THE CAMBRIDGE FARM ACCOUNT BOOK

Obtainable from

The Farm Economics Branch
Department of Agriculture
Cambridge University

9(1):87.3. N4 G6 21817

PRICE THREE SHILLINGS NET, POSTAGE 6d.

Advice on keeping and interpretation of farm accounts and costs can be obtained from the Advisory Economist, Farm Economics Branch, School of Agriculture, Cambridge.

The County Agricultural Organisers are prepared to give advice in regard to such matters as livestock rations, fertilisers, soil analysis, etc. Enquiries should be made to the Organiser responsible for the County in which your farm is situated. The following is a list of the names and addresses of the various County Organisers:—

Bedfordshire J. W. Dallas, Shire Hall, Bedford.

Cambridgeshire J. A. McMillan, Shire Hall, Cambridge.

Essex J. C. Leslie, Institute of Agriculture, Chelmsford, Essex.

Hertfordshire J. Hunter-Smith, Oaklands, St. Albans, Herts.

Lincoln (Kesteven) F. WAKERLEY, County Offices, Sleaford, Lincs.

Lincoln (Holland) J. C. Wallace, Kirton Agricultural Institute, Lincs.

Norfolk F. RAYNS, Agricultural Station, Sprowston, Norwich.

Suffolk, East A. W. Oldershaw, County Hall, Ipswich.

Suffolk, West R. SAYCE, Shire Hall, Bury St. Edmunds.

If you wish another account book similar to this one, tear out this slip and post it, together with 3/6, to the Advisory Economist, School of Agriculture, Cambridge.

Please send me a Cambridge Farm Account Book, for which I enclose 3/6.

FARM ACCOUNTS.

- 1. This account book should meet the requirements of the majority of mixed arable farmers in the eastern counties of England, but is not suitable for fruit growers, market gardeners, and other "specialist" types of producers.
- 2. This account book is grouped for convenience into six sections, viz.: (i) Valuations, (ii) Livestock Sales and Purchases, (iii) Crop Sales, and Miscellaneous Receipts, (iv) Labour, Purchased Foods, and Other Expenses, (v) Balance Sheets and Profit and Loss Account for the year, and (vi) Interpretation of the year's figures.
- 8. The most important reason for keeping accounts is to obtain information which will help to increase the "economic efficiency" of the farm organisation. The more dissatisfied a farmer is with the profits he is obtaining, the more need is there for him to keep accounts. The principal difference between this account book and others on the market is that it suggests [in Section (vi)] a method of interpreting the year's book-keeping results.
- 4. In keeping farm accounts it is essential to make a valuation of the farm live and dead stock on the first and last day of the financial year, and to determine the debtors and creditors on the same dates. Section (i) is designed for this purpose. It will be obvious that the closing valuation for one year will act as the opening valuation for the next year.
- 5. In keeping a record of the payments and receipts occurring during the financial year a few simple rules will simplify the work as well as adding to the accuracy of the accounts. (a) Pay all receipts, whether cheque or cash, into the farm bank account as soon as possible, entering the details as fully as may be necessary on the counterfoils of the "Pay-in slips" provided by the bank. Never use cash received from sales of eggs, milk, etc. for paying current expenses, and pass all cheques received through the bank account. If this is done the bank pass book will contain a record of all receipts, and the "pay-in" slip counterfoils will act as a reference for the details. (b) Pay as many bills as possible by cheque, entering the details carefully on the cheque counterfoils. (c) Cash required for paying wages and petty cash expenses should be obtained by drawing a cheque on "self" at the bank weekly for the amount required. The wages paid to each employee should be entered in a separate note book (e.g., the Labour Book), and the weekly totals copied into the labour account on page 44 of this book. Petty cash expenses at market or elsewhere should be entered as they are made in the farmer's pocket diary and transcribed once a week into the appropriate pages of this account book. A check on the accuracy of these records of cash expenses should be made periodically, preferably once a week. This can be done easily by adding the cash drawn from the bank (shown on cheque counterfoils) to the petty cash in hand at the beginning of the period, and comparing this total with the labour and other cash expenses (noted in the labour book and pocket diary) plus the petty cash in hand at the end of the period. Probably a small sum will be "unaccounted for" at each reckoning, and this should be included under "miscellaneous expenses" or "private expenses." (d) Private Expenses paid either by cash or by cheque should be dealt with in exactly the same way as farm expenses, but must be transcribed to the "Private Expenses Account" o
- 6. Sales and purchases should be entered in the account book only when the value concerned has been received or paid. Debts payable or receivable by the farm on the last day of the financial year must be ascertained and entered on pages 10 and 11 as well as in the livestock, crop, or expenditure accounts concerned. For example, if at the end of the year £200 is owing to a merchant, of which £170 is for foods, and £30 for fertilisers, appropriate entries will be made in the feeding stuffs and fertilisers accounts on pages 46 and 48, as well as in the list of debts payable on page 10. Amounts paid or received for purchases or sales carried out in the previous financial year must be entered as they arise in the produce or expenditure accounts concerned. For example, a payment made for cake purchased in the previous year will be entered in the feeding stuffs account. Adjustment for such items is made at the end of the year by subtracting the debts payable or receivable at the beginning of the year (see pages 10 and 11) from the various livestock, crop, or expenditure accounts concerned.
- 7. If any sales or purchases are made by exchange, for example, where feeding stuffs purchased from a merchant are paid for by selling him grain, the purchase and sale must be entered in this account book just as if the transaction had taken place on a cash basis. That is, the amount and value of the feeding stuffs bought must be entered in the purchased feeding stuffs account, and the amount and value of the grain sold must be entered in the corn account.
 - 8. It is advisable to keep all vouchers, invoices and receipts for a reasonable period.
- 9. Occupiers who own their holdings will find a special account for their commitments as Landlords on page 54.
- 10. A few blank pages are left at the end of each section to be used in the event of the space allowed in the ruled pages not proving adequate. In the general arrangement of the account book it has been assumed throughout that only one current bank account is used.

VALUATIONS.

- 1. The best time to make a valuation is when there is the least amount of crops and livestock on the farm. Any time between December and April should be suitable. Whatever date is selected for the first valuation should be adhered to in all subsequent valuations.
- 2. On the day chosen for valuation the farmer must walk round all his fields and premises and make a note in any small note book of all the livestock, harvested crops, growing crops and tillages, stores, implements and machinery which are on the farm. A brief description of the ages and condition of the livestock, of the quantity and quality of the harvested crops, etc. should be made as each is entered in the note book. The next step is to estimate the money value of each item.
- 8. In estimating the money value of the livestock the animals may be valued individually or in groups according to age or condition. For example, in valuing the working horses, animals less than 8 years old may be grouped together, animals 8—12 years old may be put in a second group, and a third group made for animals over 12 years. For young horses "8 year olds," "2 year olds," "1 year olds," and "under 1 year" will be the obvious groupings. The valuation of breeding stock (e.g., cows, ewes, sows, etc.) should be kept as stable as possible from year to year, while the valuation of fattening and store stock should be based on market prices current at the date the valuation is made.
- 4. In valuing harvested crops four considerations have to be taken into account, viz.: (a) the quantity, (b) the quality, (c) the market price, and (d) the cost of preparing the crop and transporting it to market. In valuing corn crops in stack it is customary to assume that the value of the straw will off-set the cost of threshing and marketing. But in valuing, say, a pit of potatoes, considerable allowances will have to be made for dressing and transport. In estimating the quantity of roots or potatoes in pit it can be assumed that 60 cubic feet equal I ton of crop. Hay stacked for 6—9 months cuts out at about 300 cubic feet to the ton. Beans, wheat, oats and barley in stack generally thresh out at about 1 sack of grain to 130, 110, 90, and 80 cubic feet respectively.
- 5. In valuing growing crops and tillages each field should be considered by itself. If the crop is ready for harvesting the valuation may be made on the basis of the estimated yield. But in the case of tillages or young growing crops the valuation should be made on the basis of the estimated cost to date. This estimate can be arrived at by detailing the number of days manual, horse and tractor work already spent on the field in ploughing, harrowing, drilling, applying fertilisers, etc., and the amount of seed and fertilisers already applied. Seed and fertilisers should be charged at market price; manual labour may be charged at 5/6 per day, horse labour at 4/6, and tractor work at 20/- per day. Dung may be charged at 5/- per load, plus 1/6 to 2/- per load for carting and spreading. A proportion of the year's rent may also be included. Where tillages and unexhausted values remain fairly constant from year to year they may be kept at a fixed figure in the valuation, or even omitted entirely.
- 6. Stores in hand, such as coal, paraffin, feeding stuffs and fertilisers should be valued at their cost delivered to the farm.
- 7. In valuing implements, machinery and plant, care should be taken to make the first valuation in detail. The second and subsequent valuations may be made with less trouble. All the most valuable machinery, implements, and plant (e.g., tractor, motor van, motor car, carts, drills, cultivators, elevators, wagons, drums, binders, sweeps, fixed engines, milking machines, poultry huts, incubators, etc.) should be itemised each year, but other implements and plant may be grouped. It is unnecessary to attempt to value minor loose plant and utensils, such as brushes, forks, pails, dairy utensils, etc. In valuing the equipment at the end of the year a figure acceptable to the Inland Revenue Authorities may be arrived at merely by reducing the opening valuation by the following proportions: tractors, one-quarter; motor cars and motor vans, one-fifth; steam engines, threshing drums, fixed oil engines, one-twentieth; all other plant and machinery, one-tenth. Equipment purchased during the year (see page 51) must be included in the valuation at the end of the year at an appropriate figure. Any equipment sold during the year will be noted under Miscellaneous Receipts (see page 89), and must be excluded, of course, from the valuation at the end of the year.
- 8. It is very desirable that tradesmen should render their accounts promptly at the end of each financial year, so that the details of amounts outstanding may be entered on pages 10 and 11. The Bank Pass Book should also be made up to the end of the financial year, and the balance or overdraft ascertained.

LIVESTOCK.

Every ration and most foods are made up of three main classes of organic compounds, viz.: (1) the Carbohydrates, containing starches and sugars, (2) the Fats, and (3) the Proteins, or nitrogen-containing factors.

Simply stated, the carbohydrates and the fats supply the fuel for the animal engine, and any excess is laid down in the form of fat. The proteins build up the tissues and muscles, hair, and viscera of the body, and at the same time repair the wear and tear of the tissues that goes on from day to day. In addition to the above factors, certain other constituents are required in small amounts. Various minerals (notably calcium and phosphorus) go to form the skeleton, while salt and iron and small quantities of other minerals, for example, copper, perform certain essential functions in the body cells. At the same time the various vitamins perform obscure but necessary functions in the body. When we speak of a balanced ration, therefore, we are thinking of a ration in which the above mentioned constituents are arranged in the proportions which, as far as present knowledge is aware, will give maximum growth, with minimum food consumption. Thus, if your pig rations are lacking in salt, your pigs will grow relatively slowly, and will require more food per lb. live weight gain than if they had been fed on a ration containing sufficient salt (on a balanced ration 1 lb. live weight gain can be put on for 81 lb. of meal, while on certain unbalanced rations 7-8 lb. are required). Or if your cows do not receive sufficient protein they will lose flesh and milk yields will fall. On the other hand, a ration which is suitable for a mature animal is quite unsuitable for a young one. In youth growth is normally more rapid than in maturity, bones, muscles, and tissues develop apace and the ration at this stage must contain a higher proportion of the body building materials, i.e., proteins. It must, therefore, be borne in mind that it is necessary to use rations with a higher percentage of protein when dealing with young stock if you wish to obtain the best results.

Concentrated feeding stuffs may be roughly classified according to their protein and carbohydrate content. Broadly speaking, barley, wheat, oats, maize, and rice supply carbohydrates, while soya beans, peas, milk, ground nuts, and particularly fish meal supply protein. Cereals in general are rich in starch but deficient in protein, and ash (salt and lime). These deficiencies can partly be remedied by including in the ration protein and lime rich hay from leguminous crops. At the same time fish meal and milk are rich in mineral matter, particularly in lime and phosphates. If any of the other protein foods are used minerals in the form of ground limestone, steamed bone flour, and salt must be added. A suitable mixture for pig feeding is 6 parts of ground limestone, 5 parts of steamed bone flour, and 1 part of salt, fed at the rate of 2 lb. per cwt. of ration. Young green grass is the most valuable natural source of vitamin, but most green foods contain small amounts. Cod liver oil is valuable in winter when grass or other green crops are not available.

A great deal of money is wasted by farmers every year as a result of the use of unsuitable and badly balanced rations. A common mistake, especially in the Eastern Counties, made by feeders of fattening cattle is to use rations that are far too rich in protein. An even more common error in the case of pig feeders is to use rations deficient in protein. Now that livestock and their products are the farmers most important source of income, and as skilful management is necessary if a profit is to be secured, a knowledge of scientific rationing is essential in any attempt at cost reduction.

The following bulletins, obtainable from H.M. Stationery Office, Adastral House, Kingsway, London, W.C.2, will be found useful for reference purposes:

- 1. Home Grown Feeding Stuffs, Bull. 18, price 7d.
- 2. Rations for Livestock, Bull. 48, price 1/2.

#### PIGS ACCOUNT.

It is best to express the weight of pigs in terms of "score lb. liveweight." Where it is not possible to use this measure be careful to note in the weight column below the units employed: e.g., sc. dead weight, 8 lb. or 14 lb., st. deadweight or liveweight.

#### CROPS.

The growth and yield of crops are largely dependent on soil conditions, especially aeration, water supply, micro-organisms, absence of injurious substances, and plant food supply.

The texture of a soil imposes limits on the amounts of air or water which it can contain, but the farmer may control the actual content within those limits by cultivation, drainage, or the addition of moisture-retaining material such as well-rotted farm-yard manure. Cultivation should aim at producing not only a fine tilth, but also the right degree of consolidation for proper root development and free, but not excessive, movement of air and water within the soil. No amount of time or money spent in other directions, e.g. on the purchase of artificial fertilisers, can compensate for insufficient cultivation. Again, adequate drainage is fundamental to successful crop production, whilst a good dressing of well-made farm-yard manure is often invaluable on light sandy soils.

Vast numbers of micro-organisms are to be found in the soil, some are harmful, but many are beneficial. They are chiefly concerned with the conversion of reserves of plant food into a form in which these can be taken up by the plant roots. For these organisms to work satisfactorily the soil must be well aerated, free from waterlogging and well supplied with lime.

Injurious substances are most frequently associated with "sour" or "acid" soils. The presence of plenty of lime will put out of action most injurious substances. Soil acidity is a frequent cause of failure or patchiness in barley, sugar beet, mangolds and clover. Common crops which can be grown successfully on acid soils are potatoes, oats, rye and lupins. Soil acidity can be corrected by the application of some form of lime, e.g., burnt lime, chalk, or ground limestone.

The most important elements of plant food taken from the soil are Nitrogen, Phosphorus and Potash. Each of these plays a distinct part in the growth of a plant and excess of one cannot make up for deficiency of another. Nitrogen stimulates leaf development and general growth, encouraging the deep green colour characteristic of luxuriant growth. It increases the "bulk" of a crop and is, therefore, particularly valuable for green crops, potatoes, mangolds, sugar beet, etc. Excess of nitrogen delays ripening, leads to "lodging," increases the proportion of straw to grain, and tends generally towards poor quality produce. Phosphorus encourages root development, especially in young plants, and hastens maturity. It tends to improve size and quality of grain and to counteract some of the ill effects of excess nitrogen. Excess of phosphorus may lead to premature ripening, especially under dry conditions. Potash increases the efficiency of the leaf and helps in the formation and transport of sugars within the plant. It promotes strength of straw in cereals, and helps the crop to resist fungoid diseases. Potash also improves the quality of produce, and helps to counter-act ill effects arising from excess nitrogen.

The supply of nitrogen, phosphorus, or potash in a soil is frequently insufficient for good crop yields, and the requisite additional plant food should then be supplied in the form of manure or fertiliser. Farm-yard manure supplies all three elements of plant food, but not in the right proportions for many crops, and should be supplemented by artificial fertilisers. Of the artificial fertilisers, Sulphate of Ammonia, Nitrate of Soda, Nitrate of Lime, Nitro-Chalk, and Cyanamide supply Nitrogen; Superphosphate, Basic Slag, Ground Mineral Phosphate, and the various Bone Manures supply Phosphorus; whilst Potash is supplied by Muriate and Sulphate of Potash, Kainit, and Potash Salts.

"Organic Manures," e.g., Guanos, Dried Blood, Hoof and Horn Meal, Shoddy, etc. are much sought after by market gardeners and others engaged in intensive cultivation. There is some evidence that, for intensive culture, organic manures possess a special value over and above the actual content of plant food as shown by analysis. For ordinary extensive farm crops, however, on land receiving periodic dressings of farm-yard manure or being folded by sheep, there is little to be gained from the use of these manures which could not be obtained from a properly balanced fertiliser

The following bulletins, obtainable from H.M. Stationery Office, Adastral House, Kingsway, London, W.C.2, will be found useful for reference purposes:

- 1. Manures and Manuring, Bull. 86, price 1/5.
- 2. The use of Lime in Agriculture, Bull. 85, price 7d.
- 8. Ensilage, Bull. 87, price 1/2.
- 4. The Improvement of Grass Land, Bull. 3.

## CROPPING RECORD FOR THE HARVEST YEAR 19.....

Record all double croppings. So far as possible estimate the yields of all fodder crops (e.g., hay, roots, silage, etc.) grown primarily for feeding to livestock on the farm.

Name or number of field	Crops in this field	Acres of crop	Notes on growth and disposal of crop

#### MISCELLANEOUS RECEIPTS.

Note.—The receipts entered in the livestock and crop accounts will probably cover more than nine-tenths of the total income. The remaining items of income will probably fall under the following headings: (1) Labour, horses and machinery hired out. (2) Shooting rents (if included in rental value of farm), game and rabbits, (3) Old machinery and implements sold, (4) Dung sold, (5) Livestock taken in, (6) Grazing and foldings let out. All these should be entered here, cheque receipts being copied from the Bank Paying-in Slips, and cash receipts being copied from the pocket note book.

# LABOUR ACCOUNT, FEEDING STUFFS AND OTHER EXPENSES.

#### LABOUR ACCOUNT.

Note.—The actual cash paid to each employee each week (i.e., his total wage less his share of Health Insurance and any other deduction for cottage, board, milk, etc.) should be noted in a separate book, and only the weekly total for all employees (regular and casual) entered here. Purchases of National Health Insurance Stamps and Employer's Liability Premiums should be entered as they arise.

		TOTALS FOR YEAR						1

#### MISCELLANEOUS FARM EXPENSES.

Note.—The entries in the previous pages will account for nearly three-quarters of total expenses. The remaining items of expense will probably fall under the following headings: (1) Rent (or rental value if farm is owned by occupier, see page 54); (2) Rates on house and cottages; (8) Drainage rates if paid by tenant; (4) Bank charges and interest on loans; (5) Insurance of crops and stock; (6) Tax and insurance of motor vehicles; (7) Binder twine; (8) Vet, medicines and disinfectants; (9) Milk recording, and milk Marketing Board levies; (10) Fencing and draining materials; (11) Sprays, seed dressings and sheep dips; (12) Telephone, postage stamps and stationery, and (18) Subscriptions to societies and journals, and petty cash expenses at market, etc. All these should be entered here, cheque payments being copied from counterfoils of cheque book and cash payments being copied from pocket notebook. Note that bank charges are deducted from the current bank account, and the amounts thus involved must therefore be looked for in the Pass Book. Any rent outstanding at the end of the year should be entered here as well as on page 10.

<del>erendendi degenepene usan</del> 1- farang	Carried forward				OI year	TOTAL FOR YEAR			

#### LAND & BUILDINGS INCOME & EXPENDITURE ACCOUNT.

When the whole or part of the farm is owned by the occupier a "fair rental charge" (usually the gross Schedule A Assessment plus tithe) must be included here under "Income" as well as in the Miscellaneous Expenses Account on page 51. In addition, income from "the Estate" may also be obtained from the following sources: (1) Sales of timber, gravel, etc.; (2) Rents of property not included in the gross Sch. A Assessment of the farm (above); (3) Sales of parcels of land or cottages, etc. All these should be entered here under "Income." Expenditure incurred on maintenance of or improvements to the Land and Buildings, together with Statutory Charges (e.g., Tithe, etc.) should be entered in the "Expenditure" column. Maintenance expenses are generally incurred at irregular intervals, while there is frequently difficulty in distinguishing between maintenance and improvements. The method here adopted is to carry the total of the year's income and expenditure (irrespective of whether it is "current" or "capital") to the Private Account on page 68. It must be remembered that if there has been substantial expenditure on additions or improvements, or if property has been sold or bought, there will be some alteration in the capital value of the Land and Buildings which is not shown in the Balance Sheet on page 60. If much property is owned in addition to the farm a more detailed form of Land and Buildings Account will be advisable.

^{*}See Note at top of pages 10 & 11

#### PRIVATE EXPENSES.

Note.—Household, education, clothing, Income Tax, and other private expenses are paid out of the profit obtained from the farm, and are not costs chargeable against the farm. Private expenses paid by cheque should be entered here direct from the cheque book counterfoils. Private Expenses paid by petty cash should be noted in the pocket note book at the time they are made and the weekly totals entered here. If capital is withdrawn from the Farm Bank A/c. for the purchase of stocks, shares or other investments, it may be entered either here as an expense or in the Private A/c. on page 68.

This blank page may be used in the event of the space allowed in any one of the previous accounts not proving adequate.

#### SUMMARY OF YEAR'S ACCOUNTS.

#### BALANCE SHEET AT BEGINNING OF YEAR.*

Date.

#### BALANCE SHEET AT END OF YEAR.*

^{*}Owner-occupiers must bear in mind that the capital value of Land and Buildings, including improvements carried out during the current year, is not included amongst the Assets of these Balance Sheets. Thus to determine the real Net Capital of the owner occupier it is necessary to add the estimated value of the property to the Net Capital value shown in these Balance Sheets.

#### FARM PROFIT AND LOSS ACCOUNT

fore transferring the year's totals to this page be sure that all debts receivable and payable at the beginning and end of the ur have been correctly entered in the various accounts as well as on pages 10 and 11.

#### PRIVATE ACCOUNT.

This account enables comparison to be made of private expenses against current income from the Farm and other sources. It also shows movements of the occupier's own capital into and out of the farm and, in the case of owner-occupiers, compares gross income and expenditure arising from the Land and Buildings Account.

Net loss from Profit and Loss Account  (p. 61)  Farm produce, etc., used by household  (see below)  Private expenses (p. 57)  Purchase of stocks, shares or other investments paid out of Farm Bank  A/c. # INTERPRETATION, COST ESTIMATES, AND BUDGET.

It will be remembered that the principal objective in keeping accounts is to obtain information on the efficiency of the economic organisation of the farm. When the year's accounts have been summarised in the form suggested in the previous section, the important matter of interpretation may be commenced. Certain business factors appear to be of special importance at the present time, and the two most general of these are concerned with the relationship between:—

- I. The value of the gross farm output and the total labour bill.
- II. The value of the livestock output and the total value of foodstuffs consumed. An examination of the accounts from these two aspects will give at least a rough idea as to the efficiency of the labour organisation and livestock management respectively. Four figures must be calculated before these relationships can be compared, and the following notes show how to make the necessary calculations.
- (i) Value of Gross Farm Output. This can be obtained by reference to the Farm Balance Sheets and Profit and Loss Account on pages 60 and 61. From these statements abstract the following figures.

Total sales for year (from Profit and Loss A/c.) = £	
Valuation of livestock at end of year (from Balance Sheet) = £	
Valuation of crops at end of year (from Balance Sheet) = £	
TOTAL OF ABOVE (A) £	
Purchases of livestock during year (being the total of the first seven items on left hand side of Profit and Loss A/c.) = £	
Valuation of livestock at beginning of year (from Balance Sheet) = £	
Valuation of crops at beginning of year ((from Balance Sheet) = £	
TOTAL OF ABOVE (B) £	
The value of the Gross Farm Output for the year equals the difference be (A) and Total (B). Thus:—	tween Total
Total (A) = $\mathfrak{L}$	
Total (B) = $\mathfrak{L}$	
DIFFERENCE EQUALS GROSS FARM OUTPUT £	
(ii) Total Labour Bill. This is found by adding to the labour cost shown hand side of the Farm Profit and Loss Account (page 61) an allowance at coof pay for the Manual work done by the farmer himself or any other "unparhus:—	current rates
Labour Cost (from Farm Profit and Loss A/c.) = £  Estimateweeks "unpaid labour" atper week = £	
· -	
Total Labour Bill £	
(iii) Livestock Output. This can be found by reference to the Farm Baland Profit and Loss Account. From these statements abstract the following Sales of livestock and livestock products during year (being the total of the first seven items on right hand side of Profit and	
Loss A/c.) = £	
Valuation of livestock at end of year (from Balance Sheet) = £	
Total of Above (A) £	
	···

Purchases of livestock during year (being the total of the first seven items on left hand side of Profit and Loss A/c.) = £  Valuation of livestock at beginning of year (from Balance Sheet) = £
Total of Above (B) £
The value of the Livestock Output for the year equals the difference between Total (A) and Total (B). Thus:—  Total (A) = £  Total (B) = £
DIFFERENCE EQUALS LIVESTOCK OUTPUT £
(iv) Total Value of Foodstuffs Consumed. This is found by adding to the cost of purchased feeding stuffs fed to livestock during the year an estimate of the value of the home grown foods (including pasture) consumed by the stock. The value of purchased foods consumed during the year may be found by reference to the Profit and Loss Account on page 61, not forgetting to make allowance for any difference in the quantity of foods in hand at the beginning and end of the year. Thus:—
Feeding stuffs bought (from Profit and Loss A/c.) = £  Value of purchased foods on hand at beginning of year (page 8) = £
Deduct value of purchased foods on hand at end of year (page 8) = £
Difference equals purchased foods consumed £
An estimate of the quantities of home grown foods (including pasture) can be made on page 70, and reasonable money values applied to these. The estimated value of home grown fodders can be worked out on a spare sheet of paper, and the total sum (whatever it may come to) inserted here:  Total estimated value of home grown foods  Add purchased foods consumed (from above)  Total Estimated Food Cost for All Livestock  £
TOTAL ESTIMATED FOOD COST FOR ALL LIVESTOCK
Some of these foods have, of course, been fed to working horses, and allowance will have to be made for this in order to arrive at an estimate of the value of foods consumed by productive livestock. A working horse can be fed for a year at a cost averaging £20, so make the following calculation:  Number of working horses on farm  Cost of their food at £20 each = £  Total estimated food cost for all livestock (see above) = £  Subtract estimated cost of food for working horses = £
PRODUCTIVE LIVESTOCK £
Now you are in a position to work out the important relationships described in the first paragraph on page 65.
I. Value of Gross Farm Output per £100 Labour. Multiply the value of the Gross Farm Output [(i) above)] by 100, and divide by the Total Labour Bill [(ii) above]. Thus:—  Gross Farm Output £ × 100
Total Labour Bill £
II. Value of Livestock Output per £100 Food Cost. Multiply the value of the Livestock Output [(iii) above] by 100, and divide by the Value of Foods Consumed by Productive Livestock [(iv) above]. Thus:—  Livestock Output £
Foods Consumed by Productive Livestock \$

There are no absolute standards with which the results of the above two calculations for a single farm may be compared but, generally speaking, the greater the output under these two headings the more likely is the farm to yield a profit. The following figures represent "average" standards in 1931-38 for farms of various sizes in different parts of the eastern counties. You should aim to exceed these standards very considerably.

		s Farm ( £100 La		Livestock Output per £100 food costs			
Size of farm	20-100 acres	100-300 acres	Over 800 acres	20-100 acres	100-800 acres	Over 300 acres	
	£	£	£	£	£	£	
Heavy clay soils of Huntingdon, west Cambridge & north Essex Medium to heavy loams in	160	190	210	190	175	160	
Norfolk and Suffolk Light soils in south Cambridge	170	200	220	170	155	145	
and south-east Suffolk Suburban districts in south	200	210	280	180	170	150	
Hertfordshire Pasture district in south Essex	280 280	240 290	250 800	240 240	220 220	200 200	

To illustrate the use of the above "standards" let us assume that on your farm for the past year the value of gross farm output per £100 labour works out at £290, while the value of the livestock output per £100 foods is only £110. If your farm is 200 acres in size and is on a heavy loam in central Suffolk, it is suggested by the table that "normal" standards for these two relationships would be about £200 and £155 respectively. Clearly then there appears to be more scope for improving the livestock management than for improving your labour organisation, and it is the livestock departments which should be given first attention. The weakness of the livestock organisation may be due to one or all of a number of causes common to each or confined to only one of the livestock departments. Perhaps the wrong type of livestock is being produced, perhaps you are not "balancing" your rations scientifically, perhaps you are buying relatively expensive foods, perhaps breeding is at fault, or low producers have not been eliminated. The important thing is to carry out a careful investigation for yourself and to determine the reasons for your sub-normal position, and here the cost records on pages 72 to 77 will come in useful.

Two other points of general interest can be studied from the figures shown in the Farm Profit and Loss Account and Balance Sheets. It is clear that a large profit cannot be made from a small business; e.g., a profit margin of 1d. per gallon gives a negligible income from 100 gallons of milk, but a considerable return on 10,000 gallons. Similarly, if the gross farm output [see (i), page 65] is only £500 the occupier's chance of securing a big profit is small, as it would require a profit margin of as much as 20 per cent. to yield him £100. Thus the value of the gross output is a factor influencing profits.

Value of gross output on this farm for the year [(i), page 65)] = £

The second point of interest is the ratio between gross farm output and the value of the Total Assets shown in the Balance Sheet at the beginning of the year on page 60; this relationship is called the "rate of capital turnover." If the value of the gross output is £1,000, and the value of the Total Assets is also £1,000, then you have produced £100 output for every £100 capital. If with the same capital the gross output is only £500, you have produced only £50 output for every £100 capital. A large output per £100 capital, i.e., a quick rate of capital turn-over, is advantageous. Output per £100 capital is calculated by multiplying the Gross Farm Output by 100 and dividing by the value of the Total Assets at the beginning of the year. Thus:—

Gross Farm Output (see above) £ × 100

Value of Total Assets at beginning of year (p. 60) £ £

The following figures represent the average annual output and rate of turnover in 1981-88 on farms of various sizes in different parts of the eastern counties. They will

give you at least some idea of what your neighbours achieve in these two respects, and you should aim at exceeding these averages in your own farm organisation.

	Gross	Farm O	utput	Gross Farm Output per £100 Capital			
Size of Farm	20-100 acres	100-300 acres	Over 800 acres	20-100 acres	100-800 acres	Over 800 acres	
	£	£	£	£	£	£	
Heavy clay soils of Huntingdon, west Cambridge & north Essex Medium to heavy loams in	850	900	2000	62	58	54	
Norfolk and Suffolk	400	1100	2500	68	60	57	
Light soils in south Cambridge and south-east Suffolk Suburban district in south Hert-	500	1200	8000	76	68	64	
fordshire	700	1200	2500	100	75	65	
Pasture district in south Essex	750	1300	2500	95	80	70	

To illustrate how the above "standards" may be useful let us assume that on your farm for the past year the gross farm output is £900 and the output per £100 capital is £50. If your farm is 200 acres in size and is on a heavy loam in central Suffolk, it is suggested by the table that the average gross farm output and output per £100 capital is about £1100 and £60 respectively. Under these circumstances it is probable that it would be profitable for you to try to increase your gross output and rate of capital turnover. How can this be done? Gross output can be increased in a number of ways, e.g., (i) using more fertilisers and getting bigger crop yields per acre, (ii) growing crops such as sugar beet, fruit, market garden crops, and seed crops, which have a relatively high value per acre, (iii) selling a bigger proportion of the crops grown and buying more feeding stuffs for the livestock, (iv) keeping more livestock, (v) getting higher yields from the livestock, e.g., more milk per cow, eggs per hen, pigs per sow, lambs per ewe, etc. Speaking generally each of these measures will also tend to increase the rate of capital turnover, but obviously no hard and fast rule can be laid down as to which is most desirable. Choice will depend on circumstances, and the relative advantages of each can only be determined by a process of budgeting (see page 82).

There are more ways of reducing costs than by cutting down expenditure. As a matter of fact the most profitable farms in recent years have generally spent more on foodstuffs, fertilisers, and labour than have the unprofitable farms. There are two directions from which costs may be considered. First the total output of the farm may be compared with the total costs of the farm. This aspect of cost is concerned mainly with the relative advantages of different types of crops and livestock as a source of income, and the proportions in which these different types are combined. For example, should more wheat be grown at the expense of the barley area; should cows be reduced in number and more pigs kept; should the temporary grass be allowed to lie for three years instead of two, and more sheep and store cattle introduced; is there an opening for a few acres of potatoes; should more oats be grown and less concentrated foods purchased; are there any side lines that can be exploited; can surplus milk be more advantageously marketed as cream and butter, or should it be sold as whole milk for what it will fetch, or would it be more economic to feed it to pigs and young stock, etc.? Obviously if the farm output can be increased £100 by spending an extra £50, then costs will be reduced and profits augmented.

The skeleton budget form outlined on pages 82 and 88 is arranged to allow of the setting out of alternative working plans, so that such comparisons may be made, and the organisation which seems likely to be most profitable selected. It should be noted that if items which might legitimately be described as capital costs (e.g., purchases of additional equipment) are included in the expenditure side of the budget, or if the realisation of capital (e.g., reduction in numbers of livestock) helps to swell the estimated receipts, due allowance will have to be made for such valuation changes.

The other aspect of cost relates to the efficiency with which each of the various crop and livestock departments is managed. It is known, for example, that in pig production it should be possible to produce 1 lb. live-weight increase for every 4 lb. of meal fed. On some farms, however, as much as 8 lb. of meal are fed for every 1 lb. live-weight increase and this results in high costs and low profits in the pig department. Similarly in milk production there are sometimes differences in the cost of foods of as much as 6d. per gallon between one farm and another. Sometimes high costs in a department are due mainly to low yields. For example, it costs just about as much to keep a sow which raises 10 pigs a year as it does to keep one raising 15 pigs a year, but the cost of each weaned pig will be considerably less in the latter case. Very frequently high costs in livestock departments are due to badly balanced rations, the use of unsuitable or unduly expensive foodstuffs, or to extravagant feeding. Such losses can only be eliminated by acreful recording of foodstuffs fed, and a knowledge of the scientific principles of feeding (see p. 13).

It is very helpful for a farmer to investigate the management of his most important departments by keeping a record of the number of hours of labour and hundredweights of material which are used to produce the finished article. Pages 70 to 81 are designed to help you to keep these records for yourself, and careful interpretation of these statements may help you to effect economies in costs and to increase your profits.

#### DISPOSAL OF CROPS USED ON THE FARM.

Note.—The value of home grown crops fed to livestock is on the average more than the amount spent on purchased feedi stuffs. Their money value may, therefore, run into hundreds or even thousands of pounds, and it is obviously desirable have at least a rough check on how they have been used. Some sort of estimate is better than no estimate at all. In t table below the amount used as seed plus the amounts fed to the various classes of livestock should equal the total used farm. Space for more accurate livestock costings will be found in the ensuing pages.
