ECONOMIC AND FINANCIAL SECTION

INTERNATIONAL ECONOMIC CONFERENCE

Geneva, May 1927

DOCUMENTATION

MEMORANDUM ON COAL

VOLUME I

GENEVA, 1927

Publications of the League of Nations
II. ECONOMIC AND FINANCIAL
1927. II. 8¹.

PREFACE

The Preparatory Committee for the International Economic Conference, at its first meeting in April 1926, laid down an elaborate plan of documentation in order to enable it to determine "in what domains the economic difficulties which are at present experienced are international in character". It decided that amongst other documents a series of memoranda should be prepared concerning certain industries including coal-mining, and at the same time laid down the general lines on which these memoranda should be compiled. In the early summer of 1926 the Secretariat accordingly drew up a rough preliminary draft which was circulated to certain members of the Preparatory Committee and submitted by them to the industrial associations in their own countries for comment and criticism. A fresh draft was then prepared before the second meeting of the Preparatory Committee in which account was taken of the observations received. By the date of this second meeting, however, all comments expected had not been forwarded and the document then circulated was accordingly provisional in character.

The present volume is based on information communicated by members of the Preparatory Committee from Austria, Belgium, Czechoslovakia, France, Italy, Germany, Great Britain, Poland, Spain and the United States, including observations from the Comité central des houillères de France, the Fédération nationale française des travailleurs du sous-sol, the Fachgruppe Bergbau der Reichsverbandes der deutschen Industrie, and the Mining Association of Great Britain.

The memoranda communicated by M. de Peyerimhoff on the French industry, by Dr. Lammers on the German industry, by Sir Arthur Balfour and Mr. W. T. Layton on the coal industry in general, and the Notes communicated by Dr. Page on the American industry are printed in Vol. II. Note has been taken in the present volume of these documents, and of the Austrian, Belgian, Czechoslovak, Italian, Polish and Spanish observations. The information regarding labour conditions has been furnished by the International Labour Office and by the replies from the different countries.

<i>Annex IV.</i> — (For list of contents, see page 41.)	

I. GENERAL CONDITIONS

In the other memoranda in this series, account is taken, as far as possible, both in the text and in the statistics of the situation in 1926. In the case of coal, it has generally been necessary to take 1925 as the last year under consideration, because of the abnormal position created by the stoppage in British coal-mining.

The crisis in the coal industry in Great Britain has indeed dominated the world situation ever since the granting of the nine months' subsidy in August 1925. During the period in which the subsidy was in operation, the British industry was assisted in finding an export market and in maintaining production at a higher level than would otherwise have been possible; subsequently, the reversal of a large export balance into a steady flow of imports created a situation without parallel even during the strikes of 1921 and 1922. Attention is therefore concentrated on the more normal conditions in 1925.

It is possible to overrate the effect on the coal industry of the political, economic and financial disturbances arising out of the war. In point of fact, the world production of coal and lignite¹ in 1925 was 9.5 per cent above the average level in 1909-13. The outstanding fact in coal production is that, of the total average world production in 1909-13, 78 per cent was produced in three countries, the United States, Germany (post-war boundaries) and Great Britain. In 1925 the proportion produced in these three areas was 76.7 per cent. These great exporting countries are faced with a certain contraction in external markets. In Europe there has been a decided movement in favour of each country supplying its own fuel and power requirements as far as possible. Industrial depression has also reduced the demand in certain countries. Taken as a whole, European consumption has declined. In the countries outside Europe there has been a remarkable expansion in the coal industry, especially in China and Japan, so that Pacific markets, which were formerly largely supplied from Europe, are receiving increasing quantities from Asiatic sources. The British report², in referring to the national security policy fostered throughout the world, but especially in Europe, by the war, suggests that this tendency towards a self-sufficing policy in coal "has now almost reached its limit".

Of the factors likely to effect a permanent reduction in the demand for coal, the most important are :

- (1) Improved methods of combustion, and the increasing indirect use of coal for the generation of gas and electricity instead of direct use, effecting substantial savings in coal consumption per unit of heat;
- (2) The competition of oil-fuel;
- (3) The supply of hydro-electric power.

¹ Except where otherwise stated, "coal and lignite" means coal and lignite converted in terms of hard coal on the basis of 9 tons of lignite = 2 tons of coal. All the conversions have been effected on this basis. It should, however, be noted that the ratio currently used in Czechoslovakia is 7 to 1, which corresponds roughly to the calorific value of Czechoslovak lignite as compared with that of coal.

² See Vol II.

(1) Detailed information of the economies recently effected in the utilisation of coal are generally lacking. The increase in indirect consumption (as gas or electricity) certainly indicates a large saving on direct use. Other economies by improved methods of combustion, etc., should be taken into account. The adaptation of low temperature carbonisation processes to industrial use would undoubtedly create economies in fuel and increase the productive value of coal. These purely scientific questions lie outside the scope of this memorandum, but they are of fundamental importance to the future of the industry.

(2) Oil fuel is now increasingly used in industrial processes ; an example is the conversion to oil-burning of installations in the Chile nitrate mines. Its increasing use in sea transport is shown in the following table :

Table A.
TONNAGE OF STEAMSHIPS AND MOTOR-SHIPS LAUNCHED IN THE WORLD.
PROPORTIONS BURNING COAL AND OIL.

Period	Types of Engines			Fuel			
	Steam reciprocating	Steam turbines	Motors	Coal		Oil	
	Gross tons (000's)	Gross tons (000's)	Gross tons (000's)	Gross tons (000's)	Per cent	Gross tons (000's)	Per cent
1918-1919	2,634	1,051	76	2,491	66.2	1,270	33.8
1919-1920	2,821	1,286	80	2,111	50.4	2,076	49.6
1920-1921	2,373	755	102	1,260	39.0	1,969	61.0
1921-1922	1,421	870	227	895	35.5	1,622	64.5
1922-1923	842	603	165	663	41.1	948	58.9

1924-1925	895	114	302	671	51.2	640	48.8
1925-1926	576	146	602	419	31.6	906	68.4

Source : *Annual Report of the Society's Operations (Lloyd's Register of Shipping) 1925-26.*

It is estimated that as much as seven to eight million tons of shipping has been adapted for oil burning and can readily be converted backward or forward to coal or oil according to the price. The great liners converted to oil could not be reconverted without enormous expense.

There has recently been a shift back to coal, except in the big liner companies, where oil has special advantages because of the time saved in taking in fuel, the saving in labour and the smaller space occupied by oil. It has been stated that, with oil at 72s. 6d. per ton, a competitive price for coal, taking all considerations into account, would be 48s. 6d. Much depends on the voyages in question. Vessels fitted to burn oil, bunkering, say, in California or at Panama, Borneo or Singapore, could obtain oil cheaply there, sufficient to take them to Europe and back. A boat of 8,000 tons, using one of these routes, would, if converted into oil-burning, reduce the demand for coal by at least 2,000 tons of coal per voyage¹.

¹ Evidence of Sir E. W. Glover and Mr. R. D. Holt before the British Royal Commission on the Coal Industry.

The increase in the use of oil-fuel at sea affects Great Britain more seriously than other countries, because of the large place in her exports filled by bunker coal.

(3) Under the third head the following figures concerning the existing and prospective development of water-power for the generation of electricity, given in Vol. I¹ of the Report of the World Power Conference of 1925, are of interest :

Country	H.P. in millions	
	In operation	Estimated further development
Austria58	2.28
Finland19	2.54
France	1.34 ²	10.72 ³
Italy	1.53 ⁴	8.00
Norway	1.82	16.00
Spain	1.26	6.00
Sweden	1.42	11.60
Switzerland	1.49	8.00
Total H.P.	9.63	65.14
Kilowatts, in millions.	7.18	48.6
Annual load factor. .	50%	50%
Units generated, in millions.	31,450	213,000
Assumed consumption of coal per unit generated .	2 lb. (0.9 kg.)	2 lb. (0.9 kg.)
Equivalent total in tons of coal (2,240 lb.)	28,000,000	190,000,000

It will be seen that the water-power actually utilised in these countries only represents the equivalent of the potentialities of about 2.3 per cent of the world production of coal and lignite in 1925.

Italy is frequently quoted as an example of the effect on the consumption of coal of an increased supply of hydro-electric power. The following table illustrates the progress made :

Consumption of Electric Power in Million Kwh. in Italy.

	Lighting	Railways and tramways	Industry	Total
1914-15	209	40	2,275	2,524
Percentage	8.3	1.7	90.0	100
1923-24	550	161	5,588	6,199
Percentage	9.0	2.6	88.4	100
1924-25	600	500	6,400	7,500 ⁵
Percentage	8.0 .	6.6	85.4	100

¹ See Summary in Report of Royal Commission on the Coal Industry, Vol. III, Appendix No. 4.

² 1 kw.

³ 8 kw.

⁴ Italian statistics show 2.6 millions in 1925.

⁵ Information supplied direct (calculation of the electrical trade); the official figure is rather lower : 7.05 million kwh.

The estimated corresponding coal economy on the railways (in thousands of tons per annum) is : 1914-15, 95 ; 1919-20, 150 ; 1924-25, 325. Nevertheless, consumption of coal in Italy shows an increase in 1923-25 as compared with the average of 1909-13, but the addition of the new provinces should be taken into account. Consumption per head shows a decrease.

The increasing use of alternative primary sources of power in the United States illustrates the change in demand for different kinds of fuel.

Percentage Production of Power in the United States¹.

	Coal	Oil	Gas	Water-power	Total
1911-15	83	9	4	4	100
1921-25	70	19	5½	5½	100
1926	67	21	6	6	100

In Germany great interest is being shown in the recent development of the chemistry of coal, especially in the production of fuel oil — the production of mineral oils from coal by the application of hydrogen. The economic possibilities of the process are now being tested for its application on a commercial scale. If success is achieved, a great impulse will be given to coal-mining, and some compensation will be provided for the effect on the demand for coal by the increased use of water-power, oil, etc. But the results of the experiments now being made cannot yet be foreseen².

The import and export figures given in Annex IV, Table VIII, bring out clearly the fact, which is common knowledge, that it is in the great exporting countries, more especially in Great Britain, where, before the war, one-third of the coal raised was for foreign markets, that the crisis in the industry is most seriously felt. The year 1925 saw an absolute drop of more than 17 million metric tons in British exports as compared with the average 1909-13, and of more than 27 million metric tons as compared with 1913.

But the difficulties experienced by the coal industry in the great producing and exporting countries are not due so much to a general decrease in demand as to changes in the distribution of production and in the direction of the trade, both of which are dealt with in detail in the sections on production and trade. The former is likely to be permanent, failing a great reduction in price in the main exporting countries; the second is partly due no doubt to circumstances which may be susceptible of modification by political and commercial understandings and agreements.

Post-war difficulties have led at various times to the imposition of restrictions on the import of coal. Restrictions on the import of coal, whether direct or indirect, are, however, few, and ultimately the determining factors must be price and cost of production.

Cost of production itself must depend not only on labour costs and the natural configuration of the mines, but also on the extent to which mechanical appliances in coal-getting are employed. In a note supplied by the Mining Group of the

¹ See Vol II.

² Information supplied direct.

Reichsverband der deutschen Industrie¹, it is stated that the increase shown in Germany in output per head per shift since 1922 must not be attributed solely to the lengthening of the shift, but also to the rationalisation of the industry and to the increased application of machinery. In Great Britain, in 1925, 18.7 per cent of the coal output was estimated to have been raised by mechanical means as against 8.5 per cent in 1913². In the United States of America, where the natural configuration of the mines is more favourable for the use of machinery, the amount of coal extracted in this way was 69.5 per cent in 1923³.

On the question of international action to assist the coal industry, the opinion is expressed by the Mining Association of Great Britain that, with the restoration of normal financial and economic conditions in Europe and the abandonment of a rigorous policy of "economic nationalism", no remedy will be necessary.

The "Fédération nationale des Travailleurs du sous-sol", however, draws attention to the danger of the attempt by certain countries to control the markets for their products, leading to reprisals by those favourably situated with respect to other materials, and general political and economic tension. The Federation recommend the establishment of a central coal bureau to ascertain requirements and ensure equitable division of the coal supply, avoiding over-production and the consequent evil effects on wages, output, etc.

The German note says that, in view of the extraordinary depression on the European coal market, which does not seem to be of a merely transient character, and of the acute price-cutting war waged in these markets by the coal producers, there is much to be said in favour of some international agreement being reached.

II. CONSUMPTION.

In Annex IV, Table IX, the consumption of coal and lignite in 1909-13, 1913 and 1923-25 in 26 countries is given in terms of coal. Information as to changes in stocks of fuel during the period under review has been received from Belgium, Czechoslovakia, France and Poland but, since it was only available for these countries, Table IX of Annex IV and the summary table below have been based solely on production and the movement of trade, the other figures being shown in footnotes. The error thus involved is — probably — never greater than 10 per cent of consumption. The figure for total consumption includes coal consumed at the mines, miners' coal and metallurgical coke. Table B shows for certain countries total consumption, consumption per head, and the percentage which the excess of imports over exports forms of consumption in each case, *i.e.*, the extent to which each country is dependent on external supplies.

¹ See Vol. II.

(¹) 1924. (²) 1913. (³) Including Luxemburg.

(*) For fuller details and explanations, see Annex IV, Table IX.

Consumption of coal per head is to some extent an index of the degree of industrialisation of any country.

In the United States, water-power accounted in 1925 for 6 per cent of the power raised. Leaving water-power out of account, the following table¹ shows the changes in the consumption of fuel for power and all other purposes. Gasoline and kerosene are omitted, also wood fuel.

Fuel Consumption in the United States in Terms of Coal or Coal Equivalent.

	Average 1911-15		Average 1921-25		Increase %
	Metric tons (000,000's)	%	Metric tons (000,000's)	%	
Coal	466	89.6	491	82.2	5
Oil	30	5.8	68	11.3	126
Natural gas . .	24	4.6	39	6.5	62.5
Total . .	520	100	598	100	15

More heat and power, however, is now being derived from fuel than formerly, the increase since 1913 being estimated at 26 to 28 per cent.

The fuel consumption on railways shown below affords an example of the economy in use effected². Pre-war figures are not available.

Lbs. of Coal or Equivalent consumed :

	Per 1,000 gross freight-ton-miles.	Per passenger train-car-mile
1920	197	18.8
1922	186	17.9
1924	170	17.0
1925	159	16.1
1926 (estimated)	155	—

This means a fuel economy of 21.3 per cent for goods traffic and of 14 per cent for passenger traffic within the last seven years.

In Great Britain the consumption of coal in the twelve months ending June 1925 showed a decrease of 5 per cent as compared with 1913. The division among classes of consumers in 1913 and 1924 is shown in the following table³ :

¹ See Vol. II. The amounts have been converted into metric tons. Conversions to coal equivalents are on the basis of 4.2 barrels of petroleum to 2,000 lb.; natural gas at 22,000 cubic feet to 2,000 lb.

² See Vol. II.

³ Appendix to Report of the Royal Commission on the Coal Industry, Vol. III, page 6. Under "manufactured fuel" only that retained for home consumption, under "electricity stations" only those belonging to recognised undertakings and to railway and tramway authorities are included. The share of exported coke from coke ovens and gasworks is not distinguished in the 1913 returns; it has therefore been divided between the two, which may cause a slight error.

*Approximate Distribution of the Coal available for Consumption in Great Britain
in 1913 and 1924 (000,000's).*

Tons of 2,240 lb.

	1913	%	1924	%	Increase or decrease
Coke ovens	(18.6)	(10.1)	16.2	9.0	— 2.4
Gasworks	(16.4)	(8.9)	16.7	9.2	+ 0.3
Manufactured fuel	0.3	0.1	0.1	—	— 0.2
Electricity stations	4.9	2.7	7.7	4.3	+ 2.8
Railway transport	13.2	7.2	13.5	7.5	+ 0.3
Bunkers (coastwise trade) .	1.9	1.0	1.3	0.7	— 0.6
Blastfurnaces	2.8	1.5	1.5	0.8	— 1.3
Collieries	18.0	9.8	16.6	9.2	— 1.4
Domestic use	39.3	21.5	40.3	22.4	+ 1.0
General manufacturing and other purposes	68.4	37.2	66.5	36.9	— 1.9
	183.8	100	180.4	100	— 3.4
Foreign bunkers	21.5		17.9		— 3.6

The decrease in British consumption is thus more than accounted for by the decreased demand of industry — $3\frac{3}{4}$ million tons in the iron and steel industries and over $1\frac{3}{4}$ million tons for general manufactures.

In Germany the average post-war consumption per head shows a substantial decrease, which is explained mainly by the condition of German heavy industry, but partly by more economical methods of using coal. In 1925, pig-iron production was 93 per cent and steel production 100 per cent of the pre-war production within post-war boundaries, but the index for the three preceding years was much lower¹. Coke production fell from 31.7 million tons in 1913 to 26.8 million tons in 1925, a decrease of nearly 16 per cent². It is stated that lignite, which was first regarded as a substitute for coal, is now preferred for certain purposes, that it is used almost exclusively in the nitrate industry and is preferred in the glass industry. In 1924, 41 per cent of the public electricity supply was derived from lignite fuel³.

The Belgian figures for 1923-25 are for the Customs Union of Belgium and Luxembourg and therefore include the Luxembourg steel industry. They show an absolute increase of 5,596,000 tons over the pre-war figure. In Belgium alone the consumption of coal for metallurgical coke averaged 383,480 tons a month in 1913; in 1925, the monthly average was 461,768 tons⁴.

French production of about 47 million metric tons (excluding the Saar) leaves a deficit of 26 million tons to be imported to meet a consumption of over 73 millions. This consumption figure is practically the same as in the present boun-

¹ See *Memorandum on Iron and Steel*. Geneva, 1927.

² Information supplied direct.

³ Report of the British Royal Commission on the Coal Industry, page 244.

⁴ Administration des Mines. *Revue de l'Industrie minérale*, August 1926.

daries in 1913, 61 millions for the former French territory and 10 or 11 millions for Alsace-Lorraine. There is therefore a retardation of what formerly was considered normal development. In the ten years before the war, coal consumption regularly increased by about $1\frac{1}{2}$ million tons per annum. It is expected that the industrial development realised since the war will lead eventually to an increased consumption in spite of the competition of liquid fuels and hydraulic power¹.

The figures² given by French official statistics give a consumption reckoned in coal of 75,631,000 metric tons in 1925. The consumption of three important classes of consumers was in 1913 and 1925 as follows :

	1913	1925
	(Metric tons, 000,000's)	
Metallurgy.	12.5	11.2
Railways	9.1	11.6
Mining	5.1	4.9

In 1913, gasworks consumed 4.7, shipping 1.7, industries other than iron and steel 19.8 million tons, and approximately 12 millions went into domestic consumption. Post-war figures for these categories of consumers are not available.

Austria has increased her production of lignite from 2.5 to 3 million metric tons. She has effected economies in the use of coal by the electrification of many stretches of railway, and by improvements and consequent economies in the generation of heat and power.

Effective consumption in Italy within pre-war boundaries probably remains about the level of 1913, in spite of the greatly increased industrial production. The reason is to be sought in the development of water-power. Consumption of coal among the various classes of consumers was roughly as follows in 1925 : railways and tramways 3.5, bunkers 1, industry 6 and domestic consumption 1 million metric tons. Only a small amount of coal enters directly into domestic consumption, most of which is in the form of gas. The consumption of coal by the metallurgical and engineering industries, by the chemical industries and by gasworks increased in 1920-25. Other industries use hydro-electric power in an increasing degree³.

The actual decrease in Switzerland and in Sweden has been made good to some extent by the same means as in Italy, by the use of water-power; but the production of pig-iron and of steel in Sweden is also less than in 1913.

Russian⁴ consumption has fallen by more than 40 per cent. Russian industry before the war consumed the equivalent of 22.4 million tons of coal in coal, wood, etc.; in 1923-24 fuel consumption was only 11.3 million tons for industrial purposes. The changes in consumption to make good the shortage of coal are as follows, the various fuels used being reduced to coal equivalents :

¹ See the French Memorandum, Vol. II.

² Communicated direct. The figures in Annex IV, Table IX, used in the preceding paragraph, give different results for reasons explained in the footnote to the table.

³ Mortara *Prospettive Economiche*, 1926, pages 292-3.

⁴ Ramsin, Russian Power Resources. World Power Conference Report. Vol. I, page 1255.

	Average 1909-13	Average 1923-24
	%	%
Coal	23.3	13.5
Lignite	0.4	0.8
Oil, etc.	8.6	6.9
Peat	0.7	1.3
Wood and vegetable fuel .	67.0	77.5
Total	100	100

In 1923-24 the Russian railways used 21 per cent wood, 25 per cent oil and 54 per cent coal.

Polish consumption of 20.6 million metric tons of coal and lignite was distributed in 1925 as follows : metallurgy, 14.65 per cent ; gas and electricity works, 4.9 per cent ; railways, 17.32 per cent ; mines, 15.66 per cent ; bunkers, 1.09 per cent ; various industries, 18.46 per cent; domestic, 27.92 per cent¹.

In Spain consumption has fallen. The diminution is partly explained by the necessity for economising in coal during the war, which led to the development of water-power resources and to the creation of an industry for the distillation of coal. Many industrial and transport companies use benzol and gasoline ; fuel resources have also been increased by alcohol derived from vegetable products¹.

But whereas the European countries show relatively small increases or actual decreases in consumption, the consumption of China, India, Japan and Australia is now much higher than it was, and that of the Union of South Africa is substantially higher owing to the progress of industrialisation. The South American countries show a decrease, the most pronounced being in Chile. The drop in coal imports into Chile began in 1914, when oil fuel began to be used on a large scale in the nitrate plants. In view of the high cost of oil, certain plants are being changed over to coal-burning and an effort is being made to develop the national production of coal².

Decreased consumption in Argentina is also explained by the displacement of coal by oil fuel. The use of oil fuel on Argentine railways is a post-war development. In 1924 the percentage of oil fuel to all fuel used on the railways was 26.9 per cent ; in the year ended June 1925, there was a certain reversion to coal, the percentage of oil fuel used falling to 21.5 per cent.

III. PRODUCTION.

The world production of coal and lignite (converted at the ratio 2 : 9) before the war and in 1923-25 is shown in Table C, below ; the figures for coal and lignite are given separately and in greater detail in Tables I and II of Annex IV. The post-war production of the principal countries is expressed in Table D as a percentage of pre-war production within the same boundaries, and of world production in each year.

(*) Post-war territory.

¹ Including Formosa, Korea, Kwantung and Karafuto, except for 1925.

² Great Britain, 1923-25.

³ Including Asiatic Russia.

The output in 1913 was a record, though the Mining Association of Great Britain points out that it should not be regarded as abnormal in view of the upward trend of production before the war. The low level in 1921 and 1922 was largely due to strikes in Great Britain and the United States. The recovery of these two countries in 1923 offset the fall in Germany due to the occupation of the Ruhr, and world output in that year exceeded the average in 1909-13 by 10 per cent, falling little short of the 1913 level of coal and lignite expressed in terms of coal. There was a slight falling-off in 1924; but production was 9.2 per cent higher in that year than the average of the period 1909-13.

The principal features of recent development have been : (1) the drop in the production of European exporting countries ; (2) the increase in the production of European importing countries and of countries outside Europe ; and (3) the increased output in Europe of lignite.

In Germany, the production of coal and lignite reached its highest point in 1913 with a total of 208.4 million tons. Under the Peace Treaty, Germany lost some 26 per cent of her coal resources. The production of hard coal within the present boundaries of Germany reached 140.7 million tons in 1913, but had fallen to 62.2 million tons in 1923, the year of the Ruhr occupation. Domestic requirements were met to a large extent by the increased production of lignite, which in 1925 was 87 per cent greater than the average of 1909-13 and 60 per cent greater than that of 1913. The total production of coal and lignite in 1925 thus amounted in terms of coal to 163.8 million tons, or 3.7 million tons more than the 1913 output from the same area.

The improvement in 1924, 1925 and 1926 was secured by the rationalisation of the industry and the greatly increased application of machinery, even in the Ruhr, where the configuration of the coal-seams complicates the mechanical problem¹. But the hard coal production of 1925 was still 5 per cent below that of 1913 in the same area. The decrease was due to the contraction of output in the Ruhr area. The figures² are as follows for the principal areas :

	1913	1925
	(in millions of metric tons)	
Ruhr	114.2	104.1
Saxony	5.4	3.9
Lower Silesia	5.5	5.6
Aix-la-Chapelle	3.3	3.5
German Upper Silesia	11.1	14.3

German Upper Silesia was thus able to make up for the coal which she previously purchased¹ from the Polish district.

Conditions in Europe were favourable to the British coal industry in 1923, and the total production was 2.4 per cent above the pre-war average and 96 per

¹ See Vol. II.

² *Jahresbericht der A. G. Reichskohlenverband*, 1925-26.

cent of the 1913 record. In 1925, in spite of the granting of the subsidy, production fell to 248 million metric tons, or 85 per cent of 1913.

The coal industry in Poland has been affected during the last few years by circumstances dealt with in the section on trade. In 1925 the combined production of coal and lignite in terms of coal was 80.9 per cent of the 1909-13 average. The Polish industry was, however, favourably affected in 1926 by the consequences of the British coal dispute.

In 1913 the mines of Nord and Pas de Calais furnished two-thirds of the total French production. The mines of Central and Southern France had made very little progress in the decade before the war. But development in the mines of Nord and Pas de Calais had been rapid, and, as soon as the war damage had been made good, was resumed, with the result that production in 1926 was estimated to be 32 million tons, an increase of 17 per cent on 1913. The following table¹ shows the progress made, 1919 being added to show the falling-off immediately after the war.

	1913	1919	1925
	(in millions of metric tons)		
Centre and South.	13.5	12.0	14.1
Nord and Pas de Calais.	27.4	7.9	28.7
Lorraine.	3.8	2.5	5.3

The output of hard coal in the Netherlands in 1925 was 357 per cent greater than that of 1909-13; in Spain 52 per cent; in France 7 per cent. Of the other importing countries which are also coal producers, Italy, Portugal, Bulgaria, the Kingdom of the Serbs, Croats and Slovenes and Austria have largely increased their production, though the absolute amounts are in each case small. Spitzbergen has developed an export of 400,000 tons a year, or eleven times that before the war. In Russia, the output of coal and lignite has been growing steadily since 1920, but was in 1925 still only 74.2 per cent of the average of 1909-13 in the same territory. Czechoslovakia, Sweden, Hungary and Roumania all produced slightly less in 1925 than they averaged before the war. On the whole, however, the importing countries have increased their home production.

There has been a general increase in the production of coal and lignite in the other continents. Production of coal and lignite in North America has risen to 9 million tons above that of 1913; Central and South America raised 1.5 million tons in 1913 and 2.2 millions in 1925. Asia, with an estimated output of 80.5 million tons in 1925, produced 62.6 per cent more coal than before the war; African output has risen from 6.9 (1909-13) to 12.6 million tons, or by 82.7 per cent. The production of Australia and New Zealand in 1925 was about 15½ million tons, an advance of 3½ millions on 1909-13. Table D shows that America and Asia have increased their share of the world's production at the expense of Europe; though the shift has only been 4 per cent. Production in the United States was greatly stimulated by the war and reached its peak in 1918.

¹ The figures are supplied by the Comité Central, and include lignite, but the amount is small and does not seriously affect the totals.

IV. PRICES.

Table E on the following page gives the selling price at the pit-head of certain qualities of coal in Germany, France, Belgium, Great Britain, United States, Poland and Czechoslovakia in 1913 (yearly average) and for each month from December 1923 to December 1925. The quotations in the first column are taken from *Glückauf*, except those for Poland and Czechoslovakia, which have been supplied in the replies from those countries. For the last month in each year, index numbers have been calculated on the basis of the average prices in 1913.

The interpretation of price statistics is extremely difficult, owing to changes in the value of money, to the confusion between price per ton raised and per ton commercially disposable, to the considerable but varying difference between pit-head and f.o.b. prices, and to the fact that in several countries different pit-head prices are quoted for coal for inland consumption and coal for export.

Prices must be considered in connection with freight charges. In countries where the coal-mines are distant from the ports it may be economical to import foreign coal by sea rather than from inland national centres. This explains the reason for the import of English coal into French Gironde and Mediterranean ports and to the northern German ports. At the end of April 1926, a ton of English Durham gas coal (best), f.o.b. English ports, cost 20.10 marks and the freight to Hamburg 3.77 marks, so that the cost c.i.f. Hamburg was 23.87 marks.

In evidence given before the British Royal Commission on the Coal Industry, Sir Richard Redmayne laid stress on the high price of coal as the most important factor in the depressed state of the coal market.

The following figures¹ of coal export values in 1924 and 1925, reckoned in gold Reichsmarks, in Great Britain, Germany and the United States (bituminous coal) give averages over three months :

Export Values for Coal.

Average	British	German	American
	In gold marks per metric ton.		
July-September 1924	21.03	22.28	20.57
October-December 1924	20.76	19.21	19.79
January-March 1925	20.81	20.06	19.36
April-June 1925	20.53	19.46	18.93
July-September 1925	19.44	20.31	18.90
September-November 1925 . . .	18.77	21.25	19.66

For Great Britain the difference between costs and proceeds before the coal stoppage of 1926 may be seen from the two following tables (F and G) published in the Royal Commission's Report on the Coal Industry.

¹ Report of the Royal Commission on the Coal Industry, page 245. In the original table, prices for the overlapping periods are also shown.

The situation varies greatly from district to district, and it is necessary to supplement the above by a table of costs and proceeds in different areas.

Table G.

QUARTER ENDING DECEMBER 1925. SHILLINGS AND DECIMALS THEREOF.

¹ Including subvention.

The foregoing tables may be supplemented by Table H, supplied by the Mining Association of Great Britain, giving yearly average pit-head prices over a longer period. Gold-value indices, on the basis of the average price in 1909-13, have been added. Table I is taken from the Report of the Royal Commission on the Coal Industry (Great Britain) and shows the average annual value f.o.b. per long ton exported from Germany, Japan, Great Britain and the United States ; gold-value indices have been inserted.

Table H.

V. IMPORTS AND EXPORTS.

The balance of trade in coal, coke, etc. (expressed in terms of coal) in the principal consuming countries is shown in Table J. The foreign trade by country of destination of the four principal exporting States — Great Britain, the United States, Germany and Poland — is shown in Table K ; while details of

the imports and exports of coal, coke and manufactured fuel of the countries given in Table J will be found in Annex IV (Table VIII). The transfer of Alsace-Lorraine from Germany to France, the inclusion of the Saar district in French Customs territory from 1925, the transfer of part of Upper Silesia to Poland, and the formation of the Belgo-Luxemburg Economic Union make direct comparison with pre-war figures difficult as far as these countries are concerned. In the case of France, the imports from the Saar in 1925 have been taken at the figure of 1924 and added to the importation figures in order to allow of a reasonable comparison with the preceding years in Table J. Reparation deliveries are included in the German export statistics.

¹ Austria-Hungary.

Comparatively unimportant amounts of lignite enter into international trade, except in the case of Germany and the Austro-Hungarian Succession States.

The main feature of post-war trade in coal and coke has been a general drop in the net imports of all the principal importing countries except Canada, Belgium, Italy and France. China, which showed a net import of 952,000 tons per annum in 1910-13, had an export balance of 1,588,000 tons in 1924 and 193,000 tons in 1925. The net imports of Argentine, Brazil and Chile fell from 8.2 million tons in 1913 to 5.4 million tons in 1924. The greater part of this decrease was in Chile, which took about 1½ million tons of coal in 1910-13 and only 314,000 tons in 1924. The import of coal into Russia has practically ceased. In the period 1909-13 gross imports averaged 6.4 million tons per annum and in 1925 only 63,000. In this latter year, there was an export balance of 261,000 tons, most of which passed into the Mediterranean trade. The consumption of coal in Scandinavia has also fallen off. In 1913, Sweden, Norway and Denmark imported 12.3 million tons; and in 1925, under 11 millions from the principal exporting countries.

The changes in the destination of the exports of the principal exporting countries are shown in Table K.

In 1925 Great Britain had lost over one-quarter of her 1913 trade in coal. The reduction in bunker fuel, which is itself partly due to the decrease in coal exports, accounts for 16 per cent of the decrease, the closing of the Russian market for 23 per cent, and the diversion of the French, German and Italian demand for 37 per cent.

The United States shows a reduction in exports of only 19 per cent on a total export which was not quite 30 per cent of that of the United Kingdom in 1913; and the greater part of the reduction (58%) is in bunker coal. On the basis of the average export of 1909-13, an increase is shown.

The German export question is complicated by the deliveries of reparation coal. If these are included, the export in 1925 was about 12 million metric tons less than in 1913 and 3 million metric tons less than the average of 1909-13. Probably the loss of the Saar coal accounts for 4 million tons of this decline. Export to France, Belgium, Italy, Luxemburg and Alsace-Lorraine amounted in 1913 to 26.5 million tons; approximately equal amounts have been annually delivered as reparations. The pre-war market for German coal was disturbed by the new boundaries in Europe. Austria-Hungary (excluding Galicia) took about 11.6 million tons in 1913; in 1925 the Succession States took 1.8 million tons and from East Upper Silesia 3.6 million tons — in all 5.4 million tons. Russia took 1.7 million tons and Russian Poland and Galicia 3.5 million tons in 1913, and these markets are lost¹. The drop in German exports is accounted for by the changes in these markets. German imports are from Great Britain to northern ports and places served from those ports by inland waterways. Small quantities come from Lorraine and Czechoslovakia, from the latter principally lignite for special industrial uses.

¹ Information supplied direct.

The export of coal from Poland met with a severe check on the termination, in 1925, of the Upper Silesian Convention, under which Germany undertook to accept delivery amounting eventually to 500,000 tons of coal a month from the mines in the transferred territory. In the first half of 1925, Germany took 58 per cent of the total Polish exports ; subsequently she took none. Poland had, however, met with a fair degree of success in finding other markets before the British coal stoppage ; but this recovery was only achieved with the assistance of the State, which remitted the coal tax, granted special railway rates, etc.

Much concern has been expressed in England over the effect of reparations deliveries on the market for export coal. The conclusion reached by the Coal Commission was that such deliveries as a rule only took the place of the ordinary commercial exports of Germany before the war. In so far as part of the reparations coal goes to countries (*e.g.* Italy) which were not large markets for German coal before the war, the direction of international trade in coal may be altered, but the advantage due to sea transport tells heavily in British favour under normal conditions.

The considerable interchange of coal between France and Belgium is due to the fact that Belgium exports coal for domestic consumption, receiving in exchange French coal for industrial purposes. English imports into France are for coastal districts where sea transport offers an advantage ; they form half of the total imports. French imports from Germany and the Saar show a great increase, the change being due to the requirements of the Lorraine steel industry and to reparations deliveries. France's total imports of coke in 1913 were 3 million tons ; in 1925 she took over 4 million tons from Germany. She has developed an export trade to Switzerland. The higher figures of export for 1925 are principally due, however, not to any great change in the export trade but to the fact that from 1925 the Saar Territory is reckoned within French Customs territory.

VI. ORGANISATION.

The nature of the coal industry is in general favourable to the development of large-scale organisation and horizontal combination ; nevertheless, the industry remains comparatively unorganised in the majority of countries. The four most important of the coal-producing countries are here treated separately.

(1) *The United States.* — The bulk of the anthracite production of the United States is concentrated in the hands of eight companies (out of a total of 174 in operation), which produced 70 per cent of the output in 1920. They are closely connected with one another and with the railroad interest. The Federal Commission published an enquiry into their activities in 1925 and recommended greater publicity. On the other hand, the 12,122 undertakings engaged in the bituminous coal industry are, generally speaking, competitive.

(2) *France.* — There is no selling syndicate in the French mining industry. The industry, however, as a general policy, endeavours to maintain the greatest possible stability in its selling prices. As the industry produces almost exclusively for the home market, this is not a matter of extreme difficulty. To achieve this stability, the mines in each district have a common organisation for the study of markets. Modifications in price which are seen to be necessary or opportune are thus put into force simultaneously in the same locality, and sharp commercial fluctuations are avoided. The Central Committee of the coal industry (Comité central des Houillères) does not intervene in questions of selling prices¹.

(3) *Great Britain.* — In each coalfield there is a District Colliery Owners' Association. Of these, all except that in Cumberland are members of the Mining Association of Great Britain, the functions of which are "generally to watch and take action on behalf of its members in connection with all matters affecting or which may be likely to affect its members or the coal-mining industry, particularly matters which may be the subject of action by the State". The Mining Association possesses no power to deal with coal prices or the distribution of orders.

It is stated that the need for a cartel organisation has not been felt because of the large proportion of coal which is destined for export. Collieries normally employ salaried salesmen and sell their coal direct to factors, merchants, shippers, etc.; but in some cases, particularly in South Yorkshire, selling agencies in which collieries have a substantial interest act for a colliery or a group of collieries. Although there were in 1924 2,481 coal mines belonging to about 1,400 separate undertakings, the division of the industry is not as extreme as these figures would appear to indicate. In 1925 84 per cent of the total output was raised in 613 undertakings, and 9.1 per cent in eight undertakings each of which employed 2,000 men or over. There are examples of associations of undertakings in South Wales and Yorkshire, but they are not the rule. The Doncaster Collieries Association, for instance, controls an output of from 5 to 6 million tons per annum. There is a certain amount of vertical association with other industries. Probably not less than one-fifth of the coal production, other than that for export, is carried on by companies which conduct at the same time blastfurnaces or coking enterprises in other localities or other associated industries².

(4) *Germany.* — The coal industry is more highly organised in Germany than in any other country, but even here there is no general combination, partly because the coal areas are widely separated and have divergent interests. The official organisation of the industry owes something to pressure from the State, which in certain cases has insisted on a degree of syndication. But the central official organisation, the Reichskohlenrat, whose original function was the fixing of prices, is now mainly concerned with watching imports and exports. Its functions are mainly advisory. Each producing district has its own organisation.

¹ Information supplied direct.

² Report of the Royal Commission on the Coal Industry.

All these organisations are members of the Reichskohlenverband, on which the workers are also represented¹. The Ruhr Syndicate is in close contact with the Saar and the Aix-la-Chapelle areas for purposes of price fixation. The most closely knit associations are the Ruhr Syndicate and the Rhenish Lignite Syndicate. The Lower Silesian coal undertakings have loose-price agreements but no close association ; the lignite mines of Central Germany, although a compulsory syndicate has been imposed on them, have no central selling association and very little combination except for statistical purposes. The various groups, including the Upper Silesian group, compete for markets in spite of attempts at delimitation of areas. The Ruhr Syndicate provides the supreme example of concentration. The fusion of undertakings has proceeded so far that the Vereinigte Stahlwerke A.G. alone produces about one-third of the total output, and there are now very few members of the Syndicate producing less than 1,000,000 tons a year. Within the Syndicate there is difficulty in reconciling the interests of the mixed undertakings which consume in their own works the coal they produce and the firms producing for direct sale².

The main objects of the Ruhr Syndicate (Rheinisch-Westfälisches Kohlen syndikat), whose members produce four-fifths of the total output of hard coal in Germany and 95 per cent of the coke, are stated to be :

(a) Rationalisation of the industry :

(b) The fixing of prices for each category of coal under three heads : (1) a stable minimum price ; (2) the account price at which the Syndicate buys from its members ; (3) the selling price, which may be above or below the account price.

Profits are distributed in proportion to the participation quotas of the constituent undertakings. Each mine has a consumption coefficient (*Verbrauchsteiligung*), which includes coal consumed at the colliery, local sales and miners' coal, and, for mixed undertakings, coal used in allied undertakings. These items are excluded in estimating the sales coefficient. Production is then regulated on the basis of the consumption quota plus a variable percentage of the sales quota.

The selling organisation varies for markets with or without foreign competition. In markets where there is no foreign competition, the Syndicate sells directly to large consumers and through selling syndicates or intermediaries to other buyers. In markets open to foreign competition the Syndicate reserves to itself large clients and hands over the surplus to merchants and selling agencies.

The Polish coal industry has as a central organisation the Ogolno-Polska Konweneja Weglowa Company, which regulates the delivery of coal by rail to destinations within the Polish Customs Union (including Danzig) and to certain foreign destinations ; fixes prices and the reductions to be granted to buyers and

¹ Information supplied direct.

² See WIEDENFELD : *Cartels and Trusts*, Geneva, 1927.

consumers ; unifies conditions of delivery, and awards fines on those mines which fail to observe the regulations. The central organisation has two decisions : one for Upper Silesia, and one for the other mining areas.

STATE OWNERSHIP OF COAL MINES.

The output of the more important State-owned mining undertakings and the percentage of the total production of the country which this output represents in each case is shown in the following table¹ :

State-Owned Mines.

	Year	Production (millions of metric tons)	Percentage of total output
Russia	1924	15.9	100
France (Saar Mines)	1924	13.8	
Netherlands	1924	2.9	50.3
Dutch East Indies	1923	0.8	71.0
Bulgaria	1923	0.9	90.6

The Governments of New Zealand, Queensland, Nigeria and Japan also own coal-mines, but the percentage of world output in State ownership is very small. The principal State-owned coal area in Germany before the war, the Saar district, is now in the French Customs area, and the remaining mines belonging to the Prussian State have been denationalised. The Roumanian Government has offered the Petrozseny State mine to a Roumanian syndicate.

The Polish State owns the Brzeszcze mine in the Cracow district, with a production in 1924 of 288,000 metric tons (0.9 per cent of Polish production), and of three mines in the Silesian basin with a production in 1924 of 2.4 million metric tons (7.3 per cent of the total production). The latter are leased to a Franco-Polish company, and the State share in them is 50 per cent.

¹ See Memorandum by the British Mines Department in the Evidence given before the Royal Commission on the Coal Industry, Vol. III, pp. 260 *seg.*

ANNEX I.

CUSTOMS TARIFFS AND RESTRICTIONS.

In most countries coal, lignite and manufactured fuel are exempt from import duty. No duties are imposed in Germany, Austria, Belgium, Denmark, Hungary, Italy, Netherlands, Poland, Great Britain, Sweden, Czechoslovakia, the United States, Argentine and certain other countries. Only those countries which impose duties on coal are shown in the table given in Annex IV, Table VII, indicating the rates of duty in 1913 and 1926 on coal, coke and briquettes.

Of the countries imposing duties, Japan, and Canada show no change in rates; in Roumania there has been a decrease. In Switzerland, India and Brazil, where duties did not exist in 1913, they have been imposed. The Kingdom of the Serbs, Croats and Slovenes and Spain have increased their duties, the latter very considerably. In China, a change has been made from specific to *ad valorem* rates, which makes the increase difficult to ascertain. The Australian duties on coke from outside the British Empire have also been raised. During 1926 two successive increases of 30 per cent were made in all Customs duties in France on account of currency depreciation; the duty on coal had stood at 1 f. 20 per ton since before the war. In general there has been little change since 1913; where rates have been increased, this has been usually from a desire to foster home production or the development of alternative sources of power (see Annex IV, Table VII).

PROHIBITION AND LICENCES.

In October 1924, complications arising from the price of reparations coal made it necessary for Belgium to establish a system of import licences on coal coming from Germany and the Netherlands, but the decree was temporarily rescinded owing to the cessation of British imports in 1926.

Germany : The export and import of fuel is subject to a system of licences. The licensing authority is the Coal Commission of the Reich, which acts in consultation with the Reichskohlenrat. By the Agreement signed at Geneva in May 1922, Germany undertook for a period of three years to take delivery of amounts of coal rising in 1924-25 to 500,000 tons of coal a month from Polish Upper Silesia, one-quarter of the total production. The agreement having lapsed in June 1925, the German frontier is now closed to supplies of fuel coming from Poland.

Spain : Spanish railway companies are under an obligation to use Spanish coal, and shipping companies in receipt of subsidies have been obliged to fill two-thirds of their requirements from Spanish sources.

ANNEX II.

LABOUR CONDITIONS.

(1) General.

The comparative statistics given in the adjoining tables have either been supplied by the International Labour Office or taken from the Report of the Royal Commission on the Coal Industry (1925), Great Britain. It must be emphasised that the figures are not strictly comparable and should be accepted with reserve.

The principal Governments concerned are collaborating with the International Labour Office in an endeavour to obtain comparable figures for average winding time, average travelling time below ground, and total wages received by coal-mining workers.

(2) Number of Workers.

Figures for the number of workers employed in the principal producing districts are given in Table M. They represent the total number on the pay-roll of the mines at a certain date, or on the average of several dates; or are estimated by dividing the "number of man-shifts worked" by the number of working days.

It will be observed that, in each country for which data exist, with the exception of the U.S.A., the total number employed has increased more rapidly than the annual output. The German figures, however, improved in 1925.

The proportion of workers above ground to workers below the surface is larger, as far as it can be ascertained, than before the war.

(3) *Unemployment.*

Statistics of unemployment only exist in some of the principal producing countries. In others, they are incomplete or do not distinguish between voluntary absences and involuntary absences due to sickness, accident, etc., or to lack of trade.

In *Germany* the average number unemployed in all mines (coal, salt, peat, etc.), based on the monthly statistics, was 30,166 during the first eleven months of 1925, or 5 per cent approximately.

In *Belgium*, monthly figures are published covering 40 per cent of the mines. Total unemployment is very rare, almost the whole being registered as intermittent, 10 to 14 per cent in 1926.

In *Great Britain*, the monthly statistics of unemployment among insured coal-miners cover the whole industry. During the twelve months preceding the stoppage of 1926, the average rate was 10 per cent, of which 1.2 per cent was intermittent.

In *Poland*, the "approximate number of unemployed" in mining was 18,390 on February 1st and 21,005 on March 1st, 1925.

In *Czechoslovakia*, the figures for unemployment in September 1925 are given as 600 in receipt of relief and 123 registered at employment exchanges out of a total of about 70,000 workers.

In *Canada*, the percentage of trade unionists unemployed in mining was 2.2 in December 1925; this figure is based on a membership of 8,300, less than one-half of the total employed.

In the *United States* and in *France*, no statistics are available.

(4) *Hours of Work.*

The conditions of employment of surface workers are similar to those of industrial workers in general.

Varying practices exist in the regulation of hours for underground workers connected with the question of winding time.

In Table L, the normal hours of work have been adjusted by allowing for the time of winding so as to give as far as possible the "daily average hours underground".

(5) *Individual Output.*

Figures for output per head and per shift are given in Table M.

Apart from the bituminous mines in the U.S.A., a general decrease is noticeable.

The variations in individual output between the different countries are primarily the result of different natural conditions. Particulars of this difference are given in Annex III. Recent technical changes in coal-getting have not been considerable except in the adoption of coal-cutting machines and mechanical means of transport.

Mechanical aids to coal-getting are most widely adopted in the United States, where the natural configuration of the mines lends itself most easily to the use of machinery. The proportion of coal got by machinery was 69.5 per cent in 1923, and the number of machines in use rose from 14,362 in 1909-13 to 21,229 in 1923 in the bituminous coal-mines; 99 per cent of anthracite coal, however, is got by manual labour only¹. In the Ruhr the increase of coal-getting machinery is very great in all the departments of the industry. At the present time, only 49.6 per cent of the output is got by manual labour plus blasting (*Schiessarbeit*), whereas in 1913 only 5 per cent was got by mechanical means. In the Upper and Lower Silesian coalfields also the use of machinery has enormously increased.

In Great Britain the proportion of coal got by machinery has risen from 8.5 per cent in 1913 to 18.7 per cent in 1924.²

¹ Report of the Royal Commission on the Coal Industry, Vol III, Appendix 18.

² *Ibid*, page 3,

(6) *Wages.*

International comparisons of wage rates should be made with care, because the methods of compilation and the nature of the statistics differ in many cases considerably from country to country. Further, the hours of labour, per day or per shift, vary in different countries. This fact must also be considered in comparing, in the same country, pre-war with post-war figures.

Statistics of wages in 1924, supplied by the International Labour Office, are given in Table N.

Table L.

HOURS OF WORK.

Country	Underground				On the surface			
	Daily average 1913	Daily average 1925	Hours in a full week 1925	Estimated working time at coal face per day 1925	Daily average 1913	Daily average 1925	Weekly 1913	Weekly 1925

1924	54	16	70	282	217	1,085	814

¹ The figures for the Dortmund area alone are given in this table. The total number employed in hard-coal mining in Germany (post-war frontiers) was 515,843 in 1913, and 561,754 in 1925 (above and below ground). See *Jahresbericht der A. G. Reichskohlenverband*, 1925-26. The figures of workers employed represent the number of "Vollarbeiter" for each period, i.e., the workers supposed to be working every day the mine is open for normal hours. The figure of pre-war output is that of the year 1913 only. The figures of 1922 have been quoted instead of those of 1923, which were abnormal.

² Figure for June 1914.

³ The mean number of workers calculated by dividing the total number of days when they were present, drawn from the wages sheets on working days, by the number of working days. [See *Statistiques des industries extractives et métallurgiques* (Administration des Mines)].

⁴ Total number of personnel. (See Statistics of the Bureau of Mines, Department of Commerce).

⁵ Number of workers calculated by dividing the number of "worker-days" by the number of days when the mines were open.

⁶ Coal and lignite.

⁷ Arithmetical mean of the number of workers calculated at the end of each year.

⁸ The figures given (taken from the Evidence before the British Royal Commission on the Coal Industry) do not agree exactly with those of the annual statistics of the Mines Department, from which the information given in Table N and in Table VI of Annex IV are taken.

⁹ The number of workers quoted is calculated according to the numbers ascertained at the beginning and end of each payment period.

Table N.

TOTAL WAGES BILL, WAGES PER METRIC TON OF COAL RAISED AND PER SHIFT, 1924.

Country	Total wages bill (000,000's)	Wages per metric ton		Wages per shift	
		Per ton extracted	Per ton saleable	All workers	Underground workers

United States (1919)	\$ 830	1.63 ⁷	—	—	9.07

¹ Total earnings.² Including money bonuses of all kinds.³ Including all allowances in money and kind as well as payment for holidays.⁴ Including the value of free coal given to the workers.⁵ Including insurance. Wages per shift are for each day paid, including holidays. Underground shift wage quoted is for hewers and drawers only.⁶ Including the value of allowances in money and kind.⁷ Per short ton. U.S.A. shift wages quoted are for contract workers.

ANNEX III.

**COMPARISON OF CONDITIONS IN LEADING EUROPEAN COALFIELDS WITH THOSE PREVAILING
IN THE UNITED STATES.**

Extracted from Evidence given before the Royal Commission on the Coal Industry (Great Britain), 1925.

	United States	Great Britain	France	Belgium	Westphalia	Upper Silesia
Approximate annual output capacity	850,000,000 tons	275,000,000 tons	145,000,000 tons.	25,000,000 tons	140,000,000 tons.	40,000,000 tons.
1. Coal-seams	Large available reserves of coal in seams of suitable section for economic working lying at or near the surface. Large proportion of coal hard.	Considerable proportions of coal worked from seams thinner than most economical section and lying at considerable depth below surface. Large proportion of coal hard.	Seams worked on average thinner than most economical section and lie at considerable depth below surface. Coal rather soft.	Seams worked on average thinner than most economical section and lie at considerable depth below surface. Coal rather soft.	Seams worked on average thinner than most economical section and lie at considerable depth below surface. Coal moderately hard.	Thick seams, some of them excessively so, lying at relatively shallow depth. Coal fairly hard.
2. Roofs and floors	Generally good.	Moderate (good, bad and indifferent).	Moderate (good, bad and indifferent).	Moderate (good, bad and indifferent).	Moderate (good, bad and indifferent).	Good.
3. Faults.	Relatively free from faults.	Fairly numerous in the majority of districts.	Very faulted.	Very faulted.	Very faulted.	Relatively free from faults.
4. Inclination of seams	Generally flat except in the anthracite region.	As a rule fairly flat.	Highly inclined.	Highly inclined.	Highly inclined.	Moderately inclined.
5. Inflammable gas	Relatively free from gas.	Gas prevalent in the majority of districts	Gas fairly prevalent.	Gas fairly prevalent.	Gas prevalent.	Little gas, but very liable to spontaneous combustion.
6. Quality of coal	Fairly high.	Generally high.	Fairly good.	Fairly good.	High, particularly for cooking purposes.	Second class — high oxygen content.
7. Drainage	Either free drainage or shallow pumping.	Pumping demand heavy in many districts.	Pumping demand fairly heavy.	Pumping demand fairly heavy.	Pumping demand fairly heavy.	Fairly heavy pumping demand, but from relatively shallow depth.
8. Sinking conditions for new developments	Generally easy.	Generally difficult.	Moderate.	Difficult.	Difficult.	Generally easy.
9. Transport : (a) Water	Fairly well supplied with inland navigable waterways, but long distance from deep water to nearest coalfield.	Poorly supplied with large inland waterways, but ideally placed geographically in respect of proximity of coalfields to deep water.	Poorly supplied with large inland waterways, and coalfields a moderate distance from deep water.	Poorly supplied with large inland waterways, and coalfields a moderate distance from deep water.	Very favourable, due to proximity to Rhine and good inland canal system	Unfavourable, due to absence of navigable waterways in vicinity.

ANNEX III (contd).

**COMPARISON OF CONDITIONS IN LEADING EUROPEAN COALFIELDS WITH THOSE PREVAILING
IN THE UNITED STATES.**

Extracted from Evidence given before the Royal Commission on the Coal Industry (Great Britain), 1925.

	United States	Great Britain	France	Belgium	Westphalia	Upper Silesia
(b) Rail	Railway rates per ton-mile relatively low.	Railway rates per ton-mile relatively high.	Railway rates per ton-mile relatively high.	Railway rates per ton-mile relatively high.	Railway rates per ton-mile relatively high.	Railway rates per ton-mile relatively high.
10. Markets :						
(a) Inland.	Good, due to richness of land and of mineral resources and consequent demand for coal to enable these assets to be developed, transported and converted into semi or finished products.	Normally good, due to highly industrialised condition of country and intensity of population per square mile.	Very good, due to consumption of coal in France exceeding production.	Fair, due to industrialised state of country and intensity of population and relative proximity to Alsace-Lorraine iron-ore fields, calling for demand for coking coal. Consumption of country in excess of production.	Normally good, due to industrialised state of country, intensity of population and relative proximity to Alsace-Lorraine iron-ore fields, calling for demand for coking coal.	Prior to severance by new frontier, good, due to relative distance from other important coal-fields and demand from local zinc and iron industries. Handicapped at present by new Polish-German frontier.
(b) Export.	Handicapped by distance from sea-board and particularly by absence of demand for imports of raw materials on a large scale and consequent difficulty in arranging for convenient return freights from countries to which coal exported.	Normally very good, due to high-quality coal, proximity of coal to sea-board, and big demand for imports of raw materials facilitating the arrangement of return freights for ships carrying coal on the outward journey.	Excess of consumption over production precludes any serious attempts to develop export trade.	Under normal conditions favourable, particularly by land to France.	Under normal conditions favourable, due to high quality of coal and advantage of Rhine.	Unfavourable by water, due to second-class quality of coal and distance from sea-board. Prior to demarcation of new frontiers, fair export by rail to neighbouring countries.

SOURCE : Statistiques officielles.

(*) Estimation.

(1) Y compris une faible partie de lignite.

(2) Y compris après 1921, estimation annuelle pour l'Irlande 75-85.000 tonnes.

(3) U. R. S. S. (y compris territoire d'Asie).

SOURCE : Official Statistics.

(*) Estimate.

(1) Including small quantity of lignite.

(2) Includes estimates for Ireland after 1921 amounting to 75,000 to 85,000 tons per year.

(3) U. R. S. S., i.e., including Asiatic Russia.

Tableau II.

LIGNITE

Production en milliers de tonnes métriques.

(a) = Territoire d'avant-guerre.
(b) = Territoire d'après-guerre.

Table II.

LIGNITE

Production in metric tons (000's omitted).

(a) = Pre-war territory.
(b) = Post-war territory.

Renseignements fournis par le Bureau international du Travail.

- (1) Gains moyens en espèces (Barverdienst) comprenant les cotisations d'assurance des ouvriers et toutes les allocations en espèce.
- (2) Piqueurs et traiteurs.
- (3) Non compris piqueurs et traiteurs.
- (4) Salaires moyens nets par jour de présence (réduction faite des amendes, participation aux caisses de retraite).
- (5) Y compris les primes de toute nature.
- (6) Gains par journée de travail (y compris la subvention de 1925).
- (7) Y compris les indemnités sociales.
- (8) Y compris les allocations régulières de cherché de vie, mais à l'exclusion des cotisations d'assurance des ouvriers.

Information supplied by International Labour Office.

- (1) Average earnings in money (Barverdienst) (including insurance and money allowances).
- (2) Hewers and loaders.
- (3) Excluding hewers and loaders.
- (4) Workers at the face. Net average wages per day present at the mine (deduction being made for fines, pensions premiums).
- (5) Including all kinds of bonuses.
- (6) Earnings per man-shift (including the subvention of 1925).
- (7) Includes "social" allowances.
- (8) Includes regular cost-of-living bonuses but excludes workers' insurance subscriptions.

(1) Or (ou équivalent).

(2) Royaume-Uni, France, Allemagne ; droit réduit de 4 pesetas-or par tonne à l'importation de houille britannique jusqu'à 750.000 tonnes par an.

(3) Après-guerre, coefficient pour paiements en lei-papier = 30, dès le 5. VI. 1926 (parité exacte = 50 environ).

(4) Après-guerre, approximativement or (coefficient mensuel publié par le Ministère des Finances).

(5) Par tonne de 1.016 kg.

(6) Par tonne de 907 kg.

(7) Les taux cités sont pour la houille bitumineuse. Les taux pour le « slack », sont de 0,14, 0,12, et 0,10 respectivement bitumineux. Libre entrée pour l'anthracite.

(8) Augmenté de 10 % dès le 1. XI. 1926 (Board of Trade Journal, 17. IX. 1925, p. 323).

(9) Charbon d'Asie ; autres charbons = 0,600.

(10) D'Asie ; autres charbons = 0,900.

(11) Par picul = 60 kg.

(1) Gold (or equivalent).

(2) United Kingdom, France, Germany ; reduced rate of 4 gold pesetas per metric ton on imports of British coal up to 750,000 metric tons a year.

(3) Post-war coefficient for payments in paper lei = 30, from 5. VI. 1926 (true parity about 50).

(4) Post-war, approximately gold (monthly coefficient published by Minst. of Finance).

(5) Per long ton (2,240 lbs.).

(6) Per short ton (2,000 lbs.).

(7) The rates quoted are for bituminous coal. The rates for bituminous slack are 0.14, 0.12 and 0.10 respectively, Anthracite free.

(8) After 1. XI. 1926 increased by 10% (Board of Trade Journal, 17. IX. 1925, p. 323).

(9) Asiatic coal ; other = 0.600.

(10) Asiatic ; other = 0.900.

(11) Per picul = 133 $\frac{1}{2}$ lb.

(1) Pour obtenir le chiffre de la consommation, on n'a pas compris la production de la Sarre, lors même que cette région fait partie de l'union douanière française depuis janvier 1925. Les chiffres d'importation comprennent les importations de la Sarre, le chiffre de 1925 étant évalué à 5,214,030 tonnes — le montant des importations de 1924. En tenant compte des stocks et des charbons de route, la consommation intérieure doit être, d'après les calculs du Comité central des Houillères de France : moyenne 1909-13, 64,834 tonnes 1925, 76,882 millions de tonnes.

(2) Les chiffres sont très peu inférieurs à ceux qui seraient établis en tenant compte des stocks.

(3) Les chiffres de consommation pour 1909-13 sont calculés sur la base de la population totale des îles Britanniques ; pour les années d'après-guerre sans l'Etat Libre d'Irlande.

(1) For the purposes of this table the production of the Sarre is not included, although that area is included in the French Customs Union from Jan. 1925. French imports include import from the Sarre. For 1925 the figure of 1924 has been used — 5,214 thousand tons. Taking account of stocks of coal and of bunkers, internal consumption is as follows according to the statistics of the Comité Central des Houillères de France : moyenne 1909-13 64,834 ; 1925, 76,882 thousand tons.

(2) The figures given are slightly inferior to those obtained if stocks are taken into account.

(3) Consumption figures for 1909-13 are calculated on the basis of the whole population of the British Isles ; for post-war years without the Irish Free State.
