PRINTED IN GREAT BRITAIN
PREFACE

It is extremely difficult to give in a very short space a well-balanced account of the races and peoples of mankind. The present effort must necessarily be open to grave criticism from several points of view. For various reasons I have not attempted to give proportional representation to the several areas and continents. Thus it will be noticed that Europe is dealt with in greater detail than other continents, and for obvious reasons I have given disproportionate space to the British Isles and Dominions. The effects of European colonisation are entirely omitted.

If the beginner makes himself acquainted with the terms and definitions given in the Basis of Classification he should find no difficulty in understanding the somewhat condensed accounts of the various peoples which limitation of space has necessitated.

This little book is to some extent a summary of a larger work upon which I am at present engaged. As it is intended to be of use to students of geography and history, as well as to the general reader, who presumably require synthetic conclusions rather than detailed information, I have not hesitated to make generalisations, often perhaps on but slender grounds. These, however, should be regarded as being held only in a tentative manner. I have omitted most of the data upon which such generalisations are founded and also, to secure brevity of treatment, I have refrained from quoting in the text the names of my authorities and the sources for various statements. By consulting the works given in the short Bibliography, the student will be able, for the most part, to check what I have written. References are sometimes given to minor papers of recent date, while other more important memoirs of earlier date are omitted, but references to these will be found in the papers cited. Thus in one way or another the
more advanced student should be able to obtain a sufficient knowledge of the literature of any people or area.

The book consists of four parts: The first portion deals mainly with some of the physical characters employed in racial discrimination and classification. A grouping is next given of various stocks according to these characters, together with their distribution. The different varieties here recorded have a very unequal value, numerical and otherwise. Some are well-defined, relatively pure groups, others are much mixed and therefore ill-defined; in some cases an element in a population has been described although it has no special location, as it appears to represent an old racial stock which has become submerged in the existing population. I frankly admit that the selection of these groups has been determined mainly from a practical point of view and it is probable that other groups would have been added, if a logical scheme had been adopted. This is followed by an attempt to indicate a probable racial history of the various areas. Finally in the General Summary I deal briefly with the problem of heredity and the effects of environment on the formation of races, and also give a sketch of what I assume to have been the main lines of the progressive evolution and the early migrations of Homo sapiens.

My thanks are due to Dr Davidson Black, Mr L. H. Dudley Buxton, Prof. H. J. Fleure, Mr H. J. E. Peake, Dr R. N. Salaman, Prof. C. G. Seligman and Dr F. C. Shrubsall for personal advice and assistance, in addition to the authors of the books and papers I have consulted and from whom I have frequently quoted. I gratefully acknowledge the invaluable help I have received in various ways from Miss E. S. Fegan of Girton College in the preparation of the book.

A. C. H.

PLATE II is from a photograph taken on the Cambridge Expedition to Torres Straits, etc., 1898.

PLATES III, IV and VIII are from purchased photographs.

PLATE VI is from a photograph taken by my friend, Mr J. Thomson.
THE RACES OF MAN

THE BASIS OF CLASSIFICATION

Various methods are employed in the attempt to group together different human communities, but in the endeavour to classify mankind it is essential to keep the consideration of physical characters, culture, and language quite apart from one another, much confusion having arisen in the past from the non-observance of this elementary rule.

The problems of racial affinity are purely zoological, thus in considering race, only external and internal physical characters, or even to some extent physiological characteristics, can be taken into account. This is the method upon which is based the classification adopted in this book. Unfortunately there is still a lack of uniformity in the employment of certain terms, as for example in the use of the word "race."

The term "race" is employed in various senses, but usually to connote a group of people who have certain well-marked characters in common. What these characters are, or how many characters are to be taken into account, is usually a matter of individual opinion. If all fair-skinned peoples are grouped under the term of the White Race, this will include long-headed and broad-headed groups. Or the term "race" may be applied to one of these groups. Race names, such as Nordic or Alpine, are merely convenient abstractions helping us to appreciate broad facts. A race type exists mainly in our own minds. Assuming that by isolation and consequent inbreeding a group of people can acquire a number of similar traits, when such a group mixes with another group that has acquired different traits a population will result of which a certain number will, in the main, possess most of the characters of one parent group, a certain number will possess most of those of the other group, while the greater number of persons will on the whole seem to be intermediate in appearance, not necessarily because the characters themselves are intermediate but because there may be a mingling of characters from both parental groups. Processes of this type, between closely allied
