to safety methods, and considerable progress has been made in all provinces in the fencing of dangerous machinery. But employers have not always shown due regard for the safety of their operatives. Cases are by no means rare in which accidents are due to lack of supervision or an indulgence in unsafe practices on the part of the management. Thus the Report of the Chief Inspector of Factories, Bihar and Orissa, for the year ending 31st December, 1926, refers to a series of catastrophes which were due to the "technical incompetence" of the management. The Punjab and Burma Reports for 1927 also refer to the disregard shown by some factory owners for the essential and oft-repeated precautions against accidents. In some of the provincial reports on the working of the Indian Factories Act, accidents are classified according to their causing agent.† Plant and machinery account for the highest number of accidents, but there are also other important causes, such as falling weights, persons falling and slipping, explosions, fires, hot liquids and molten metals, flying splinters and hand tools. In Bengal, 42 per cent. of the total accidents in 1927 were caused by machinery and another 18 per cent. by falling objects. The percentages in Bombay were 31 and 18, and in Bihar and Orissa 38 and 21, respectively. The percentage of accidents in these three provinces in 1927, which were caused by persons slipping and falling, were 7, 10 and 9, respectively. In mines under the Indian Mines Act, the responsibility for fatal accidents in 1927, as gauged by the inspectors of mines, was as follows :—

	Number of fatal accidents.	Percentage of total number of fatal accidents.
Misadventure.. .. .	131	62.68
Fault of deceased .. .. .	45	21.53
Fault of fellow workmen .. .. .	7	3.35
Fault of subordinate officials .. .. .	14	6.70
Fault of management .. .. .	12	5.64
<b>Total .. .. .</b>	<b>209</b>	<b>100.00</b>

It will be observed that with proper care a large proportion of the accidents might have been prevented.

\* The substance of the notification in these Provinces is reproduced in Appendix VIII.

† *Vide* Bengal and Assam Report for 1927, pages 55-56; B. and O. Report for 1927, pages 35-36; Bombay Report for 1927, pages 14-15; Madras Report for 1927, page 9.

The following is an abridged classification of fatal accidents which occurred during the last five years. The figures show the number of lives lost :—

Cause.	Period.						Per-centage.
	1923.	1924.	1925.	1926.	1927.	1923-27.	
Explosions and suffocation by gases.	87	2	4	7	10	110	8
Falls of roof and side ..	193	151	123	122	122	711	51.7
In shafts .. .. .	32	31	28	17	10	118	8.58
Explosives .. .. .	11	26	19	17	27	100	7.27
Haulage .. .. .	29	20	15	26	24	114	8.29
Miscellaneous underground	13	17	20	12	23	85	6.19
Surface .. .. .	19	29	22	25	29	124	9.02
Electricity .. .. .	3	5	2	1	2	13	0.95
Total .. .. .	387	281	233	227	247	1,375	100.00

The bulk of mine accidents in India, as in all mining countries, are due to falls of roof and side.\* The heavy death rate on account of explosions in 1923 was due to an accident which occurred on the 4th January, 1923, at the Parbelia Colliery of the Bengal Coal Company, in the district of Manbhum, Bihar and Orissa, in which alone 74 lives were lost. Measured by the death rate this accident was the most serious accident that has occurred in the history of mining in India. The committee which was appointed by the local government to enquire into the accident came to the conclusion that it was due to an explosion of coal dust caused by a faultily placed shot. The committee also drew attention to the fact that owing to the introduction of coal-cutting machinery, which produced dust in greater quantity and of finer consistency than the old system of hand-cutting, the danger of explosions had greatly increased in Indian mines and recommended that this danger should be systematically investigated by a representative committee. A committee, with the Chief Inspector of Mines as Chairman, was accordingly appointed by the Government of India in 1923 with the following terms of reference:—"To enquire into the danger of explosions of coal dust in Indian mines; to make experiments on different kinds of coal dust with a view to determine their liability to explode or otherwise; and to report what means, if any, are necessary or desirable to provide against the risk of coal dust explosions in Indian coal mines." The committee submitted its first report in 1924 and a second report in 1929, but its investigations have not yet been completed.

*Accident Prevention.—Use of Safety Posters.*—Progress in the prevention of accidents rests to a very large extent in the education of the worker in safety methods. Regulations and safety devices have done much to check the speedily rising accident rate in factories and mines, but the Indian worker requires protection against his own ignorance and carelessness, which is due to his inability to recognize the risk which he runs in industrial employment. Some of the larger employers of labour are now beginning to realize the importance of educating the worker to a sense of greater responsibility to himself and to his fellow workers. The Government of Madras have issued a rule requiring all factory owners to affix in conspicuous places in every room in which machinery is in use a notice, both in English and in the vernacular of the district, warning all operatives of what they should or should not do within the factory. Such notices cannot, however, achieve very much in India, where the vast majority of the operatives are illiterate. Safety posters, which have been tried with great success in America and Europe, are the only means of warning the illiterate worker against the particular actions which may endanger his life or the life of his fellow-workers. But it is not so easy to design safety posters which are both simple and arresting enough to penetrate the mental equipment of the average Indian operative. So far few employers in India have recognized the value of safety posters. They have been introduced in some of the railway workshops in Bombay, and the Chief Inspector of Factories, Bombay, reports that they have been so well received by the employees that they have been obtained and are being tried in other engineering shops in the province. The Millowners' Mutual Insurance Association has also now recognized the value of safety posters as an aid in the reduction of accidents and has undertaken the preparation of some posters for the textile industry. The posters which are now under preparation will illustrate the danger on carding machines at the front plate, either during or after the shifting

\* An interesting analysis of accidents in mines is given in an article on "Regulations for the prevention of Accidents in Indian Mines," by Mr. R. R. Simpson, M.Sc., Chief Inspector of Mines in India, in the Journal of Indian Industries and Labour, Vol. I, Part III, for August, 1921.

process, dangers at the under side of the lickers-in, dangers of wearing unsuitable clothing, and the danger from careless sweeping under ring frames. Safety posters showing the right and the wrong way to perform various mining operations with safety have also been introduced in some of the collieries, and the Report of the Chief Inspector of Mines in India indicates that mine-owners are to an increasing extent carrying on a "safety first" propaganda among their labour force. In other countries "safety committees," consisting of the management and the employees from the various departments, have been able to play an important part in checking the increase in the number of accidents by concentrating attention on all industrial risks. In India it is unfortunately not yet possible to secure the same degree of co-operation from the workers as in the west. Safety committees are, however, to be found in the railway workshops and from the report of the Chief Inspector of Factories, Bengal, it appears that an experiment is being made with such a committee in a jute mill in that province.

*First Aid and Medical Relief.*—Some of the local governments have framed rules requiring the provision, under the charge of responsible persons and in readily accessible positions, of first aid appliances containing an adequate number of sterilized dressings and some sterilized cotton wool in all factories employing 500 and more operatives. The legality of such rules is somewhat doubtful, but it may be stated that they have not been challenged in any of the five major and four minor provinces in which they have been in force during the last six years. Most of the factories are situated within easy reach of Government hospitals or hospitals maintained by local authorities, but many of the large and enlightened employers are already maintaining their own medical staff and equipment, which are readily available in case of accidents.

In Indian mines the mortality from injuries of a simple character is high, owing to the fact that in many cases the injured persons have to be carried long distances before they are able to obtain medical relief. The provision of "first aid" training is, therefore, of considerable importance. Rules have been framed by local governments under the Indian Mines Act of 1923, which require that in every mine in which 50 persons or more are employed underground, at least one person for every 100 persons employed underground shall be trained in ambulance work to the standard of St. John's First Aid Certificate. The rules also require mines which have been notified in this behalf by the local government under Section 18 of the Act to keep a suitably constructed stretcher and a sufficient supply of splints, bandages and other medical requirements. Classes in "first aid" are held both in the Jharia and the Raniganj coalfields. In 1927, such classes were held at 45 centres in the Jharia coalfield and at 14 centres in the Raniganj coalfield.

**Chapter IX.—Workmen's Compensation.**

*The Indian Workmen's Compensation Act, 1923.*—The increase in the number of accidents consequent on the growing industrialization of the country made it necessary for the Government of India to consider the possibility of introducing a system of workmen's compensation in India. The Indian Workmen's Compensation Act, which was passed in 1923 and came into force on the 1st July, 1924, was based on similar legislation in other countries, but it has certain distinctive features to suit the special conditions obtaining in India. The advisability of such a measure was generally recognized, but owing to the migratory habits of the Indian worker, the paucity of qualified medical men, the tendency to litigation which is strong even among the poorer classes, and the ignorance and illiteracy of the workmen, the introduction of a practicable system of workmen's compensation presented considerable difficulties. The Act was admittedly a tentative measure, and as stated by the Government of India in a letter addressed to local governments, "many of its features owe their origin more to a desire to minimize the difficulties attendant on the introduction of an entirely new measure of this kind than to any belief in their permanent value." It is not possible in this memorandum to describe in detail the provisions of the Indian Act, for which a reference is necessary to the Act itself. But it may be useful here to refer briefly to some of its more important features: these are dealt with under three heads, viz., the scope of the Act, the scale of compensation benefits, and administration.

(i) *Scope of the Act.*—The Act extends to the whole of British India, including British Baluchistan and the Sonthal Parganas. It was subsequently extended to the Shan States in Burma, Aden, the Military Cantonment of Bangalore and the Andaman Islands. The Act does not apply to all work in India, and as stated in the Statement of Objects and Reasons prefaced to the Bill on its introduction,

two criteria were followed in the determination of the classes to be included :—  
 (1) That the Bill should be confined to industries which are more or less organized ;  
 (2) that only workmen whose occupation is hazardous should be included.

Neither of these criteria can be said to be logically sound, but the inclusion of all classes of workmen would have rendered the administration of the Act impossible. As a first step, the object of the Government of India was to include only those workmen who are most affected by the increased risks of modern industry. The persons protected are those included within the definition of the term "workman" in Section 2 (1) (a) of the Act.

Casual labourers employed otherwise than for the purpose of the employers' trade or business are excluded from the scope of the Act. In all cases, excepting railway servants, persons employed on non-manual labour are excluded if their monthly wages exceed Rs. 300. For railway servants this limitation does not apply, provided they do not come under any of the other categories of workmen, e.g., persons employed in railway workshops or mines. The Act is not applicable to agricultural workers and workers in organized plantations nor to workers in small industrial establishments and in industries not making use of power of any kind. The Governor-General in Council is empowered to bring within the scope of the Act other classes of workmen whose occupations are of a hazardous nature. Several such classes have been added since the Act came into force, but no large extension of the scope of the Act is possible so long as the two criteria referred to above are maintained.

(ii) *Scale of Compensation Benefits.*—As stated by Dr. Downey, "the scale of compensation benefits is the crux of the compensation system."<sup>o</sup> The recommendation adopted by the Seventh International Labour Conference laid down that the minimum compensation should be two-thirds of the amount which the workman would have earned had he not been killed or incapacitated, and it is difficult to see how the workman or his family can, without hardship, do with less. In India, however, the agricultural connection of the industrial worker and the joint family system are of some avail to him in times of distress. The Act provides for the payment of compensation if personal injury is caused to a workman by accident arising out of and in the course of his employment, and also if the workman contracts certain occupational diseases mentioned in Section 3 (2) and in Schedule III while employed in the occupations specified therein. The compensation is based entirely on the earnings of the deceased or injured workman. The average monthly earnings are first calculated in accordance with Section 5, and these average monthly wages are then subject to what is called a table of "assumed wages" whereby meticulous calculations are avoided by a system of rounding. The scales of compensation laid down in the Act are as follows :—

(a) *Death.*—(i) For adults, 30 times the "assumed" monthly wages, with a maximum limit of Rs. 2,500 ; (ii) for minors (i.e., persons under the age of 15 years), Rs. 200.

(b) *Permanent Total Disablement.*—(i) For adults, 42 times the "assumed" monthly wages with a maximum limit of Rs. 3,500 ; (ii) for minors, 84 times the "assumed" monthly wages, with the same limit as for adults.

(c) *Permanent Partial Disablement.*—A proportion of the compensation payable for permanent total disablement calculated with reference to the reduction of earning power caused by the injury.

(d) *Temporary Disablement.*—After a waiting period of 10 days, for which no compensation is payable, an adult is entitled to a monthly compensation amounting to one-half of his monthly "assumed wages" subject to a maximum of Rs. 30, whereas a minor is entitled to two-thirds of his monthly "assumed wages" subject to the same maximum. In both cases the maximum period for which compensation is payable is five years. The Act also provides for the commutation of the recurring payments.

The scales of compensation in India are thus considerably below the minimum standard suggested in the recommendation of the International Labour Conference. The most striking feature of the Indian Act is the preference for lump sum payments as against recurring payments. This is due to the fact that industrial labour is recruited from distant areas and the payment of lump sums is administratively much more convenient than the payment of pensions. A waiting period of 10 days has been provided in the case of temporary disablement in order to exclude all cases

<sup>o</sup> Downey : *Workmen's Compensation*, page 35.

of trivial injury, which would give rise to administrative difficulties, and to minimize the risk of malingering. The question of the reduction of the waiting period or the adoption of the method known as "dating back" is being considered by the Government of India in consultation with local governments.\* The Act does not expressly provide for a minimum scale of compensation, but as the "assumed wages" of a workman cannot be less than Rs. 8, a minimum compensation is automatically provided for. The minimum is, however, probably inadequate and in the case of death it is only Rs. 240 for adults as against £200 in England.

(iii) *Administration*.—The Act is an "all-India" measure but its administration is entrusted to local governments. It is administered not by the ordinary civil courts but by special commissioners who are appointed by local governments. These officers are called upon to decide disputes and are empowered to suramon one or more expert assessors to help them if necessary. The right of appeal to the High Court against the decisions of the commissioners is severely limited. In introducing what is now the Workmen's Compensation Act, 1923, in the Legislative Assembly, the Honourable Mr. (now Sir) Charles Innes stated: "What we have tried to do is to frame a Bill under which men without any expert legal knowledge, the employer and the workman will be able to see for themselves whether in any particular case compensation is due, and if so, what the compensation amounts to." This desire to leave as few opportunities as possible for litigation has made the provisions of the Act somewhat rigid and has left very little discretion in the hands of those who are called upon to administer it. The liability to compensation, the amount of compensation and the persons to whom compensation is payable are determined by the law itself and cannot be varied by any tribunal. The commissioners for workmen's compensation are not authorized to take the initiative in securing for workmen what is due to them under the Act, and an application can only be made to them "if some question has arisen between the parties which they have been unable to settle by agreement,"† In the case of death, however, the employer must deposit the compensation with the commissioner who alone is authorized to distribute the amount among the dependants of the deceased workman. The Act further requires the employer in two cases to register with the commissioner an agreement with his workman for the payment of compensation. One is the case of the payment of any lump sum whether that sum is paid as compensation for permanent disablement or whether it represents the commuted value of half-monthly payments. The other is the case of the payment of any sum, whether a lump sum or a recurring payment to a person under a legal disability. In such cases the commissioner may refuse to register an agreement if he considers that the amount of compensation is inadequate or that the agreement was obtained by improper means. Finally, the Act requires employers to submit such returns as may be prescribed by the Government of India under Section 16.‡

*The Working of the Act*.—The Act has been in operation for nearly five years and, contrary to expectation, its administration has given rise to remarkably little difficulty. But the provisions of the Act are still unfamiliar to workmen in many areas, though each year of its operation has shown a distinct improvement in this respect. Statistics are not collected regarding all cases of compensation paid under the Act but the statistics available for the more important classes of workers, i.e., workers in factories, mines and docks and on railways and tramways, show that the total amount of compensation paid in 1927 in respect of these classes of workmen was over Rs. 11 lakhs, whereas in 1926 and in 1925 it was about Rs. 8½ lakhs and Rs. 6½ lakhs respectively. The total number of accidents among the same classes of workers which occurred in 1927 and which came within the purview of the Act was 15,216, as against 14,096 in 1926 and 11,371 in 1925. The number of applications filed before commissioners has also risen from 284 in 1925 to 554 in 1927. It is clear, however, that full use is not yet being made of the Act; in particular, the number of claims made in respect of minor disablements is still very far short of the number of possible claims. Even in the case of fatal accidents a number of dependants who could have preferred successful claims have failed to do so presumably on account of their ignorance of the law. In the Bengal Presidency no application for compensation was made by any colliery worker in 1925; in 1926 only seven applications were filed, while the number of those filed in 1927 was only four. In the engineering works in the same Presidency only a small proportion of the workers appear to be aware of the existence of the Act. In Burma no compensation has yet been paid for occupational disease, although it is known that cases of lead poisoning occur every year. A hopeful

\* *Vide* circular letter printed as Appendix IX.

† Section 22 (1) of the Act.

‡ Returns have been prescribed for certain classes of employees in Notification No. L.-1189, dated the 28th June, 1924, issued by the Government of India.

feature is the increasingly active part which labour organizations, particularly in Bombay and Bengal, are taking in furthering the claims of their members. A workmen's compensation aid society has been formed in Karachi, which is reported to be doing particularly useful work in this direction. The Act has so far given rise to remarkably little litigation. The number of contested cases before commissioners during 1927 was less than 300 and appeals against the orders of the commissioners have been rare. The experience which has been gained of the working of the Act does not confirm the fear which was expressed in certain quarters that it would lead to cases of deliberate self-mutilation on the part of workmen, with the object of obtaining compensation. No such case has come to notice and in regard to malingering the following statement made by Mr. W. J. Herridge, Manager, Calcutta Claims Bureau, is of some interest :—

" There is some malingering among the more severely injured workmen, but this to a certain extent is only natural. Such malingering, however, is what doctors call 'Traumatic Neurasthenia,' and is particularly noticeable in serious bone injury cases, especially in spine and pelvis fractures. The expression implied that the injured worker does not make any appreciable effort to get well until his case has been settled. When the claim is settled and the worker has received his lump sum compensation, he is relieved of much mental anxiety, and thus obtains that perfect and undisturbed bodily and mental rest without which recovery is well-nigh impossible. This is a very strong argument in favour of payment of lump sum compensation as opposed to weekly payments or pensions."

*Effect on industry.*—A compulsory system of workmen's compensation does enhance the cost of production, but not to any appreciable extent. Dr. Downey in his book on Workmen's Compensation\* estimates that a really adequate scale of compensation benefits, such as has never been established in the United States or elsewhere, would only add something like ten cents to the cost of a sixty dollar suit of clothes, thirty-five cents to the cost of a fourteen dollar ton of anthracite coal and two hundred dollars to the cost of a ten thousand dollar home. The effect of the Indian Act with its comparatively low scale of compensation benefits must therefore be almost negligible. Complaints have, however, been made by the coal industry, particularly by the owners of small coal mines, many of whom have been compelled to close down owing to the severe depression with which the industry has been faced. In dealing with these complaints the Indian Coal Committee, 1925,† observed as follows :—

" Frequent mention was made in the evidence before us of the effect of legislation in increasing costs. The requirements of the new Mines Act, the new Boiler Act and the Workmen's Compensation Act together with the higher standard demanded in such matters as housing, sanitation and water-supply have undoubtedly contributed their quota to the enhanced cost of raising coal, but even at the highest estimate the cumulative effect of these cannot in our opinion be placed at more than four annas per ton. The influence of legislation on costs is thus not comparable in importance with that of the increase in wages."

In Bihar and Orissa it is reported that some of the smaller coal mines have shown an increasing tendency to resist claims, and to deny their liability to pay compensation while the Report of the Chief Inspector of Mines refers to the fact that the proprietors of coal mines in the Jhelum district of the Punjab are not satisfied with the privileges enjoyed by the miners under the Workmen's Compensation Act, as some of them have had to pay as compensation on a single accident more than they could earn during a month.‡ An unexpected increase in the number of serious and fatal accidents may undoubtedly make a big hole in the profits of a concern, but the remedy for this lies in accident insurance, and this is particularly necessary in the case of small concerns which have not sufficient capital to meet possible claims under the Act.

*Insurance facilities.*—The handling of claims under the Act requires considerable attention to numerous details of procedure, and it is here that insurance companies with their specially trained staff can be of considerable help to the employer. Facilities for accident insurance are now being provided by a number of the leading insurance companies in the country, and the most important step has been the establishment of a Claims Bureau at Calcutta, Bombay and Madras. These bureaux, which are supported by practically all the leading insurance companies engaged in this particular line, have been set up with the main object of acting on behalf of their constituent companies in connection with the settlement of claims under Workmen's Compensation policies submitted to them for disposal. The works of the Calcutta

\* Op. cit., page 86.

† Paragraph 39 of the Report.

‡ Annual Report of the Chief Inspector of Mines in India for 1927, page 3.

Claims Bureau in particular has grown with great rapidity since it first came into being. In the first year of operation it handled a total of 1,900 claims; in the second year nearly 2,300; in the third 2,900 and in the fourth over 5,000. The provincial reports on the working of the Act indicate that insurance is widely resorted to by the employers in Bengal, Bombay and Madras. In Burma most of the larger employers of labour are also insured against the risk, but in other provinces accident insurance does not appear to have made much progress.

*Amendments.*—The Indian Workmen's Compensation Act has been twice amended, once in 1926 and again in 1929. The Amending Act of 1926 merely modified the provision relating to occupational diseases in order to bring it into conformity with a draft convention adopted by the International Labour Conference. The amendments made in 1929 related mostly to matters of detail, but the opportunity was also taken to make two important changes. The scope of the Act was extended to workmen employed upon a railway by a person fulfilling a contract with the railway administration, and proviso (c) to sub-section (1) of Section 3 which restricted the payment of compensation in the case of workmen employed in the construction, repair or demolition of a building or bridge only to cases of death and permanent total disablement was removed. The Amending Act of 1929 also incorporated the provisions of the notifications issued by the Governor-General in Council bringing within the scope of the Act certain classes of workers such as inspectors, mail guards, sorters or van peons in the Railway Mail Service, persons employed in connection with certain operations for winning natural petroleum or natural gas and persons employed in blasting operations. In regard to dock labourers, the Act was expanded so as to include all persons employed for the purpose of loading, unloading, fuelling, constructing, repairing, demolishing, cleaning or painting any ship. No attempt made to make any modification of the principles underlying the Act or of its more important features.

The Government of India have in their letter No. L.-1125, dated the 30th November, 1928,\* addressed local governments on the question of the further revision of the Act, but the replies of some of the local governments have not yet been received.

### Chapter X.—Hours of Work.

*Statutory limitation in factories.*—The Indian Factories Act prescribes a daily as well as weekly limit to the hours of work in factories and provides for rest intervals and for a weekly holiday. The hours of work of adults in factories are limited to eleven † in any one day and to sixty‡ in any one week. Section 21 of the Act provides for a rest period of at least one hour at intervals not exceeding six hours or at the request of the employees concerned two rest periods of half an hour each, at intervals not exceeding five hours. With the previous sanction of the local government and at the request of the employees concerned the rest interval may also be reduced to half an hour for each male person provided that they are not employed for more than eight and a half hours on each working day, and are not required to work for more than five hours continuously. Section 22 of the Act provides for a weekly holiday on Sundays or on any other day of the week, provided that no person is allowed to work continuously for more than 10 days without a holiday for a whole day. For children the daily hours are limited to six, and a rest period of half an hour is obligatory if their daily hours of work exceed five-and-a-half hours. The rest period, where necessary, must be so fixed that no child is required to work continuously for more than four hours. The Act further prohibits the employment of women and children for a period of 10½ hours during the night. No child can be employed in more than one factory on the same day, but adults may be so employed in such circumstances as may be prescribed by the local government.§ The Governments of Madras, Bombay, the United Provinces, the Punjab and the Central Provinces are the only local governments which have prescribed the circumstances under which adults may be employed in more than one factory on the same day. The rules framed by these local governments invest the Inspector of Factories with the power to sanction such employment if he is satisfied that the adults concerned are not employed for more than 10 hours on any one day, and that they receive the weekly holiday prescribed by section 22 of the Act. ¶

In order to maintain a check over hours of work, etc., the Act provides that the manager of a factory shall fix specified hours for the employment of each person employed in his factory, and that no person shall be employed except during such hours.† A register has also to be maintained of all persons employed in a factory

\* Appendix IX. † Section 28. ‡ Section 27. § Section 25. \*\* Section 26 of the Indian Factories Act.

in the form prescribed by the local government showing their hours of work and the nature of their respective employment. The local government can exempt, by notification, any factory or class of factories from this requirement of the law in the case of adults only, if it is satisfied that no contravention of the provisions of the Act regarding hours of employment and holidays is possible. The Inspector of Factories can also, by an order in writing, allow a factory to maintain a muster roll or any other register in lieu of the register prescribed by the local government if he is satisfied that such muster roll or register gives the necessary particulars.\*

*Hours, intervals and holidays in Indian factories.*—Statement V of the statistics of factories, which is published annually by the Government of India, gives the information available in regard to hours of work, holidays and rest intervals in factories. The percentage of factories in India maintaining a week of 48 hours for men was 27 in 1927. In 14 per cent. more factories the men employed worked for 54 hours or less. The percentage of factories working more than 54 hours a week was 59. For women the corresponding percentages were 31, 13 and 56. Children were employed in 1,564 factories in 1927. In 563 or 36 per cent. of the factories the children employed were worked for 30 hours a week or less, but in the remainder they were worked up to the maximum limit permissible under the Act, *i.e.*, 36 hours a week. The statistics of factories do not show the hours of work in particular industries. From the figures given in the Report of the Chief Inspector of Factories, Bombay, it appears that in the cotton factories in Bombay, Ahmedabad and Sholapur the normal hours of work for men and women are the maximum prescribed by the Act, whereas the normal hours for children do not exceed 30 in a week except in Bombay District, where there are very few children employed in the cotton mills. In the jute mills of Bengal in which a system of multiple-shifts has been in force, the hours of work are from 5.30 a.m. to 7 p.m. The working of the multiple-shift system in these mills will be seen from the diagram,† which shows the time when each shift is at work, and also the total daily hours of work. The daily hours of work of each of these general shifts are 8½, 9½ and 9 respectively; for piece-workers the daily hours of work are generally 11, and for children 6. In 1922 the jute mills under the Indian Jute Mills Association arrived at an agreement whereby each mill undertook not to work more than 13½ hours a day for 4 days in the week, *i.e.*, a total of 54 hours in the week. In the case of the mills which had adopted the single-shift system it was agreed that the working hours would be 11 hours a day for 4 days of the week and 10 hours on the fifth day, *i.e.*, a total of 54 hours a week. This agreement remained in force till the 1st July, 1929, from which date the Association has decided to introduce a 60-hour week in all jute mills under its control. The change to a 60-hour week may result in the abandonment of the complicated multiple-shift system under which it is exceedingly difficult for the Inspector of Factories to exercise effective control over the hours of work. But the operatives are opposed to the change, as they fear that it will throw some of them out of employment, while the remainder will not secure an increase in wages proportionate to the increase in their hours of work. In the tea factories in Assam and Bengal the hours of work for adults are reported to be generally in the neighbourhood of 48 in a week. In 1927 in no less than 3,704, out of a total of 7,515 factories in British India, holidays were granted on one or more weekdays in addition to Sundays. The number of factories in which a rest period of one full hour was granted on each working-day was 5,299. In 768 more factories the rest period was split into two intervals of half an hour each, while the number of factories in which the rest period was reduced to half an hour in accordance with the proviso to Section 21 (1) (a) of the Act was only 38.

*Exempting provisions of the Indian Factories Act.*—The provisions of the Act relating to hours of employment and holidays do not apply to persons who are defined by the rules made by local governments under the Act, as persons holding positions of supervision or management or to persons employed in a confidential capacity. The rules made by local governments provide that the following persons shall be deemed to hold positions of supervision and management:—(1) the manager of a factory; (2) assistant managers; (3) any other person who, in the opinion of the Inspector of Factories, holds the position of supervision and management. Bombay, Bengal and the United Provinces give a more detailed list, and the Bombay Government further lays down that all clerks, accountants and timekeepers shall be deemed to be employed in a confidential capacity. In such circumstances and subject to such conditions as may be prescribed by local governments, the provisions contained in sections 21, 22, 27 and 28 of the Indian Factories Act do not apply to

\* Section 35 of the Indian Factories Act.

† Not reproduced here. The diagram is given in the Memorandum of the Indian Jute Mills Association, Bengal. Vol. V, Part I, page 296.

work on urgent repairs. The further exemptions which may be granted by local governments from certain of the provisions of the Act are shown in the following statement :—

Serial No.	Nature of work, class of factory, class of workers, or circumstances in which exemptions may be granted.	Provisions of the Act from which exemptions may be granted.
1	Preparatory or complementary work— Section 30 (1) (a)	Section 21 (rest interval). Section 27 (limitation of working hours per week). Section 28 (limitation of working hours per day).
2	Essentially intermittent work— Section 30 (1) (b).	Section 21 (rest interval). Section 22 (weekly holiday). Section 26 (fixation of hours of employment). Section 27 (limitation of working hours per week). Section 28 (limitation of working hours per day).
3	Work requiring continuous production for technical reasons— Section 30 (1) (c).	Section 21 (rest interval). Section 22 (weekly holiday). Section 28 (limitation of working hours per day).
4	Factories supplying public with articles of prime necessity— Section 30 (1) (d).	Section 22 (weekly holiday).
5	Seasonal factories— Section 30 (1) (e) (i).	Section 22 (weekly holiday).
6	Factories which can only work at times dependent on the irregular action of natural forces— Section 30 (1) (e) (ii).	Section 22 (weekly holiday). Section 26 (fixation of hours of employment).
7	Exceptional press of work— Section 30 (2).	Section 21 (rest interval). Section 22 (weekly holiday). Section 27 (limitation of working hours per week). Section 28 (limitation of working hours per day).
8	Tea, indigo and coffee factories— Section 32.	Section 21 (rest interval). Section 22 (weekly holiday).
9	Persons employed in an engine-room or boiler-house of a factory— Section 32A (a).	Section 22 (weekly holiday).
10	Fish-curing or fish canning factory— Section 32A (b).	Section 24 (a) (employment of women in the night).

It will be observed that exemptions can only be granted from the provisions of Sections 21, 22, 24 (a), 26, 27 and 28 of the Act. No exemption can be granted from the provision of the Act relating to the employment of children in the night (Section 23 (b)), nor can any woman or child be permitted to be employed for more than eleven hours\* or six hours† respectively. Except in the case of item 7 in the statement, the power vested in local governments to grant exemptions is subject to the control of the Governor-General in Council. The local government may also impose such conditions as it may consider necessary before granting any exemption. In the case of items 1, 2, and 7, the Act further provides‡ that where the hours worked exceed 60 a week the payment for overtime shall be at least one and a quarter times the normal rate.

\* Section 24 (b) of the Act.

† Section 23 (c) of the Act.

‡ Section 31 of the Act.

*Exemptions in Factories.*—The total number of factories under the Indian Factories Act was 7,515 in 1927, and the number of factories in which the majority of the operatives were exempted from the various provisions of the Act is shown below :—

Section of Act from which exemption was granted.	Number of factories.
Section 21 (rest interval) .. .. .	1,440
Section 22 (weekly holiday) .. .. .	1,883
Section 26 (fixation of hours of employment) .. .. .	896
Section 27 (limitation of working hours per week) .. .. .	385
Section 28 (limitation of working hours per day) .. .. .	236

Only in one factory in India situated in the Madras Presidency was it necessary to grant an exemption from the provisions of Section 24 (a) of the Act.

The exemptions granted by local governments under the Indian Factories Act may for convenience be divided into two classes, general exemptions and special exemptions. The former consists of exemptions which are of a general nature and applicable to a specified class of work or a specified class of workers without reference to the class of factory in which the work may be carried on or in which the workers may be employed; the latter consists of exemptions which are granted in favour of a particular industry or a particular class of factories or in favour of a specified class of work or a specified class of workers in a particular industry or a particular class of factories. In the Punjab and the Central Provinces no exemptions of a general nature have been granted, but in all the other provinces the exemptions are both general and special. The nature of the exemptions under both these classes, the conditions under which they are granted and their scope are shown in Appendix X and Appendix XI.\* It will be observed that the procedure followed in the different provinces is by no means uniform. For instance, the work of boiler attendants and engine drivers is treated as preparatory or complementary work (Section 30 (1) (a)) in some provinces, whilst in others it is treated as essentially intermittent (Section 30 (1) (b)) or as work which necessitates continuous production for technical reasons (Section 30 (1) (c)). Further, the scope of the exemptions differs from province to province, as also the conditions under which they are granted. Thus, breweries in Madras are exempted only from the provisions of Section 22 and in Bihar and Orissa from the provisions of Sections 21 and 22, while in the United Provinces and the Punjab they are further exempted from the provisions of Section 28.

The exception provided for in Section 30 (3) of the Act in regard to work on urgent repairs applies only in such circumstances as may be prescribed by the local government. In Bombay, the Punjab and the Central Provinces no such circumstances have been notified, and the exception provided for by Section 30 (3) of the Act is not applicable in these provinces. The circumstances and conditions prescribed in the other provinces vary to some extent. In the United Provinces the exception is restricted to adults, whereas in Bengal it is still further restricted to men only. In Madras, Burma, Bihar and Orissa and Assam no such restriction is imposed. In Madras the operatives cannot be worked for more than 18 hours a day on three consecutive days or for more than 80 hours in any period of seven days. In Bengal the average weekly hours in any one month are restricted to 60, whilst in Assam they are restricted to 66. In the United Provinces the average weekly hours of an operative employed on urgent repairs in any period of four weeks are not to exceed 66. In Madras, Bengal and Assam no condition is prescribed with regard to the rest interval, but the Government of Burma have insisted on an interval of one hour for every ten hours of work, while the Government of Bihar and Orissa require an interval of one hour to be given before the ninth hour of work commences. The Government of the United Provinces provide that a rest interval of one hour shall be given during the day "as work permits." The Governments of Bengal, United Provinces, Burma, Bihar and Orissa and Assam also provide specifically for fortnightly holidays for the operatives employed on urgent repairs.

In the case of other exemptions the general practice in all provinces is to insist on a holiday at least once a fortnight wherever an exemption is granted from the provisions of Section 22 of the Act. Three provinces (*viz.*, the United Provinces, the Punjab and the Central Provinces) have framed a rule under the Act which provides that in the case of every exemption from Section 22 of the Act provision shall be made for compensatory periods of rest. The rules framed by all local

\* Not printed. Particulars are given in the Local Government's memoranda.

Governments, excluding Madras and Burma, also prescribe an overtime limit for all exemptions from the provisions of sections 27 and 28 which are granted under section 30 (1) and (2) of the Act. The limits prescribed in the case of men are shown below:—

	Maximum daily hours including overtime.	Maximum weekly hours including overtime.	Maximum hours of overtime in the month.
Bombay and the Central Provinces .. .. .	..	72	..
Bengal .. .. .	..	..	40
The U.P., Punjab, B. and O., and Assam .. .. .	12	..	..

In the case of women, all the local Governments except Madras have framed rules to secure that no woman is worked overtime for more than six hours a week. In Madras rules were originally framed prescribing overtime limits for men and women, but these rules were recently cancelled by the local Government on the advice of the Advocate-General, Madras, who expressed the opinion that they were not strictly in conformity with the provisions of the Indian Factories Act, inasmuch as the Act requires local Governments to prescribe the conditions under which exemptions are granted in the notifications sanctioning the exemptions and not by means of rules framed under the Act. In this connection, it may be pointed out that the Washington Hours of Work Convention, which has been ratified by India, provides that the competent authority shall fix by regulations the limits of overtime that may be worked in exceptions made from the normal hours of work.\*

When the Indian Factories (Amendment) Act, XXVI of 1926, came into force the Government of India suggested certain broad principles for the guidance of local Governments in granting exemptions. In view of the important amendment made in section 21 of the Act, which made it possible in certain circumstances to reduce the rest interval from one hour to half an hour, the Government of India hoped that it would be possible for local Governments to withdraw a number of exemptions from the provisions of that section. Where exemptions were absolutely necessary, it was suggested that care should be taken to ensure that the operatives so exempted were not required to work continuously for unnecessarily long periods, and that when idle intervals were not a necessary concomitant of their work, the conditions laid down by local Governments should secure for them, in as many cases as possible, compensatory periods of rest. With regard to exemptions from the provisions of section 22 of the principal Act, the Government of India drew attention to the necessity of the strict fulfilment of the Draft Convention relating to the weekly rest day, adopted by the Third International Labour Conference. They also pointed out that section 22 and section 27 were the most important provisions of the Act relating to hours of work and that as few operatives as possible should be exempted from the operation of these sections. Local Governments have since been engaged in reviewing the exemptions granted by them and the revisions so far made indicate that where the existing exemptions have not been withdrawn, suitable conditions have been imposed to secure, as far as possible, compensatory benefits for the employees.

*Hours of Work in Mines.*—The first attempt to regulate the hours of work in mines was made in 1923 as a result of the Hours of Work Convention which was adopted by the Washington Conference in 1919. The Indian Mines Act of 1923 provides that no person shall be employed in a mine for more than 60 hours in any one week, if he works above ground, or for more than 54 hours in any one week if he works below ground. The Act also provides for a weekly holiday but does not specify any particular day for the purpose. In every mine a register has to be maintained of all persons employed in the mine, of their hours of work, of their days of rest, and of the nature of their respective employments. The Indian Mines Act of 1923 did not impose any limit on the hours during which any person may be employed in a mine on any one day. A proposal to impose such a limit was made in the Legislative Assembly when the Bill was under consideration but was rejected. The opposition to this proposal was based on the ground that the miners prefer to work long hours on certain days of the week and to return to their homes in the village for the rest of the week, and that they would resist any attempt to impose a shorter working day which would necessitate their having to work for more days in the week. The Government of India, however, gave an undertaking at the time that they would examine, in consultation with local Governments, the question of the introduction of a compulsory system of shifts. Local Governments were accordingly addressed on the subject in June, 1923, and a suggestion was made to them that, to begin with, the day might be divided into two shifts of 12 hours each. It was pointed out that as the workers in the mines became accustomed to the

\* Article 6 of the Washington Hours of Work Convention.

stricter regulation of hours the time would come when a shorter working day, with definite rest intervals, might be imposed. The suggestion made by the Government of India, though opposed by the Indian Mining Association and the Indian Mining Federation, met with the approval of the local Governments concerned. In March, 1927, a Bill to amend the Indian Mines Act was introduced in the Legislative Assembly. The main purpose of this Bill was to enforce more regular working hours and to prevent miners from spending unduly long hours underground. The Bill sought to prohibit the employment of any person in a mine for more than 12 hours in any consecutive period of 24 hours, and to make it compulsory for mineowners working their mines for more than 12 hours in any day to adopt a system of shifts so arranged that not more than one shift of persons employed in work of the same kind shall be at work in the mine at the same time. The Bill, on being circulated, met with no serious opposition and was passed by both Chambers of the Legislature in 1928. It was considered necessary to allow mineowners a period of grace in order to enable them to make the necessary adjustments in their mines and the main provisions of the amending Act do not therefore come into force until the 7th April, 1930. A proposal was made in the Select Committee and in the Legislative Assembly for the introduction of a compulsory 8-hour day in mines but was rejected. The Select Committee, however, expressed the view that the eight hours' shift should be gradually worked up to in Indian mines and it accordingly recommended that Government should re-examine the position in this respect after the Bill has been in force for a period of three years. Some mines have already introduced an eight hour shift and although the daily hours may be excessive in mines which do not work under a system of shifts, it will be seen from the table printed on pages 88 and 89 of the Report of the Chief Inspector of Mines for 1927 that the average hours worked in a week in the major coalfields do not exceed 48 in the case of underground workers and 52 in the case of surface workers.

*Exempting Provisions and the Use made of Them in Mines.*—As in the Indian Factories Act, the provisions in the Indian Mines Act relating to hours of employment\* do not apply to persons who may by rules be defined to be persons holding positions of supervision or management or employed in a confidential capacity. Under section 46 of the Act, the Governor-General in Council is empowered to exempt any local area or any mine or group or class of mines or any part of a mine or any class of persons from the operation of all or any specified provisions of the Act. The exemptions† granted by the Governor-General in Council are as under:—

Exempted from all the provisions of the Act:—

1. Mines of *kanhar, murum, laterite, gravel, sand, clay* (not including kaolin, china clay, or white clay), fire clay, ochre, stone, earth, fuller's earth, bauxite, slate, and lime-stone:

Provided that the depth of the excavation measured from the level of the adjacent ground nowhere exceeds 20 feet and that not more than 50 persons are employed at any one time in or about the mine: Provided further that this exemption shall not apply to:—(a) Slate mines in the province of the Punjab and in the Monghyr district of the province of Bihar and Orissa. (b) Limestone mines in the districts of Shahabad and Jubbulpore. (c) The Danapahari fire-clay mine situate in Bonjamuri village in the Asansol sub-division of the Burdwan district.

2. Borings and oil wells.
3. Mines or parts of mines in which excavation is being carried out for prospecting purposes only and not for the purpose of obtaining minerals for use or sale:

Provided that—

- (i) not more than 20 persons are employed in or about such excavation;
  - (ii) no part of the excavation extends beneath the superjacent ground; and
  - (iii) the depth of the excavation measured from the level of the adjacent ground nowhere exceeds 20 feet or, in the case of an excavation for coal, 50 feet.
4. Iron-ore mines worked without mechanical power, the whole of the ore from which is supplied locally to village smelters and blacksmiths.
  5. In the North-West Frontier Province:—
    - (i) Salt mines in the Kohat district.
    - (ii) Carbonaceous clay pits in the Hazara district.

\* Section 23.

† The provisions of the notification are printed in a slightly abridged form.

6. In the Province of Burma :—
- (i) Steatite mines in the Kyaukpyu, Chin Hills, and Minbu Districts and the Pakokku Hill Tracts and native precious stone mines in the Katha district.
  - (iii) The ore-dressing plant of the Burma Corporation, Limited, at Namtu, Northern Shan States.
7. In the Province of Bihar and Orissa :—
- Five specified coke factories.
  - (vi) Open excavations for coal in the Rajmahal coalfields in the district of the Santhal Parganas, provided that not more than 20 persons are employed in or about the mine at any one time.
8. In the United Provinces :—
- Certain specified stone quarries in the Mirzapur district.
9. In the Presidency of Bombay :—
- (i) Kharkhada stone quarry in the Kaira district.

Exempted from the provisions contained in sections 23 and 28 :—

All mines in the Federated Shan States, and such mines in the Tavoy and Mergui districts as are worked under the tribute system.

The exemptions are from all the provisions of the Act, except in the case of the mines in the Federated Shan States and in the Tavoy and Mergui districts worked under the "tribute" system, where it is necessary to grant exemptions only from the provisions of sections 23 and 28 of the Act. In these mines the management deal only with the "tributaries" who are paid for the quantity of ore which they produce. The "tribute" workers come with their "tributary" and work in the mine whenever they please. They are paid by the "tributary" and the management exercise no control whatsoever over them.

Section 46 of the Indian Mines Act also confers a similar power on local Governments but this power can only be exercised on the occurrence of a public emergency. In addition, the Act authorizes the manager of a mine to employ persons for longer hours than is permissible under the Act in case of an emergency involving serious risk to the safety of the mine or of persons employed therein, but on each occasion in which this power is exercised by the manager a record of the fact must be made immediately and shown to the Chief Inspector or the Inspector of Mines at his next inspection of the mine.

#### Chapter XL.—Women and Children in Factories and Mines.

*Employment of Children in Factories.*—The revision of the Indian Factories Act in 1922 raised the minimum age of children from nine to twelve and the maximum age from fourteen to fifteen. No child can be employed in a factory unless he is in possession of a certificate granted by a certifying surgeon showing that he is not less than twelve years of age and is fit for employment in a factory and while at work carries either the certificate itself or a token giving reference to such certificate. A child cannot also be employed during a period of ten and a-half hours during the night and his hours of work are limited to six in any one day.

The number of children employed in factories during the years 1921-27 is shown in the following table :—

Year.	Boys.	Girls.	Total.
1921	56,926	11,187	68,113
1922	56,552	11,106	67,658
1923	61,841	12,779	74,620
1924	60,240	12,291	72,531
1925	57,199	11,526	68,725
1926	50,015	10,079	60,094
1927	40,028	9,534	49,562

The decrease since 1921 in the number of children employed in factories has been a little over 27 per cent. whilst the total factory population has risen during the period from 1,266,395 to 1,533,382, i.e., an increase of 21 per cent., and the total number of factories has increased from 4,059 to 7,515, i.e., by 85 per cent. The reduction in the number of children would have been considerably greater but for the fact that the revision in 1922 also brought within the scope of the Indian Factories Act a number of seasonal factories which employ a larger percentage of children than perennial factories. Thus the large increase in the number of children in 1923 is explained by the fact that the tea factories in Assam employing no less than 11,000 children were now brought within the scope of the Act.\* Further, the amendmen

\* Cf. Section 3 (1) (d) of the old Act.

of the Act in 1922 did not apply to children who were lawfully employed in a factory on or before the 1st July, 1921\*, and it was not until 1924 that full effect was given to the new age restrictions for children. The effect which the amendment of the Act in 1922 had on the employment of children is seen more clearly from the following table which gives the number of children employed in jute mills and in cotton spinning and weaving mills during the years 1921-27:—

Year.	No. of children employed in jute mills.	No. of children employed in cotton mills.
1921 .. .. .	29,372	23,828
1922 .. .. .	24,428	20,451
1923 .. .. .	28,612	18,087
1924 .. .. .	28,046	16,111
1925 .. .. .	26,671	14,140
1926 .. .. .	21,212	12,830
1927 .. .. .	19,803	12,128

According to the Chief Inspector of Factories, the reduction in recent years of the number of children employed in jute mills is due principally to the gradual introduction of the single shift system in place of the multiple shift system, to which reference has been made in an earlier chapter. The credit for the large reductions in the number of children employed in textile mills must be given to the strictness of inspection and to the increasing efficiency of the arrangements for the certification of children which have, to a large extent, reduced the possibility of the employment of children in two mills on the same day.

The double employment of children in factories was an abuse which it was by no means easy to check particularly in Ahmedabad where it was associated with the system of recruitment known as the *sathi* system. Under this system children are brought from the villages to work in mills under an agreement whereby they are maintained by others who take in return the wages earned by them. An enquiry which was made in 1925 by the Inspector of Factories and the Certifying Surgeon showed, however, that only a very small percentage of the children employed in factories were not living with their parents or relatives. The *sathi* system was not therefore the main cause of the double employment of children at Ahmedabad. In order to strengthen the hands of the Inspectors of Factories in stamping out this abuse, a section† was added to the Indian Factories Act by the Amending Act of 1926 providing for the punishment of parents and guardians who allowed children to be employed in two mills on the same day. Eleven convictions, all in Ahmedabad, were obtained under this new section in 1926 and the Chief Inspector of Factories, Bombay, reports that these prosecutions had a beneficial result and that no such cases were detected in the following year.

The Indian Factories Act does not prohibit the admission in factories of children who cannot by reason of their age be lawfully employed therein, but if a child over the age of six years is found inside any part of a factory in which children are employed, the onus of proving that such a child was not actually employed in the factory is thrown on the employer.‡ The Inspectors of Factories are also empowered to prohibit the presence or children below the age of twelve years inside any part of a factory where any risk is involved to their health or safety.§

*Employment of Women.*—The number of women employed in factories during the years 1921-27 is shown in the following table:—

Year.	Number of women employed.
1921 .. .. .	187,596
1922 .. .. .	206,887
1923 .. .. .	221,045
1924 .. .. .	235,332
1925 .. .. .	247,514
1926 .. .. .	249,669
1927 .. .. .	253,158

There has been a steady increase in the number of women employed in factories and the rate of increase has been even greater than that of the total factory population. The number of women employed in factories in 1927 was 35 per cent. higher

\* Section 14 (3) of Act II of 1922.

† Section 44A of the Indian Factories Act.

‡ Section 46 of the Indian Factories Act.

§ Section 19A of the Indian Factories Act.

than in 1921, whereas during the same period the total factory population rose by 21 per cent. only. The large increase in the employment of women is due partly to the restrictions imposed on the employment of children and partly to the inclusion within the scope of the Act in 1922 of quasi-agricultural factories (e.g., in tea gardens which are dependent on woman labour to a larger extent than other factories).

An important change that the revision of 1922 made in regard to the employment of women was the repeal of the provision\* of the 1911 Act which permitted the employment of women at night in ginning factories. In view of this amendment, the Government of India considered that they were in a position to ratify the Convention concerning the employment of women during the night adopted by the Washington Conference in 1919 without undertaking any further legislation. But the Indian Factories Act secures a night period of rest of only ten and a-half hours as against eleven hours provided for by Article 3 of the Convention. At the time of ratification it was thought that, though the Indian Factories Act was not in strict conformity with the Convention, advantage could be taken of the provisions of Article 7 which allows a shorter period of rest during the night in countries where the climate renders work by day particularly trying to the health of the operatives, provided compensatory rest is accorded during the day. But Article 7 of the Convention has not been formally applied to any part of India and the Government of India were under the impression that in practice a rest period of full eleven hours, as required by the Convention, was being secured for women operatives. Recently, however, it has come to notice that this is not the case in the jute mills in Bengal which were working under the multiple shift system. As will be seen from the diagram,† some of the shifts in which women are employed, commence work at 5.30 a.m. and are not free till 7 p.m.; the night interval in their case being thus reduced to 10½ hours only. On an enquiry made from the local Government, it was discovered that about 80 per cent. of the women employed in the jute mills are given the shorter period of rest during the night. The Indian Jute Mills Association, whose attention was drawn to the matter, represented that the existing arrangements in the jute mills were "in the best interests of the workers themselves" and that there was no contravention of the Convention concerning the employment of women during the night, as Article 7 of that Convention was particularly applicable to Bengal. The local Government did not, however, agree that the shorter rest period during the night was in the best interests of the women concerned and pointed out that the mills were not closed during the hottest part of the day. A similar difficulty has arisen in connection with the Convention concerning the night work of young persons which has also been ratified by the Government of India. The Committee appointed by the Conference in 1929 to examine the summary of the reports submitted under Article 408 of the Treaty of Versailles pointed out in regard to this Convention that in India "the eleven-hour night rest period did not appear to be expressly secured by legislation and it would be useful to know whether it is secured in practice." From the diagram† it is clear that in jute mills working under the multiple shift system children employed on one of the shifts are actually given a shorter period of rest during the night than is provided for by the Convention.

*Use made of Section 2 (3) (b) of the Indian Factories Act.*—Section 2 (3) (b) of the Indian Factories Act was inserted in 1922 mainly to protect children employed in factories which would not, except for their notification by the local Government, come within the scope of the Act. In 1922 only one factory situated in the United Provinces was notified by the local Government, but the number has been increasing steadily, as shown below :—

Year.	No. of factories notified.
1923 .. .. .	11
1924 .. .. .	60
1925 .. .. .	100
1926 .. .. .	122
1927 .. .. .	160

The power vested in local Governments by this sub-section has been utilized in all provinces except Burma. In 1924 the Government of the Central Provinces discovered that small ginning factories were being constructed in the province with a view to escape the restrictions imposed by the Indian Factories Act, but these

\* Section 27 of Act XII of 1911.

† Not printed: the diagram is reproduced in the memorandum of the Indian Jute Mills Association.

factories were promptly notified by the local Government. In Bombay the local Government have notified small match factories where children of tender years were being employed in large numbers under dangerous conditions. In Bihar and Orissa the local Government have notified some saw mills employing less than 20 persons which were in a dangerously unfenced condition. In Burma the Report of the Chief Inspector of Factories indicates that there are a number of rice mills and saw mills employing less than 20 persons in which the machinery is not properly fenced. The question of the notification of such factories has been under the consideration of the local Government for some time.

In one important instance a local Government has not considered it advisable to make use of this provision of the Act for the protection of children employed in factories which do not automatically come within the scope of the Indian Factories Act. In 1927 it came to the notice of the Government of India that children of tender age were being worked for unduly long hours in the carpet factories at Amritsar, which are outside the scope of the Act as they do not use any mechanical power. The attention of the Government of the Punjab was drawn to the matter and the suggestion was made that the factories might be notified under section 2 (3) (b) of the Act. The local Government pointed out, however, that the question of notification had been considered in 1924 but the conclusion reached was that no useful purpose would be served by bringing these carpet factories within the scope of the Indian Factories Act. The carpet factory owners at Amritsar do not employ children, but pay the master-weavers a fixed sum for work done by measurement. The children in the factories are employed by the master-weavers and are paid by them. In the opinion of the local Government any attempt to bring the carpet factories within the scope of the Factories Act would lead to the erection of single looms in the homes of the workers where the children would be employed under infinitely worse conditions than those prevailing in the factories. The local Government, however, exerted its influence privately with the carpet factory owners and the master-weavers in order to secure an improvement in the conditions in which children were employed in such factories. As a result, the carpet factory owners agreed to the immediate exclusion of children under eight years of age from their factories, and to the appointment of a qualified medical practitioner who in addition to looking after the health of the children would be required to certify the age of each child employed in carpet factories. A higher minimum age for children was not acceptable to the industry because it was argued that, unless boys are employed on this work from their childhood, they would not be able to learn the art. In regard to the working hours of children nothing could be done by the local Government on account of the opposition of the master-weavers, who maintained that a reduction in the hours of employment would make it impossible for them to get the work done on the terms fixed by the carpet factory owners. The number of children under 12 years of age employed in the carpet factories at Amritsar as reported to the local Government is about 500, which represents 23 per cent. of the total number of operatives employed therein, and the hours of work, according to the Inspector of Factories, are from sunrise to sunset with a break of an hour at midday in the winter and two to three hours in the summer. The Government of India were unable to acquiesce in the continuance of the existing conditions and they pointed out to the local Government that the existence of more or less similar conditions in the carpet factories in Persia had led to the intervention of the International Labour Office, with the result that orders were issued by the Persian Government to the carpet manufacturers in Kerman, which is one of the principal seats of the carpet industry in Persia, whereby an eight-hour day was enforced and the employment of children under 10 was prohibited. The local Government was accordingly asked to consider the lines on which legislation might be undertaken to secure adequate control over the conditions of employment of children in carpet factories. The Government of the Punjab pointed out in reply that there were carpet weaving factories in Agra, Mirzapur, and in the Indian States and if the proposed legislation were applied to the Punjab alone it would place the Amritsar industry at a distinct disadvantage and would drive most of the labour from Amritsar to other places in India to the ruin of the Amritsar industry. An enquiry has been addressed to the Government of the United Provinces regarding the conditions under which children are employed in the carpet factories situated within the province and the reply of the local Government is being awaited before any further action is taken by the Government of India.

*Control over the System of Shifts in Factories.*—After the revision of the Indian Factories Act in 1922, the Government of Bengal suggested that a further amendment should be made which would enable the local Government to regulate the working of shifts in the case of any class of factories or in any area. The necessity for this control arose out of the difficulty which had been experienced by the local Government in enforcing the provisions of the Indian Factories Act relating to the employment of children in the jute mills which were working under a system of

multiple shifts. The proposal was supported by the Conference of the Chief Inspectors of Factories which was held in 1924, but the Government of Bengal subsequently decided not to press for the amendment until they had satisfied themselves that effective control over the working hours of children could not be exercised by means of a special employment register which they had recently prescribed for jute mills under Section 35 of the Act. The proposal for the control of shifts in factories was accordingly excluded from the Amending Bill which was passed in 1926. The local government have since reported that the special employment register in jute mills has failed to achieve its object, but the Government of India are awaiting a further communication from the local government on the subject.

*Prohibition of the Employment of Children in Mines.*—In the Mines Bill, which was introduced in the Indian Legislature in September, 1922, a provision was included prohibiting the employment of children (a child being defined as a person under the age of 13 years) in mines and also prohibiting their presence underground in mines. When the Bill was framed it was not considered practicable, owing to the floating nature of the labour population, to insist on each person employed in a mine having a certificate of age, but a provision was inserted which would empower local governments to prescribe a certification system in cases where they consider this to be practicable. In case of dispute between the inspecting staff and the management of a mine as to the age of a child, the Bill provided that the matter was to be referred to a qualified medical practitioner whose decision was to be conclusive evidence as to the age of the child. In the Joint Committee of the Indian Legislature, to which the Bill was referred, proposals were made for raising the maximum age of a child to 14 and even 15, but without success, and the provisions in the Bill relating to the employment of children were passed by the Legislature without any modification.

The Indian Mines Act of 1923 came into force on 1st July, 1924, but both in 1924 and 1925 children continued to be employed in a number of mines. This was due to a misunderstanding of the provisions of the Act on the part of the managers of mines,\* which was promptly removed by the Chief Inspector of Mines. So far, criminal proceedings have been instituted in three cases only, all of which ended in convictions. Instances have occurred of disputes between mine-owners or managers and the inspecting staff as to the age of a child employed in a mine, but the medical examination prescribed in such cases by the Act† has generally failed to confirm the inspector's suspicions.

*Prohibition of the Employment of Women in Mines.*—Soon after the passing of the Indian Mines Act of 1923, the Government of India, in accordance with the recommendation of the Joint Select Committee, addressed local governments on the subject of the prohibition of the employment of women in mines. On receipt of the replies and after a careful consideration of the question they came to the conclusion that the summary exclusion of women in the main coalfields would result in a very serious dislocation to the industry and that the only solution was to adopt a method of gradual exclusion. Accordingly in 1927 revised proposals were referred for opinion to the Mining Boards and the provincial governments mainly concerned, and after their views had been received draft regulations on the subject were published for criticism in June, 1928. These regulations under Section 29 (j) of the Act, which were finally promulgated on 7th March, 1929, prohibit the employment of any woman underground in the coal mines in Bengal, Bihar and Orissa and the Central Provinces and the salt mines in the Punjab, with effect from 1st July, 1939, and in all other mines, with effect from 1st July, 1929. In the coal mines in Bengal, Bihar and Orissa and the Central Provinces, and in the salt mines in the Punjab, women may still be employed underground up to 30th June, 1939, provided that the total number of women so employed at any time in any mine does not exceed a gradually decreasing percentage (i.e., 29 per cent. in the case of coal mines decreasing by 3 per cent. each year and 40 per cent. in the case of the salt mines decreasing by 4 per cent. each year) of the total number of both men and women employed underground in the mine. These regulations do not apply, and under the existing law cannot apply, to coal quarries or open workings, which are largely owned by the railways. With a view, however, to meet the criticism that these regulations will give the railway collieries an unfair advantage over privately owned collieries, the railway board has issued orders introducing, with effect from 1st July, 1929, a similar system of gradual reduction in the numbers of certain classes of women workers employed in open workings in railway collieries.

## Chapter XII.—Wages.

*Lack of Accurate Statistics.*—The first attempt to collect wage statistics in India was made in 1873, when instructions were issued to district officers to submit half-yearly returns showing the average monthly wages of certain classes of skilled and unskilled labour. These returns were based on information collected by subordinate revenue officials and in some cases by police officers, and from these returns a series of comparative figures for selected districts in each province were published annually in the publication "Prices and Wages," issued by the Director-General of Commercial Intelligence and Statistics. For the reasons given by Mr. Datta in his report on an enquiry into the rise of prices in India,\* these statistics were wholly unreliable, and by 1910 the half-yearly returns were discontinued throughout British India except in British Baluchistan. In their place a quinquennial wage census was adopted in all provinces except in the Central Provinces, where an annual return was obtained from district officers. The first quinquennial wage census was taken in 1911-12 and the second in 1916-17. The statistics regarding wages continued to be published in "Prices and Wages," which gave the results of the quinquennial wage census in respect of a few urban and rural occupations. As the statistics were still far from satisfactory, the third wage census, which was due in 1921-22 was abandoned, except in Madras and the Punjab. In 1921 an attempt was made by the Government of India to hold an All-India census of industrial wages with the "active and voluntary co-operation of employers," but nothing could be done partly because a number of employers either failed to submit returns or submitted incomplete returns, and partly because neither the central nor the local governments were able to provide the staff required for the purpose owing to financial stringency. In the circumstances the Government of India came to the provisional conclusion that "the question must be allowed to remain where it is for the present." But in communicating this conclusion to local governments they expressed the view that it might be necessary at some future date to take steps by legislation to secure statistics of this kind. The annual issues of "Prices and Wages" were also suspended in 1923 as a result of retrenchment, and no regular official wage statistics are now published for British India as a whole.†

*Rates of Wages and Earnings in Certain Industries.*—Three enquiries into the wages of operatives in the cotton mill industry in Bombay Presidency have been held since 1921. The last of these enquiries was held in 1926, but its results have not yet been published. According to the enquiry which was held in 1923, the average daily earnings of the millhands were as shown in the following statement, which is reproduced from the Report of the Labour Office, Bombay.

## Average Daily Earnings (August, 1923).

Centre.	Men.	Women.	Big lads and children (a)	All work- people. (a).

In the enquiry which was made in 1921, the Bombay Labour Office attempted an estimate of the trend of nominal and real wages and came to the conclusion that real or effective wages for men operatives in Bombay City were 14 per cent. higher

(a) Counting two half-timers as one full-timer.

\* Report on an Enquiry into the Wages and Hours of Labour in the Cotton Mill Industry, published by the Bombay Labour Office in 1925, pages 9-11.

than in 1914. But in the second enquiry in 1923 a similar estimate was not attempted owing to certain limitations of the cost of living index numbers and other practical difficulties.\*

Accurate statistics of wages in the jute mills of Bengal are not available, but the following figures obtained in 1925, from the Chairman, Indian Jute Mills Association, may be of some interest :—

	Per week consisting of 4 working days.	Per day.
	Rs. a. p.	Rs. a. p.
Male daily workers .. .. .	3 10 0	0 14 6
Female daily workers .. .. .	2 9 0	0 10 3
Male piece-workers .. .. .	6 9 0	1 10 3
Female piece-workers .. .. .	5 10 0	1 6 6
Children .. .. .	1 12 0	0 7 0

Since 1922 it has been the practice in the jute mills to work only for four days in the week. During the remaining three days a large majority of the workers are employed in the fields and in agricultural work generally. As stated in Chapter X, the Indian Jute Mills Association have now decided to introduce a 60-hour week in the jute mills.

In the coal mines, wages are paid on the piece-work system, i.e., at a fixed rate per tub of coal and the average out-turn of the miner is three tubs of coal per working day. The regulations under the Indian Mines Act require mine owners to submit returns regarding the wages paid to the various classes of labour employed in mines. On the basis of these returns the Chief Inspector of Mines in India, compiles statistics of the average daily earnings in each important mining field in British India. These statistics are reproduced in the Annual Report of the Chief Inspector of Mines in India.‡

In the tea gardens in Assam, wages are mostly paid on the piece-work basis. In addition to the standard daily task which the worker must execute in order to earn his wages (called *hariva*), the labourer is given an opportunity at certain seasons to supplement his earnings by the performance of a second task, the payment for which is known as *ticca*. In Darrang, Sibsagar and the Lakhimpur districts, the unit system is in force under which wages are paid at the rate of 1 anna per unit in the case of hoeing and pruning and of 1 pice per unit for plucking. In some cases where it is impracticable to prescribe a definite task as in leaf plucking at the beginning and end of the season, payment is made by time.§ The annual reports on immigrant labour in the province of Assam, published by the Government of Assam, give statistics of average earnings of labourers separately for the Assam Valley Division and for the Surma Valley Division. The average monthly cash earnings calculated on the average daily working strength for the months of September, 1927, and March, 1928, in the Assam Valley Division was Rs. 13-2-1 pice for men, Rs. 11-6-11 pice for women, and Rs. 7-0-6 pice for children. The corresponding figures for the Surma Valley Division are Rs. 10-4-7 pice, Rs. 8-6-4 pice and Rs. 5-4 annas respectively. In addition to the cash wages, the labourers are allowed certain concessions, such as the supply of tea, rice and cloth at less than the market rate, private cultivation, free housing, free medical attendance, free fuel and grazing. The nature and extent of these concessions are discussed in Chapter III of the Report of the Assam Labour Enquiry Committee, 1921-22. In Assam, importance has always been attached to the necessity of taking into account joint family earnings in the case of tea garden labourers. The Assam Labour Enquiry Committee adopted Mr. Melitus' standard of an average working family as consisting of one working man, one working woman, and three-tenths of a working child. On this basis the figures tabulated below show the average family earnings calculated

\* The reasons for not attempting to publish index numbers of real wages are explained in detail in paragraph 58 of the report.

‡ For the figures for 1927, see table on page 5 of the Annual Report of the Chief Inspector of Mines for the year ending 31st December, 1927.

§ For details see Chapter IV of the Report of Assam Labour Enquiry Committee, 1921-22.

on the average daily strength in 1914, 1922 and 1928. For 1914, the figures are based on the average earnings of September, 1913, and March, 1914; for 1922, on the average earnings of September, 1921, and March, 1922; and for 1928, on the average earnings of September, 1927, and March, 1928. Column 5 of the table shows the percentage of increase in 1922 as compared with 1914, while column 6 shows the percentage of increase in 1928 as compared with 1922:—

District.	1914.	1922.	1928.	Percentage of rise in 1922, since 1914.	Percentage of rise in 1928, since 1922.

In the absence of index numbers for Assam it is not possible to frame any reliable estimate of the movement of real or effective wages in the tea gardens. Mr. Datta, in the "Enquiry into the rise of prices in India," stated that in 1912 the *real* wages of tea garden coolies in Assam had fallen 5 per cent. *below*, while those of agricultural labourers in India had risen 38 per cent. *above* the level of the standard period (1890-1894). The Assam Labour Enquiry Committee also came to the conclusion that the family earnings in 1922 did not keep pace with the increase in the cost of living since 1914. From the table above it will be seen that there has been a substantial increase of wages since 1922. The percentage of increase is even higher than what is shown in column 6 as the figures for 1914 and 1922 include diet and subsistence allowances, whereas these items are being excluded from the statistics of wages since 1923. As it is unlikely that the cost of living has risen appreciably since 1922 in Assam, it may be inferred that real wages in the tea gardens are also tending to rise. This is due to the difficulties which are being experienced by the tea industry in securing an adequate supply of labour owing to the competition of other industries, e.g., the coal and the steel industries in Bihar and Orissa, and the textile industries in the United Provinces and the Central Provinces.

*Extent of Standardisation.*—Wages are now paid mostly in money, except in the tea gardens in Assam, where certain concessions to which reference has already been made are allowed to the labourers. But no attempt has hitherto been made to standardize wages. Thus the report of the Bombay Labour Office on an enquiry into the wages and hours of labour in the cotton mill industry in 1923 refers to the fact that in one muster roll there were seven oilers doing exactly the same work for exactly the same length of time who received wages varying from 9 annas to Re. 1-6 annas per day.\* The question of standardization was considered by the Bombay Industrial Disputes Committee in 1922 and by the Textile Tariff Board in 1927. The Industrial Disputes Committee remarked that "employers' associations have not yet evolved any standard scales of wages and individual employers are usually ignorant of how their rates compare with the wages given by others," and that "the uncorrelated raising of wages in one factory is almost invariably seized upon as a grievance in other factories of the same class." The Textile Tariff Board also recommended for the consideration of the Millowners' Association the adoption of a system of standardized wages for the same class of work as between mill and mill. As a result of this recommendation the Millowners' Association prepared in 1928 a

\* Paragraph 30 of the report.

standardization scheme which was examined in detail by the Bombay Strike Enquiry Committee, 1928-29.\* It appears from the report of this committee that the Millowners' Association propose to introduce their standardization scheme in October, 1929.

*Effect of higher Wages on Indian Labour.*—Compared with European standards, the Indian worker lives in a vicious circle of low wages, low standard of living and low efficiency. To increase his efficiency it is necessary to raise both his wages and his standard of living. There is, however, a consensus of opinion among employers in India that an increase in wages does not effect an improvement in the standard of living of the Indian worker and does not, therefore, result in increased efficiency. It is argued that an increase in wages is either wasted on useless expenditure, e.g., on drink, or leads to greater idleness on the part of the labourer. Thus the Indian Industrial Commission made the following observation :—

" All authorities who are qualified to speak on the subject agree that Indian labour is content with a very low standard of comfort. This secured, the Indian workman, speaking generally, takes advantage of the greater earning power given to him by increased wages to do less work, and shows no desire to earn more money by working more regularly or by improving his own efficiency. In the case of Bombay, witnesses have stated that since the 10 per cent. rise in the wages of mill operatives given during the rains of 1917 there has been an actual falling off in output."†

Similarly, most of the witnesses who appeared before the Assam Labour Enquiry Committee, 1921-22, were of opinion that any appreciable rise in the rates of wages would result in the labourer doing just sufficient work to enable him to earn the same amount as before. But the committee were not disposed to accept this view without qualification and made the following observation :—

" If the increase in the rate of wages corresponds more or less to the rise in the cost of living they (the committee) think it probable, unless the standard of living has fallen, that the average coolie will be inclined to do as much work, while some may be encouraged by the higher wage to do more. If the rise in wages is in excess of the increased cost of living, many would probably do less work."‡

The Indian Coal Committee, 1925§, also remarked " that the standard of comfort of the labourer in the Indian coalfields is so low that the only effect of an increase in wages is a decrease in output, as he can obtain the amount which he needs by working fewer days in a week." The immediate effect of higher wages may be less work, but it has not been proved conclusively that this is the permanent effect or that the out-turn of the worker does not tend to rise after he has adjusted himself to the higher rate of wages. In any case, the remedy for this lies in education and in the improvement of the conditions of employment. So long as the worker is compelled to live in unhealthy and insanitary surroundings, an increase in wages must necessarily be a temptation for him to spend longer periods in his village. And it is not the Indian worker alone who is apt to dissipate his extra income in forms of pleasure which are positively harmful.

*Minimum Wages.*—The International Labour Conference at its eleventh session, held at Geneva in 1928, adopted a draft convention and a recommendation concerning the creation of minimum wage-fixing machinery. The convention contemplates the creation of such a machinery only in the case of trades or parts of trades (and in particular in home-working trades) in which no arrangements exist for the effective regulation of wages by collective agreement or otherwise and in which wages are exceptionally low. The obligation which the convention imposes on a State member ratifying it is to create such a machinery and to communicate annually to the International Labour Office a general statement giving a list of the trades or parts of trades in which it has been applied and certain other particulars; questions such as the nature and form of the machinery and the trades to which it is to be applied are left entirely to the discretion of the state concerned. In view of the fact that labour in India is for the most part unorganized, the acceptance of the Convention, if it is to be applied in a reasonable manner, would present many difficulties and the Government of India therefore came to the conclusion that it would not be possible to enter into any commitment or to give any indication of possible ratification until a thorough enquiry was held into the practicability of establishing Wage Boards in India. The question of minimum wages was new to India and had not been considered in any province except in Bengal, where a resolution for the statutory fixation of

\* Chapters IV and VI of the report.

§ Paragraph 40 of the Report.

minimum wages was moved on the 7th July, 1921, by Mr. K. C. Roy Chaudhry in the local council. The resolution was lost on the opposition of the local government which considered that it would not be practicable to give effect to such a proposal.\*

*Deductions from Wages.*—In June, 1926, the Government of India made an enquiry from local governments as to the extent to which fines and other deductions were being realized by employers in India from their workpeople. The views of the local governments were also invited on the desirability of taking any action, legislative or otherwise, to counter any abuses which might be found to prevail. The replies received indicated that :—(1) Except in the tea gardens of Assam and the coalfields of Bihar and Orissa, the system of fining is common throughout India ; (2) in addition to the fines imposed for breaches of discipline or for bad or negligent work, or injury to materials, deductions are made in the Bombay Presidency in respect of supply of materials and tools, rents for housing, supply of medicines, medical attendance, food grains and water, contributions to provident funds, use of reading rooms and libraries, education and compulsory contributions to charity and entertainments provided by the employer ; (3) in a number of cases the fines collected are credited to a fund mainly devoted to the benefit of the workmen.

All the major local governments, except Bombay, were of opinion that the system of fining had not led to any serious abuse and that legislation was unnecessary. The Government of Bombay, on the other hand, after an exhaustive enquiry into the subject by its Labour Office,† came to the opposite conclusion. A copy of the correspondence with local governments on the subject is contained in Appendix XII to this memorandum.

*Periods of wage-payment.*—In 1924 the Government of India collected information for the leading branches of organized industry in India regarding the periods by which wages are paid and the time which elapses between the end of the period for which wages are earned and the date of payment, *i.e.*, the waiting period. This information was published in Bulletin No. 34 of Indian Industries and Labour. Briefly, the enquiry disclosed that, in the case of skilled workers, the most general system is that of payment on a monthly basis, the most important exceptions to this rule being the jute mills in Bengal, where payment is made on a weekly basis, and the Ahmedabad cotton mills, where payment is made by *haptas* (a period varying from 14 to 16 days). Unskilled labour is frequently paid on shorter periods. The waiting period varies widely. As a general rule it lies between one-third and one-half of the period of payment, *i.e.*, the monthly payments are normally made ten to fifteen days after the close of the month, fortnightly payments within five days to a week after the close of the fortnight, and weekly payments in two to four days. Wide variations in the date of payment are common only in the smaller and less organized industries, while in the larger establishments regularity of payment is the rule.

In September, 1924, Dewan Chaman Lall introduced a Bill in the Legislative Assembly known as the "Weekly Payments Bill." The object of this Bill was to provide for the payment of wages on a weekly basis, but it allowed employers to continue payments on any other system provided wages were not withheld for more than a week. The Bill which was circulated for opinion, met with general opposition, particularly in regard to the proposal to interfere with the existing periods of payment. When it came before the Assembly for the second reading in February, 1926, it was opposed by Government, and on an assurance being given that the question of legislation to secure the prompt payment of wages would be considered, the Bill was withdrawn by its sponsor. In July, 1926, the Government of India accordingly invited opinions from local governments on the advisability of legislation. The correspondence with local governments is reproduced in Appendix XIII. It will be observed that most of the local governments are opposed to legislation, but in view of the contemplated appointment of a Commission to enquire into various problems connected with labour, the Government of India decided not to formulate, at present, any definite conclusions in the matter.

*Treatment of unclaimed wages.*—The question of the forfeiture of unclaimed wages was raised in connection with the question of the prompt payment of wages. The practice of forfeiting wages which are not claimed within a certain time is common in the mills in Bombay. In some cases it is the rule that the wages of a worker absent without leave for over a month should be forfeited, unless a medical certificate is produced. In others wages are not forfeited until six months have elapsed. The Bombay Strike Enquiry Committee, 1928-29,‡ considered this question, and recommended that in future unclaimed wages should be paid at any time on their being claimed by the operative or his legal representative, subject to the operative being sufficiently identified.

† See Report of an enquiry into deductions from wages or payments in respect of fines, 1928.

‡ Para. 91 of the Report.

*Indebtedness.*—Indebtedness is as much a feature of town life as of village life in India. The results of the enquiries conducted into the family budgets of the working classes in Bombay, Ahmedabad, Sholapur and Rangoon show that indebtedness is generally prevalent among the operatives in all these centres. In Rangoon the labourer from India is generally indebted to the *maistry*, who advances him money in order that he may be able to come to Burma. The report of the Officer-in-charge of the Labour Statistics Bureau, Burma, indicates that the labourer generally remains indebted to his *maistry* for the rest of his life.\* In the important industrial centres of the Bombay Presidency, the prevailing indebtedness of the operatives is attributed chiefly to the social and religious customs of the people which necessitate an expenditure on marriages, funerals, etc., quite out of proportion to the income of the family. The Ahmedabad Report † shows that the millhand at that centre is generally heavily indebted, while in Bombay City ‡ and in Sholapur § it is estimated that the percentage of the millhands who are in debt is 47 and 60 respectively. The average indebtedness extends to an equivalent of 2½ months' earnings in Bombay City, while in Ahmedabad it varies from a few rupees to many times the monthly income. The rates of interest charged are heavy. In Bombay the usual rate is 75 per cent. per annum, while the rates in Ahmedabad vary from 12 to 24 per cent., but higher rates are not uncommon.

*Bonus and profit sharing schemes.*—Bonuses are granted to workers in India for different reasons. In some cases a bonus is merely an allowance for dearness of food, which is granted to the operatives in order to avoid the necessity of raising wages. For instance, a war bonus of 10 per cent. was granted in the cotton mills in Bombay in July, 1917. This was raised to 15 per cent. in January, 1918, and to 35 per cent. in January 1919, when it was termed a special allowance on account of the high prices of foodstuffs. The allowance was further increased on 24th January, 1920, and on 30th November, 1920, till it stood on the latter date at 70 per cent. for operatives on fixed wages and for winders, and at 80 per cent. for pieceworkers other than winders. Again, a bonus is also sometimes granted for regular attendance. This bonus is paid in cash in the textile mills in the Bombay Presidency, except in Sholapur, where it is given in the form of a grain allowance to all workers who are present on 22 days in the month. There is another form of bonus, called the efficiency bonus, which is granted by several concerns in the Bombay Presidency. During the boom period the cotton mills in Bombay were paying an annual bonus of one month's wages, but this was discontinued at the beginning of 1924. Similar bonuses were also paid by the cotton mills in Ahmedabad and Sholapur.

Profit sharing schemes have been tried by very few concerns in India. In April, 1928, the Tata Iron and Steel Company introduced such a scheme for their workers under which a monthly bonus based on production is paid to all men drawing less than Rs. 300 per mensem or Rs. 10 per day whose work contributes to the production obtained and who have been in the Company's employ for at least six months. The bonus is based on the total monthly finished production from each producing unit, and the works as a whole. It is reduced if the production falls below a certain figure and increased if it rises above that figure. For the standard figure of production, the total amount of bonus is fixed at Rs. 10 lakhs per annum. The men on lower rates of pay receive a higher bonus in relation to their wages than those on higher rates. Another interesting scheme is in operation in the Buckingham and Carnatic Mills where half-yearly bonuses are paid to the workmen on a basis relative to the dividend declared. Thus, if the Company pays a dividend of 10 per cent. on the ordinary shares, the bonus is paid to each workman at the rate of 10 per cent. on the total pay he has earned during the half-year.

*Annual leave.*—No information is available with regard to the extent of annual leave taken by workers or the extent to which it is countenanced or assisted by employers. There is probably no regular system for the grant of leave to operatives, except in rare cases. The Empress Mills, Nagpur, have fixed rules for the grant of leave to their employees. The apprentices, assistants and clerks serving in the mills on fixed salaries are allowed privilege leave to the extent of two days for every month of active service, but in the case of the other operatives leave on full pay is allowed only for 12 days in a year to those whose period of service with the Company exceeds

20 years. From the Report of the Bombay Strike Enquiry Committee, 1928-29,\* it appears that the Bombay Millowners' Association have under consideration the question of framing a new rule regarding the grant of leave to the operatives in the textile mills.

#### Chapter XIII.—Trade Combinations.

*Growth of the Trade Union Movement in India.*—The trade union movement in India is of comparatively recent origin, and the period during which it may be said to have taken root in this country is from the year 1918 to 1920. Organizations intended to promote the interests of workers were in existence before 1918, but the primary function of trade unionism, viz., the organization of wage-earners with a view to promote collective bargaining, had not been developed until 1918, when the economic, social and political conditions obtaining in India as a result of the Great War were decidedly favourable to the growth of the trade union movement. As early as 1884 an organization known as the Mill-hands Association was formed in Bombay under the chairmanship of Mr. N. M. Lokhanday, but its main purpose was to agitate for a revision of the first Indian Factories Act of 1881.† Similarly the Kamgar Hitwardhak Sabha and the Social Service League, Bombay, which were both started in 1911, and also the Servants of India Society took an active interest in the welfare of the working classes, but these organizations were not, and in fact did not claim to be, trade unions. The lateness of the trade union movement in India was due partly to the slow progress of the industrialization of the country, and partly to the special difficulties arising out of the illiteracy of the workers, their migratory habits and the heterogeneous composition of the labour force in industrial centres. It is significant, however, that the period which marked the birth of the movement synchronised with the period of unprecedented boom in trade and industry which immediately followed the Great War. The movement was essentially an economic one, though it was given a political complexion owing to the fact that a number of its supporters were politicians. During this period there was a steady rise in the cost of living without a proportionate increase in wages and the growth of labour unrest was therefore only natural. A series of successful strikes demonstrated to the workers, as nothing else could have done more successfully, the importance of organization. Trade unions were formed either immediately before or immediately after a strike. Many of them were more of the nature of temporary strike committees than proper trade unions, and they ceased to exist as soon as the grievances of the men were remedied. But the trade union movement had come to stay. A number of important unions which had been established during this period, e.g., the Madras Labour Union (started in 1918), the G.I.P. Railway Workmen's Union (started in 1919), and the Ahmedabad Textile Workmen's Union (started in 1920) are still functioning.

In 1920 an important development took place in the trade union movement of the country. In that year the All-India Trade Union Congress came into being, and held its first session at Bombay under the presidency of the late Lala Lajpat Rai. The object of the Congress as laid down in its constitution was "to co-ordinate the activities of all the labour organizations in all the trades and in all provinces in India, and generally to further the interests of Indian labour in matters social, political and economic." The Congress has established provincial committees in most of the important provinces, and has so far held nine annual sessions. A factor of some importance in the formation of the Congress was the establishment of the International Labour Conference to which, according to the Treaty of Versailles, it is incumbent on the Government of India to nominate to each session of the conference a non-official delegate in consultation with the industrial organizations which are most representative of workpeople. The object of the promoters of the All-India Trade Union Congress was to ensure that the Workers' delegates to the International Labour Conferences would be duly elected representatives of the organized workers in India.

*Extent of Trade Unionism in India before 1926.*—Accurate and reliable statistics are not available of trade unions in India, except in Bombay, where information regarding the trade unions in the Presidency is given in the *Labour Gazette* published by the Bombay Labour Office. In the report of the first annual session of the All-India Trade Union Congress in 1920, it was stated that 60 unions were affiliated to the Congress while 42 more unions expressed their sympathy with its objects, and it was estimated that the Congress represented no less than 5,00,000 workers. But in 1926 the General Secretaries' Report to the Sixth Annual Session of the All-India Trade Union Congress showed that the number of affiliated unions was only 52, and the total membership a little over 1,25,000. The All-India Trade Union Congress does not, however, include all the trade unions which are in existence in the country. The Ahmedabad Labour Union, which is one of the best organized unions in India,

\* Page 28 of the Report.

† Clow, Indian Factory Legislation, page 15.

has not yet been affiliated to it and from the Directory of Trade Unions, which was prepared in 1925 by Mr. R. R. Bakhale, Assistant Secretary of the All-India Trade Union Congress, it appears that there were in that year no less than eight federations and 167 unions. But all these unions are not equal in strength and vitality, and about half of them are organizations either of Government servants or of persons connected with Government employment. Trade unionism has made substantial progress among railway, postal and telegraph employees, but on the whole it is still weak in the great organized textile and mining industries, though rapid progress is being witnessed in some important centres like Ahmedabad and Bombay. The movement embraces only a small fraction of the workers in India, and considerable progress remains to be made before it can be said to have attained the level of other industrial countries.

*Registration of Unions under the Indian Trade Unions Act.*—The Indian Trade Unions Act \* came into force on the 1st June, 1927, and it is yet too early to pronounce any judgment as to the effect of this Act on the trade union movement of the country. The total number of unions registered under the Act up to the 31st March, 1928, was 29, with a total membership of 1,00,619; no less than 12 of these unions with a total membership of 52,559, were registered in the Bombay Presidency. In Bengal only two unions were registered under the Act, while in the Punjab out of the six unions registered during the year only one union, viz., the North Western Railway Union, with a membership of 5,000, is of any importance. The total membership of the remaining five unions was less than 800, and one of them, viz., the Homeopathic Association, with a membership of only 19, can hardly be said to be a trade union in the ordinary sense of the term. An explanation given for the slow progress of registration in the first year of the working of the Act is that the constitutions of the existing unions had to be revised in order to comply with the provisions of the Act, and this took a little time. The total receipts during the year in the general fund of all the 29 registered unions amounted to about Rs. 1,63,600, which gives an average of Rs. 5,641 per union and Re. 1 and annas 10 per member. Only one registered union† constituted a political fund, but the income during the year in this fund was only Rs. 340 as against an income of Rs. 7,785 in the general fund. No federations were registered in the year 1927-28. The returns for the year ending 31st March, 1929, have not yet been received, but the progress of registration during the two years of the operation of the Act is shown below :—

† The Madras Labour Union for Textile Workers.

‡ For two unions only; the third union is defunct, and it is proposed to cancel its registration.

§ For six unions only.

•• Two of these unions have since amalgamated.

†† For five unions only.

‡‡ For 47 unions only.

The importance of registration as securing a special status for a trade union became apparent during the general strike in the Bombay textile mills which commenced in April, 1928. Before the strike, the two important unions consisting of employees in the textile mills were the Bombay Textile Labour Union and the Girni Kamgar Mahamandal. But owing to differences among the labour leaders, two other associations, viz., the Bombay Mill Workers' Union and the Girni Kamgar Union, under the control of extremist labour leaders, and decidedly communist in character, came into being. The Millowners' Association which had hitherto refused to recognize any union of textile workers in Bombay City, gave an assurance to His Excellency the Governor that it would be prepared to receive representatives of registered trade unions with a view to opening negotiations for a settlement of the dispute. The Bombay Textile Union was then the only trade union registered under the Act, but it had arrived at an agreement with the other unions whereby a Joint Strike Committee, consisting of representatives of the four unions, mentioned above, was appointed to negotiate with the Millowners' Association. The latter, however, refused to enter into any discussion with the Joint Strike Committee unless all its members were representatives of duly registered trade unions. The deadlock thus created was removed by the action of the President of the Girni Kamgar Mahamandal which resulted in the registration of this union on the 21st May, 1928. Two days later the Girni Kamgar Union, a rival union controlled by the extremist labour leaders of the Workers' and Peasants' Party, also obtained registration, and the Bombay Mill Workers' Union followed suit on the 1st June, 1928. Thus all the members of the Joint Strike Committee were members of registered unions, and the ground was prepared for a round table conference. In referring to the events of the general strike in his report for the year ending 31st March, 1928, on the working of the Act, the Registrar of Trade Unions, Bombay Presidency, observed as follows:—"In the six months that have elapsed since the 31st March, 1928, it has become abundantly clear that registration will be sought by every union of any importance." The table of the principal trade unions in the Bombay Presidency, which is published in the Bombay Labour Gazette for April, 1929, bears testimony to the correctness of this observation. By April, 1929, no less than 35 unions with a total membership of about 1,57,000, were registered under the Act; the number of unregistered unions was 60, but their total membership less than 44,000. In this connection it is interesting to note the progress made by the Girni Kamgar Union in Bombay City. At the time of registration (23rd May, 1928) this union consisted of only 174 members, but the membership has since risen to 54,000, which is six times the aggregate membership of the other three unions of the textile workers in Bombay City.

*The Trade Unions Act and unregistered Unions.*—The question of legislation for the protection of Indian Trade Unions arose out of a decision of the Madras High Court in 1920, granting an injunction restraining the leader of a local labour union from influencing the employees of a mill to break their contract with their employers. The object of the Indian Trade Unions Act was to give trade unions in India the necessary protection from civil suits and from the criminal law relating to conspiracy in order to enable them to carry on their legitimate activities. The Indian Act however, differed in one important respect from similar legislation in Great Britain and the Dominions. The privileges which it proposed to confer were only for those unions which accepted registration, and the legal position of unregistered unions was left unaltered. As registration is not compulsory, the immunity from civil suits and from prosecutions for criminal conspiracy does not extend to all trade unions, but registration involves no obligation which a reputable and well-conducted union should not be willing and indeed anxious to accept. An attempt was made when the Act was under consideration in the Legislative Assembly to extend to unregistered unions the privileges which it proposed to confer on registered unions, but without success. In February, 1928, Mr. Joshi introduced a Bill to amend the Indian Penal Code, the object of which was to extend immunity from criminal prosecution to other combinations of workmen. The Bill, on circulation, received little support, and was rejected by the Legislative Assembly in September, 1928. The fact that unregistered trade unions are still in the same position as before the passing of the Indian Trade Unions Act, was shown by a case in Sholapur which was decided shortly after Mr. Joshi's Bill was rejected by the Legislative Assembly. On the application of three of the mills at that centre an interim injunction was granted against certain members of an unregistered union, restraining them from inciting the workers of these mills to strike work or to continue to be on strike.

*Attitude of Government towards Associations consisting of its Employees.*—Before 1919, it was not the policy of Government to accept any representation from an association consisting of its employees or even a joint representation from its employees. The Government Servants' Conduct Rules did not prohibit Government employees from forming themselves into associations, but disciplinary action could be taken against a Government servant if his membership of an association involved

a breach of the Government's Servants' Conduct Rules. The right of association for all lawful purposes by the employed as well as by the employers was recognized in Article 427 of the Peace Treaty, which was signed in 1919, as a principle which the High Contracting Parties regarded as being of special and urgent importance. In view of the assertion of this principle, the Government of India found it necessary to consider the circumstances in which they would be prepared to accord recognition to Associations of their own employees and rules for the recognition by Government of associations formed by its employees were accordingly framed and issued in 1921. To obtain recognition an association must ordinarily consist of a distinct class of Government employee, and every Government employee of the same class must be eligible for membership. No representation or deputation will be received except in connection with a matter which is, or raises questions which are, of common interest to the class represented by the Association. Outsiders are not definitely excluded from being office-holders of the Association, but Government reserves the right in particular cases of refusing recognition to associations of which all the office-holders are not either in the active service of Government or honourably retired officers belonging to the same class of employees as the Association represents. Government can also require the regular submission for their information of copies of the rules of the Association, and the annual statement of its accounts and of lists of its members. It was also provided that in the event of legislation being passed which will permit of the registration of the association, the association shall be duly registered. The Recognition Rules do not apply to employees subject to military law or to the Indian Army Act, 1911, and more stringent conditions are laid down for the employees in the police and prison departments.

The passing of the Indian Trade Unions Act has created certain difficulties in its application to Government servants, as both the Government Servants' Conduct Rules and the rules for the recognition of associations consisting of Government servants are in certain respects inconsistent with its provisions. Thus, the following activities permitted by the Act are forbidden by the Government Servants' Conduct Rules:—(i) The payment of expenses of a political candidate (Section 16 (2) (a)); (ii) the holding of a meeting and the distribution of literature or documents in support of a candidate (Section 16 (2) (b)); (iii) the maintenance of a member of a legislative body (Section 16 (2) (c)); (iv) the registration of electors or the selection of a candidate (Section 16 (2) (d)); (v) the holding of political meetings of any kind or the distribution of political literature or political documents of any kind (Section 16 (2) (e)).

The Government Servants' Conduct Rules are statutory rules framed or confirmed under Section 96-B (2) of the Government of India Act and in so far as they are inconsistent with the Trade Unions Act they override it. But these rules regulate only the actions of individual Government servants; there is nothing forbidding them to form themselves into an association, and once an association is formed the corporate body cannot be controlled by the Government Servants' Conduct Rules or by any rules framed under Section 96-B of the Government of India Act. With regard to the rules for the recognition of associations consisting of Government servants the difficulty arises from the fact that these rules enforce the principle of homogeneity while the Indian Trade Unions Act contains no such restriction. The position is thus somewhat anomalous. Government servants are free to form themselves into a registered association which can indulge in activities forbidden to Government servants. Such an association may, under the Indian Trade Unions Act, include outsiders in its membership, and it may consist of different classes of Government servants, but, in accordance with the Recognition Rules, Government will not have any dealings with it.

The reconsideration of the principles which should govern the recognition of associations of Government servants in the light of the provisions of the Indian Trade Unions Act has presented numerous difficulties, and the Government of India have not yet formulated their final conclusions. On the one hand, it is necessary that Government, which is the largest employer of labour in the country, should not adopt too conservative an attitude in the matter of the recognition of associations consisting of its employees, particularly those who belong to the artisan class: on the other hand, it is necessary for Government to take adequate precautions against such activities on the part of associations consisting of its employees as would be subversive of reasonable discipline. It is clearly impossible for Government to promise that recognition will be given or continued to every registered union of their servants, for there are many actions open to a union which would amply warrant a withdrawal or refusal of recognition but which would in no way impair the union's right to registration. For example, in the past it has been necessary to withhold recognition from a union whose officers indulged in scurrilous attacks on the officers of the department with which the union was concerned. Pending the consideration of this difficult question, Government have relaxed the provision contained in the existing rules for the recognition of associations consisting of its employees which requires them to register under the Act.

*Trade Combinations among Employers.*—There are numerous organizations in India which protect the interests of employers. First of all are the chambers of commerce, which are mostly either preponderantly European or entirely Indian. The Indian Chambers of Commerce are under one federation known as the Federation of Indian Chambers of Commerce, while the European chambers are federated as the Associated Chambers of Commerce of India and Ceylon. In addition to these chambers are the associations representing particular branches of trade. The Bombay Millowners' Association, the Ahmedabad Millowners' Association and the Indian Jute Mills Association, Calcutta, represent the textile interests in India, while the Indian Tea Association with its branches in Assam, Surma Valley, Darjeeling and the Dooars represent the tea planting interests in these areas. There are two other important planters' associations, viz., the Bihar Planters' Association, which is, however, gradually losing its importance since the decline of indigo cultivation, and the United Planters' Association of Southern India, which represents the interests of organized plantations in Madras and the neighbouring Indian States. The mining interests are looked after by the Indian Mining Association and the Indian Mining Federation; the former includes all European employers and a number of Indian concerns in Bengal and Bihar and Orissa, while the latter represents only Indian capital in the coal-mining industry of these two provinces. There are also a number of smaller local organizations, such as the Delhi Factory Owners' Federation, Delhi, the Factory Owners' Association, Central Provinces and Berar, and the Mills and Factories Owners' Association, Beawar.

Generally speaking, the employers' organizations in India are concerned more with the promotion of business interests than with labour problems. Comparatively little has been done to standardise wages or to secure uniformity in the conditions of employment. But the growth of labour unrest in recent years has in some cases, e.g., in the textile industry in Bombay, and the jute industry in Bengal, compelled employers to take collective action in dealing with their workpeople. The Indian Trade Unions Act applies to employers' as well as employees' organizations, but so far no employers' organization has registered itself as a trade union under the Act.

#### Chapter XIV.—Administration.

*Labour Questions in the Central Legislature.*—In the Central Legislature a number of labour measures have been passed in recent years. These include (i) three Acts amending the Factories Act of 1911, one of which constituted a radical revision of that Act in almost every direction; (ii) a new Mines Act passed in 1923 and an amending Act passed in 1928; (iii) the Workmen's Compensation Act, 1923, with two amending Acts passed in 1926 and 1929 respectively; (iv) the Trade Unions Act, 1926, with a minor amending Act which was passed in 1928; (v) an Act regulating child labour in ports\*; (vi) an Act repealing certain provisions of the law relating to criminal penalties for breach of contract by workmen; (vii) the Trades Disputes Act, 1929.

All these were Government measures, but in some cases action by Government followed on proposals made in the Legislative Assembly. For instance, the Trade Unions Act was the outcome of a private member's resolution adopted in the Assembly and a private member's Bill (i.e., the Workmen's Freedom Bill, introduced by Mr. N. M. Joshi in the Legislative Assembly on 23rd September, 1924) influenced Government in connection with the repeal of the Workmen's Breach of Contract Act. In addition, two other Bills were introduced by private members, viz., Diwan Chaman Lall's Weekly Payments Bill and Mr. Joshi's Maternity Benefits Bill, an account of which has already been given in previous chapters. Of the Resolutions on labour matters discussed in the Central Legislature, the majority were moved by Government in connection with the proceedings of the International Labour Conferences.

The interest of the Legislative Assembly in labour questions was at the outset small, but, with the growing importance of economic questions, labour measures now occupy the attention of the House to a very much larger extent. The radical revision of the Factories Act in 1922 went through with a fraction of the discussion that a similar measure would evoke to-day. In the debates on the Workmen's Compensation Act of 1923 Government were able to carry through a large and detailed measure without a single amendment being made to which they were opposed. The Indian Trade Unions Bill did not, however, have such an easy passage in 1926, and a number of amendments were made by the Legislative Assembly in the Select Committee and in the House. The most important of these amendments was the introduction of a clause permitting registered trade unions to maintain a separate fund for political purposes. In the case of the Trade Disputes Bill, the

\* The Indian Ports (Amendment) Act, 1922.

Assembly made itself felt to a very much larger extent. Although all the three parts of this Bill were accepted by the House, important amendments were made in the Select Committee. The period during which the Act was to remain in force was limited to five years, and the scope of the provisions relating to strikes in public utility services and general strikes was curtailed considerably. The attitude of the Legislature towards this Bill was, however, to a large extent influenced by political considerations. The Council of State has generally devoted less attention to labour matters. All the Acts referred to above were passed in this Chamber without much discussion.

*Labour Questions in the Provincial Legislatures.*—Provincial Legislatures are competent to enact labour legislation, with the previous sanction of the Governor-General. But their output has been small. The only labour measures which have been passed up to the present are (i) an Act\* repealing the Madras Planters' Act, which included provisions for criminal penalties for breach of contract; (ii) the Coorg Labour Act, 1926, which was a step in precisely the opposite direction as it made provision for the criminal punishment of breaches of contract; (iii) the Bombay Maternity Benefit Act, 1929, which provides for the grant of maternity benefits to women employed in factories.

The first two were Government measures but the Bombay Maternity Benefit Act, 1929, was introduced by a private member and was passed by the local council in spite of the initial opposition of the local government. Certain other labour measures have been introduced in local councils but have not passed into law. Mr. R. W. Fulay, a non-official member of the Central Provinces Legislative Council, introduced two labour measures in January, 1929. One was a Maternity Benefit Bill and the other a Workmen's Welfare Bill, which would make it compulsory for all factory owners employing more than 100 persons to provide free of charge dining sheds and rest rooms for their workers and creches or day nurseries for the infants of the female employees. A Bill known as the Bengal Tea Gardens Public Health Bill, which was designed to set up a Board of Health for the tea-producing areas of Bengal and to replace the Jalpaiguri Labour Act of 1912, was introduced in the first Bengal Legislative Council in 1923, but lapsed with the dissolution of that Council. A Statistics Bill, which was designed mainly to overcome the difficulties experienced by the Bombay Labour Office in collecting labour statistics was introduced in the Bombay Legislative Council in 1924, but was eventually abandoned by the local government owing to the vigorous opposition with which it was received. Of the resolutions on labour matters moved from time to time in local councils, the majority related to the investigation of the problem of unemployment, particularly amongst the educated classes, an account of which has already been given in Chapter IV. A resolution was moved in the Bengal Legislative Council in 1921 recommending the statutory fixation of minimum wages and a resolution was moved in the Bihar and Orissa Council in 1926 regarding the payment of maternity benefits. The former resolution was rejected, while the latter was adopted, but no legislative action has yet been taken to give effect to it.

*India and the International Labour Conference.*—The preamble to Part XIII of the Treaty of Versailles refers to the fact that "the failure of any nation to adopt humane conditions is an obstacle in the way of other nations which desire to improve the conditions in their own countries." In order to establish universal peace based on social justice the Peace Treaty not only laid down general principles in regard to questions affecting labour which were recognised by the High Contracting Parties to be "of special and urgent importance," but also brought into being an organization to which was entrusted the task of securing, as far as practicable, the observance of these principles. The Conventions and recommendations adopted by the International Labour Conference are not automatically binding on the members of the organization, but they have to be submitted to the legislature of each country, and this secures the regular examination both by the executive and the Legislature of schemes which international opinion considers necessary and desirable for the amelioration of labour conditions. The International Labour Organization has thus been able to exercise a considerable influence on recent labour legislation in India. Eleven sessions of the International Labour Conference have been held between 1919 and 1929, and no less than 26 draft Conventions have been adopted by the Conference. Of these, eleven Conventions have been ratified by India, while the question of ratifying certain other Conventions is still under consideration. But the progress achieved in India as the result of the deliberations of the International Labour Conference cannot be judged solely by the number of ratifications. Account must also be taken of the extent and nature of the legislation which has resulted from

\* Madras Planters (Repealing) Act, 1927. The Madras Planters' Labour Act, 1903, ceased to have effect from the 1st January, 1929.

the decisions of the Conference. As was stated by Sir Louis Kershaw, the Government delegate to the tenth session of the International Labour Conference, "if a Government, whose legislation is already in conformity with the provisions of a Draft Convention, ratifies that Convention, it is clear that no tangible benefit follows to the worker; but if, on the other hand, ratification involves new obligations and fresh legislation, then the workers benefit."

The action taken by India on each of the Draft Conventions adopted by the International Labour Conference is indicated below. The Conventions marked with an asterisk are those which have been ratified by the Government of India.

*First Session. (Washington, 1919).*

(i) \**Draft Convention limiting the Hours of Work in Industrial Undertakings.*—This Convention required India to adopt the principle of a sixty-hour week for all workers in industries covered by the Indian Factories Act, in mines and in such branches of railway work as may be specified for this purpose by the competent authority. The Indian Factories Act of 1911 contained no provisions for limiting the weekly hours of work. It placed a daily limitation on hours of work, but that too, so far as male workers were concerned, applied only to textile factories. The position under the Indian Mines Act of 1901 was still worse; it contained no provisions for regulating the hours of work. The ratification of the Convention accordingly led to a radical revision of both these Acts. In the case of railways, orders were issued in September, 1921, that the sixty-hour week should be adopted for workshop staff and station staff not employed in connection with the working of trains. These orders were, however, modified in January, 1922, so as to exclude from their operation the following classes of electrical workers on railways (i) running and maintenance staff of power house; (ii) maintenance staff in shops who can be classed as millwrights; (iii) maintenance staff on outside work who are required to work on maintenance of electric installation, distribution mains, etc.

The question of extending the application of the sixty-hour week on railways has been for some time under the consideration of the Government of India. The matter was referred to the Indian Railway Conference Association, which, at a meeting held in October, 1927, adopted a resolution approving of certain rules on the subject. These rules have also been approved of by the Railway Board in respect of the State-managed railways and by the several boards of directors concerned in respect of company managed railways, but the question of their enforcement is still under consideration.

(ii) \**Draft Convention concerning Unemployment.*—An account of this Convention has already been given in Chapter IV.

(iii) *Draft Convention concerning the Employment of Women before and after Child-birth.*—As already explained in Chapter VI, this Convention was not intended to be applied immediately to India.

(iv) \**Draft Convention concerning the employment of Women during the Night.*

(v) \**Draft Convention concerning the night work of young persons employed in industry.*—The position in regard to both these Conventions, which have been ratified by the Government of India, is explained in Chapter XI.

(vi) *Draft Convention fixing the minimum age for admission of children to industrial employment.*—This Convention required India to prohibit the employment of children under twelve years of age in (a) manufactories working with power and employing more than ten persons; (b) mines, quarries and other works for the extraction of minerals from the earth; (c) the transport of passengers or goods or mails, by rail or in the handling of goods at docks, quays and wharves but excluding transport by hand.

The Indian Factories Act as it stood at the time when this Convention was under consideration applied only to factories using power and employing more than 49 persons. The Government of India proposed to amend the definition of "factory" in the Act so as to cover factories using power and employing not less than 20 persons, and to empower local governments to bring within the scope of the Act any factory employing not less than 10 persons. But they were not prepared to go so far as was required by this draft Convention, as they realized that, without an efficient inspecting staff, legislation would prove nugatory, and it was quite impossible to provide for the large and sudden increase of staff that would be required to deal with the numerous small industrial establishments employing 10 or more persons. The Government of India therefore expressed their inability to ratify this draft Convention unless the two following reservations were accepted (i) that it shall not apply to factories employing more than 10 but less than 20 persons unless the local

Government so direct; (ii) that transitional regulations should be made regarding children between the ages of nine and twelve already lawfully employed in factories.

Although the Draft Convention was not ratified, provisions were included in the Indian Factories and Mines Acts prohibiting the employment of children under the age of twelve years in factories and under the age of thirteen years in mines. An amendment was also made in the Indian Ports Act of 1908 so as to make it obligatory on a local government to make rules prohibiting the employment of children under the age of twelve years upon the handling of goods at piers, jetties, landing-places, wharves, quays, docks, warehouses and sheds.

#### Second Session (Genoa, 1920).

(vii) *Draft Convention fixing the minimum age for admission of children to employment at sea.*—This Convention was designed to prohibit the employment of children under the age of fourteen years on all ships and boats of any nature whatsoever engaged in maritime navigation, except ships of war, school ships, training ships and vessels in which members of the same family are employed. It further provided that every shipmaster should be required to keep a register of all persons under the age of 16 years employed on board his vessel and of the dates of their birth. The ratification of this Convention presented two difficulties. In the first place, under the existing Indian Shipping law, agreements with seamen are obligatory only in respect of engagements for service on foreign-going ships and home-trade ships of a burden exceeding 300 tons, and it is only where agreements are obligatory that the Government of India could undertake to enforce this Convention. Secondly, a practice exists in India whereby Indian seamen are allowed to take with them on boardship their young sons and nephews. These boys serve as deck-hands on nominal wages and are, in fact, apprentices. The practice is regarded in the light of a privilege, and it was not possible to interfere with it. The Government of India were, therefore, unable to ratify the Draft Convention, but they decided to give effect to it subject to the following reservations (a) that it shall apply only to foreign-going ships and to home-trade ships of a burden exceeding 300 tons; and (b) that nothing in the Draft Convention shall be deemed to interfere with the Indian custom of sending young boys to sea on nominal wages in the charge of their fathers or near relatives.

No legislation has as yet been undertaken, but the question of introducing a single Bill dealing with all the maritime Conventions adopted by the International Labour Conference is at present under the consideration of the Government of India.

(viii) *Draft Convention concerning unemployment indemnity in case of loss or foundering of the ship.*—This Convention required the owner of a vessel, or the person with whom the seamen had contracted for service on board the vessel, to pay to each seaman employed thereon an indemnity against unemployment resulting from loss or foundering of the vessel. This indemnity was to be paid at the same rate as the wages payable under the contract for the days during which the seaman in fact remained unemployed, but the Convention provided for the limitation of the total indemnity to two months' wages. The Government of India anticipated great difficulties in giving effect to this Convention in the circumstances obtaining in India, where no labour exchanges or employment offices exist with whom shipwrecked seamen on their return to India could be registered for employment. The Draft Convention was not ratified, but the resolution which was adopted by the Legislative Assembly and the Council of State recommended to the Government of India that enquiries should be undertaken to ascertain whether the law should not be amended so as to provide (1) that any Indian seaman whose service is terminated before the period contemplated in his agreement by reason of the wreck or loss of the ship should be entitled to his wages until he is repatriated to the port of his departure from India; and (2) that he should be paid compensation for loss of his personal effects up to the limit of one month's wages. No legislation has yet been undertaken.

(ix) *Draft Convention for establishing facilities for finding employment for seamen.*—The Legislature did not recommend the ratification of this Convention but suggested that an examination should be undertaken of the methods of recruitment of seamen at the different ports in India in order to ascertain whether abuses existed and, if so, whether they were susceptible of remedy. A Committee was accordingly appointed in 1922 to enquire into the whole system of recruitment of seamen in India, and, as a result of its investigations, administrative action was taken to prevent certain serious abuses which were found to exist at Calcutta.

#### Third Session (Genoa, 1921).

(x) *Draft Convention concerning the age for admission of children to employment in agriculture.*—This Convention was designed to prohibit the employment of children under the age of 14 years in any agricultural undertaking, except outside the hours

fixed for school attendance. The wording of this Convention was somewhat ambiguous and the Government of India had some correspondence with the Director of the International Labour Office with regard to the exact intention of its provisions. According to the interpretation of the Director, the obligation imposed by the Convention upon a State member ratifying it is confined to securing that those children who are compelled by law to attend school should have no obstacle placed in their way by reason of their employment in agriculture. But in that event, while the ratification of the Convention involved no legislative action so far as India was concerned, it became virtually devoid of meaning. On the whole, therefore, the Government of India decided not to ratify it.

(xi) *\*Draft Convention concerning the rights of association and combination of agricultural workers.*—This Convention has been ratified, but it involved no legislative action on the part of the Government of India. The Convention required a State member ratifying it to secure to all those engaged in agriculture the same rights of association and combination as to industrial workers. There was nothing in the law in force in India at the time when this Convention was ratified which discriminated between these two classes of workers and this position has been maintained by the Indian Trade Unions Act, which was passed in 1926.

(xii) *\*Draft Convention concerning workmen's compensation in agriculture.*—This Convention required each State member ratifying it to undertake to extend to all agricultural wage-earners the provisions of its workmen's compensation laws. It was obviously impossible to bring agricultural labourers within the scope of the Indian Workmen's Compensation Act, and the Convention was not, therefore, ratified.

(xiii) *\*Draft Convention concerning the use of white lead in painting.*—The action taken on this Draft Convention has already been indicated in Chapter VI.

(xiv) *\*Draft Convention concerning the application of the weekly rest in industrial undertakings.*—This Convention, which has been ratified, applies in India to factories as defined by the Factories Act, mines and to such branches of railway work as may be specified for the purpose by the competent authority. The ratification of this Convention was made possible by the amendment of the Factories Act in 1922 and by the Indian Mines Act of 1923. In the case of railways a weekly rest-day is granted by railway administrations for practically all classes of employees except train staff, certain men working on stations and yards, those engaged in light intermittent duties, such as gatemen and men employed on maintenance of way and bridges, but in all these cases periods of rest are arranged which, although not strictly in accordance with the Convention, approximate to the principle involved. The application of the weekly rest-day on railways has in some cases led to certain practical difficulties. For instance, on one railway, where, under the existing arrangement, station staff are employed on work for eight hours a day throughout the week, an arrangement to allow a day for rest once a week by increasing the working hours on other days, without raising the total hours beyond 60 in the week, was objected to by the staff. On another railway, gangmen employed on the permanent way objected to a weekly day of rest which was proposed to be substituted for two days' leave every fortnight now given to the men to enable them to go to their homes. The whole question is still under examination by the Railway Board, in consultation with the railway administrations.

(xv) *\*Draft Convention fixing the minimum age for the admission of young persons to employment as trimmers or stokers.*—This Convention stipulated that young persons under the age of 18 years shall not be employed on vessels as trimmers or stokers, but in the case of vessels exclusively engaged in the coastal trade of India it permitted young persons of not less than 16 years of age to be so employed. The Convention was ratified by the Government of India and instructions were issued to the shipping officers not to permit any young person to be signed on as a trimmer or stoker in contravention of the terms of the Convention. It is proposed to undertake legislation for giving statutory effect to this Convention.

(xvi) *\*Draft Convention concerning the compulsory medical examination of children and young persons employed at sea.*—This Convention stipulated that no child or young person under the age of 18 years shall be employed on any vessel, unless he produces a medical certificate attesting fitness for such work. It also provided for the periodical medical examination of young persons employed at sea. This Convention was also ratified and its provisions have been enforced by means of executive instructions. It is also proposed to undertake legislation for giving statutory effect to this Convention.

*Seventh Session (Geneva, 1925).*

(xvii) *\*Draft Convention concerning workmen's compensation for accidents.*—The provisions of this Convention went much beyond the Indian Workmen's Compensation Act, 1923, and its application in India involved a radical revision of that Act,

which had then been in force only for little over a year. The Government of India considered it impracticable to undertake any such revision at that time and the Convention was not, therefore, ratified.

(xviii) \**Draft Convention concerning workmen's compensation for occupational diseases.*—The ratification of this Convention led to the amendment of the Workmen's Compensation Act. The Act already provided for the grant of compensation for such diseases, but a slight amendment was made in order to bring the Act into conformity with the Convention. It was also necessary for the Governor-General in Council to issue a notification under section 3 (3) of the Act adding mercury poisoning to the list of occupational diseases for which compensation can be claimed.

(xix) \**Draft Convention concerning equality of treatment for national and foreign workers as regards workmen's compensation for accidents.*—This Convention has been ratified but it necessitated no legislative action on the part of the Government of India, as foreign workers in British India are equally eligible with nationals for the benefits conferred by the Indian Workmen's Compensation Act.

(xx) *Draft Convention concerning night work in bakeries.*—This Convention was designed to prevent the making of bread, pastry or other flour confectionery during the night. It was not suited to conditions in India, where the night is normally the more healthy time for such work than the day. The Convention was accordingly not ratified.

#### *Eighth Session (Geneva, 1926).*

(xxi) \**Draft Convention concerning the simplification of the inspection of emigrants on board ship.*—The ratification of this Convention led to the amendment of the Indian Emigration Act of 1922. The term "emigrant ship" was defined and the Governor-General in Council was empowered to make rules for the appointment of Inspectors for the voyage should circumstances require such action. But no Inspectors were actually appointed for the inspection of emigrants, as it was considered that, in view of the short duration of the voyages concerned in Indian emigration, and the fact that the peculiar complications of European emigration did not arise, the guarantees afforded by the existing system of port inspection were sufficient to protect the emigrant.

#### *Ninth Session (Geneva, 1926).*

(xxii) *Draft Convention concerning seamen's articles of agreement.*

(xxiii) *Draft Convention concerning the repatriation of seamen.*

The ratification of both these Conventions would have involved the amendment of the Indian Merchant Shipping Act. The resolution adopted by the Legislature recommended that the question of the ratification of these Conventions should be considered at a later date when the amendments necessary to bring the existing law into conformity with these Conventions had been further examined in consultation with the parties interested.

#### *Tenth Session (Geneva, 1927).*

(xxiv) *Draft Convention concerning sickness insurance for workers in industry and commerce and for domestic servants.*

(xxv) *Draft Convention concerning sickness insurance for agricultural workers.*

These Conventions have already been dealt with in Chapter VI.

#### *Eleventh Session (Geneva, 1928).*

(xxvi) *Draft Convention concerning the creation of minimum wage-fixing machinery.*—A reference to this Convention has already been made in Chapter XII.

Thus out of the eleven Conventions ratified by India only three involved no further legislation, viz., items (ii), (xi) and (xix) above. Two Conventions [items (xv) and (xvi) above] have been ratified but the necessary legislation has not yet been undertaken. In some other cases [e.g., items (vi), (ix) and (xviii) above] some action has been taken, though the Conventions have not been ratified by the Government of India.

*Relations between Central and Local Governments.*—Under the existing constitution, industrial matters included under the following heads, namely :—(a) factories; (b) settlement of labour disputes; and (c) welfare of labour, including provident funds, industrial insurance (general, health and accident) and housing, are provincial reserved subjects but subject to central legislation. The provincial legislatures are not debarred from initiating legislation on these matters but they can only do so with the previous sanction of the Governor-General. The actual administration of the Acts passed by the Central Legislature under the above heads falls on the local governments which have to bear the entire cost of administration, as it is not permissible under the constitution to incur any expenditure from central revenues on the administration of provincial subjects. This constitutional position is perhaps, to some extent, responsible for the opposition shown by some of the local governments to labour measures on which their opinions have recently been invited by the Government of India. The Governor-General in Council exercises control over the administration of the Acts passed by the Central Legislature falling under the above heads in two ways. In the first place he is vested by statute with the general power of superintendence, direction and control, and, secondly, these acts in most cases either specially reserve certain powers to him or make the exercise of the powers conferred on local governments subject to his control. Thus, the Indian Factories Act confers power on the Governor-General in Council to make rules requiring occupiers or managers of factories to furnish returns and for the adequate disinfection of wool used in factories which may be infected with anthrax spores (Sections 38 and 38A) while Section 57 of that Act also empowers the Governor-General in Council to exercise any power conferred upon the local government by the Act. Again, the exercise by local governments of the powers to make rules under Section 37 and to grant exemptions from the provisions of the Act under Sections 30 (1), 32 and 32A, is subject to the control of the Governor-General in Council. The Workmen's Compensation Act, 1923, reserves the following powers to the Governor-General in Council :—(1) to extend the scope of the Act to persons employed in any occupation, which may be declared to be a hazardous occupation (Section 2 (3)); (2) to add to the list of occupational diseases contained in Schedule III (Section 3 (3)); (3) to direct persons employing workmen to furnish returns relating to the amount of compensation paid and the number of injuries in respect of which compensation has been paid (Section 16); and (4) to make rules to carry out the purposes of the Act (Section 32). The power conferred by Section 33 of this Act on local governments to make rules is subject to the control of the Governor-General in Council. The general principle observed by the Government of India has been to grant to the provinces as free a hand as possible in the administration of these Acts. Where interference is found to be necessary, the general policy has been to tender criticisms in the form of advice and to avoid the issue of direct orders.

Under the Devolution Rules "Regulation of mines" and "Inter-provincial migration" are central subjects. The Indian Mines Act of 1901 conferred large powers on the local governments, but these were curtailed considerably by the Act of 1923. The technical administration of the latter Act is vested in the Governor-General in Council, while minor matters of administration are left to be dealt with by local governments. Here again the power to make rules conferred on local governments can be exercised by them only subject to the control of the Governor-General in Council. In the matter of inter-provincial migration the part played by local governments is that of an agent of the Central Government. There are four embarkation depots\* in Bengal and two emigration hospitals in Assam† which are maintained at the expense of the Central Government. In Burma, there is a whole-time officer called the Assistant Protector of Emigrants and Immigrants under the control of the officer in charge of the Labour Statistics Bureau, Rangoon.

*Work of Special Labour Offices or Officers.*—There are only four provinces in India in which there are special labour offices or officers to deal with labour questions. In Madras there is a Commissioner of Labour and in Calcutta a Labour Intelligence Officer. Both of these officers were appointed in 1920. The former is also Protector of Depressed Classes, in which work most of his time is occupied, while the latter also acts as a deputy secretary to the local government. The Bombay Labour Office, which is organized on an elaborate scale, was established by the local government in April, 1921. This office has to its credit most of the statistical research into labour conditions done in India. It has conducted three enquiries at different times into the wages and hours of labour in the cotton mill industry in the Bombay Presidency and one enquiry into the wages of agricultural labour.

\* These embarkation depots are at Kharagpur, Naihati, Asansol and Goalando.

† At Gauhati and Tezpur.

It has also conducted a number of investigations in other directions, and has published monthly since 1921 a Labour Gazette containing information on questions concerning labour in Bombay. In Burma a Labour Statistics Bureau was set up in 1926. This Bureau has conducted an extensive investigation into the standard and cost of living of the working classes in Rangoon, the report of which was published in 1928.

A Labour Bureau was also established by the Government of India in 1920, but it was abolished in March, 1923, on the recommendation of the Indian Retrenchment Committee. It was intended to act as a Bureau for the collection of information, but its attention was mainly devoted to labour legislation, which was particularly heavy during that period.

*Effect of differences in Law in Indian States and British India.*—Few Indian States have any labour legislation but most of them are of little industrial importance. From an enquiry which was made on behalf of the International Labour Office, Geneva, it appears that there are only seven Indian States\* in which the number of persons employed in factories and mines is over 8,000. Most of these States have a Factories Act which is, however, much below the standard of the corresponding Act in British India. In recent years there has been a distinct tendency on the part of certain capitalists to endeavour to evade the provisions of the factory law of British India by establishing mills or factories in the territories of Indian States. The Inspector of Factories, Punjab, in his annual report on the working of the Indian Factories Act for the year 1924 reported as follows:—

"Factory owners in districts adjoining Indian States protest that the Amended Act, entailing the upkeep of registers and compliance with other regulations regarding working hours, Sunday closing, etc., places them at a disadvantage with those in Indian States, where the Factories Act is not in force. Their complaint is a genuine one and felt particularly during the busy ginning season, when there is an all-round demand for skilled and unskilled labour. Employment in factories in States situated within two or three miles of the British territory is always given preference by the workers as they know they are at liberty to work in State territory as long as they wish and thereby earn bigger wages. This is particularly applicable to child labour. During 1924, one factory in Multan district was removed to an Indian State for the purpose of avoiding the provisions of the Indian Factories Act, whilst another in Lyallpur district is expected to be removed next season. Unless the Factories Act is made uniform in both the British and Indian States territories, the tendency will be for factories to be erected in States where factory legislation does not exist and the objects of the Act will be defeated."

Another case was reported in 1928 in which a certain factory owner attempted to remove his factories from one Indian State, where recently a law had been adopted imposing restrictions on the hours of work, to another State, where no such law was in operation.

*Factory Inspection.*—The inspection of factories is entrusted to officers designated, Inspectors of Factories. They fall broadly into two classes, viz., (1) whole-time officers with technical qualifications who are specially appointed for the purpose by the local government, and (2) district magistrates who are ex-officio inspectors under the Act. In addition, the local government may appoint such other public officers, e.g., Sub-divisional Officers and Directors of Public Health, as additional inspectors for all or any of the purposes of the Act. At first, the inspection of factories in India was entrusted almost entirely to local officials, but this proved a complete failure, as the district magistrates were able to devote very little time to the inspection of factories owing to their other and more important duties. Besides, they were not in a position to deal with technical matters such as the adequate fencing of machinery. The tendency has therefore been to rely more on a regular staff and less on local officials for the administration of the Factories Act. Owing to the size of the country and to the fact that the smaller factories lie scattered over a vast area, it has not been possible to dispense with the inspection by district officers, but the responsibility for the efficient administration of the Act now rests primarily with the regular staff, which in each province is under the control of a Chief Inspector of Factories. In order to secure the necessary co-operation between the district magistrates and the inspecting staff the rules made by local governments provide that a copy of all inspection notes shall be sent by the one to the other for information. In addition to inspectors, the Act also provides for the appointment of qualified medical practitioners as certifying surgeons. The powers and duties of these officers are laid down in Section 7 of the Act; they are

\* Viz., Hyderabad, Mysore, Indore, Baroda, Jammu and Kashmir, Gwalior and Travancore.

required ordinarily to visit every factory within their jurisdiction in which children are known to be employed at least once in every three or four months. At each visit the manager of a factory has to produce all the children employed by him before the certifying surgeon who has to satisfy himself as to their fitness for employment.

When the revision of the Indian Factories Act was under consideration the Government of India impressed on local governments the necessity of strengthening the whole-time inspecting staff in the provinces in order to secure the regular inspection of the numerous small concerns and seasonal factories which it was proposed to bring within the scope of the Act. The statement below shows the increase in the regular staff in each province since 1921.

*Strength of the Factory Inspection Staff in 1921 and 1927.*

Name of Province and year.	No. of Chief Inspectors.	No. of Inspectors.	No. of Assistant Inspectors.	Total.
Madras .. .. 1921	1	2	..	3
	1927	1	4	1
Bombay .. .. 1921	1	10	..	11(a)

	1927	1	2	..

(a) Combined staff for factory and boiler inspection.

(b) Staff employed solely for factory inspection.

(c) Also the Senior Inspector of Boilers.

(d) Combined staff for factory and boiler inspection.

(e) The staff in the Punjab also serves three Administrations, viz., the North-West Frontier Province, Ajmer-Merwara, and Delhi.

(f) The Assistant Inspectors in the Punjab are Industrial Surveyors who are appointed additional Inspectors of Factories.

In view of the fact that the number of factories has increased by about 85 per cent. and a large number of the new factories are situated at some distance from the main lines of communications, the increase of staff can hardly be regarded as adequate. In 1921 the Government of India drew the attention of local government to the desirability of appointing medical women as lady inspectors, but, so far, only one such appointment has been made.\* The only province which has not a separate staff is Assam where most of the factories are seasonal and there is not sufficient work for an Inspector of Factories during the off season. At the instance of the Government of India, the local government are now trying to recruit an inspector who will combine the work of factory inspection with that of electrical adviser to the local government. There are only four whole-time certifying surgeons in India of whom two are employed in Bombay and two in Bengal.

In spite of the fact that the increase of staff has not kept pace with the increase in the volume of work, considerable progress has been made in the number of

\* The only lady inspector in India is employed in the Bombay Presidency.

inspections, as will be seen from the table below. It should, however, be pointed out that the figures for 1926 and 1927 include inspections by ex-officio inspectors, which were excluded from the statistics of 1921 in some provinces.

1926 ..	7,251	44	24	11	9	88	12
1927 ..	7,515	42	23	13	11	89	11

The best progress has been made in Madras, Bombay and the Central Provinces, while in Assam the percentage of uninspected factories continues to be high. The figures regarding convictions also show that substantial progress has been made in the enforcement of the Act. In 1921 the number of persons convicted was only 55, but in 1927 no less than 1,420 convictions were obtained against 432 persons. In some provinces\* the number of prosecutions for infringements of the Act has been comparatively small, and in one case† the attention of the local government was drawn to the fact that the small number of prosecutions accompanied by a high accident rate might give the impression that the Act was not being stringently enforced within the province.

A complaint which is often repeated in the factory reports is the inadequacy of the fines inflicted by magistrates for deliberate violations of the factory law. As the result of the action taken in some provinces there has in recent years been a marked improvement in this respect, but there are still a large number of cases in which the penalty imposed can hardly be regarded as deterrent.

*Inspection of Mines.*—The inspection of mines in India is entrusted to the Mines Department, which is directly under the Central Government. In the year 1901 when the first Indian Mines Act was passed, the department consisted of one Chief Inspector and two Inspectors. In 1905 an additional Inspector was appointed and in 1913 the department was further strengthened by the appointment of a junior Inspector. In 1919–20 two more officers were appointed, and in 1922, in view of the increasing use of electricity in mines, an Electric Inspector of Mines was added to the staff. In 1925 the department was further strengthened by the addition of two more appointments, viz., one of an Inspector and one of a junior Inspector. The inspecting staff now consists of one Chief Inspector, three Inspectors, five junior Inspectors, and one Electric Inspector. The Inspectors and junior Inspectors are all required to possess first-class certificates of competency to manage a coal-mine, while the Electric Inspector is a qualified Electrical Engineer with knowledge of electricity as applied to mines. For purposes of inspection, British India has been divided into two circles, the first circle consisting of the Provinces of Baluchistan, North-West Frontier Province, the Punjab, Ajmer-Merwara, the United Provinces, and a portion of the province of Bihar and Orissa, and the second circle of the rest of British India including Burma. Each circle is in charge of an Inspector of Mines who is assisted by junior Inspectors and is responsible for the inspection of mines within his jurisdiction.

The Indian Mines Act of 1923 involved a considerable increase in the work of the Mines Department as the definition of a mine was changed to include a large number of stone and other mines which are scattered throughout India. This increase has, to a certain extent, been countered by the large number of collieries which have been closed owing to the slump in the coal trade. The total number of mines in 1928 coming within the scope of the Act was 1,948, of which 982 mines were inspected during the year. Many of these mines were inspected several times, the total number of inspections being 2,410. The causes and circumstances of practically all fatal accidents and serious accidents of importance, and all complaints of breaches of rules are promptly investigated by the Indian Mines Department. It is not possible for the staff to inspect each mine annually or to inspect more than a part of a mine in the case of the larger mines, but, as will be seen from the statement below the number of inspections has nearly doubled since 1920.

*Inspection of Mines in British India.*

Year.	No. of mines within the scope of the Act.		No. of mines inspected.	No. of inspections.
	Coal-mines.	All mines.		
1919 ..	741	1,719	312	564

## APPENDICES.

### APPENDIX I.

#### *The Assam Labour Recruitment Bill.*

#### *A Bill to consolidate and amend the law relating to recruitment to the Labour Districts of Assam.*

Whereas it is expedient to consolidate and amend the law relating to recruitment for the labour districts of Assam ; it is here by enacted as follows :—

#### *Chapter I.—Preliminary.*

1. (i) This Act may be called the Assam Labour Recruitment Act, 19 ..
  - (ii) It extends—
    - (a) to the Presidencies of Madras and Bengal and to the United Provinces, Bihar and Orissa (including the Santhal Parganas), the Central Provinces, and Assam ; and
    - (b) to such other parts of British India as the local government may, subject to the control of the Governor-General in Council, by notification in the local official Gazette, direct.
    - (iii) It shall come into force—
      - (i) In the territories mentioned in Clause (a) of Sub-section (ii), at once ; and
      - (ii) in any territories to which it may be extended by a notification under Clause (b) of the said Sub-section, on such day as may be specified in that behalf in the notification.
  2. (i) In this Act, unless there is anything repugnant in the subject or context—
    - (a) " Board " means the Assam Labour Board constituted under Chapter III ;
    - (b) " dependant " includes any woman (not being a labourer), any child and any aged or incapacitated relative or friend accompanying any labourer with the consent of a garden-sardar or recruiter or the local agent under whose control the garden-sardar or recruiter may be working ;
    - (c) " employer " means the chief person for the time being in charge of any estate ;
    - (d) " Estate " means land used for the purposes of tea plantation upon which labourers have been engaged to labour and may, if so notified by the Governor-General in Council, include land used for purposes other than of tea plantation ;
    - (e) " garden-sardar " means a person employed on an estate and deputed by his employer to recruit labourers ;
    - (f) " labour-district " means any of the districts of Lakhimpur, Sibsagar, Nowgong, Darrang, Kamrup, Goalpara, Cachar and Sylhet in the Province of Assam ;
    - (g) " Labourer " means any person (not being a native of a labour-district) of the age of 16 years and upwards who is recruited, engaged, or assisted to proceed from any part of the territories in which this Act may for the time being be in force, to a labour-district for the purposes of performing manual labour for hire on an estate otherwise than as a domestic servant.
- Explanation.*—If any such person having proceeded from an Indian state into such territories is assisted to proceed therefrom for the purpose aforesaid, he shall be deemed to be a labourer within the meaning of this definition :
- (A) " local agent " means a local agent licensed under this Act ;

(i) "magistrate" means a District Magistrate or other person appointed by the local government to perform the functions of a magistrate under this Act ;

(j) "native district" in the case of a person who, having proceeded from an Indian State into territories in which this Act is in force, proceeds therefrom, includes such an Indian State ;

(k) "recruiter" means a person who is not a garden-sardar and is deputed by an employer to recruit labourers ;

(l) "recruiting-district" means a district in which this Act is for the time being in force, other than a labour-district.

3. (i) The local government may, with the previous sanction of the Governor-General in Council, by notification in the local official gazette, prohibit either absolutely or subject to such exceptions, conditions and restrictions as may be prescribed in the notification all persons from recruiting, engaging or assisting any native of India, or any specified class of natives of India, to proceed from the whole or any specified part of the province, to any labour-district or any specified portion of any labour-district otherwise than through the agency of garden-sardars.

(ii) The local government may with the previous sanction of the Governor-General in Council by notification in the local official gazette, direct that garden-sardars shall work under the control of local agents duly licensed under this Act ;

Provided that a notification under this section shall not take effect until the expiry of six months from the date of its publication in the gazette, unless for any special reason the local government thinks it necessary to direct otherwise.

4. (i) The local government may appoint so many persons as it thinks necessary to be officers for the administration of this Act, and, with respect to any such officer, may declare the local area situate in the province within which he shall exercise the powers and perform the duties conferred and imposed upon him by this Act or any rule thereunder.

(ii) Every person so appointed shall be deemed to be a public servant within the meaning of the Indian Penal Code.

#### *Chapter II.—Garden-Sardars and Recruiters.*

5. The Government of Assam may prescribe by rules the conditions for and the procedure to be observed in the grant of a certificate of authority to a garden-sardar or recruiter by his employer for recruiting labourers in recruiting districts. The certificates shall be in such form and contain such particulars as may be prescribed.

6. (i) The local government may authorize any district magistrate to grant licences to suitable persons to be local agents, for the purpose of representing employers within a specified area and for a specified period, in all matters connected with the supervision of garden-sardars and recruiters under this Act.

(ii) Any employer, or on behalf of any employer, any association or firm duly authorized by general or special order of the local government for the purpose of this clause, may apply for a licence as aforesaid to be granted to a specified person.

(iii) A local agent shall furnish such information and make such returns as the local government may, by rules, prescribe.

7. (i) The district magistrate of any district within which a local agent acts as such may, by order in writing, cancel or suspend for a specified period a licence granted to a local agent :—(a) If he is satisfied that the conduct of the local agent justifies such a course ; or (b) on an application made for the cancellation or suspension of the licence by an employer, association or firm at whose instance the licence was granted under Section 6.

(ii) A local agent may, within three months from the date of any order of a district magistrate cancelling or suspending his licence under Clause (a) of Sub-section (i), appeal against the order to the local government, and the decision of the local government thereon shall be final.

8. The local government may, subject to the control of the Governor-General in Council prescribe by rules the procedure to be adopted and the duties to be performed by garden-sardars and recruiters working independently, and, by garden-sardars and recruiters working under the control of local agents, respectively, and by local agents, for the recruitment of labourers, their registration, medical inspection (if necessary), accommodation, removal to labour-districts, and provision of escort.

9. (i) Subject to any orders which the local government may make in this behalf, the district magistrate (or any other magistrate empowered by the local government in this behalf) may, if he thinks fit, detain and send back to his native district any

labourer found within the jurisdiction of the said magistrate, together with his dependants (if any), on the ground that the labourer was recruited by any coercion, undue influence, fraud or misrepresentation, or of any irregularity in connection with his recruitment.

Any expenditure incurred under this sub-section may be recovered from the employer on whose estate the labourer concerned was working or was proceeding to work.

(ii) The magistrate may provide an escort or make such other arrangements as he may think necessary for ensuring that the labourer or other person is actually conveyed to his native district. Any expenditure incurred under this sub-section may be recovered as part of the amount expended in sending the labourer or other person back to his native district.

10. (i) Every employer shall keep such registers of all labourers and other persons employed on the estate of which he is in charge, and of their dependants, in such form, and shall make to the district magistrate within the local limits of whose jurisdiction the estate is situate, such periodical returns in writing as the local government may, by rule, prescribe.

(ii) The district magistrate, or any other magistrate authorized by him, may examine the registers so kept and muster all labourers and other persons employed on any estate within the said local limits, and may verify the accuracy of the entries in the registers, or in any prescribed periodical return.

### *Chapter III.—Assam Labour Board.*

11. (i) There shall be a board, to be called the Assam Labour Board, for the supervision of local agents, and of the recruitment and engagement of natives of India under this Act.

(ii) The Assam Labour Board shall be a body corporate, and have perpetual succession and a common seal, and may by that name sue and be sued.

(iii) The Assam Labour Board (hereinafter called the Board) shall consist of nine members, including the chairman, who shall be an officer in the service of Government, to be appointed by the Governor-General in Council by notification in the Gazette of India. Four persons shall be nominated by the Governments of Madras, United Provinces, Bihar and Orissa and the Central Provinces, respectively, to represent the interests of labour. The remaining members shall be elected by the following bodies, namely :—(a) Two by the Indian Tea Association, Calcutta, as representatives of that Association and of the Indian Tea Association, London ; (b) one by the Assam Branch, Indian Tea Association ; and (c) one by the Surma Valley Branch, Indian Tea Association.

(iv) The election shall be made in such manner as may be determined by the electing bodies subject to the approval of the Governor-General in Council, and the name of every person so elected shall be published in the Gazette of India.

(v) If within the period prescribed by rules made under this chapter any of the aforesaid bodies fails to elect representatives or to elect the full number of representatives to which it is entitled, the Governor-General in Council may nominate persons to be members of the Board as representatives of the said bodies.

(vi) No act done by the Board shall be questioned on the ground merely of the existence of any vacancy in or any defect in the constitution of the Board.

12. (i) The Governor-General in Council may fix the salary of the chairman of the Board.

(ii) Such salary shall be paid in such proportions by the Governor-General in Council and the Board as the Governor-General in Council may from time to time determine.

13. (i) The Board may appoint so many persons as it thinks necessary to be supervisors, with such powers and duties in respect of the supervision of local agents, and the other matters mentioned in Section 11 as may be conferred and imposed on them by rules made under this chapter.

(ii) Subject to the control of the Governor-General in Council, the Board may fix the salary to be paid to supervisors.

(iii) The local government may, subject to the control of the Governor-General in Council, declare the local area in the province within which supervisors shall exercise the powers and perform the duties conferred and imposed upon them by rule under this chapter.

(iv) Every supervisor shall be deemed to be a public servant within the meaning of the Indian Penal Code.

14. (i) Subject to the provisions of rules made under this chapter, the Board may levy a cess on employers for the purpose of meeting expenditure incurred in carrying out its functions under this Act, and in particular for the payment of the salary of the supervisors and of such proportion of the salary of the chairman as may be determined under Section 12.

(ii) Such cess shall be payable on every garden-sardar or recruiter deputed by an employer to recruit or engage labourers and on every labourer assisted to proceed to a labour-district :

Provided that the rates at which the cess is levied shall not exceed the following rates, namely :—Rs. 5 a year on each garden-sardar or recruiter so deputed ; and Rs. 5 on each labourer assisted to emigrate.

(iii) On the failure of an employer for the space of one month after the receipt of a notice in such form and served in such manner as the Governor-General in Council may, by rule under this chapter, prescribe to pay any sum due under Sub-section (i), the same shall be recoverable from him.

15. (i) The Governor-General in Council shall, after previous publication, make rules to carry out the purposes of this chapter.

(ii) In particular and without prejudice to the generality of the foregoing power such rules may, subject to the provisions of this Act, provide :—

(a) For the powers to be exercised and the duties to be performed by the Board in carrying out the purposes for which it is constituted, and for the powers and duties of the chairman ;

(b) For the period within which elections to the Board must be made, and for the appointment of temporary or acting members of the Board during the absence of any member ;

(c) for the times and places of meeting and procedure of the Board ;

(d) for regulating the rate of the cess, the method of levying and collecting the cess, the purposes to which the cess may be applied, and the accounts to be kept and the audit thereof ; and

(e) for the powers and duties of supervisors appointed under Section 13.

#### *Chapter IV.—Rules.*

16. (i) In addition to the powers hereinbefore conferred, the local Government may make rules to carry out any of the purposes and objects of this Act in the province.

(ii) In particular and without prejudice to the generality of the foregoing power, such rules may :—

(a) Define and regulate the powers and duties of the several officers appointed by it under this Act ;

(b) prescribe the returns and reports to be made under this Act by any such officers as aforesaid or by any local agent within the province and the form in which they shall respectively be made ;

(c) prescribe the forms of all registers, licences, certificates, permits and notices required under this Act with respect to the province ;

(d) prescribe the fees to be paid for any licence granted under this Act and for the registration of labourers or their dependants in any district in the province ;

(e) regulate the provision of the accommodation, food, clothing, and medical treatment of all labourers and their dependants detained on account of sickness by order of a magistrate at any place within any district in the province.

(iii) Where any employer, local agent or other person fails to perform any act which he is by any rule made under Sub-section (ii) required to perform, the local Government may cause the act to be performed and the cost may be recovered from the employer, local agent, or other person, as the case may be.

(iv) In making any rule under this Act the local Government may direct that every breach thereof shall be punishable with a fine not exceeding in any case Rs. 500.

(v) All rules made by the local Government under this Act shall be published in the local official gazette, and, on such publication, shall have effect as if enacted by this Act.

#### *Chapter V.—Penalties and Procedure.*

17. Whoever knowingly recruits, engages or assists, or attempts to recruit, engage, or assist, or abets the recruitment, engagement or assistance of any person to proceed to a labour district in contravention of any of the provisions of this Act or of any

rule or notification for the time being in force thereunder, shall be punishable with imprisonment for a term which may extend to six months, or with a fine which may extend to Rs. 500, or with both.

18. Whoever, being an employer, refuses or wilfully omits to keep such registers or to make such periodical returns in writing to the district magistrate as may be prescribed by any rule made under this Act, or knowingly keeps an incorrect register or makes an incorrect return, shall be punishable with fine which may extend to Rs. 500.

19. Whoever, being an employer, or acting under the orders or on behalf of an employer, wilfully obstructs any entry, inspection or inquiry, or omits to comply with any requisition made under Section 10 shall for every such offence be punishable with fine which may extend to Rs. 500.

20. Whoever commits any offence under this Act or under any rule framed under this Act shall be triable for the offence in any place in which he may be found, as well as in any other place in which he might be tried under any law for the time being in force.

#### *Chapter VI.—Miscellaneous.*

21. Every sum recoverable under this Act from any person may be recovered on application to a magistrate having jurisdiction where the person is for the time being resident, by the distress and sale of any moveable property belonging to that person and situated within the limits of the magistrate's jurisdiction.

22. The Assam Labour and Emigration Act, VI of 1901, and of the Assam Labour and Emigration (Amendment) Acts, XI of 1908, VIII of 1915, XXXI of 1927, are hereby repealed.

## APPENDIX II.

### *Unemployment.*

*Letter from the Government of India in the Department of Industries and Labour, to all major local Governments, No. L.1378, dated 26th May, 1926.*

I am directed to forward, for the information of the local Government, a copy of the debate which took place in the Legislative Assembly on 28th January, 1926, on the subject of unemployment. A resolution was passed in the Legislative Assembly in the following terms:—

"This Assembly recommends to the Governor-General in Council that he may be pleased to appoint a committee with a non-official majority to investigate into the problem of unemployment in general and among the educated classes in particular, and devise suitable remedies, whether by a system of industrial and technical education, or by a revision of the existing system of education, or by offering encouragement to the starting of new industries, or by opening new avenues of employment, or by the establishment of employment bureaux, or by all these or any other means; and that the said committee do make a report on the latter problem as early as possible."

2. A perusal of the debate will show that two different and, in the view of the Government of India, distinct problems came under discussion. A portion of the debate had reference to the question of unemployment in the sense in which it is understood in western countries, i.e., unemployment among industrial workers. The Government of India are aware that such unemployment occurs sporadically among particular classes of workers, and is possibly a regular feature in a few industries, such as shipping. They do not believe, however, that, either at the present time or normally, general unemployment, as it is known in Europe, is a feature of the Indian industrial system. It is certainly true that in a number of industries, at any rate, the demand for labour is generally greater than the supply. Widespread unemployment in the ordinary sense of the term is probably confined to seasons when the occurrence of scarcity or famine produces partial or complete stoppage of agricultural activity over considerable areas, and thus throws out of work not only agricultural labour but labour employed in industries subsidiary to agriculture. A situation of this character is met in India by a system of famine relief which probably has no parallel in other countries, but to which no reference was made in the course of the debate.

3. The Government of India do not desire to pursue this aspect of the question. For it is clear, both from the actual wording of the resolution and from the general course of the debate, that the majority of members who supported the resolution in the Legislative Assembly had principally in mind a problem of an entirely different

character, namely, the problem of unemployment among the educated classes. But for certain statements to the contrary made in the course of the debate, it would be unnecessary to say that the Government of India have never attempted to minimize the gravity of this problem, which they believe to be one of increasing urgency and importance. There is ample evidence of the fact that in almost every part of India the openings for employment in clerical and professional occupations are few in proportion to the numbers seeking such employment. The economic stress resulting from this state of affairs is responsible in no small measure for political discontent, and it is obvious that, even if the governments in India were, as some critics incorrectly alleged, indifferent to the humanitarian side of the problem, self-interest alone would impel them to do what they can towards securing an improvement.

4. It is no part of the intention of the Government of India to attempt in this letter either to analyse the causes of, or to suggest remedies for, this state of affairs. The present trade depression is an incident, possibly temporary and certainly by no means the most important, contributory to this form of unemployment. The root causes lie far deeper, and are far more complex. The educational system, the state of industrial development, the changes that are being slowly wrought in the social structure, such as the gradual disintegration of the caste system, which at one time operated to prevent middle-class unemployment by restricting admission to the clerical professions, and at the bottom psychological factors inherent in the habits and customs of the people are all contributory causes to a state of affairs for which, from the nature of the case, no Government can find a panacea. The people alone can produce a change, and the change must necessarily take time to accomplish.

5. These considerations, however, must not stand in the way of the adoption of any measures which would tend to alleviate the situation, and the opposition of the Government of India to the resolution in the Assembly was based not on these considerations, but on their conviction that the problem is one which must be tackled in the first instance by local governments and local bodies. It is not merely the case that the problem differs both in nature and extent in different parts of India, but it seems to the Government of India that such remedies as may be found practicable are remedies which only local governments, and more particularly the transferred sides of local governments, can apply. Industrial development and changes in educational policy are the direct concern of Ministers, and the immediate appointment of a committee by the Central Government could not, in the view of the Government of India, serve any useful purpose. The Government of India are, of course, fully aware of the fact that the subject is one which has not been neglected either by local governments or local legislative councils. On the contrary, it has already been discussed by legislative councils in the majority of the major provinces, and in some it has been, or is at present, the subject of investigation by committees appointed by the local governments. The deliberations of these committees should indicate the extent to which Government action can provide a means of ameliorating the existing situation. It is not apparent to the Government of India that there is any present need for a central committee to co-ordinate local efforts, and unless and until it becomes clear that such co-ordination would be of real value, the Government of India are not prepared to give effect to the resolution of the Assembly for the appointment of such a committee. They can only for the present ask that the problem, the gravity of which they fully recognize, should receive the most careful consideration of the local government.

### APPENDIX III.

#### *Ventilation and Humidification in Cotton Mills.*

*Letter to all Local Governments (except Burma, Bihar and Orissa and Assam) and the Chief Commissioners of Delhi and Ajmer-Merwara, No. L.843, dated 26th April, 1924.*

I am directed to address you regarding the regulation of ventilation and of humidification in cotton mills.
