DNISTEY, the Tyras of the classical authors, and the Turul of the Turks, a river of south-eastern Europe belonging to the basin of the Black Sea. It takes its rise on the northern slope of the Carpathian Mountains in the Samber circle of Galicia, and belongs for the first 330 miles of its course to Austrian, for the remaining 600 to Russian territory. In its excessive meandering it frequently almost returns to the same spot; for example, while the actual distance from Turunchuk to Mayakovsk is about 33 miles, the development of the river would require about 133. At the same time, as the average fall is from 25 to 26 inches in the mile, the current in most parts even during low water is pretty rapid, the mean rate per hour being calculated at 863 feet. The average width of the channel is from 360 to 700 feet, but in some places it attains as much as 1400 feet, the depth is various and changeable. The banks are usually about 3500 feet apart, but in certain reaches approach each other so as to leave room for nothing but the actual bed; their average height above the water in the Bessarabian portion is 350 feet. The principal interruption in the navigable portion of the river, besides the somewhat extensive shallows, is occasioned by a granitic spur from the Carpathians, and bears the name of the Yampolskie Porogi, or Yampol Rapids. For ordinary river-craft the passage of these rapids is rendered possible, but not free from danger, by a natural channel on the left side, and a larger and deeper artificial channel on the right; for steam-boats they form an insuperable barrier. The river falls into the sea by several shallow arms, of which the most important has a depth of only 2½ feet near its mouth; but the Turunchuk, an independent stream, disemboguing in the neighbourhood, has a depth of 7 or 8 feet, and is connected with the main channel of the Dnieper by the Surrovtszoff canal, so named after the merchant at whose expense it was constructed. There are two periodical floods in the river,—the first and greatest caused by the breaking up of the ice, and occurring in the latter part of February or in March; and the second, due to the melting of the snows of the Carpathians, and consequently taking place about June. The spring flood raises the level of the water 20 feet, and pours along so violent a current that large blocks of stone are drifted from their position; towards the mouth of the river gardens and vineyards are submerged, and the surface of the stream measures from four to six miles across. In some years the general state of the water is so low that navigation is possible only for three or four weeks, while in other years it is so high that navigation continues without interruption. Steamboat traffic was introduced in the lower reaches in 1840, when
the government vessel "Prince Vorontzoff" began to make regular trips between Ovidiopol and Akerman, and since that date it has acquired very considerable dimensions. The fisheries of the estuary are of some importance; and the lakes which are formed by the inundations of the valley furnish a valuable addition to the diet of the people in the shape of carp, pike, and tench. The principal towns on the river are Sambor, Khotin, Mohileff, Dubossari, Gregoropol, Bender, Traspol, and Akerman; its tributaries are numerous, but not of individual importance.

DOAB, or DUAB, or DOOAB, a name, like the Greek Mesopotamia, applicable, according to its derivation (do, two, and ab, river), to the stretch of country lying between any two rivers, as the Baroe Doab between the Sutlej and the Ravee, or the Bucchans Doab between the Ravee and the Chemab, but frequently employed, without any distinctive adjunct, as the proper name for the region between the Ganges and its great tributary the Jumna. In like manner the designation of Doab Canal is given to the artificial channel which breaks off from the Jumna near Fuzailpur, and flows almost parallel with the river till it reunites with it at Delhi.

DOBELL, STONEY (1824—1874), a distinguished English poet, born on the 5th of April 1824 at Cranbrook, Kent, was sprung from an old Sussex family, noted for its staunch loyalty in the struggle between the Cavaliers and Roundheads. His father, John Dobell, who wrote a pamphlet on Government, was a wine merchant at Cheltenham, his mother was a daughter of Samuel Thompson, a famous political reformer. When Dobell was twelve years old, the family went to Gloucestershire; and the poet, ever after, with occasional breaks, kept up his connection with the district. He was educated privately, and never attended either school or university. He refers to this in some precocious lines, in imitation of Chaucer, dating from his eighteenth year. In 1844 he married Emily Fordham, a lady of an old county family in Cambridgeshire. Cheltenham was, for the most part, his home in those early years, as his father's business had to be carried on; but the summer was often spent in the country. During this period his poetic vein flowed freely. He wrote a number of minor poems instinct with a passionate desire for political reform. The Roman was also in progress, and was written mainly among the Cotswolds. It appeared in 1850, under the name de plume of Sidney Yendys. Next year he travelled through Switzerland with his wife; and, after his return, he formed friendships with Robert Browning, Paul Lonsdale, George Macdonald, Emanuel Deutsch, Lord Houghton, Ruskin, Holman Hunt, Mazzini, Tennyson, and Carlyle, and conducted an interesting correspondence with Charlotte Bronte. His second large poem, Belder, written partly at Cowthorne, partly among the Alps, and finished at Amberley Hall, appeared in 1854. The three following years were spent in Scotland—the winters in Edinburgh, the summers in the Highlands. Here he endeavoured to an entirely new circle, including Dr John Brown, Dr Hanna, Hugh Miller, Sir Noel Paton, Sir James Y. Simpson, and Professor and Mrs Blackie. Perhaps his dearest friend at that time was Alexander Smith, in company with whom he published, in 1855, a number of sonnets on the Crimean War, which were followed by a volume on England in Time of War. The delivery of an elaborate lecture on the "Nature of Poetry" to the Edinburgh Philosophical Institution, in April 1857, seriously injured Dobell's chest. Accordingly he spent the winters of the four following years in the Isle of Wight, and, after 1862, the winter generally found him on the Continent, the summer in Gloucestershire. On one occasion, while near Naples, he fell through a thin crust of earth into some underground works, to a depth of about 12 feet. This accident proved injurious to his health; and, in 1869, a mare, which he was trying to break, fell and rolled over with him. After this he was, more or less, an invalid, and lived in Gloucestershire, preserving his devotion for natural beauty, his keen interest in public affairs, his sunny sweetness of temper, and deep religious feeling, till his death in 1874.

As a poet Dobell belongs to the "epic school," as it was happily named by Professor Ayton, who parodied its style in Formulan. The epistle, however, was first applied by Carlyle by Byron. The school includes the Rev. George Gilfillan, Philip James Bailey, Stanyan Baggs, Dobell, Alexander Smith, and, according to some critics, Gerald Massey. It is characterized by an under-current of discontent with the mystery of existence, by vain effort, unrewarded struggles, sceptical unrest, and an uneasy straining after some incomprehensible end. It thus faithfully reflects a prevalent phase of 19th century thought, and consequently is a perfectly legitimate exercise of the muse. Poetry of this kind is marked by an excess of metaphors, which darkness rather than illuminates, and a general extravagance of language. On the other hand, it manifests a freshness and originality, and a rich natural beauty, not often found in more conventional writings. In this school Dobell shares with Bailey the foremost place, and his genius received early recognition from the Rev. George Gilfillan. He is possessed by his ideal of what a poet ought to be. An intensely earnest spirit pervades all his works; and, like Milton and Wordsworth, he has no humour. We sometimes meet, in his writings, conceptions and obscures which remind us of Cowley and Dobell, and still often his intellectual subtlety, gorgeous imagery, and exquisite lyrics recall Shelley. The Roman, a poem dedicated to the interests of political liberty in Italy, is marked by pathos, energy, and passionate love of freedom; and its clear vivid style enchants the reader throughout. His treatment of the Colosseum has been compared, not unfavourably, with Byron's. The faults of the work arise almost entirely from the author's embarrassment in dealing with his own riches. The drama, too, is overlaid with monologue, which is carried to such a dreary excess in Belder—a poem so intensely subjective as to fail utterly in human interest. The gloomy egotism of the moody hero wearies most readers, but is relieved, from time to time, by some of the finest descriptions of nature in English poetry, by Amy's exquisitely touching songs, and by grander passages than any to be found in The Roman. There is a distinct off, however, in purity of style. The purpose of Belder has been strangely misunderstood by many critics; and some have actually identified the hero with the author. The object of the book is to show the evil moral effects of egotism and a lust for power on a man of genius. The passage on Chamouni is unsurpassed by Coleridge. Belder, still more than his other poems, manifests Dobell's wealth of thought, as well as the prodigal richness of his imagery. England in Time of War is the most pleasing of Dobell's works, and allows his lyrical impulse full scope. The book is steeped in passion, and gives faithful and poetical expression to the feelings of many English hearts at the time. In all Dobell's poems a great fondness for alteration is observable.

His chief prose writings have been collected and edited with an introductory note by Professor Nichol (Thoughts on Art, Philosophy, and Religion. London: Smith, Elder, and Co., 1876). The lecture on the "Nature of Poetry" is an elaborate disquisition in which a perfect poem is defined as "the perfect expression of a perfect mind." In his pamphlet on Reform, he maintains that a just national representation is such as represents the nation at its efficient duralbe best. In his memoranda for
DOB—DOB

A projected play, the character of the cardinal is finely conceived. He was to have "no element not common to all men and no element as common to all men,—a life such as every man might lead but no man does lead,—in which the things done are not those which men do rarely, but the common acts of men done in a rare spirit." Dobell's prose writings are studded with such suggestive sentences as we have noted. The singular truth of his observations of nature is well seen in his description of the "Symptoms of the Dissolution of Night" (Thoughts, p. 83). His prose style lacks simplicity, both in the individual words used and in the structure of the sentences. The classical element is much too prominent in his vocabulary. In his religious views, Dobell was a Christian of the Broad Church type. Socially he was one of the most amiable and true-hearted of men. He will long be remembered as an admirable song-writer, a suggestive and original thinker, and an ardent lover of political liberty. The standard edition of his poems is edited by Professor Nichol of Glasgow University, who has profited to the work a beautiful in his written life.

DOBELN, a town of Saxony, in the circle of Leipzig, and 35 miles to the south east of that town, standing partly on an island formed by the Mulde. It is the centre of a considerable corn trade. The manufactures are cloth, cordwain and other leather, shoes, hats, belts lacquered tin ware, agricultural and weighing machines, and cigars. Population, 10,969 in 1875.

DOBERAN, or Dobberan, a market town of Northern Germany, in the grand duchy of Mecklenburg-Schwerin, about two miles from the shores of the Baltic, and seven west of Rostock. Besides the ruins of a Cistercian abbey, founded by Pribislav II, it possesses a church of the 14th century, which ranks as one of the finest in Northern Germany, a grand ducal palace, a theatre, an exchange, and a concert-room. In 1793 Duke Frederick Francis caused the first sea-side watering-place in Germany to be established on the neighbouring coast, at the spot where the Heiliger Damm, a great bank of rocks about 1000 feet broad and 15 feet high, stretches out into the sea and forms an excellent bathing ground. Though no longer so popular as in the early part of the century, it is still frequented. In the immediate neighbourhood of the town three mineral springs were discovered in 1829—one sulphurous, a second saline, and the third chalybeate. Population in 1875, 3866.

DOBRETEI, GABOR (i.e., GABRIEL) (1786-1851), an Hungarian philologist and antiquary, was born at Nagyszollos in 1786. He completed his studies at the universities of Wittenberg and Leipsic, and was afterwards engaged as a tutor in Transylvania. At this period he originated and edited the Erdélyi Múzeum, which, notwithstanding its important influence on the development of the Magyar language and literature, soon failed for want of support. In 1820 Dobrentei settled at Pesth, and there he spent the rest of his life. He held various official posts, but continued zealously to pursue the studies for which he had early shown a strong preference. His great work as the Ancient Monuments of the Magyar Language (Régi Magyar Nyelvemlékek), the editing of which was intrusted to him by the Hungarian Academy. The first volume was published in 1835 and the fifth was in course of preparation at the time of his death. Dobrentei was one of the twenty-two scholars appointed in 1825 to plan and organize, under the presidency of Count Teleki, the Hungarian Academy. In addition to his great work he wrote many valuable papers on historical and philological subjects, and many biographical notices of eminent Hungarians. These appeared in the Hungarian translation of Brockhaus's Conversations-Lexikon. He translated into Hungarian Macheek and other plays of Shakespeare, several of Schiller's tragedies, and Molière's Avers, and wrote several original poems. His article on "Magyar Literature" in the Conversations-Lexikon was translated into English. Dobrentei does not appear to have taken any part in the revolutionary movement of 1848. He died at his country house, near Pesth, March 28, 1851.

DOBRIHOFFER, MARTIN (1717-1791), a Roman Catholic missionary, whose fame is preserved by the historical interest and the literary character of his narrative. Born at Gratz, in Styria, he joined the Society of Jesus in 1736, and in 1749 proceeded to Paraguay, where for eighteen years, first among the Guarans, and latterly among the Abipones, he continued with steadfast devotion and easy cheerfulness to discharge the difficult and hazardous duties of his profession. Returning to Europe on the expulsion of the Jesuits from South America, he settled at Vienna, obtained the patronage, or rather the friendship, of Maria Theresa, survived the extinction of his order, continued the history of his mission, and died at Brussels on January 17, 1791. His history appeared at Vienna in 1784, in the author's own Latin, and in a German translation by Professor Krail of the university of Pesth. Of the contents of the work some idea may be obtained from its extended title:—Historia de Abiponibus, Exeunt Bellacognae Paraguayae Nationis, locupletata Captiosa Barbararum Gentium Urbium, Fluminum, Ferarium, Amphibiorum, Insectorum, Serpentum praecipuorum, Pacium, Avisum, Arborum, Plantarum altiorumque ejusdem Provinciae Observationum. The "lively singularity" and garrulous quaintness of the style could only be displayed by lengthened quotation. In 1822 there appeared in London an anonymous (not altogether complete) translation, which has not unfrequently been ascribed to Southey, but was really the work of Sara Coleridge, who, while still in her teens, had undertaken the task to defray the college expenses of one of her brothers. To the youthful translator a delites compliment was paid by Southey in the third canto of his Tale of Paraguay, the story of which was derived from the pages of Dobrihoff's narrative:—

"And if he could in Merlin's glass have seen
By whom his tomes to speak our tongues were taught,
The old man would have felt as pleased,
As when he won the ear of that great Empress Queen."

DOBROWSKY, JOSEPH (1753-1829), one of the earliest and greatest of Slavonic philologists, was born of Bohemian parentage at Gjermet, near Raab, in Hungary. He received his first education in the German school at Bischontznitz, made his first acquaintance with Bohemian at the Czechbrod gymnasium, studied for some time under the Jesuits at Klattau, and then proceeded to the university of Prague. In 1772 he was admitted among the Jesuits at Brünn; but on the dissolution of the order in 1773 he returned to Prague to study theology. After holding for some time the office of tutor in the family of Count Nostitz, he obtained an appointment first as vice-consul, and then as censor, at Hradisch; but in 1790 he lost his post through the abolition of the seminaries throughout Austria, and returned as a guest to the house of the count. In 1792 he was commissioned by the Bohemian Academy of Sciences to visit Stockholm, Abo, Petersburg, and Moscow in search of the manuscripts which had been scattered by the Thirty Years' War; and on his return he accompanied Count Nostitz to Switzerland and Italy. His reason began to give way in 1795, and in 1801 he had to be confined in a lunatic asylum; but by 1803 he had completely recovered. The rest of his life was mainly spent either in Prague or at the country-seats of his friends Counts Nostitz and Corinna; but his death took place at Brunn, whether he had gone in
1828 to make investigations in the library. While his fame rested chiefly on his philological labours, his botanical studies are not without value in the history of science. The following is a list of his more important works; and it will be observed that, dealing as they do, with Slavonic subjects, they are all composed in Latin or German:

DOBROUDJA, or DOBRUSCHIA, or Bulgarian Dobritch, is the district lying between the Black Sea and the lower reaches of the Danube, by which it is separated from Roumania. The southern part of its area and much of its miles is occupied by an irregular steppe stretching north from the Balkan range, while the northern belongs to the alluvial tract produced by the action of the river. The predominant element in its heterogeneous population, which is more than 160,000, consists of the Tartars, whose numbers have been greatly augmented by immigration since 1859; but there are also Turks, Bulgarians, Roumanians, Greeks, Armenians, Germans, and Jews, and all the various nationalities remain strictly distinct, and usually occupy more or less exclusively separate settlements. The principal places in the Dobrudja are Rassova, Hirsova, Matsch, Isakcha, and Tulcha on the Danube; Badabagh towards the north, which was formerly regarded as the chief town of the district; Kustendj, Mangalia, and Belzchik on the coast; Basarabj towards the south and some distance inland; and, finally, the new Tartar city of Meljadin, which has sprung up since 1860 on the railway between Tchernava and Kustendj. The strategic importance of the Dobrudja was recognized by the Romans, who in the reign of Trajan built a line of fortifications from the river near Rosseva to the coast near Kustendj; and in modern times it has been more than once utilized, especially during the Russian invasions of 1828, 1854, and 1857. See Peters, Grundlinien zur Geographie und Geologie der Dobrudja, Vienna, 1867-1868.

DOBSCHAU, or Domina, a town of Northern Hungary, in the county of Gomor, on the Dobrudja. In the vicinity are mines of iron, copper, cobalt, and mercury. Population, 5505 in 1869.

DOBSON, William (1610-1645), an English portrait and historical painter, born at London in 1610. His father was master of the Almication Office, but by his improvidence had been reduced to distress. The son was accordingly bound an apprentice to Peak, a stationer and picture dealer in Holborn Bridge; and while in his employment he began to copy the pictures of Titian and Van Dyck, whose manner he had retained. He also took portraits from life under the advice and instruction of Francis Cleyn, a German artist of considerable repute. Van Dyck, happening to pass a shop in Snow Hill where one of Dobson's pictures was exposed, sawed out the artist, and presented him to Charles I, who took Dobson under his protection, and not only sat to him several times for his portrait, but caused the prince of Wales, Prince Rupert, and many others, to do the same. The king had a high opinion of his artistic ability, styled him the English Titorell, and appointed him sergeant-painter on the death of Van Dyck. After the fall of Charles, Dobson was reduced to great poverty, and fell into dissolute habits. He died at the early age of thirty-six. Excellent examples of Dobson's portraits are to be seen at Blenheim, Chatsworth, and several other country seats throughout England. The head in the Decollation of St John the Baptist at Wilton is said to be a portrait of Prince Rupert.

DODCTE (from Dōctē), a name applied to those heretics in the early Christian church who held that Christ, during his life, had not a real or natural, but only an apparent or phantom body. Other explanations of the Docetism, or appearance, have, however, been suggested, and in the absence of any statement by those who first used the word of the grounds on which they did so, it is impossible to determine between them with certainty. The name Docetism is used by Clement of Alexandria as the designation of a distinct sect, of which he says that Julius Cassimus was the founder. Docetism, however, undoubtedly existed before the time of Cassimus. The origin of the heresy is to be sought in the Greek, Alexandrine, and Oriental philosophizing about the imperfection or rather the essential impurity of matter. Traces of a Jewish Docetism are to be found in Philo, and in the Christian form it is generally supposed to be comulated in the writings of John, and more especially in the epistles of Ignatius. It differed much in its complexion according to the points of view adopted by the different authors. Among the Gnostics and Manicheans it existed in its most developed type, and in a miller form it is to be found even in the writings of the orthodox teachers. The more thoroughly Docetism assumed the position that Christ was born without any participation of matter, and that all the acts and sufferings of his human nature, including the crucifixion, were only apparent. They denied, accordingly, the assumption of a truly human body. Amongst these were Valentinians, Bardesanians, Basilides Tatianus, and their followers. They praised considerably in their estimation of the share which this body had in the real actions and sufferings of Christ. Clement and Origen, at the head of the Alexandrian school, took a somewhat subtle view of the incarnation, and Docetism pervades their controversies with the Monophysites. Docetism tendencies have also been developed in later periods of the church's history, for example by the Priscillians and the Bogomiles, and also since the Reformations by Jacob Bohme, Menno Simons, and a small fraction of the Anabaptists. Docetism springs from the same roots as Gnosticism, and the Gnostics generally held Docetism views. Accordingly, for a fuller account of the principles out of which Docetism arose, and of the various modifications it assumed, the reader is referred to the article Gnosticism. See also the articles on the leading Docetism mentioned above.

DOCK, the name applied to the plants constituting the section Lappathum of the genus Rumex, and natural order Polygonaceae. The leaves of the docks are pinnate-vened, and are never sagittate or hastate; the flowers, which are arranged in two to five rows, in alternate fascicles similar to whorls, are generally perfect, and have three free styles, multifid stigmas, six stamens, and the three inner perianth-segments or petals in some cases tubercled, the fruit is an achene (see vol. iv. p. 150). In the common or broad-leaved Dock Rumex obtusifolius, the flower-stem is erect, branching, and 18 inches to 3 feet high, with large radical leaves, heart-shaped at the base, and more or less blut, the other leaves are more pointed, and have shorter stalks. The whorls are many-flowered, close to the stem, and mostly leafless. The root is many-headed, black externally, and yellow within. The flowers appear from June to
August. In autumn the whole plant may become of a bright red colour. It is a troublesome weed, common by roadsides and in fields, pastures, and waste places through-out Europe. An infusion of its root has been used as a remedy for ichthyosis; in large quantities it acts as a purgative. The powdered root is sometimes employed as a dentifrice. The Great Water Dock, R. Hydrolapathum, belonging to be the herb britannica Play (Nat. Hist., xxv. 6), is a tall-growing species, its root is used as an antiscorbutic. The root of the Curled Dock, R. crispus, affords an ointment and decoction reputed to be cures for scabies; and the seeds of the same species have been found efficacious in dysentery. Other British species are the Sharp Dock, R. capillipes, the root of which has been employed in dyeing; the Bloody-reined Dock, or Bloodwort, R. sanguineus; the Yellow Marsh Dock, R. palustris; the Fiddle Dock, R. palustris; the Golden Dock, R. martimurum, the Grainless Curled Dock, R. domestica (= aquaticus); and the Meadow Dock, R. pratensis, species. R. alpinus, or "Monk’s Rhubarb," was early cultivated in Great Britain, and was accounted an excellent remedy for ague.

DOCK. See Harbours.

DOCKYARDS. Previously to the reign of Henry VIII., the kings of England had neither naval arsenals nor dockyards, nor any regular establishment of civil or naval officers to provide ships of war, or to man them; they had admirals, however, possessing a high jurisdiction and very great power (see the article Admiral). There are strong evidences of the existence of dockyards, or of something answering thereto, at very early dates, at Rye, Shoreham, and Winchelsea. In November 1243 the sheriff of Sussex was ordered to enlarge the house at Rye in which the king’s galleys were kept, so that it might contain seven galleys. In 1238 the keepers of some of the king’s galleys were directed to cause those vessels to be breasted, and a house to be built at Winchelsea for their safe custody. In 1254 the baliffs of Winchelsea and Rye were ordered to repair the buildings in which the king’s galleys were kept at Rye. At Portsmouth and at Southampton there seem to have been at all times depôts both for ships and stores, though there was no regular dockyard. At Portsmouth till the reign of Henry VIII. it would appear, from a very curious poem in Hakluyt’s Collections, called The Policie of Keeping the Sea, that Henry V. had ships, officers, and men exclusively appropriated to his service, and independently of those which the Cinque Ports were bound, and the other ports were occasionally called upon, to furnish on any emergency. By this poem it also appears that Little Hampton, until as it now is, was the port at which Henry built his great Dromons.

Which passed other great ships of the common.

The dromon, "dromon," or "dromedary," was a large war ship, the prototype of which was furnished by the Saracens. Roger de Hoveden, Richard of Devizes, and Peter de Longtoft celebrate the struggle which Richard I. in the "Trinch the Mer," on his way to Palestine, had with a huge dromon,—a "marvellous ship! a ship than which, except Noah’s ship, none greater was ever read of." This vessel had three masts, was very high out of the water, and is said to have had 1500 men on board. It required the united force of the king’s galleys, and an obstinate fight, to capture the dromon.

The foundation of a regular navy, by the establishment of dockyards, and the formation of a board, consisting of certain commissionners for the management of its affairs, was first laid by Henry VIII.; the first dockyard erected during his reign was that of Woolwich. Those of Portsmouth, Deptford, Chatham, and Sheerness followed in succession. Plymouth was founded by William III. Pembroke was established in 1814, a small yard having previously existed at Milford.

From the first establishment of the dockyards to the present time, most of them have gradually been enlarged and improved by a succession of expedients and make-shifts, which answered the purposes of the moment, but the best of them have not possessed those conveniences and advantages which might be obtained from a dockyard systematically laid out on a uniform and consistent plan, with its wharfs, basins, docks, slips, magazines, and workshops arranged according to certain fixed principles, calculated to produce conveniences, economy, and despatch.

Neither at the time our dockyards were first established, nor at any subsequent periods of their enlargement, could it have been foreseen what incalculable advantages would one day be derived from the substitution of machinery for human labour; and without a reference to this vast improvement in all branch of naval operations, it could not be expected that any provision was be made for its future introduction; on the contrary, the docks and slips, the workshops and storehouses, were successively built at random, and placed wherever a vacant space would most conveniently admit them, and in such a manner as in most cases to render the subsequent introduction of machinery, and railways, and those various contrivances found in large private manufacturing establishments, quite impossible, even in the most commodious of Her Majesty’s dockyards.

From a brief description of the royal dockyards as they now stand a general idea may be formed of their capacities, advantages, and defects. Taking them in succession, according to their vicinities to the capital, the first is Deptford.—Deptford dockyard was first established about the year 1513, and continued to be a building yard, as well as a large depot for naval stores, until 1869, when it was closed as a building yard in pursuance of a recommendation of a committee of the House of Commons, which reported in 1864. The increasing size of ships of war rendered the yard unsuitable for any but the smaller types of vessels, while the continuous deposits of river mud, not only along the frontage but also in the docks and basins, rendered it a costly and decreasingly valuable place of construction. It had an interesting history. Not only were some of the most celebrated ships of the navy built there, but during the Great Plague the office of the Admiralty was removed thither from Seething Lane. Peter the Great worked in the yard as a shipwright, dwelling the while at Sayes Court, the residence of Evelyn, the author of Syphilis and of the diary not less famous than Pepys’s. Evelyn was the greatest of some of the ground on which the dockyard stood, for no other consideration than that there should always be a keel laid down in the yard. Queen Elizabeth’s Admiralty officials were at one time resident at Deptford; and thither went the queen in 1580 to confer the honour of knighthood on Sir Francis Drake, and to dine with the admiral on board the ship in which he had circumnavigated the world.

Though closed as a building yard in 1869, in accordance with the recommendation of a committee of the House of Commons, part of the establishment, with suitable storehouses, was retained as a depot for naval stores, and as the one place from which shipments of stores to naval depots abroad should be made. Of the residue, part was sold to Mr Evelyn, who made the purchased part into a recreation ground for the Deptford people, and gave it to them. The rest was sold for a metropolitan meat market to the Corporation of London. When taken the front or wharf sides of this dockyard, facing the Thames, were 1300 feet in length, and the mean breadth of the yard 650 feet; the superficial content about 30 acres. It had three slips
Dockyards

4 for ships of the line on the face next the river; and two for smaller vessels, which launched into a basin or wet dock, 260 by 220 feet. There were also three dry docks,—one of them a double dock, communicating with the Thames, and the other a smaller one, opening into the basin. The number of men employed in this yard, in time of war, was about 1500, of whom one-half were shipwrights and artificers, and the other half labourers. There were, besides, 18 or 20 teams of 4 horses each, to drag timber and heavy stores.

The proximity of Deptford yard to the capital is of great importance, in the convenience it affords for receiving from this great mart all the home manufactures and products which may be purchased for the use of the navy. It is the general magazine of stores and necessaries for the fleet, whence they are shipped off, as occasion requires, to the home yards, the outports, and the foreign stations, in store-ships, transports, coasting ships, lighters, and launches, according to the distance they have to be sent.

The management of Deptford naval store yard is now merged with that of the victualling-yard, for a most complete establishment of its kind. Till 1869 this management comprised a naval captain superintendent, with a master in the navy as his assistant. Under them a storekeeper, a store receiver, an accountant, an inspector of stores, and their respective staffs, conducted the administrative duties of the place. In 1869 the Board of Admiralty, in accordance with the recommendations of a departmental committee, abolished the offices of captain superintendent and master attendant, and placed the establishment under the civil management of the storekeeper. The naval superintendents were appointed for five years, and after that time were withdrawn to make way for others. The superintending storekeeper is appointed as a permanent officer, and under him experience is accumulated and applied in all the manufactories and other business departments of the yard. The manufacturers conducted by him and for the Government at Deptford comprise biscuit making on such a scale as to supply, with the yield of the victualling yard at Gosport and Plymouth, biscuit enough for the whole navy, and also chocolate making, mustard making, flour grinding, and the operations of a large cooperage. Most of the salt beef required for the navy is salted and put up there. Deptford may be called the heart of the victualling service. From its stores are shipped the whole of the consignments required for replenishment of depots abroad, as well as the requirements of the other two victualling yards in England. There is no place at that at the last-named the supplies of biscuit and flour are provided on the spot. The number of men employed at Deptford necessarily varies. During war upwards of a thousand men are required. The space occupied by the victualling yard is about 15 acres. There is a river frontage of 1700 feet, and a mean depth of 1600 feet. In 1877 there were employed in the naval store and victualling yard at Deptford 205 men on the establishment, and 390 men on the hired list, at a cost of £25,847.

Woolwich Dockyard.—This no longer exists as a naval station. Though retaining its name, it remains as a depot in the hands of the War Department, for whose work its river frontage of 3650 feet, and its docks and basins, afford excellent accommodation. Woolwich was the first and most ancient of all the dockyards, having been established in the reign of Henry VII. From it have been launched some of the finest and most celebrated ships of the English navy. In 1512 the “Harry Grace de Dieu” was built, and in 1552 was accidentally burnt. In more modern times the “Nelson” and the “Ocean” were from Woolwich, and those latest specimens of the new extent class of fighting ship, the “Trafalgar,” “Agamemnon,” and “Royal Albert.” As an establishment for the building and repair of ships, especially steam ships, Woolwich was perhaps the complete and best furnished of all the dockyards. Its power to make and repair engines and all iron work, whether of ship or fittings, was so extensive as to enable the Government before the introduction of iron-clads, to be nearly independent of the private trade. With occupation for 1500 workmen, it was able to rely upon its own resources almost exclusively. Its proximity to London gave it other great advantages, including this, that the Admiralty were thereby enabled the more easily to superintend the constructive work for which its artisans were responsible. But for the fatal operation of two causes, the increased and increasing depth of ships of war, and the continuous siltng of the river into the docks and basins of the yard, Woolwich would probably have remained one of the chief dockyards. Both these causes, however, operated. The depth of the “Nelson’s” hold had to be lessened in order to ensure her passing Erith, and it was stated in the Eighth Report of the Select Committee on Finance (1818) that “the wharf wall at Woolwich, owing to the action of the tide on the foundation, is in a failing state, and in danger of being swept into the river,” it being secured only in a temporary manner, and requires to be immediately rebuilt in a direction that will preserve it from similar injury hereafter, and prevent, in a great degree, that accumulation of mud which has, in the course of the last ten years, occasioned an expense of upwards of £125,692, and would threaten in time to render the yard useless.” Till 1869, however, notwithstanding the recommendations of a parliamentary committee, and the frequent urgings of members on both sides of the House of Commons, Woolwich yard was kept open. Then, in accordance with a policy long commended, it was closed, steps were taken to dispose of the plant and materials that remained, and the place itself was handed over, with its workshops and factories, to the War Department in 1872.

Woolwich Division of Royal Marines.—About the same time that the dockyard was broken up, the division of marines—no longer in contact with ships and shipping—was abolished, and its strength was distributed between the divisions at Chatham and Plymouth.

Chatham Dockyard.—This dockyard, founded by Queen Elizabeth, though not on the present site, is situated on the right bank of the Medway, to which it presents a line of wharfage extending 10,000 feet, and of embarkment 4500 feet more. The superficial contents may be estimated at about 500 acres. The old part of the yard has seven building-slips on the front, from which ships are launched into the river, all equal to the building of ships of the line, and three others for frigates and smaller vessels. In the same front are four dry docks communicating with the Medway. At the southern extremity of the yard is the shipyard, 1248 feet in length and 472 feet in width, in which are employed about 250 persons. It is equal to the manufacture of every description of cordage required for the naval service, including the largest size cable. The hemp houses, 300 feet long by 36 feet wide, are equal to the stowage of 1600 tons of hemp and 3000 hanks of yarn. Next to these are the slips and docks, with the working-sheds and artificers’ shops close in the rear, an excellent smithery, timber-berths, seasoning sheds, deal and iron yard, &c., and beyond these, on the eastern extremity of the yard, the officers’ houses and gardens.

The superintendent’s house is situated nearly in the centre of the yard. The lower or north-eastern part of the old yard is occupied by mast-ponds, mast-houses and slips, store-boat houses and slips, ballast wharf, timber-berths, and saw-pits.

Before the construction of the extension works in 1867–73, there was no dock or basin in Chatham yard; but the
DOCKYARDS

Medway, flowing along it in a fine sheet of water, in some degree answered the purpose of one. Owing to the shallowness of the water and the crooked navigation from Chatham round Upnor Point, ships were obliged to take in the river at the Eddes at one place, their stores and provisions at another, their guns, powder, and ammunition at a third; in consequence of which, a ship was usually longer in getting out to sea from Chatham than even from Deptford.

The necessity of improving the accommodation at Chatham forced itself upon the attention of those who were responsible for the navy many years before the opportunity came for effecting the improvements. Pepys records a visit to Chatham in July 1663, to inspect the site of a projected wet dock. It was estimated to cost £10,000, and Pepys remarked that “the place indeed is likely to be a very fit place when the king hath money to do it with.” In effect, however, it was not taken in hand by the king, who allowed the Dutch, instead of docks, to be found in the Medway. It was not till 1667 that ground was broken for the extension works at Chatham, though the plans had been prepared and certain preparations made many months before, under the supervision of Colonel Sir Andrew Clarke, C.B. The extension works may be thus described. Three basins give access from Gillingham Reach, which formerly connected the mainland with the salt marshes. These marshes were covered with water every spring tide. The Government bought 150 acres of them, and proceeded to re-make the ground which forms the site of the new dockyard workshops and factories. The three basins communicate with each other by caissons, so that ships of the largest class can pass from the bend of the Medway at Gillingham to that at Upnor. Upnor Reach entrance, opposite Upnor Castle, is 80 feet wide, the others are 84 feet. The first (Upnor) basin is the repairing basin, which has an area of 22 acres, and a depth, in common with the others, of 33 feet at spring, and 30 feet at neap tides. On the south side of this basin, and opening into it, are four graving docks, each capable of receiving the largest man of war. From this basin a passage about 175 feet long leads to the “factory” basin, which has an area of 20 acres. Contiguous to it are being erected the engine and boiler factories, and the principal workshops necessary for iron war-ship building. Next to the “factory” basin is the fitting-out basin, with an area of 28 acres. In this place ships preserve their sea stores and are got ready for service. Here, too, they will be dismantled and paid out of commission.

Very great engineering difficulties had to be contended against in prosecuting these works, owing chiefly to the soft mud and to the treacherous character of the ground on which foundations had to be laid. Congest labour was largely employed in the work of excavation, and in the manufacture of bricks, whereof 20,000,000 a year were turned out, at small cost, on the spot. The cost of these new works is reckoned at about £2,000,000.

A considerable piece of new ground (about 2000 feet in length by 200 in breadth) was added a few years ago to the upper part of the present Chatham dockyard, on which Mr Brunel erected one of the most perfect sawmills in the United Kingdom. It is supposed to be equal to the power of fifty saw-pits and nearly one hundred sawyers, and is capable of supplying the dockyards of Chatham and Sheerness with all the straight sawn timber they can require.

But the great advantage of the plan is in its application of the steam engine to the management and arrangement of timber, by which the labour and expense of a great number of horses are saved, and the obstruction and impediments to the general services of the yard avoided.

Since the introduction of iron as the material for ships hulls, Chatham has taken a more prominent place amongst dockyards. Most of the iron ships built in the royal yards have been built at Chatham and Pembroke,—the capabilities being greater at Chatham, where the “Achilles,” “Monarch,” “Clutton,” “Rupert,” “Raleigh,” “Dellerephon,” “Sultan,” “Alexandra,” “Temeraire,” and many of the Musquito fleet of gunboats were built. At Chatham and Devonport the whole of the ordnance required for the navy is manufactured; and, since 1869, the whole business of remanufacturing copper and old iron for the navy has been concentrated at Chatham.

The first division of royal marine, consisting of twenty-eight companies, is stationed at Chatham, in excellent barracks, situated near one of the extremities of the dockyard, and occupying nine acres of ground. There was formerly a small victualling depot, situated partly in the parish of Chatham and partly in that of Rochester, from which the ships at Chatham and at Sheerness and the Nore received a supply of provisions and water. Ships now obtain their supplies from Deptford, except fresh meat and vegetables, which are obtained on local contracts on demand.

It may be found necessary to establish a fresh depot for victualling stores at Chatham when the port becomes developed as a place for fitting out and repairing as well as for building. This process of development is going on rapidly. In March 1873 the executive of the Sheerness steam reserve with their ship were removed to Chatham, and the steps necessary for transferring the principal powers and attributes of the exposed dockyard at Sheerness to the strongly defended port of Chatham will be quickly taken. The great difficulties of navigation in the Medway, combined with the successive forts and torpedo stations which guard the river, are calculated to make Chatham unsuitable. As Hollingshed said of Lundy Island, there will be “no entrance but for friends.” When the Chatham works shall have been finished, the question will probably be revived whether Sheerness should not, as has been often recommended, be closed; but the advantages of having even a small yard whither ships only slightly injured by sea or by the enemy can run for repair, without having to thread the reaches of the Medway up and down, are so great that it is unlikely the place will be abandoned.

In 1876 Chatham dockyard was raised to a rear-admiral’s command. The number of workmen employed at Chatham yard in 1877 is 1478, established and 2022 hired men, at an aggregate cost of £230,158.

SHEERNESS DOCKYARD.—This dockyard is situated on a low point of land on the island of Sheppey, of which the soil is composed of sand and mud brought from the sea on the one side, and down the Medway on the other, and has so much contorted the mouth of that river as completely to command the entrance of it. The situation, in a military point of view, is a most important one, particularly from its vicinity to the North Sea and to the anchorage at the Nore; by which anchorage, and by the works of Sheerness, the mouths of the Thames and the Medway are completely defended.

As a situation for a dock, the objections to which it was liable are now in a great measure removed. On account of the low swampy ground on which it stood, fevers and agues were at one time so prevalent that shipwrights and other artificers were literally impressed and compelled to work at Sheerness. In 1857, as soon as that town sprang up close to the dockyard, and with it some little improvement by drainage, embankments, and other measures, it continued, for a considerable time, an unhealthy and disagreeable place. As a dockyard it was totally destitute of all convenience or arrangement; and
the whole premises, walled around wharfs and buildings belonging to the Ordnance Department, did not cover more than 15 acres. The storehouses were dispersed in various parts of this space, and in so ramous a state, that a ship hauled up in the mud was by far the best storehouse in the whole yard. There were two small inconvenient docks for frigates or smaller vessels. It was in fact a mere port of refitment, and might be considered as an appendage to Chatham.

The very limited capacity of Sheerness, and other considerations, led to the origination of the project of a naval arsenal at Northfleet, which, from change of circumstances, and from the important improvements now carried out at Sheerness, is not likely ever again to be revived. These improvements were of sufficient magnitude to render any establishment at Northfleet wholly unnecessary, by making Sheerness a very complete dockyard. Previously to carrying into execution this important undertaking, a committee of engineers and others was appointed, whose plan was afterwards submitted to the Privy Council, and with some slight improvements adopted. The first stone was laid on the 19th August 1814, and the whole work was completed at an expense not far short of one million sterling. The additions, together with some part of the premises held by the War Department, make the whole area of the dockyard of Sheerness amount to upwards of 50 acres. The wharf wall on the south side of the basin in front of the mast-houses is 100 feet, and that on the river front 60 feet in width, lined on both sides with as complete a specimen of good and beautiful masonry of granite as any in the kingdom.

Portsmouth Dockyard.—Portsmouth dockyard, founded by Henry VII, will always be considered as the grand naval arsenal of England, and the headquarters or general rendezvous of the British fleet. It appears at all times to have been regarded as an important naval station, notwithstanding the rivalry of Southampton, which was the principal port in Plantagenet times. In 1225 an order was issued to the barons of the Cinque Ports to provide men for the king's galleys at Portsmouth. In 1225 the sum of £25, 14s. 4d. was paid to the masters and crews of the "king's two great ships at Portsmouth." In 1229 £10 was paid to the king's clerk for the repair of the king's galleys and great ship at Portsmouth. King John on several occasions assembled his barons at Portsmouth for naval expeditions. He seems, moreover, to have aimed at increasing the accommodation there for ships. In May 1212 the sheriff of Southampton was commanded to cause the docks at Portsmouth to be inclosed with a strong wall, in the manner which the archdeacon of Taunton would point out, for the preservation of the king's ships and galleys. He was also to cause shed-houses to be erected for their stores and tackle. This was to be done immediately, lest the galleys or their stores should be injured in the coming winter.

In 1540, when the dockyard seems to have been regularly established, the area of the yard was comprised in 8 acres of ground, and abutting upon the harbour near what are now known as the King's Stauns. Cromwell added 2 acres in 1658, Charles II. added 8 in 1663, and 10 more in 1667. Between 1667 and 1710, 30 acres were reclaimed from harbour mud, or bought from the town, and various subsequent additions gave 30 acres as the area on which Portsmouth dockyard stood at the end of the last century. Early in Queen Victoria's reign the growth of the steam navy necessitated an enlargement of dock accommodation. In 1843 were ordered, and in 1848 were opened a fine steam basin holding 27 acres of water, and four deep docks, the dockyard ground being extended to 115 acres in all. A few years more and the want of dock room was as great as ever. Huge iron-clads, of a draught and length greater than had yet been known, required new docks and basins of special construction. The extension works at Chatham (see above) and Portsmouth were accordingly entered upon. At the present time (1877) great progress has been made with both sets of works, under the direction of Colonel Sir A. Clarke, C.B., R.E. and Colonel Pasley, R.E. When finished the Portsmouth new works will comprise a tidal basin, three floating basins (upon one of which four docks will abut), a large deep dock, entered from the tidal basin, two floating basin entrance locks, which may also be used as deep docks, and greatly increased wharfage and space for building storehouses and factories. The system of docks and basins will begin with the tidal basin, entered from the harbour by an opening 100 yards wide, and having a depth of 30 feet of water at low spring tides. The deep dock and the two locks at the head of this basin will carry 28 feet of water over the invert at low spring tides, the latter will be by an entrance between the tidal basins, three floating basins, which will lead from each other in the order named. These locks will in themselves be magnificent docks, able to receive the largest iron-clad at once from the tidal basin. They will lead to the repairing basin, a vast excavation, of a parallelogram shape, which will measure 22 acres, and carry at high spring tides 33 feet of water. This depth of water will be common to the three basins, it may be made permanent by the closing of the lock gates, and one great use of the locks will be that vessels may be docked in them in any state of the tide without lowering the level of water in the inner basins, where the tide may be ponded at its highest level of 35 feet of water, if necessary. Having been raised to this level in the locks by ingress of water from the tidal basin, vessels will be able to pass inwards to the repairing and other basins without any lessening of the depth of water. The four large docks of the repairing basin will have a depth of 30 feet of water on their sills, even when filled at high neap tides. Two of them are entirely finished, and the excavation of the others is far advanced. Opposite to these docks will be the entrance to the rigging basin, an excavation of 14 acres, in a trapezoid shape. The third, or fitting-out basin, which will receive the ships when they have been repaired and rigg'd, will be a pentagon of 14 acres. On one side of this basin there will be a coal depot, so that vessels may leave the docks with their coals on board, ready to go to sea. In addition to these four basins and seven docks there is an entrance between the tidal basin of the new works and the steam basin of 1814, which will connect the old and new portions of the dockyard; and, as for wharfage, the harbour or north wall of the extension works will have 26 feet and the wall of the tidal basin 30 feet of water alongside it at low spring tides, making altogether three miles of wharfage accommodation in connection with the extension works, and that for ships of the largest class. The size of the whole dockyard will be more than doubled, for its present 115 acres will be the entry by more than 173 acres of reclaimed mud land and various fortifications glass, making in all an exact measurement of 293 acres. 2 roads and 29 perches. These great works were estimated when designed in 1865 to cost £3,000,000, exclusive of convict labour. They have given employment on the spot to upwards of 1600 free men and about 800 convicts. The latter are employed in brick-making, and have made upwards of 100,000,000 bricks since the works were begun.

A complete network of railway connects all parts of the yard with the docks and basins, and the whole of the neighbouring railroad to all parts of the kingdom, so that iron or coal can be put into wagons at Sheffield or Cardiff.
and brought in a few hours, without change of medium, to the side of the slip which is to use the material.

The dockyard, accordingly, is by far the most capacious of all; and the safe and extensive harbour, the noble anchorage at Spithead, the central situation with respect to the English Channel and the opposite coast of France, render Portsmouth the very first importance as a naval station; and in the view of it, every possible attention appears to have been paid to the extension and improvement of its dockyard.

In the centre of the old wharf-wall, facing the harbour, is the entrance into the great basin, whose dimensions are 380 by 260 feet, and its area 2½ acres. Into this basin open four excellent dry docks, and on each of its sides is a dry dock opening into the harbour; and all of these six docks are capable of receiving ships of the largest class. Besides these is a double dock for frigates, the stern dock communicating through a lock with the harbour, and the head dock with another basin about 250 feet square. There is also a camber, with a wharf-wall on each side, 500 feet in length, and of sufficient width to admit of transports and merchant ships bringing stores to the dock-yard. In the same face of the yard are three building slips capable of receiving the largest ships, and a small one for sloops, besides two building slips for frigates on the northern face of the yard, and a smaller slip for sloops. The range of storehouses on the north-east side, and the rigging-house and sail-loft on the south-west side of the camber are magnificent buildings, the former occupying nearly 600 feet in length, exclusive of the two intermediate spaces, and nearly 60 feet in width, and the two latter 400 feet. The sea-store houses occupy a line of building which, with the three narrow openings between them of 25 feet each, extend 800 feet. The rope-house, tarring-house, and other appendages of the ropery are on the same scale, but since the suppression of the Portsmouth ropery (in 1869), and the concentration of rope-making at Deptford and Chatham, these premises have been used as general storehouses. The two sets of quadrangular storehouses, and the two corresponding buildings, with the intervening timber-beths and saw-pits, at the head of the dry docks, issuing from the great basin, are all excellent, and conveniently placed. The smithery is on a large scale, and contiguous to it are the various factories for metal work used in the building and repair of iron ships. Formerly there was also a copper mill, capable of turning out 300,000 sheets a year, besides bolts, bars, and gudgeons for ships’ use. But since 1869 the whole business of remaking old metal of whatever kind has been concentrated at Chatham. Most of these factories were constructed under the direction of General Beaulham. At the head of the north dock are the wood mills, at which every article of turnery, rabeting, &c., is performed for the use of the navy, from boring the chambert of a pump to the turning of a button for a chest of drawers. But the principal part of these mills is the remarkable machinery for making blocks, contrived by Drulcn (see Block-Machinery).

The northern extremity of the dock-yard is chiefly occupied with sawmills, and the timber-beths, the working boat-house, and boat store-house. On the eastern extremity are situated the houses and gardens of the superintendent and principal officers of the yard, the chapel, and the late royal naval college.

Portsmouth yard, in 1877, employs 4910 men, at a cost of £224,814.

Naval College — The establishment of a college at Portsmouth for the education of young gentlemen for the navy was first formed in 1729 under the title of the Naval Academy. It contained 40 scholars, the sons of the nobility and gentry. In 1806 it was reorganized under the name of the Royal Naval College, and the number of scholars was raised from 40 to 70; of whom 40 were to consist of the sons of commissioned officers of the navy, and to receive their board, clothing, lodging, and education free of all expense; the remainder to consist of sons of noblemen, gentlemen, civil and military officers, on payment of £72 a year. The age of admission was from twelve and a half to fourteen years. No student to remain at college longer than three years; at the end of which time, or sooner if he should have completed the plan of education, he was to be discharged into one of Her Majesty’s ships, the college time being reckoned two years of the six required to be served to qualify for such a commission. In 1837 the Royal Naval College for the education of young gentlemen for the navy was abolished, and by an order in council of 1838 it was reopened as an establishment for the scientific education of a certain number of officers and mates of the naval service, the latter to have passed both their examinations in seamanship and in navigation, and to remain one year in the college. A limited number of commissioned officers of any rank were also admitted to study at the college, but no expense was incurred on their account.

Naval Architectural School — The number of students formerly did not exceed 24. Candidates were admitted by examination at stated periods, the age of entrance being from fifteen to seventeen, and the duration of apprenticeship seven years. At the expiration of their apprenticeship they were eligible to all the situations in the ship-building department of her Majesty’s dockyards, to be there employed as supernumeraries until regular vacancies might occur. This school, which was subsequently embodied with South Kensington, is now incorporated with Greenwich College.

Vaucelling Yard — There were formerly two victualling establishments at this port,—the one in Portsmouth town, the other across the harbour, at a place called Weevil,—both of them inconveniently situated for supplying the ships with water and provisions, more especially such as had to take them on board at Spithead. The former consisted chiefly of provision-shops and magazine, with a tedeem and a bakery; at the latter there were a cooperage and a brewery. The victualling establishments are now consolidated at Gosport, and the Royal Clarence Victualling

---

1 On 1st February 1873 Portsmouth College was superseded by the Royal Naval College at Greenwich. The means of education provided at Portsmouth were once too limited and not technical enough. The charmed buildings of Greenwich were required, and the system of higher education of naval officers, which was pronounced by the select committee on that subject to be necessary, was considered and carried out by Mr Goschen, then first lord of the Admiralty. Rear-admiral Sir Cooper Key, K.C.B., was the first president of the college. The minute of the Board of Admiraity consequent upon the Order in Council of 16th January 1873, whereby Greenwich College was founded, states that—"My Lords intend that the Royal Naval College at Greenwich shall be so organized as to provide for the education of naval officers of all ranks above that of midshipmen, in all branches of theoretical and scientific study bearing upon their profession; but my Lords will in future give the instruction given at the Quadrilateral Grammar School herebefore, and arrangements for instruction in practical surveying will also be continued at Portsmouth. My Lords desire, by the establishment of the college, to give to the executive officers of the navy generally every possible advantage in respect of scientific education, but no arrangements will be made at all precluding the all-important practical training in the active duties of their profession." All matters relating to the particular classes of officers admitted to study, and the different subjects of study, are determined by such regulations as may from time to time be laid down by the Admiralty. Special pecuniary concessions are made to officers on half-pay who may enter for study, and officers of the lower grades are put upon full pay, while in all cases there is a Government contribution in aid of expenses. Special professional inducements to study officers, and everything is done to make the college answer thoroughly the purposes for which it was founded. Practical knowledge is taught on the Thames and its estuaries, as theory is taught in the college.
Yard is a very fine establishment. At this victualling yard, as at Deptford and Plymouth, large quantities of biscuit and flour are manufactured. Casks and barrows are also made, but with these exceptions there is no manufacture at Gosport. The depot is supplied with sea provisions and clothing from Deptford, and reissues them to the fleet at Portsmouth. There is an excellent slaughter yard in the place, where cattle delivered under contract are slain, and the meat issued to the fleet.

Gosport Hospital.—This magnificent hospital for the reception of sick and wounded lies at the point seawards, on the Gosport side of the harbour. It is in charge of a resident medical inspector-general, who is assisted by a competent medical and clinical staff.

The second division of naval fortresses, consisting of twenty-six companies, is stationed at Forton barracks, on the Gosport side. Sixteen companies of royal marine artillery have excellent quarters at Eastney, three miles from Portsmouth, opposite St. Helen's, and at Fort Cumberland, a half mile from Eastney.

Plymouth Dockyard.—The naval station of Plymouth is hardly inferior to that of Portsmouth. It possesses one of the finest harbours in the world, capable of containing, in perfect security, at their moorings, not less than a hundred sail of the line, and by means of the breakwater it may boast of an excellent roadstead for eighteen or twenty sail of the line. The old dockyard has only one basin, without gates, but the dimensions are 300 by 280 feet. The excellent harbour of Hamoaze, on the western bank of which the wharfwall extends, almost compensates for the want of other basins, especially as the depth of water allows the largest ships to range along the jetty's, and receive their stores on board immediately from the wharf.

Plymouth dockyard proper extends in a circular sweep along the shores of Hamoaze 3500 feet, its width about the middle, where it is greatest, being 1600, and at each extremity 1000 feet, making its superficial contents about 96 acres. The land front is about 2850 feet. In the line facing the harbour are two dry docks for ships of the first rate, a double dock for seventy-four gun ships, communicating with Hamoaze, and another dock for ships of the line, opening into the basin. There is, besides, a graving-dock without gates, and a canal or camber similar to that in Portsmouth yard, for the admission of vessels bringing stores into the yard, which, communicating with the boat-pond, cuts the dock-yard nearly into two parts. There are five jetty's projecting from the entrances of the dry docks into Hamoaze, alongside of which ships are conveniently brought when undocked. All these are situated between the centre and the northern extremity of the harbour line. On the southern part are three building slips for the largest class of ships and two for smaller vessels, the outer mast-pond. On the upper basins, timber-berths, saw-pits, and smithy. Higher up, on this end of the yard is an extensive mast-pond and mast-locks, with planked houses over them, and, above these, three hemp magazines, contiguous to which is the finest ropery in the kingdom, consisting of two ranges of buildings, one the laying-house, the other the spinning-house, each being 1200 feet in length, and three stores in height. In the construction of the new rope-house no wood has been used excepting the shingles of the roof, to which the slates are fastened. All the rest is of iron. The ribs and girders of the buildings are of cast iron. Embossed over with Yorkshire paving stone, and the doors, window frames, and staircases are all of cast iron, so that the whole building may be considered as proof against fire.

The northern half of the yard, besides the docks and basins, with all the appropriate working sheds and artificers' shops, contains a cluster of very elegant stone buildings, ranged round a quadrangle, the longest sides being about 450 feet, and the shortest 300 feet. Within the quadrangle are also two new ranges of buildings, in which iron has been used in the place of wood. These buildings consist of magazines for different kinds of stores, rigging-houses, and sail-lofts. The northern and upper part of the yard is occupied by a range of handsome houses, with good gardens behind them, for the admiral-superintendent and the principal officers of the yard, the chapel, the guard-house, and pay-officer, stables for the officers and the teams, and a fine reservoir of fresh water for the supply of the yard.

Plymouth is not only a good building and repairing yard, on account of its excellent docks and slips, and the great length of line along the Hamoaze, but also a good refitting yard.

A large addition has been made to Plymouth yard by the fine establishment of Keyham steam factory which adjoins it, with a water frontage of about 1300 feet, with two steam basins—one 630 feet by 500 feet, and another 700 feet by 400 feet. There are also excellent graving docks leading into these basins, around which are coal sheds, storehouses, boat berths, engineers' shops, boiler factories, and all the necessary appliances of mast shears, cranes, and capstans worked by hydraulic or steam machinery. There is no railway within the yard connecting it with the general system of railroad, though means are being taken to secure a junction with the narrow gauge line through Okehampton. Traction engines, called "camels," at present discharge most of the work of a railway.

The number of men borne in Plymouth yard in 1877 is 4336, costing £293,505.

Plymouth Victualling Establishment.—The Royal William Victualling Yard stands on the eastern entrance to Hamoaze, on about 11 acres of ground,—adjoining 4 acres on its south side, on which stand two small forts, and a reservoir containing about 8000 tons of water, which supplies the fleet,—the water being brought from Dartmoor.

Plymouth Hospital is a handsome building of stone, or rather a series of separate buildings, regularly arranged, in which respect, as admitting a freer circulation of air, it is perhaps superior to that of Haslar.

The third division of royal marines, consisting of thirty companies, is stationed at Plymouth. The barracks, situated at Stonehouse, are very airy and spacious.

Pembroke Dockyard.—This dockyard was established in 1814, and is now used merely as a building-yard. It is situated on the southern shore of Milford Haven, not two miles from the town of Pembroke. It includes an area of about 60 acres, its surface descending in a gradual slope to the water's edge, along the shore of which there is a frontage of about 3300 feet. It has a dock, and 14 building slips, 6 of which are for first-class vessels. The largest wooden slip of the royal navy, the "Duke of Wellington," 131 guns, was launched from this yard. Here, too, were built the "Thunderer" and the "Fury," the huge mastsless iron-clad, intended with the "Devastation" and the "Stauncheas" to form the sea police of the coast.

Other Yards.—In addition to the foregoing, there are several small naval yards—at Haulbowline in the Cove of Cork, at Gibraltar, Malta, Antigua, Halifax, Bermuda, Kingston (Jamaica), Cape of Good Hope, Trincomalee, and Hong Kong.

Dockyard Officers.—The management of the dockyards is intrusted to a superintendent, either a rear-admiral or captain; a master attendant and his assistant, a chief constructor and assistant; a store-keeper; an accountant, who is also store-receiver, and a director of police.
DOCKYARDS

RESERVES IN DOCKYARDS.—At each of the ports where there is a dockyard, Penbrook excepted, a certain number of ships when put out of commission, or new ships not commissioned, are laid up in reserve, being classed in one of the four classes, according to the state in which they are when paid off, or the state of forwardness for further service to which they may be ordered by the Admiralty. The reserves used to be comprehended in what was called "the ordinary." But since twenty years the reserve ships have been placed under a captain of the navy, the flag captain of the dockyard admiral. The captain of the reserve is responsible for the care of ship and engines, and also for the due preservation and readiness for immediate service of all the ship's stores and equipment. The latter, excepting very heavy gear, which is kept on board, are kept in special storehouses at the dockyard, where all the items of the ship's "establishment," from cordage to hammocks and lanterns, are kept ready for immediate shipment. These arrangements apply to the ships in the first division of the reserve. Competent technical officers, all the ship's artificers in port not otherwise employed, and a large body of seamen are under the orders of the captain of the reserve.

HISTORY OF MANAGEMENT OF DOCKYARDS.—When Henry VIII. first established a regular king's dockyard at Woolwich, he appointed a board, consisting of certain commissioners for the management of all naval matters; and it is curious enough (see the Pepysian Collection of Manuscripts in the university of Cambridge), that the regulations which he made for the civil government of the navy, and which were in the reign of Edward VI. revised, arranged, and turned into ordinances, form the broad basis of all the subsequent instructions given to the several officers to whom the management of the civil affairs of the navy has been committed. The commissioners of the navy then consisted of the vice-admiral of England, the master of the ordnance, the surveyor of the marine affairs, the treasurer, comptroller, general surveyor of the victualling, clerk of the ships, and clerk of the stores. They had each their particular duties; and once a week they were ordered to meet at their office on Tower Hill, and once a month report their proceedings to the lord high admiral.

In 1609 the principal officers for conducting the civil affairs of the navy were suspended, in consequence of many abuses being complained of; and other commissioners were appointed, with powers to manage, settle, and put the affairs of the navy into a proper train, and to prevent, by such measures as might appear to be necessary, the continuance of the many great frauds and abuses which had prevailed. A similar commission was renewed in 1618, which in a full and minute report detailed and explained those frauds and abuses. That commission, which ended on the death of James I., was renewed by his successor, and remained in force till 1628, when it was dissolved, and the management of the reserves restored to the board of officers established by Edward VI.

In the disturbed reign of Charles I. the navy was suffered to go to decay, but by the extraordinary exertions of Cromwell it was raised to a height which it had never before reached; it again declined, however, under the administration of his son. At the Restoration, the duke of York, of whom Macaulay wrote that he was the only honest man in his dockyards, was appointed lord high admiral; and by his advice a committee was appointed to consider a plan he had drawn out for the future regulation of the affairs of the navy, at which he himself presided. "In all naval affairs," says the commissioners of revision, "he appears to have acted with the advice and assistance of Sir Samuel Pepys, who first held the office of clerk of the acts, and was afterwards secretary of the Admiralty,—a man of extraordinary knowledge in all that related to the business of that department, of great talents, and the most indefatigable industry."

The entire management of the navy was now in the hands of the duke, as lord high admiral, by whom three new commissioners were appointed to act with the treasurer of the navy, the comptroller, the surveyor, and clerk of the acts, as principal officers and commissioners of the navy. A book of instructions, drawn out by Pepys, was sent to the navy board for its guidance. A rapid progress was made in the repair and augmentation of the fleet; but the duke being called away, in consequence of the Dutch war in 1664, the example of zeal and industry set by Pepys was not sufficient, in the duke's absence, to prevent neglect and mismanagement in every department, except his own.

From 1673 to 1679, the office of lord high admiral was put in commission, while Pepys sat at the head of it. The king, through Pepys, arranged all naval affairs; but in the latter year, when the duke was sent abroad, and Pepys to the Tower, a new set of men were made commissioners of the navy, who, without experience, ability, or industry, suffered the navy to go to decay. "All the wise regulations," say the commissioners of revision, "formed during the administration of the duke of York, were neglected; and such supineness and waste appear to have prevailed as, at the end of not more than five years, when he was recalled to the office of lord high admiral, only twenty-two ships, none larger than a fourth-rate, with two fireships, were at sea; those in the harbour were quite unfit for service; even the thirty new ships which he had left building had been suffered to fall into a state of great decay, and hardly any stores were found to remain in the dock-yards." Pepys was re-appointed secretary of the Admiralty; the king instituted an inquiry into the characters and abilities of the first ship-builders in England, and by the advice of Pepys added Sir Anthony Dean, eminent in that profession, with three others, to the former principal officers. The old commissioners were directed entirely to confine their attention to the business of a committee of accounts. To each of the new commissioners was intrusted a distinct branch of the proposed reform; and it appears that, highly to their credit, "they performed what they had undertaken in less time than was allowed for it, and at less expense," having completed their business to the general satisfaction of the public two months before the Revolution. The business of the navy, thus methodized and settled, remained undisturbed by that event.

It will readily be seen that the vast increase of our naval force since that time has necessarily required many additional orders and regulations, some of which, from circumstances, were not compatible with each other; some were given to one dockyard and not to another; others in one yard became obsolete, while their continuance was acted upon in another; so that there was no longer that uniformity in the management which it is desirable—indeed, essentially necessary—to preserve. From the year 1764 to 1804, when the king appointed a commission "for revising and digesting the civil affairs of his navy," the attention of the lords of the admiralty and the navy board had frequently been directed to this important subject; but nothing was done to forward so desirable an arrangement, except that Sir Charles Middleton (afterwards Lord Earham), when comptroller of the navy, classed and digested under distinct heads all orders and regulations prior to the year 1786. The commissioners of naval inquiry, appointed in 1803, state the necessity of revising the instructions, and digesting the immense mass of orders
issued to the dockyard officers, and regret that a work of such utility should not have been completed. The commission consisted of Admiral Lord Barham, John Fordyce, Esq., Admiral Sir Roger Curtis, Bart., Vice-Admiral Donnelt, and Ambrose Stirling, Esq. They made fifteen distinct reports, the date of the first being 13th June 1805, of the last the 6th March 1806. All these except two were printed by order of the House of Commons, and were mostly carried into effect by Orders in Council. One of the two not printed is an inquiry into the state of the navy at different periods, and of naval timber; the other relates to the formation of a new dock-yard at Northfleet.

These reports led to the establishment, for the first time, in all dockyards, of one uniform system of management, by which it was hoped uncalculable advantages would have been secured, in the preventing of frauds, in the saving of labour and materials, and consequently time and expense, and in securing better workmanship in the construction of ships, but the system was cumbrous and expensive, and has given way to other more judicious management.

The management of the dockyards, and of all the civil affairs of the navy, was formerly intrusted to certain commissioners, of whom the comptroller of the navy, the surveyor of the navy, the controller of victualling and transports, the director of transports in 1869 this arrangement was modified, and the work of the comptroller of victualling and transports, the director of the survey, and master measurer were abolished, and a store-receiver was substituted for the timber-master. Many subordinate offices were abolished, and the whole system of working the men and keeping the accounts was simplified and amended. Some idea may be formed of the immense expense by the simple fact that, while in the ordinary estimate of the navy for 1817 the establishment of officers in Portsmouth yard was £50,065, in 1833 it was only £19,803, and in 1853, £20,121. To this last, however, must be added the salaries of officers employed in the steam factory, which amounted to £3,555.

The principal officers in the factory are—1, the chief engineer and inspector of machinery; 2, his assistant; 3, assistant inspector of machinery; 4, foreman of the factory; 5, foreman of boilmakers; 6, pay-clerk and book-keeper.

At one time the men in the dockyards were employed almost wholly on job and task-work. Between 1850 and the present time they have been almost wholly on a day pay smaller than that given in the general trade, but having a title to a pension, contingently upon good service and good behaviour, attached to it. In 1869 Mr Childers cut down to a considerable extent the "establishment" system of dockyardmen, replaced the vacancies with hired men on higher pay, but without a title to pension, and with the usual liability to discharge at a week's notice when work is slack. The salary system, with its concomitant vested interests, was not found to be productive of quick and therefore of economical work. Mr Childers's alteration improved matters not a little, but job and task-work, besides being more in accordance with the usages of the day, is far more likely to interest and stimulate the men. One great advantage, however, of the salary system is the discouragement it gives to strikes. The conditions under which alone pensions are earned act as deterrents.

In ordinary years the number of workmen of all kinds required for the service of the dockyards is, in round numbers, 16,000.

Defence of the yards.—In the year 1847 the workmen of the several dockyards were enrolled into a corps for the defence of the yards, and certain numbers were trained to the use of the great gun exercise, so that each of the dockyard battalions had some artillery attached to them. In 1854 the corps fell into disuse, was not found to be productive of quick and therefore of economical work. Mr Childers's alteration improved matters not a little, but job and task-work, besides being more in accordance with the usages of the day, is far more likely to interest and stimulate the men. Doctor, denoting etymologically a teacher, is the title conferred by the highest university degree. Originally there were only two steps in graduation, those of bachelor and master, and the title doctor was given to certain masters as an alternative or as a merely honorary appellation. It is in this sense that the word is to be understood in the phrase Doctor Angelicus applied to Aquinas, and in many other familiar instances of a similar kind. The process by which the doctorate became established as a third degree, distinct from and superior to that of master, cannot be very clearly traced. At Bologna it seems to have been conferred in the faculty of law as early as the 12th century, but there is no sufficient authority for the statement commonly made that the celebrated Inererus drew up the formulary for the ceremonial, and that Bulgurus was the first who took the degree. Paris, the other great university of the Middle Ages, conferred the degree in the faculty of divinity, according to Antony Wood, some time after 1150, the earliest recipients being Peter Lombard and Gilbert de la Portree. In England the degree was introduced in the reign of John or of Henry III. Both in England and on the Continent it was confined for a considerable period to the faculties of law and divinity; it was not until the 14th century that it began to be conferred in medicine, and in England it is still unknown in the faculty of arts. In Germany, however, there is a degree of doctor of philosophy. The doctorate of music was first conferred at Oxford and Cambridge, its use in Germany is comparatively recent. See Universities.

Doctors' Commons was a society of ecclesiastical lawyers in London, forming a distinct profession for the practice of the civil and canon laws. Some members of the profession purchased in 1567 a site near St Paul's, on which at their own expense they erected houses for the residence of the judges and advocates, and proper buildings for holding the ecclesiastical and admiralty courts. In the year 1768 a royal charter was obtained by virtue of which the then members of the society and their successors were incorporated under the name and title of 'The College of Doctors of Law exercent in the Ecclesiastical and Admiralty Courts.' The college consists of a president (the dean of Arches for the time being) and of those doctors of law who, having regularly taken that degree in either of the universities of Oxford or Cambridge, and having been admitted advocates in pursuance of the recipt of the archbishop of Canterbury, shall have been elected fellow in the manner prescribed by the charter. The judges of the archepiscopal courts were always selected from this college. By 20 and 21 Vict. c. 77 (the Act to amend the law relating to Probate and Letters of Administration) §§ 116 and 117, the college is empowered to sell its real and personal estate and to surrender its charter to Her Majesty, and it is enacted that on such surrender the college shall be dissolved and the property thereof shall belong to the then existing members as tenants in common for their own use and benefit. In pursuance of this enactment the college has been dissolved and the ecclesiastical courts are now open to the whole bar.

Doctor is the name applied by its opponents to a small but very influential political party in France which made itself prominent after the restoration of the Bourbons in 1815. The doctrine of fundamental principle on which its action was based was that the sole justification of any form of government was the manner in which exercised power. Rejecting the claim of divine right, whether urged for monarchy or for republicanism, the doctrinaires were opposed alike to the ultra-royalists and to the revolutionists. In the chamber they occupied the left centre, and thus marked themselves out from the centre or ministerialist and the left or opposition party. While maintaining the re-established dynasty their efforts were mainly directed towards moulding the constitution into a shape resembling as nearly as possible that of England. The leaders of the doctrinaires were Royer-Collard, the Duc de Broglie, and Guizot. After the revolution of 1830 several of them came into power and proved strong supporters of constitutional monarchy on the model that has existed in England since the reign of William. The name doctrinaires fell entirely out of use after 1845, but the principles of the party have been faithfully represented since that date by the Orléansists. See France.

Dodd, Dr William (1759-1777), an unfortunate English divine, eldest son of the Rev William Dodd, many years vicar of Bourne, in Lincolnshire was born there in May 1729. He was sent, at the age of sixteen, to the university of Cambridge, where he was admitted a sizar of Clare Hall in 1743. He took the degree of B.A. in 1750, being in the list of wranglers. On leaving the university, he married a young woman of the name of Perkins, the daughter of a veger. She had a more than questionable reputation, and her extravagant habits contributed in no small degree to her husband's disgrace and ruin. In 1751 he was ordained deacon, and in 1753 priest, and he soon became a popular and celebrated preacher. His first preferment was the lectureship of West-Hamp and Bow. In 1754 he was also chosen lecturer of St Olave's, Hart Street, and in 1757 he took the degree of M.A. at Cambridge. He was a strenuous supporter of the Magdalen Hospital, which was founded in 1755, and soon afterwards became preacher at the chapel of that charity. In 1763 he obtained a prebend at Breen, and in the same year he was appointed one of the King's chaplains,—soon after which the education of Philip Stanhope, afterwards earl of Chesterfield, was committed to his care. In 1768 he went to Cambridge, and took the degree of L.L.D. At this period he was held in high estimation; but eager for further advancement, he unhappily entered on courses which in the end proved the occasion of his ruin. On the living of St George's, Hanover Square, becoming vacant, he wrote an anonymous letter to the wife of the lord chancellor offering three thousand pounds for the same if, by her assistance, he was promoted to the benefice. This letter having been traced to him, a complaint was immediately made to the king, and he was dismissed with disgrace from his office of chaplain. After residing for some time at Geneva and Paris, he returned to England in 1775. He still continued to exercise his clerical functions, but his extravagant mode of life soon involved him in difficulties. To meet the demands of his creditors he forged a bond on his former pupil Lord Chesterfield for £4200, and actually received the money. But he was detected, committed to prison, tried at the Old Bailey, found guilty, and sentenced to death; and, in spite of numerous applications for mercy, he was executed at Tyburn on the 27th June 1777. Dr Samuel Johnson was very zealous in pleading for a pardon, and a petition from the rest of London received 33,000 signatures. Dr Dodd was a voluminous writer, and possessed considerable abilities, with but little judgment and much vanity. His Beauties of Shakespeare, published before he entered the church, was long a well known work; and his Thoughts in Prison, a poem in blank verse, written during the interval between his conviction and his execution, naturally attracted much attention. He published a large number of sermons and other theological works. An accurate list of his various writings is prefixed to his Thoughts in Prison.
epiphytic plants forming the genus 
Cuscuta and natural order 
Cuscutales or, according to some botanists, the tribe 
Cuscuteraceae. All the species are natives of 
temperate regions, and all have strong acrid properties.

The flowers, which grow in clusters, have a quinque-partite, coloured calyx; scales alternating with the corolline lobes; carpels forming a syncarpous ovary; the albumen of the seeds finely divided, so that there exist no spirals, filaments, and aculeatedoones. On coming in contact with the living stem of some other plant the seedling dodder throws out a sucker, by which it attaches itself and commences to absorb the sap of its foster-parent; it then soon ceases to have any connection with the ground. As it grows, it throws out fresh suckers, establishing itself firmly on its victim. After making a few turns round one stem the dodder finds its way to another, and thus it continues twining and branching till it resembles "fine, closely-tangled, wet outgrow." The injury done to flax, clover, hop, and bean crops by species of dodder is often very great. C. europaeus, the Greater Dodder, is found parasitic on nettles, thistles, vetches, and the hop; C. Epipilum, on flax, C. Epipilum, on flax, 

DODDIDGE, Perkin (1702-1751), a celebrated nonconformist divine, was born 1702. His father, Daniel Doddridge, was a London merchant, and his mother the orphan daughter of the Rev. John Bauman, a Bohemian clergyman who had fled to England to escape religious persecution, and who had been for some time the master of the grammar school at Kingston-upon-Thames. He was the youngest of a family of twenty, of whom there was at his birth only one other child, a daughter, surviving. It is also remarkable that he himself at his birth was put aside as actually dead, and was only preserved alive owing to the accidental glance of one of the attendants, who fancied she perceived a feeble heaving of the infant's chest, and was successful in rekindling the almost extinguished vital spark. Before he could read, his mother taught him the history of the Old and New Testament by the assistance of some blue Dutch tiles; and these stories, he says, were the means of enforcing such good impressions on his heart as never afterwards the out. He was, indeed, so early to leave the paternal roof he was placed under the tuition of the Rev. Mr. Scott, who taught a private school in London, and on attaining his tenth year he was sent to the grammar school at Kingston-upon-Thames. About 1715 he was removed to a private school at St Albans, where he began to keep an exact account of his time in order the better to improve himself by private meditation and study, and was in the habit during his walks of entering the neighbouring cottages to read to the inmates a few pages from the Bible or from some religious book. Through the interest of friends a proposal was made to him, in 1719, which would have enabled him to enter the English bar; but receiving at the same time an invitation to study for the ministry, he preferred the latter, and shortly thereafter removed to the academy for dissenters at Kidbrooke in Kent, which at that time by the Rev. John Jennings. Mr. Jennings having in 1723 received an invitation to Hackney, the academy was removed thither; and in 1723 Doddridge, having finished his studies, accepted an invitation to succeed him in the ministry at Kidbrooke. He had also been mentioned by Jennings, who died in 1723, as the person most fitted to extend his views and as an instructor of candidates for the ministry, but it was not till 1739 that he was appointed minister of Newington Green. A short time after his appointment, he was chosen to conduct the academy established in that year at Harborough. In the same year he received an invitation from the congregation at Northampton, which he accepted. Here he continued his ministrations till 1751, when the rapid progress of consumption caused him to seek the advantages of a milder climate. Accordingly he sailed for Lisbon on the 30th September of that year; but the change was unavailing, and he died there on 26th October.

His popularity as a preacher is said to have been chiefly due to his "high susceptibility, joined with physical advantages and perfect sincerity." His sermons were mostly practical in character, and his great aim was to cultivate in his hearers a spiritual and devotional frame of mind. "He endeavoured," he says, "to write on the common general principles of Christianity, and not in the narrow spirit of any particular party." "There is," says his biographer, "a remarkable delicacy and caution evinced in the works of Dr Doddridge whenever the subject approaches the disputed points of theology. The genuine expressions of the sacred writers are then employed, and the reader is allowed to draw his own conclusions, unbiased by the prejudices of human authoritres." Those portions of his theological lectures which treat on the matter alluded to, substantiate this statement. His principal works are The Rise and Progress of Religion in the Soul, The Family Expositor, Life of Colonel Gardiner, and a Course of Metaphysical, Ethical, and Theological Lectures. He also published several courses of sermons on particular topics, and is the author of many well-known hymns.

See Memoirs, by Rev. Job Orton, 1765; Letters to and from Dr Doddridge, by Rev. Thomas Steinman, 1790, and Correspondence and Diary, in 5 vols. by his grandson, John Doddridge Humphreys, 1829.

DÖDERLEIN, JOHANN CHRISTOPH WILHELM LUDWIG (1791-1863), a distinguished German philologist, was born at Jena on the 19th December 1791. His father, Johann Christoph Doderlein, professor of theology at Jena, was celebrated for his varied learning, for his eloquence as a preacher, and for the important influence he exerted in guiding the transition movement from strict orthodoxy to a freer theology. Ludwig Doderlein, after receiving his preliminary education at Windheim and Schulpforta, studied at Mannich, Heidelberg, Erlangen, and Berlin. He devoted his chief attention to philology under the instruction of Creuzer, Vischer, Wolf, Creuzer, and Buttman. In 1815, soon after completing his studies at Berlin, he accepted the appointment of ordinary professor of philology in the academy of Bern. In 1819 he was transferred to Erlangen, where he became second professor of philology in the university and rector of the gymnasium. In 1827 he became first professor of philology and rhetoric and director of the philological seminary. He continued to discharge the duties of both offices until within a short period of his death, which occurred on the 9th November 1863. Doderlein's most valuable work as a philologist was rendered in the department of etymology and lexicography. He is best known by his Lateinische Synonymen und Etymologien (6 vols., Leipzig, 1826-38), and his Homerische Glossarium (3 vols., Erlangen, 1850-59). To the same class belong his Lateinische Wortbildung (Leipsic, 1838), Handbuch der Lateinischen Synonymen (Leipsic, 1858), and the Handbuch der Lateinischen Etymologie (Leipsic, 1841), besides various works of a more elementary kind intended for the use of schools and gymnasium. Most of the works named have been translated into English. To critical philology Doderlein contributed valuable editions of Tacitus (Opera, 1847; Germania, with a German translation) and Horace (Epistola, with a German translation, Leipzig, 1839) and Satire (Leipsic, 1866). His Roman und Aufsatzen (Erlangen, 1843-7) and Oeiffische Reden (1860) consist chiefly of academic addresses dealing with various subjects in pedagogy and philology.
DODO

DODO, from the Portuguese Doudo (a simpleton), a large bird formerly inhabiting the island of Mauritius, but now extinct. The name is derived from the Dutch Dood, which he minutely describes. It was taken for a possible cure of cancer, and the late Dr Gray has suggested its identity with that now in the British Museum, but on what grounds is not apparent.

school of Utrecht, in which is past an original drawing by Van de Venne superscribed "Vera effigies huus avas Walghoogel (zuan & a manitir Dodoos propter sedum posterosa partis crassitum munerem," and this was Amsterdanscum perlat est ex insula Mauritius Anno M.DC.XXVI." Now a good many paintings of the Dodo by a celebrated artist named Roelandt Savery, who was born at Courtray in 1576 and died in 1639, have been known, and have always been more or less mistaken. These were drawn from the life. Proof, however, of the limning of a living Dodo in Holland at that period had hitherto been wanting. There can now be no longer any doubt of the fact; and the paintings by this artist of the Dodo at Berlin and Vienna—dated respectively 1626 and 1628—as well as the picture by Gheeraerts, belonging to the Duke of Northumberland, at Ston House, dated 1627, may be with greater plausibility than ever considered portraits of a captive bird. It is even probable that this was the first example which had sat to a painter in Europe. It would be enough to quote from the Hague, that in the possession of the Zoological Society of London (formerly Broderip's), that in the Schonborn collection at Pommersfelden near Bamberg, and that belonging to Dr Seyffert at Stuttgart are undated, but were probably all painted about the same time (viz. 1626 to 1628) The large picture in the British Museum, once belonging to Sir Hans Sloane, by an unknown artist, but supposed to be by Roelandt Savery, is also undated, while the still larger one at Oxford (considered to be by the younger Savery) bears a much later date, 1651. Undated also is a picture said to be by Pieter Holsteyn, and in the possession of Dr A. van der Willige at Haarlem in Holland.

In 1628 we have the evidence of the first English observer of the bird—eunuch Altham, who mentions in two letters written on the same day from Mauritius to his brother at home These have only of late, through the intervention of Dr Wilmot, been brought to light. They run thus, though several times mentioning the bird, fail to supply any important fact in its history. Their navigators, however, were not idle, and found work for their naturalists and painters. Clusius says that in 1605 he saw at Fauw's House in Leyden a Dodo's foot, which he minutely describes. Of late years a copy of Clusius's work has been discovered in the high

1 Alteny and Coldl, in their Woordenboek der twee Twaen Portugeesch en Nederland ert (Amsterdam, 1714, p. 369), read as "En vol. duas, lol. du, sinistra manch."
2 It is from one of these that the figures of the large extinct Parrot (Lophopterus macrurus), before given [Birds, vol. iii. p. 355] were taken. Prof. Schlegel has announced his intention of immediately publishing these sketches in fac-simile.
3 The etymology of these names has been much discussed. That of the latter, which has generally been adopted by German and French authors, seems to defy investigation, but the former has been shown by Prof. Schlegel (Verol in Medebel K. Akad Wetensc.h npp 355 et seq.) to be the homely name of the Dabach or Little Grebe (Podicipus minor), of which the Dutchmen were reminded by the round stern and tail drawn to a tuft that characterized the Dodo. The same learned authority suggests that Dodo is a corruption of Dodorus, but, as will presently be seen, we hereon think him mistaken.
4 Van de Venne's incised name is it, and has reference to its simplesness, a Bird which for shape and rarity might be called a Phoenix (wien in Arabia) —the rest of the passage is entertaining, but the whole has been often reprinted. Herbert, it may be remarked, when he comes to possible cure similarly.
was weak as an etymologist, but his positive statement, corroborated as it is by Altham, cannot be set aside, and he was not unprepared to assign a Portuguese derivation for the word. 1 Herbert also gave a figure of the bird.

Proceeding chronologically we next come upon a curious bit of evidence. This is contained in a MS. diary kept between 1626 and 1640 by Thomas Crossfield of Queen's College, Oxford, where, under the year 1636, mention is casually made of one Mr. Goasing "who bestowed the Dodar (a blacke Indian bird) vnpon ye Anatomy school." Nothing more is known of it. About 1638, Sir Hamon Lestrange tells us, as he walked London streets he saw the picture of a strange fowl hung out on a cloth canvas, and going in to see it found a great bird kept in a chamber "somewhat bigger than the largest Turkycock, and so legged and footed, but shorter and thicker." The keeper called it a Dodo and showed the visitors how its captive would swallow "large poble stones . . . . as bigge as nutmegges."

In 1651 Morris published an account of a voyage made by Francois Cauche, who proved to have been an admirable and correct writer. The narrative is not very trustworthy, and indeed certain statements are obviously inaccurate. Cauche says he saw there birds bigger than Swans, which he describes so as to leave no doubt of his meaning Dodos; but perhaps the most important fact (if they be facts) that he relates is that they had a cry like a Goasing ("il un crye comme l'osouer"), and that they laid a single white egg, "gros comme un pain d'un sol," on a mass of grass in the forests. He calls them "oiseux de Nazarel," perhaps, as a marginal note informs us, from an island of that name which was then supposed to lie more to the northward, but is now known to have no existence.

In the catalogue of Tradescant's Collection of Rarities, preserved at South Lambeth, published in 1656, we have entered among the "Whole Birds" a "Dadar from the island Mauritius," it is not able to fly but being so big. This specimen may well have been the skin of the bird seen by Lestrange some eighteen years before, but anyhow we are able to trace the specimen through Willughby, Llwyd, and Hyde, till it passed in or before 1684 to the Ashmolean collection at Oxford. In 1755 it was ordered to be destroyed, but, in accordance with the original orders of Ashmole, its head and right foot were preserved, and are now in the Museum of that University. In the second edition of a Catalogue of many Natural Rarities, &c., to be seen at the place formerly called the Musco House, near the West End of St. Paul's Church, collected by one Hubert alias Forbes, and published in 1665, mention is made of a "egg of a Dodo, a great heavy bird that cannot fly; it is a Bird of the Mauritius Island." This is supposed to have subsequently passed into the possession of the Royal Society. At all events such a specimen is included in Grew's list of their treasures which was published in 1681. This was afterwards transferred to the British Museum, where it still remains. As may be supposed, without the integuments, but it differs sufficiently in size from the Oxford specimen to forbid its having been part of the same individual. In 1666 Olearius brought out the Gortissches Kunst Kämmer, wherein he describes the head of a Waldhoog, which some sixty years later was removed to the Museum at Copenhagen, and is now preserved there.

1 Hence we venture to dispute Prof. Schlegel's supposed origin of "Dodo." The Portuguese must have been the prior nomenclators, and if, as is most likely, some of their nation, or men acquainted with their language, were employed to pilot the Hollanders, we see at once how the first Dutch name Waldhoog would give way. The word standing for Dodo not being plain to the Dutch, they would, as is the habit of sailors, convert it into something they did understand. Then Doodara would easily suggest itself.

having been the means of first leading zoologists, under the guidance of Prof. Reinhart, to recognize the true affinities of the bird.

Little more remains to be told. For brevity's sake we have passed over all but the principal narratives of voyagers or other notices of the bird. A copious bibliography, up to the year 1648, will be found in Strickland's hook work, 2 and the last was continued by Von Frauenfeld 3 for twenty years later. The last evidence we have of the Dodos existence is furnished by a journal kept by Benj. Harry, and now in the British Museum (Miss. Addit. 3066. 11. D). This shows its survival till 1681, but the writer's sole remark upon it is that its "shelah is very hard." The successive occupation of the island by different masters seems to have destroyed every tradition relating to the bird, and doubts began to arise whether such a creature had ever existed. Duncan, in 1628, showed how ill-founded these doubts were, and some ten years later Broderip with much diligence collected all the available evidence, which in its turn was succeeded by Strickland's monograph just mentioned. But in the meanwhile little was done towards obtaining any material advance in our knowledge, Prof. Reinhart's determination of its affinity to the Pigeons (Columbae) excepted; and it was hardly until Clark's discovery in 1659 (Birds, vol. ii. p. 729) of a large number of Dodos remains, that zoologists generally were prepared to accept that affinity without question. The examination of bone after bone by Prof. Owen and others confirmed the judgment of the Danish naturalist, and there is now no possibility of any different view being successfully maintained.

The causes which led to the extinction of this ponderous Pigeon have been discussed in a former article, and nothing new can be added on that branch of the subject; but it will be remembered that the Dodo does not stand alone in its fate, and that two more or less nearly allied birds inhabiting the outer islands of Reunion and Rodrigues have in like manner disappeared from the face of the earth.

(A. N.)

DODONA, in Epirus, was the seat of the most ancient and venerable of all Hellene sanctuaries. In the plains of the Dodonae, and on the banks of the neighbouring Achelous, there dwelt in times long anterior to history the race of Heili or Hellenes, who thence spread into Thessaly and Greece. In after years the Greek tyrants, both of Athens and the Great King of Persia, set up statues on the inhabitants of Epirus as barbarians; nevertheless for Dodonae they always preserved a certain reverence, and the temple there was the object of frequent missions from them. This temple was dedicated to the Pelasgic Zeus, the wielder of the thunderbolt in the storms so frequent in Epirus. Connected with the temple was an oracle which enjoyed more reputation in Greece than any other save that at Delphi, and which would seem to date from more early times than the worship of Zeus, for the normal method of gathering the responses of the oracle was by listening to the rustling of an old oak tree, which was supposed to be the seat of the deity, and by taking these as an augury of the future. We seem here to have a remnant of the very ancient and widely diffused tree-worship. Sometimes, however, auguries were taken in other manners, being drawn from the meaning of doves in the branches, the murmur of a fountain which rose close by, or the resounding of the wind in the brazen tripod which formed a circle all round the temple. The oracle was then compared with the articulate responses of Delphi, dumb, but none the less constantly consulted. Caesar proposed

establisli himself as bookseller in Pall Mall, and his
ment and enterprising spirit soon made him one of the
foremost publishers of the day. One of the first copyrights
he published was that of Johnson's London, for which
he gave ten guineas in 1758, and he was afterwards the
leader of the association of booksellers that furnished Johnson
with funds for the preparation of his English Dictionary.
In 1737 a new piece of his own, entitled The King and the
Miller of Mansfield, was received with undiminished
applause. His immediately subsequent fates, however,
were not so popular. In 1738 he published a collection
of his dramatic works in one volume 8vo, under
the modest title of Trites, which was followed by the
Triumph of Peace, a masque, occasioned by the treaty of
Arras-Chapel, and a fragment on Public Virtue. Dodd
was also the author of the Economy of Human Life, a work
which acquired considerable celebrity, but for this it is
supposed he was not a little indebted to the mistaken
opinion which long prevailed that it was the production of
Lord Chesterfield. The name of Dodley is from this
time associated with much of the literature of his time.
Among other things he projected The Animal Register,
commenced in 1738, The Museum, The World, and The
Preceptor. To these various works Horace Walpole,
Aekensale, Soame Jenys, Lord Lyttelton, Lord Chesterfield,
Edmund Burke, and others were contributors. His own
latest production was a tragedy entitled Cleone, which was
received with even greater enthusiasm than his earlier
works. It had a long run at Covent Garden, two
thousand copies of it were sold on the day of publication,
and it passed through four editions within the year.
It has long, however, ceased to be read, and apart from his
fame as a publisher Dodley is now chiefly remembered on
account of his Select Collections of Old Plays ( 12 vols.
He died at Dulwich while on a visit to a friend, 25th
September, 1764.

DODWELL, EDWARD (1767–1832), an English
tiquarian writer and draughtsman of considerable note in
the department of classical investigation. He belonged to
the same family as Henry Dodwell the theologian,
and received his education at Cambridge. Being under no
necessity to adapt himself to be a professional man of livelihood, he
devoted himself entirely to his favourite pursuits, travelled
for several years—from 1801 to 1806—in Greece, and spent
the rest of his life for the most part in Italy, either at
Naples or at Rome. An illness contracted in 1850 during
a visit of exploration to the Sabine Mountains, undermined
his constitution and ultimately resulted in his death,
which took place at Rome in May 1832. His widow, a
daugther of Count Giraud, was thirty years his junior, and after his
death became famous as the "beautiful" countess of Svarou,
and played a considerable role in the political life of the
Papal city.

His works are—A Classical and Topographical Tour through
Greece, 2 vols, London, 1819, of which a German translation
by Sichler was published at Hennepin in 1821, France en Greece, con-
sisting of thirty coloured plates, London, 1821, and Views and
Descriptions of Cyclopian and Pelasgian Ruins in Italy and Greece,
London, 1834. The last work, which contains 120 plates, was
brought out simultaneously at Paris with a French text.

DODWELL, HENRY (1641–1711), a learned controver-
sional writer, was born at Dublin in October 1641. His
father had once been possessed of considerable property
in Connaught, but having lost it at the rebellion settled at
York in 1648. Here Henry received his preliminary edu-
cation at the free school. By the death of his parents
he was reduced in early life to the greatest poverty.
In 1651 he was sent by his uncle to Trinity College,
Dublin, of which he was soon afterwards chosen schol-
ar and fellow. Having conscientious objections to take

the stormy shades of Sulli who sleep on the ground and wash
not their feet, and on the second occasion describing a
vast of Odysseus to the oracle. Herodot has left us a com-
plete description of the Dodona or Hellen, which he
calls a district full of cowfields, of hords and flocks and of
sheepfolds, where is built on an extremity ( νεανική) Daulons,
where Zeus dwells in the stem of an oak (άργυρος).
Herodotus tells a story which he learned at Egyptian
Thebes, that the oracle of Dodona was founded by an
Egyptian priestess who was carried away by the Phenicians,
but says that the local legend substitutes for this priestess
a black dove, a substitution in which he treated us a
rational meaning. From later writers we learn that in
historical times there was worshipped, together with Zeus,
an Asiatic goddess under the name Dione, and therefor
the responses were given by the priestesses of the
latter, who were called doves, and not by the Sulli.

As to the site of Dodona there has been a good deal of
discussion. We know from the authorities that the town
was situated in a fertile vale at the foot of the mountain
Tomaros, whence issued a multitude of springs, and that it
was on the eastern boundary of Epirus, and on the confines
of Thessalia and Molossia. We are further told that
Dodona was a two days' journey from Ambracia, and a
journey of four days from buttolotum. It would also
appear certain that it was in a region of frequent thunder-
storms. In accordance with these indications, Colonel
Leake fixed on Castria near Janina in Epirus, at the foot
of the mountain Mitakith, as the site of Dodona. But his
reasons are not conclusive. Quite recently excavations
have been undertaken at a spot in the valley of Drynnasus,
a few leagues south of Castria, at the foot of Mount
Olympos, where Leake found the remains of a theatre and
of two temples. This has usually been supposed to be the
site of Passaron, the ancient capital of the Molossian kings.
But these excavations have brought to light not only many
antiquities, but tablets ofvote bearing dedicatory inscrip-
tions to Zeus Nanos and Dione, and many fragments of
tripods, of which it would seem highly probable that
the opinion of Leake must be given up, and the new site
definitely fixed upon as that of Dodona. (See Leake,
Northern Greece, vols. 1, 2, Revue Archologicque for 1817,
p 329, 397.)

The temple of Dodona was destroyed by the Eotolans in
219 B.C., but the oracle survived to the times of
Pausanias and even of the emperor Julian.

DODSLEY, ROUSSE (1703–1761), an eminent book-
seller and versatile writer, born in 1703 at Mansfield,
Nottinghamshire, where his father is said to have been
a schoolmaster. In his youth he was apprenticed to a
stocking weaver, from whom he ran away, taking service
as a footman. His first poetical attempts seem to have
been made when he was a servant in the family of the Hon.
Mrs Lovelier, and were published by subscription under
the title of The Man in Lottery, or The Footman's Miscellany
(1730). This was followed by an elegant little satire
now called The Top-hap, the hint of which is said to have
been taken from Randolph's Moon's Vntook-glass, and which,
 having obtained the approbation of Pope, was acted
at Covent Garden with great success. The profits accruing
from the sale of these two publications enabled him to
orders he relinquished his fellowship in 1668, and resided for some time at Oxford, Dublin, and London successively. In 1671, he was elected Camden professor of history at Oxford, and in 1691 he was deprived of his professorship for refusing to take the oaths of allegiance to William and Mary. Returning to Shottesbrooke in Berkshire, and living on the produce of a small estate in Ireland, which he had at first generously relinquished in favour of a near relation, he devoted himself to those literary labours in chronology and ecclesiastical polity on which his fame now rests. In the former department he published—Discourse on the Phenician History of Sanchoniathon (1651); Annals Thucydides et Xenophonis (1696); Chronologia Graeco-Romana pro Hypothetis Dion. Italicamassii (1692); Annales Valoisiani, Quintiliani, Statiacii (1698); and a larger treatise entitled De Veteribus Graecorum Romanorum-anque Ciculis, obsterre de Cyclo Judaorum ac Erate Christi, Dissertationes (1701). All these obtained considerable reputation, and were frequently reprinted. Gibbon speaks of his learning as "the most singular, and must be his "skill in employing facts is equal to his learning." In the department of ecclesiastical polity his works are more numerous and of much less value, his judgment being far inferior to his power of research. In his earlier writings he was regarded as one of the greatest champions of the non-jurors; but the absurd doctrine which he afterwards pronounced, that immortality could be enjoyed only by those who had received baptism from the hands of one set of regularly ordained clergy, and was therefore a privilege from which dissenters were hopelessly excluded, justly deprived him of the confidence even of his friends. It is interesting, however, in view of the recent revival of the same doctrine, to know that he published in 1706 a treatise professing to prove from Scripture and the first fathers that the soul is naturally mortal. Dodwell died at Shottesbrooke, 7th June 1711. His eldest son Henry was known as the author of a pamphlet entitled Christianity not founded on Argument, to which a reply was published by his brother William, who was besides engaged in a controversy with Dr Conyers Middleton on the subject of miracles.

DOG, a name common to several species of Canis—a family of Carnivorous Mammals widely distributed over nearly every part of the globe. Many of them belonging to this family, as the wolf and the jackal, are social animals, hunting in packs, and are readily tamed; while in confinement they show little or no repugnance to breeding. In a group thus eminently capable of domestication, it is not surprising that in the earliest times one or more species should have been brought under the dominion of man, or that under human care the domestic dog should have become, as Baron Cuvier calls it, "the completest, the most singular, and the most useful conquest ever made by man." There is sufficient evidence to show that the dog existed in the domesticated state during prehistoric times; consequently neither history nor tradition is available to solve the question of the jackal. The matter must be decided, if at all, by the naturalist, and the variety of opinion existing on this point at the present time renders it exceedingly improbable that the parentage of the dog will ever be ascertained with certainty. Some suppose that all our breeds have sprung from a single wild source, others that they are the product of the blending of several distinct species. Of the former, the majority regard the wolf as the parent form, others favour the claims of the jackal, while a few regard them as the descendants of an extinct species, and point to the fossil remains of a large dog, found in the later Tertiary deposits, as the probable wild stock. The prevalent belief at the present day is probably that which regards the domestic dog as the product of the crossing of several species, living and extinct. This opinion is founded on such considerations as the presence in the earliest historic times of many breeds (totally distinct from each other, and nearly resembling existing forms), the existence of wild species of dogs in all quarters of the globe, the fondness of savage man for taming wild animals, and the extreme improbability that among so many presumably equally tameable canine species, only one should have been chosen for domestication. Nor is it to be forgotten, as Darwin has well shown, that fear of man in most wild animals is a gradually acquired instinct, and that before its acquirement a wild species would have been much more readily tamed than after. Thus the wild dog of the Falkland Islands (Canis antarcticus), when these were first visited by man, approached him without sign either of fear or of aversion. The weightiest reason for this opinion, however, lies in the fact that many of the breeds of domestic dogs, found in different countries, bear a more or less striking resemblance to the wild species and to the jackals, both of which are closely related to the wolf. The widely distributed Indian dogs; and the wolves and jackals of North America resemble the wolf of the same regions, both in appearance and in voice, that Sir J. Richardson on one occasion mistook a pack of these wild animals for a troop of Indian dogs; and the Indians are said to take the young of wolves in order to improve the same breed, which would seem to prove that the dog and wolf are sufficiently fertile inter se. The Hare Indian or Mackenzie River Dog, although somewhat smaller in size than the prairie wolf (Canis latrans) occurring in the same regions, so resembles the latter that Richardson could detect no decided difference in form. It seems, in fact, to bear the same relation to the prairie wolf that the Eskimo dog does to the grey wolf already mentioned. The wolf certainly exhibits few peculiarly dog-like qualities, being both ferocious and cowardly, and showing no attachment to man; but instances, nevertheless, are on record of tamed wolves which in their gentleness, in love for their masters, and in intelligence, showed true dog-like capacity. The Eskimo dogs are likewise decidedly wolfish in disposition, showing little or no attachment to their owners, and sometimes, it is said, even attacking them when pressed by hunger. Distinct varieties of the wolf occur in Europe and in India, and such European breeds as the shepherd dog of Hungary so closely resemble the wolf that an Hungarian has been known to mistake that animal for one of his own dogs; while certain of the Hindu pariah dogs are said by Blyth to resemble the Indian variety of wolf. The large semi-domesticated dogs of the northern parts of both hemispheres may thus be regarded as principally derived from the various species and varieties of wolves still existing there. The period of gestation in the wolf and dog is the same, being 63 days in both. In the tropical regions of the Old World the wolf disappears, and with it the prevalence of wolf-like dogs, their places being taken by smaller breeds, such as certain of the pariah dogs of India and Egypt, between which and the jackals must be decided. This structural difference can, according to Geoffroy Saint-Hilaire, be pointed out. Their period of gestation agrees with that of the dog and wolf, and like dogs, tamed jackals when caressed "will," says Darwin, "jump about for joy, wag their tails, lower their ears, lick their master's hands, crouch down and even throw themselves on the ground belly upwards;" when frightened, also, they carry their tails between their legs. Jackals associate readily with dogs, and their hybrid offspring are not sterile; there is also an instance on record of one of these which barked like an ordinary dog. The habit of barking, so characteristic of dogs, is not, however, universal among them; the domestic dogs of Guinea and certain Mexican breeds being described.
Dogs as dumb. This faculty appears to be readily lost and to be capable of reacquaintance. The domestic dogs which ran wild on the island of Juan Fernandez are said to have lost the power of barking in 53 years, and to have gradually reacquired it on removal from the island. The Harle Indian Dog makes an attempt at barking, which usually ends in a howl, but the young of the breed born in the Zoological Gardens seem to possess this faculty to the full extent. In tropical America, where jackals are unknown, there are several wild species of dogs to which the domestic breeds of those regions bear a considerable resemblance, and at the present day the Arawak Indians cross their dogs with an aboriginal wild species for the purpose of improving the breed. In Australia the Dingo, regarded by many as constituting a distinct species indigenous to that country, its remains having been found in caves associated with those of other extinct mammals, occurs both in the wild state and domesticated at the present day. Darwin, after reviewing this question, concludes that “it is highly probable that the domestic dogs of the world have descended from two good species of wolves (Canis lupus and C. latrans), and from two or three other doubtful species of wolves, namely, the European, Indian, and North African forms, from at least one or two South American canine species, from several races or species of the jackal, and perhaps from one or more extinct species.”

Remains of the dog, of Neolithic age, occur in the kitchen-middens of Denmark, and in similar deposits in Switzerland. In Denmark the earliest known dog is followed, in the Bronze period, by a larger breed, and that by a still larger form in the succeeding or Iron period; while a somewhat similar succession occurs in Switzerland. These successive changes, however, may merely indicate the appearance in those countries of new races of predatory man, who brought with them their own dogs. In historic times the earliest records of the dog are to be found in the figures of these animals on Egyptian monuments from three to five thousand years old, and these show that thus early, such varieties as the hound, greyhound, watch-dog, and turnspit were cultivated on the banks of the Nile. By the ancient Egyptians the dog was worshipped under the title Anubis, as the genius of the River Nile,—the aper of all lands, the protector of Suiris, the dog star, corresponding with the time of the annual rise of that river. The city of Cynopolis was built in its honour, and there its worship was carried on with great pomp. Certain kinds of dogs were regularly sacrificed to Anubis, their bodies being afterward embalmed, and occasionally these are still found. The earliest record of the dog in sacred history is in connection with the sojourn of the Israelites in Egypt; and the religious homage paid to it by its oppressors may probably explain why the Jews were taught to regard it as unclean. Under Moslem law, which in many matters was founded upon Jewish practices, the dog occupies an equally degraded position; and through-out Mahometan countries at the present day, their generally wretched condition bears ample testimony to the neglect and ill-treatment to which for centuries they have been subjected. The pariah dogs of Eastern cities know no master, they prowel about the streets in troops, eating whatever garbage may come in their way, thus serving the useful purpose of scavengers, and occasionally receiving a meal from the more humane of the habitants. On no account, however, must even the garments of an orthodox Mahometan be defiled by the touch of his dog, in its sleep or otherwise, and such is the intelligence and sagacity of these ownerless curs that, having become aware by painful experience of this religious prejudices, they seem to take the greatest care to avoid giving such offence. The value set upon the dog by the Egyptians seems to have been shared in by the ancient Greeks and Romans, who possessed many breeds closely allied to still existing forms. Those early breeds, however, are remarkable for the entire absence of pendulous ears, which do not make their appearance till near the decline of the Roman empire. By both Greeks and Romans they were employed in the chase, and in war, and for the latter purpose they were armed with spiked collars, and sometimes even with a coat of mail. Cortes was said to have been saved by 59 war dogs, which attacked the enemy that had landed while the garrison slept, and which fought with unbounded courage till all were killed except one, which succeeded in rousing the garrison. Shakespeare thus put no figure of speech in the mouth of Antony when he exclaimed—

“Cry havoc, and let slip the dogs of war”

Dogs are naturally carnivorous, preferring flesh that is slightly putrid; but they can also live on vegetable food, and in countries where the dog itself is eaten, it is generally thus fed. In drinking it laps with its tongue, and it never perseveres, although when heated its tongue hangs from its mouth, and a fluid runs from it. When about to sleep, no matter where, it turns round and round, and scratches the ground with its forepaws as if to form a hollow couch; and in this seemingly senseless action it is no doubt continuing a habit once found useful to its wild progenitors. Its sense of smell and hearing are exceedingly acute, and many suppose that the remarkable power possessed by the dog, in common with the cat, of finding its way for great distances along unknown roads may be due to the exercise of the former sense. The differences that obtain between the various breeds of dogs are very great, the skulls, according to Cuvier, differing more from each other than they do in the different species of a natural genus. The molar teeth, which normally consist of 6 pairs above and 7 below, sometimes number 7 pairs above and below, while in the hairless dog of Egypt the teeth are sometimes reduced to a single molar on each side. Incisors and canines being entirely wanting. Some varieties are six times as long as others, excluding the tail, and the number of vertebrae in the latter organ is also exceedingly various; nor is the number of mammm always uniform, there being 5 on each side in some, and 4 in others, while occasionally the number on the two sides is unequal.

While man has thus bestowed great attention on the physical development of the dog, and availing himself of natural variations has, by careful selection and intercrossing, moulded the dog into an almost innumerable forms, he has also, by education, developed its moral and intellectual capabilities, so that the dog may, in this respect, be said to have, within its own limits, kept pace with its master’s advancement; and it is undoubtedly owing to a certain community of feeling existing between dog and man that this domestic animal has, since the earliest times, been regarded as the companion as well as the humble servant of mankind. There are few human passions not shared in by the dog. It is, like him, subject to anger, jealousy, envy, love, hatred, and grief, it shows gratitude, pride, generosity, and fear. It sympathizes with his master’s advancement, and it is undoubtedly owing to a certain community of feeling existing between dog and man that this domestic animal has, since the earliest times, been regarded as the companion as well as the humble servant of mankind.
courageous dog will often tremble at the sudden rustle of a leaf. While the possession of such faculties has rendered him fit above all other animals for the companionship of man, the physical and intellectual qualities characteristic of the various breeds have been seized upon and developed to their utmost by man, so as to enable him to use the dog for a great variety of purposes; what these are will appear in the following necessarily brief account of the more important breeds of dogs.

According to Professor Fitzinger, there are at least 189 distinct varieties of the domestic dog, and when it is considered that the origin of many if not most of these is uncertain, it is not surprising that considerable difference of opinion should exist as to the most natural mode of grouping them together. Their arrangement into the following six races, founded to a certain extent on the form and development of the ears, probably affords an approximation to a natural classification, viz., WOLF-DOGS, GREYHOUNDS, SPANIELS, HOUNDS, MASTIFFS, and TERRIERS.

Wolf-DoGS.—Throughout the northern regions of both hemispheres there are several breeds of semi-domesticated wolf-like dogs having nearly erect ears, and long woolly hair; these include among others the dogs of the Esquimaux and the Kamtschatdales. The Esquimaux Dog is usually of a black and white colour, nearly as large as a wolf, with a fine bushy tail, and sharp pointed muzzle. It is of the greatest value to the inhabitants of the boreal regions of America in hunting the seal, bear, and reindeer; while it is equally useful as a beast of burden, carrying loads on its back—a kind of work for which dogs are by no means well suited—and drawing sledges over the snow. On a good road half a dozen of these dogs will draw, it is said, from 8 to 10 cwt., at the rate of 7 miles an hour, and Kane, the Arctic traveller, tells how that number of dogs, well worn by previous travel, carried him with a fully burdened sledge, between seven and eight hundred miles during the first fortnight after leaving his ship—a mean rate of 57 miles a day. According to the same authority, the training of these dogs is of the most ungracious sort.

"I never heard," he says, "a kind accent from the Esquimaux to his dog. The driver's whip of walrus hide, some 20 feet long, a stone or a lump of ice skilfully directed, an impertinent loud and sharp, made emphatic by the fast or foot, and a grudged ration of seal's meat, make up the winter's entertainment of an Esquimaux team." Owing to the ill-treatment to which they are thus habitually subjected, they are highly irritable and difficult to manage, and in sleighing it is necessary to have a well-trained dog as leader, to whom the driver speaks, and by whom the other dogs in the team are guided. They readily relapse into the wild state, and have been known thus to hunt the reindeer in packs like wolves. These dogs have borne a prominent part in Arctic exploration, and much of the difficult work done in this field would have been well-nigh impossible without them. The Kamtschatka dogs are also used for sledding, and are famed for their swiftness and endurance. During summer they run at large and eat for themselves, returning in winter to their masters, who feed them principally with the heads of dried fish.

The Sheep-dog.—In Eastern countries where the sheep follow the shepherd, the duties that fall upon the dog are simpler, and require less intelligence, than those performed by the European breeds. Their task is chiefly to defend the flocks and herds from wild beasts and robbers, and for this purpose the wolf-like Turkoman Watch-dog and the Sheep-dog of Natolia are, by their great strength and courage, eminently fitted. The former is described by Sir J. M'Neill as a shaggy animal, nearly as large as the Newfound dog, and very fierce and powerful, the dam of the specimen he describes having killed a full-grown wolf without assistance. The sheep-dog of Europe is generally classed among the wolf-like dogs, owing to the erect or semi-erect character of its ears, its pointed nose, and shaggy covering; and Buffon, for such reasons, regarded it as nearest to the primitive type of the domestic dog. It is more reasonable to suppose with Martin (History of the Dog) that these points "only indicate purity of breed unalloyed by admixture with other varieties." The fact that its life is spent almost entirely out of doors, and that it has little or no opportunity of mixing with dogs other than of its own kind, would tend to preserve uniformity in external appearance; while its high cerebral development and intelligence prove beyond a doubt that the breed of sheep-dogs is one of the most highly improved, and in this respect remotest from the primitive type. Its whole intellect is devoted to the one duty of tending its master's flocks, and in the performance of this it is equally sagacious, vigilant, and patient. At a word, or even a look, from its master, it will gather the sheep, scattered for miles around, to one place. During and after the snowstorms to which highland districts are so frequently exposed, the sheep-dog is invaluable in saving its master's property from almost total destruction. Without it the Highlands of Scotland would be almost useless for sheep-farming purposes.

"It would require," says the Ettrick Shepherd, "more hands to manage a stock of sheep, gather them from the hills, force them into houses and folds, and drive them to markets, than the profits of the whole stock would be capable of maintaining." The sheep-dog stands about

![Sheep Dog](https://via.placeholder.com/150)

15 inches high, is covered with long shaggy hair of a black colour varied with dark grey or fawn-brown, and its tail is of moderate length, slightly recurved and bristly. In disposition it is quiet; and although not quarrelsome, it shows great courage in defending its charge. It will not wantonly attack a stranger, but evidently regards him with suspicion, and rejects all friendly advances. There are three varieties of the sheep dog found in Great Britain, viz.—the Scotch Collie, standing only from 12 to 14 inches high, and regarded as the purest and most intelligent; the Southern Sheep-dog, of larger size, but with shorter fur, and having the tail often very short—a peculiarity which, according to Bell, "appears to be perpetuated from parents whose tails have been cut;" and the Drover's Dog or Cur, generally black and white in colour, and taller in its limbs than the others. It is employed in driving sheep and cattle to the city markets, and in the discharge of this duty shows intelligence quite equal to that of the other varieties; although in the treatment of the herds under its charge, it often displays a more savage disposition. The sheep-dogs of South America are so fashioned as to unite in themselves the duties of dog and shepherd. "When rising," says Darwin, "it is a common thing to meet a large flock of sheep, guarded by one or two
dogs, at the distance of some miles from any house
or man." And in inquiry he found out the method
by which this friendship between dog and sheep had been
established. The dog when a puppy is removed from its
mother, and is no longer allowed to associate with other
dogs, or even with the children of the family. It is kept
in the sheep pen, and suckled by a ewe. Generally also it
is cradled and thus has little or no community of feeling
with its kind. Brought up among the sheep it shows no
desire to leave the flock, but assumes the position of
leader. "It is amusing," says the above writer, "to
observe, when approaching a flock, how the dog immedi-
ately advances barking, and the sheep all close in his rear
as if round the oldest ram." It comes home daily for food,
on receipt of which it immediately returns to the flock,
and thus it is often taught to bring home in the evening.

The Newfoundland and Great St Bernard or Alpine Dogs
occupy an uncertain position, forming, according to some
authors, a group by themselves, and being classed by
others among the wolf-like dogs, although in their large
and pendulous ears they differ widely from the typical forms
already noticed. The Newfoundland Dog is believed to have been brought
to England from the island to which it owes its name, but
probably owing to partial crossing, it differs somewhat from
the original American breed, the latter being smaller in
size, with the muzzle less blunt and, almost totally black in colour.
In Newfoundland and Labrador these dogs are used as beasts of burden, drawing considerable
loads of wood and provisions on sledges. The feet are
practically webbed, and consequently they are unruviled as
water-dogs, and although their weakness of scent and com-
parative slowness of foot renders them useless to the hunter,
yet in a country of fers and morasses, the sportsman finds
them of the greatest service in rescuing birds that have
fallen into the water, nor do they hesitate in their eager-
ess for retrieving to make their way through the roughest
cover. The English variety of Newfoundland Dog is a
noble creature, standing 30 inches high at the shoulders,
even in confinement such cases are altogether exceptional.

This breed is supposed by some not to be indigenous to
North America, but to have been introduced either on the
first discovery of Newfoundland by the Norwegians about
the year 1000, or on their arrival here by Cabot in 1497.
The Norwegians, according to Martin, have dogs closely
resembling the Newfoundland breed, which are used in
hunting bears and wolves, and which are armed with spiked
collars in order to protect them from the wolves which seek
to seize them by the throat. The Great St Bernard Dog
of the present day is a powerful animal, as large as a
mastiff, with close short hair and pendulous ears, and
varying in colour, in one case being described as "sandy
tawny" with black muzzle, in another as "more or
less marked with grey, liver, and black clouds." Previous to 1820 there existed another breed of these dogs,
closely allied in form and size to the Newfoundland, but
in that year the greater portion of them died of an
epidemic, which necessitated the introduction of the present
variety. These dogs are kept by the monks of the Hospice
of St Bernard, situated on one of the most
dangerous passes between Switzerland and Italy, near the
top of the Great St Bernard, where they are trained to the
work of rescuing travellers who, overtaken by the snow-
storm, may have lost their way, or sunk benumbed by the
icy gusts. On such occasions these dogs are set out from the convent in pairs, one bearing a flank
of spouts attached to his neck, the other with a cloak
Should they come upon the bailed yet struggling traveller, they conduct him to the convent, but should he have
succumbed and be covered by the snow, their keen scent
detects his pre-ence although buried several feet beneath
the surface. By loud barking—and a young dog of this
breed kept many years ago in the suburbs of Edinburgh
was able to make itself heard a mile away—they apprise
the monks of the need of succour, while with their feet
they attempt to clear away the snow from the body.
In this way these dogs are instrumental in saving many lives
every year, although often at the sacrifice of their own,
one dog which thus met its death bore a medal stating
that it had been the means of saving twenty-two lives

If Greathoundus—Representations on Egyptian monu-
ments prove the existence of the greyhound race of dogs
at least 3000 years ago, and the silky-haired breeds existing
in Egypt, Arabia, and Persia at the present day are
probably the slightly modified descendants of those ancient
forms. The numerous varieties of this race may be con-
veniently grouped into the wire-haired and smooth-haired
breeds,—of the first of which the Irish Greyhound or Wolf-
dog is an example. In former times this magnificent breed
was employed in Ireland in hunting the wolf and the stag,
but the extermination of these beasts of chase led to the
neglect and consequent degeneracy of the breed, and it has
now become extinct in that country. It was probably in-
troduced from the sister isle into Scotland, where its
modified descendant, the Scottish Deerhound, in hunting the
stag still bears testimony to the great strength and
agility of its progenitor. The Old English Greyhound was
only allowed to be kept by the nobles and princesses, and the
killing of it was, under the old game laws, a felony punish-
able by death. It was employed in coursing the red deer
and fallow deer, and Queen Elizabeth is said to have
witnessed, on one occasion, the pulling down of 150
bucks by greyhounds. These must have been much more
powerful animals than the modern English breed, which, how-
ever, is regarded as the finest of the smooth-haired grey-
hounds. In speed and wind it is unrivalled, all other
points having been sacrificed to these by breeders. It has
thus almost lost the power of scent, and is the only dog
that hunts by sight alone, hence probably the name gue-

FIG. 2.—Newfoundland Dog.
hound formerly applied to it. According to Daniel, its speed on flat ground is little inferior to that of a racehorse, while on hilly ground it is probably superior to it. Every part of its body is suggestive of activity and speed—the long and pointed muzzle, the narrow head, thin neck, chest deep and flanks contracted, long slender legs, and the tail narrow and curved upwards. It is exceedingly docile, good-tempered, and affectionate. The colour varies in different breeds, and even in individuals of the same breed. Bell suggests that the greyhound may owe its name to the prevailing colour of the original stock; while others, with more probability, derive it from the ancient British *grech or grey*, a dog. The Italian greyhound is a small but exceedingly elegant and delicate breed, reared in this country to the parlour as a ladies' pet. The Lurcher is supposed to be the result of a cross between the rough greyhound and the sheep-dog, having the sharp, pointed muzzle of the former, and owing its diminished height but greater stouthisness to the latter. It resembles the sheep-dog still more in its great intelligence, and in devotion to its master. This breed is usually the poacher, and in his illegal pursuit of game, the keenness of scent, the cunning, and the absolute silence of this dog render it the most suitable of all for such nocturnal work. It waylays the rabbit returning to its burrow, its cunning circumvents the hare where its speed would not avail, and it has strength sufficient to pull down the fallow deer. According to Colonel Smith these dogs sometimes run wild when their owners are captured and imprisoned, and when thus catering for themselves they have been regularly hunted with hounds.

III. SPANIELS.—The spaniels are characterized by large pendulous ears, long silky hair often curled and shaggy, and acute scent. In cerebral development, and, consequently in intelligence, they are probably superior to all other dogs, while they are unrivalled in docility and in devotion to man's service. They include the Common Spaniel, the Water Dog, and the Setter, besides numerous fancy varieties, as King Charles's Spaniel, the Blenheim Spaniel, and the Maltese Dog. The Spaniel is the favourite of the sportsman, entering more than any other dog into his master's feelings, and seeming to enjoy the sport for its own sake. It is elegant in form, with remarkably long ears, and beautifully waved hair, usually of a red and white colour. It takes readily to the water, and has been known to exhibit a remarkable propensity, as well as great dexterity, in fish-catching. The Water Dog is larger than the spaniel, and is covered with abundant curly hair. Its colour is generally a mixture of black and white. From its aquatic habits it is of great service to the water-fowl sportsman as a retriever. It is readily taught to fetch and carry, and the sagacity which it shows in finding any article it has once seen, but which has afterwards been lost or purposely concealed, is truly remarkable. The Setter is also a favourite with sportsmen, its habit of crouching when it has scented game rendering it specially serviceable. This habit, like that of pointing, is probably, as Darwin suggests, “merely the exaggerated pause of an animal about to spring on its prey.” It is generally white in colour, with large liver-coloured spots.

IV. HOUNDS.—Hounds are those dogs with long pendulous ears, close hair, and long deep muzzle which hunt by scent. They include the Bloodhound, Staghound, Foxhound, Harrier or Beagle, and Pointer.

The Bloodhound, regarded by many as the original stock from which all the other varieties of British hounds have been derived, is now rarely to be met with in entire purity. Its distinguishing features are long, smooth, and pendulous ears, from 8 to 9 inches in length, full muzzle, broad breast, muscular limbs, and a deep sonorous voice. The prevailing colour is a reddish tan, darkening towards the upper part, and often varied with large black spots. It stands about 28 inches high. The bloodhound is remarkable for the acuteness of its scent, its discrimination in keeping to the particular scent on which it is first laid, and the intelligence and pertinacity with which it pursues its object to a successful issue. These qualities have been taken advantage of not only in the chase, but also in pursuit of felons and fugitives of every kind. According to Strabo, these dogs were used in an attack upon the Gauls. In the clan feuds of the Scottish Highlands, and in the frequent wars between England and Scotland, they were regularly employed in tracking fugitive warriors, and were thus employed, according to earlychroniclers, in pursuit of Wallace and Bruce. The former is said to have put the Sleuth-hound, as it was called, off the scent by killing a suspected follower, on whose corpse the hound stood.

“Nor further moved 'tis time she found the blood.”

For a similar purpose captives were often killed. Bruce is said to have baffled his dogged pursuer as effectually, though less cruelly, by wading some distance down a stream, and then ascending a tree by a branch which overhung the water, and thus breaking the scent. In the histories of border feuds these dogs constantly appear as employed in the pursuit of enemies, and the renown of the warrior was great who,

“By wily turns and desperate bounds
Had baffled Percy a best blood-hound.”

In suppressing the Irish rebellion in the time of Queen Elizabeth, the earl of Essex had, it is said, 800 of these animals accompanying the army, while in later times they
became the terror of deer-stealers, and for this purpose were kept by the earls of Buccleuch so late as the 18th century, and even at the present time their remarkable power of scent is occasionally employed with success in the detection of murder. The Cuban Bloodhound is of Spanish descent, and differs considerably in form from the English variety, having small, though pendulous ears, with the nose more pointed, and with a more ferocious appearance. Its employment in the capture of runaway slaves, and in the cruelties connected with the suppression of negro insurrections, has brought the animal into the evil repute which more properly belongs to the inhuman masters, who thus prostituted the courage, sagacity, and pertinacity of this noble dog to such revolting purposes.

The Staghound has been generally regarded as the result of a cross between the slow-paced old southern hound and the fleet foxhound; but it has been objected that the breed was known in England long before the foxhound was made use of, and indeed before there was an animal at all resembling the one which is now known by that term, and those who maintain this view regard the staghound as a bloodhound crossed with some lighter dog, as a greyhound or a lurcher. However produced, it is a majestic dog, of great strength and considerable swiftness, besides possessing in common with the bloodhound, and with it alone, the property of unerringly tracing the scent it is first laid upon among a hundred others. In the reign of George III., who was himself ardently attached to the sport of stag-hunting, packs of these dogs were maintained in several parts of the country, but since the death of that monarch this form of hunting has declined, and the total extinction of these dogs at no distant date seems probable.

The Foxhound is the hunting-dog upon which the breeder has bestowed the greatest pains, and, according to Bell (British Quadrupeds), his efforts have been rewarded "by the attainment of the highest possible degree of excellence in the union of fine scent, fleetness, strength, perseverance, and temper." It stands usually from 20 to 22 inches high at the shoulders, and is of a white colour, marked with large clouds of black and tan. Its speed is such that a foxhound has been known to get over 4 miles in 7 minutes, while its endurance has been shown in such cases as the 10 hours' continuous run performed by the duke of Richmond's hounds in 1738 before killing the fox, during which many of the sportsmen tired three horses, and several of the latter died during the chase. The Harrier is smaller than the foxhound, not exceeding 18 inches in height at the shoulders, and is exclusively used, as the name shows, in hunting the hare. Of late years it has been greatly improved, so as to be almost literally a foxhound in minia-
perfect unless used to one scent and one style of hunting." A still smaller hound is the Beagle, from 12 to 14 inches high, the most diminutive of the hunting dogs. It was formerly a great favourite, being used in hunting the hare, but in this it has been almost wholly superseded by the hounds.

Mastiffs.—The Mastiff race of dogs is characterized by extreme shortness and breadth of muzzle, enormous strength of jaws, and general robustness of form. It includes the Mastiff, the Bull-dog, and the Fug. The Mastiff equals in courage, while in strength, intelligence, and mildness of dispositions it excels, its near ally the bull-dog. It is commonly supposed to have been the breed of large dogs abundant in Britain during Roman times, which were exported in large numbers to Rome for the purpose of fighting in the Amphitheatre, although Colonel Smith believes that these early British dogs were only bull-dogs of a larger size than the present breed, and that the mastiff was introduced into Britain from the cold regions of Central Asia. It is a large dog, standing 30 inches high at the shoulders, with thick muzzle, pendulous lips, and heavy expression, drooping, and the tail well developed. It is usually of a buff-colour, with ears and muzzle darker. Although fierce in combat, it does not attack without considerable provocation, and it bears the teachings of children with the greatest good nature. When in former times it entered into combat with wild animals, it has been known to engage a bear, a leopard, and a lion, and pull each of them down in succession. At the present time the breed is rarely met with pure, and is chiefly useful as a watch-dog, its sagacity and fidelity in this capacity being well known. While he shows great attachment to man when made his companion, the temper of the mastiff becomes soured by confinement, and he is then dangerous to strangers. The Thibet Mastiff is larger than the English breed, and its countenance is still heavier. It is the watch-dog of the tribes inhabiting Thibet and the Central Asian table-land, to whom it is strongly attached, although exceedingly savage towards strangers. There is a large mastiff figured on an Assyrian sculpture, 640 B.C., and Sir H. Rawlinson states that similar dogs are still imported into that country. The Bull-dog is the least sagacious, as well as the most ferocious and obdurate, of the dog tribe. It is smaller than the mastiff, but is strongly built. Its broad, thick head, the projection of the lower jaw beyond the upper disclosing the incisor teeth, the sudden rise of the head from the face, and the scowling expression of the eyes, combine to make the countenance of the bull-dog terrible. Bell points out, in his History of British Quadrupeds, the resemblance in the deep chest, the narrow loins, muscular limbs, and staid tapering tail of the bull-dog to the elegant form of the greyhound. The chief difference appears in the muzzle, a variation which may have suddenly arisen in a single individual, and been perpetuated in its progeny. The ears of the bull-dog are short and semi-erect, and the nostrils distended; the colour varies, being brindled in some, and black and white in others. It is essentially a fighting-dog, and was formerly bred for the brutal sport of bull-baiting, in which its terrible obstinacy usually gained for it the victory. It differs from other dogs in giving no warning of its attack by preliminary barking, and when once it has fixed its teeth into the object of attack, no amount of torture will cause it to relax its hold. Colonel Smith states that he has seen one "whining down an American bison and holding his nose down till the animal gradually brought forward its hind feet, and, crushing the dog to death, tore his muzzle out of the fangs, most dreadfully mangled," and there is an instance on record of its returning to the attack on a bull.

FIG. 9.—Dalmatian Dog.

FIG. 10.—Mastiff.
after each of its feet had been cut off in succession. The intelligence of this breed has been but slightly developed, and it exhibits little of that attachment to man which characterizes other dogs, although it may be said to show a sullen sort of fondness for its master. The Spanish Bull-dog is larger and more powerful than the English breed. The Pug-dog, which in form might be described as a miniature bull-dog, is probably a monstrous variety, rather than a degenerate form, of the bull-dog. It is, however, wholly unlike the latter in disposition, being timid and good-tempered, and is kept only as a pet, for which its dulness of intellect scarcely fits it.

VI. TERRIERS — These include the numerous varieties of Terrier dog, and the Turnspit. The Terrier is a small but very distinct breed, and is probably one of the oldest dogs

found in Great Britain. Three distinct varieties exist in this country, viz., the English Terrier, smooth and graceful in form, with sharp muzzle and erect ears, compact body, strong though slender limbs, and tail carried aloft and somewhat curled—the colour being black, with the belly and extremities usually tan, but sometimes white, the Scotch Terrier, differing from the former in the shortness of the muzzle and limbs, and in the rough wiry character of the hair, which is usually of a dirty white color; and the Skye Terrier, distinguished by the length and coarseness of its hair, the extreme shortness of its limbs, and the great length of its body, its of a light brown color. The Terrier in all its varieties is an exceedingly bold, active, and intelligent dog. It was formerly a regular accomplishment to every pack of hounds, for the purpose of unearthing the fox, and to its eagerness in taking the earth it owes its name. Terriers are now chiefly employed in the destruction of otters, badgers, weasels, and rats, a form of sport which they owe to their having been formerly employed in turning kitchen spits by working inside a wheel, which when once set in motion forced the dog to continue running.

At Caerleon in Monmouthshire, a few years ago, a dog of this kind might have been seen thus employed in the inn kitchen. The Turnspit is characterized by great length of body and extreme shortness of limb, the latter being generally crooked.

DOGE, a modified form of the ordinary Italian duce, from the Latin dux, a leader or duke, employed to designate the chief magistrate in the republics of Genoa and Venice. In both cities the office underwent from time to time a variety of transformations, for details on which the larger histories of the republics must be consulted.

In Venice the doge was originally chosen by universal suffrage, held office for life, and was regarded as the civil, military, and ecclesiastical chief. His duties and prerogatives were not defined with much precision, and the limits of his ability and ambition were practically the limits of his power. In 755 his independence was diminished by the appointment of two assistants or duumviri, but this institution was again allowed to fall into the background, and the dogs acquired more and more importance and authority, while at the same time the office was usually committed to a member of one or other of the more powerful families. This tendency towards a hereditary despotism was checked in 1033 by Flabagno's law, which reinstated the duumvirs, and declared distinctly that no doge had the right of associating any member of his family with himself in the government, or of transmitting his office on his decease. In 1172 a still more important change was introduced, not only was the duumvirate replaced by a body of six councillors, but universal suffrage was abolished, and the election of the doge intrusted to a committee of twelve persons, elaborately selected from the members of the great council. On the death of Ziani II in 1222, two commissions were appointed, which obtained a permanent place in the constitution, and gave emphatic testimony to the fact that the doge was merely the highest servant of the community; the first consisted of five Correttori della promozione ducal, whose duty was to consider if any change ought to be made in the oath of investiture administered to the doge, the second was a board of three registratori sul doge, entrusted with the curious task of examining and passing judgment on the acts of deceased magistrate, whose estates might be mulcted in accordance with their decision. To minimize as far as possible the influence of individual families, the election of the doge was in 1268 effected by a curiously complex machinery, which remained, with some modifications, till the close of the republic. Forty-five members of the great council, elected by ballot, selected nine members, who in their turn chose forty, of these forty twelve taken by lot chose twenty-five, the twenty-five were next reduced to nine, the nine elected forty-five, the forty-five were reduced to eleven, and the eleven chose the final forty-one in whose hands lay the actual election of the doge. In proportion to the development attained by the oligarchical element in the constitution, the more important functions of the office were assigned to other officials or to administrative boards, and he who had once been really the pilot of the ship became little more than an animated figure-head, properly draped and garnished. On state occasions he was still attended by all the ceremonial observances of former times: his robe was still purple, the horns of his beretta were still exalted, the sword, the tapers, and the trumpets were borne before him, his leaden seal was affixed to public documents, and the ring was still dropped yearly from his hand in symbolicespousal of Venice and the sea. But he was under the strictest surveillance, had to wait for the presence of other officials in order to open the despatches from foreign powers, was forbidden to leave the city, could not legally.
be possessed of property in a foreign land, or contract a foreign alliance for any of his children, and was moreover liable to the infliction of a fine for any trespass he might commit. The office was maintained, however, till the last days of the republic, and from time to time was held by men who knew how to make it something more than such an empty simulacrum. (See Cestetti, Il Doge di Venezia, 1858.)

In Genoa the institution of the doge dates from 1339, and at first he was elected without any restriction by popular suffrage, and held office for life; but after the reform effected by Andrea Doria in 1528, the term was reduced to two years. Plebeians were declared ineligible, and the appointment was intrusted to the members of the great and the little councils, who were bound, however, to employ, in proof of impartiality, nearly as complex a machinery as that of the later Venetians.

DOG-FISH, a name applied to several species of the smaller sharks, and given in common with such names as hound and beagle, owing to the habit these fishes have of pursuing or hunting their prey in packs. The Small-spotted Dog-fish or Rough Hound (Scylium canicula) and the Large-spotted or Nurse Hound (Scylium catula) are also known as ground-sharks. They keep near the sea bottom, feeding chiefly on the smaller fishes and Crustacea, and causing great annoyance to the fishermen by the readiness with which they take bait. They differ from the majority of sharks, and resemble the nays in being ovoviviparous. Their young are brought forth inclosed in semi-transparent horny cases, known on the British coasts as mermaids’ purses, and these have tendril-like prolongations from each of the four corners, by means of which they are moored to sea-weed or some other fixed object near the shore, until the young dog-fish is ready to make its exit. The larger of these species attains a length of 4 to 5 feet, the smaller rarely more than 30 inches. The Pickled Dog-fish (Acantias taylori) is pre-eminently the dog-fish. It is the smallest and most abundant of the British sharks, and occurs in the temperate seas of both northern and southern hemispheres. It rarely attains a length of two feet, the female, as in most sharks, being larger than the male. The body is round and tapering, the snout projects, and the mouth is placed far under. There are two dorsal fins, each of which is armed on its anterior edge with a sharp and slightly curved spine, hence its name "picked." In order to strike with these spines the fish first bends itself into a bow, and by a quick motion causes them to spring asunder in opposite directions, seldom failing thus to strike the object aimed at. The dog-fish is exceedingly prolific, the female, according to Couch, producing young almost daily for 9 or 10 months in the year. These are not contained in egg cases, as in the ground-sharks, but are produced alive. It is gregarious, and is abundant at all seasons everywhere on the British coasts. In 1868 an enormous skull of dog-fish, many square miles in extent, appeared in the north of Scotland, when, says Couch, "they were to be found floating in myriads on the surface of every harbour." They are the special enemies of the fisherman, injuring his nets, removing the hooks from his lines, and spoiling his fish for the market by biting pieces out of them as they hang on his lines. Still greater injury is caused to the fisheries by the predacious habits of the Socialiius, and the wholesale destruction of small fishes by this predacious species. They are, however, eaten, both fresh and salted, by fishermen, especially on the west coast of England.

DOG-MATIC (Germ. Dogmatik) is the name usually given by modern writers, especially on the Continent, to that branch of theological study which treats of the dogmas of Christianity. As there are considerable varieties in the conception and treatment of dogmatic by different theologians, churches, and schools, it will be best to give an historical account of the origin and usage of the term.

The Greek word δόγμα, from which it is derived, has two origi and meanings, one of which is found in the LXX. and New Testament, while the other is given to it by some of the ancient philosophical writers. According to the former sense, it denotes a decree or ordinance, i.e., a precept or given to the conduct or observance, proceeding from human or divine authority (Luke ii. 1, Acts xvi. 4, Eph. ii. 15). This is the only meaning in which the word is used in Scripture; but by Plato, Cicero, Seneca, and others it is employed to denote the doctrines of the philosophers, i.e., principles or theories formulated or accepted in the different schools. In this latter sense the word was used by the early Christian writers, as describing indifferently heathen, Christian, or heretical doctrines, as the case might be; although sometimes, when the word was applied to the Christian verities, it may have acquired, from the other use of it, a certain degree of the usury of authority of the doctrines of the faith. As early as Cyril of Jerusalem (Catech. iv. 2) the distinction was made between the doctrinal and the moral elements of Christianity; and the term δόγμα was appropriated to the former, the latter being called σωφροσυνή.

But it was not till long afterwards that the adjective, "dogmatic," was used to distinguish a particular branch of theological study; for in early times the need of subdivision in the scientific study of Christian truth was not felt, and the name theology was sufficient to describe all works dealing with that subject in any way. The progress of thought and inquiry in the history of the Church has, however, made it possible and necessary to treat the truths of Christianity in various different ways, from distinct points of view; and hence different kinds and departments of theology have come to be distinguished. In the 17th century the divines who wrote systems of theology gave different titles to their works, indicating the special manner of their treatment; e.g., Maastricht, Theologia Theoretico-Practica; T. Turetin, Theol. Elenctica; Marschius, Compendium Theol. Didactico-Elencticum; Quenstedt, Theol. Didactico-Polemica; Baier, Theol. Pontiana.

The title Theologia Dogmatica was first adopted by John Francis Buddeus, a Lutheran divine, in 1724. This terminology was followed by J. H. Michaelis, Sellin, and others, and from it the word Dogmatik as a substantive came into common use in Germany. In England and America, in so far as any specific designation of the general term theology or divinity has been thought necessary, the title "systematic" has been used more than any other description by the schools of "dogmatic." As, however, the division and mutual relations of the various theological studies have been very thoroughly discussed in recent times, especially by German theologians, and as the name "dogmatic" has been largely used by them to denote one principal department of these, there is good reason for its adoption by English writers. Some prefer the form "dogmatics," after the name of "method", "physic," &c., but this seems awkward and needless.

But there is among the best authorities on the subject Nature and a considerable difference as to the proper nature and place of the theoretical sciences of dogmatic. There are two distinct conceptions of its nature, each supported by eminent names, according to one of which it is an historical, and according to the other a philosophical study. The difference may be said to turn on what substantive is to be understood along with the adjective dogmatica. If, according to what was undoubtedly the older usage, we supply theology, then the name "dogmatic theology" would denote the study of God and divine things in a doctrinal manner, or so as to exhibit its results in a series of doctrines. The epithet dogmatic would indicate, not the subject of the
study, but the manner of it; and thus it would fall under the general head of philosophical or systematic theology. This was the older view, and is held in modern times by Julius Müller¹ and Hagenbach.² If, however, it be held, as is held by many moderns, that *scientia* is the substantive understood with *dogmatica*, then the term means the science of doctrines, and has for its object not the Christian realities themselves, but the doctrines that have been formed about them; and as such it must be an historical science. This is the view adopted by Schleiermacher,³ Roth,⁴ Martensen, Oesterley, and others; though the particular form and developement of the general idea differs according to the different views of these writers as to the nature and formation of doctrines. There can be no doubt that an historical and critical study of the doctrines that have been held in the Christian Church or its several branches is a legitimate, and in its own place, not unimportant pursuit, and whether such study should be called dogmatic is a mere question of nomenclature and usage. But it can be as little doubted that this study does not occupy that central place in the theological sciences that has usually been assigned to dogmatic, and is not fitted to supersede that direct study of Christian truth that has long borne the name of theology by way of eminence. Hence some who make dogmatics a merely historical science hold that there is required besides that a science of speculative theology, dealing directly in a philosophical way with the objects of Christian faith; while Al. Schweizer thinks that dogmatics, as a science of dogmas, should be discarded as essentially un-Protestant, and that in its stead should be placed what he calls *Glaubenslehre*. It is clear that we must have some name to express the former conception of dogmatism, and there is no other name so convenient or so generally used as this. On the other hand, all are not agreed on the necessity and importance of a separate science of dogmatism in the historical conception of it; and it is not easy to draw a line of distinction between it and symbolical theology, or the study of the creeds contained in the Nicene or the Irenic. One of these subjects has great content; and such a connection that convenience almost necessitates the plan that has become usual in academic teaching and books, of giving them a separate treatment, and restricting the province of dogmatic to the truths of Christianity that are objects of direct belief, as distinct from its precepts, as matters of duty. Polemic and irenic are branches of theology that have also a very close connection with dogmatism,—the former having for its object the exclusion from the system of Christian doctrine of ideas and opinions that are essentially alien to its principles, and the latter the harmonising or bringing into a relation of mutual toleration views of doctrine which differ in some particulars, and yet are neither of them essentially un-Christian or anti-Christian. These may be regarded as appendices to dogmatics, being the application of its principles to the varieties of belief that exist among Christians.

There are two other studies, of recent origin, whose relation to dogmatics should be defined, as they have sometimes been thought capable of superseding it—biblical theology and the science of religion. The former of these is a development of Scripture exegesis, and seeks, in dealing with the sacred writings, not merely to understand their direct meaning, but to enter into the conceptions of their several writers on the whole subject of religious truth,—to find out from their writings the theology of Paul, or Peter, or John, just as the historian of doctrine endeavours to exposit the theology of Athanasius, Augustine, or Luther. Then, taking a wider view, it groups all the inspired writers of a period together, and seeks to present the theology of the New Testament, or of the Old, just as one may do with the Nicene or the Reformation theology. This is a most interesting and useful study, and much valuable work has been done by it; but it is clearly an historical study, and as such belongs to a different department from dogmatics, if that is placed in philosophical theology. It furnishes important materials for dogmatic, and gives us the power of using Scripture in a more historical way than would be possible without it; but it is not easy to say that any one inspired man, or any one age of the history of revelation, saw the entire system of divine truth as it is in itself, even the most perfect results of biblical theology will only be materials for dogmatic, not dogmatic itself.

The science of religion, again, investigates the various forms of religion among mankind, and by the comparative study of these seeks to discover their origin and mutual relations. It is probably too soon yet to judge what the results of this young and promising study may be, but they should certainly not be despised by the Christian theologian. They may have an important bearing on apologetics, and

⁴ Zu Dogmatik.
and consequently the pre-Reformation theology, and much of later theology too, consists either of the mere exposition of certain dicta of authority, biblical or ecclesiastical, or of purely legal rationalization, applying to these the principles of the philosophy current at the time. Only when the Reformers brought out the principle that Christianity is not a new law, but a work of God's grace, reconciling men to himself in Christ, and that as such it must come before theology, was the construction of a system of Christian doctrine on right principles possible. On the basis of the direct experience of reconciliation to God through Jesus Christ, it is possible to raise and investigate the question—what is the nature, the cause, the various parts and relations, of this great work, this new relation into which I as a believer am brought to God? Now this is just the question that dogmatics seeks to answer; for it is, as before said, a scientific treatment of Christianity as the perfect form of supernatural religion. On this view the existence of dogmatics is not due to a primary, but to a secondary necessity of Christian life. The primary necessity for the Christian is a fellowship with God, including a sense of His favor, of His guidance in practical life, and protection against all hostile influence. To this religious fellowship it is not necessary that a completed system of doctrines as distinct from the assumptiori of the truth that they could not have found out for themselves, which is the idea of revelation. But while supernatural religion must include revelation as an essential part of it, this is not the whole, nor even the most vital and important element in it. The divine religion is essentially the establishment of a right relation between man and God, a fellowship between earth and heaven; and it only includes the communication of new truths, because that fellowship must be an intelligent one, brought about in an intelligent way. This work has also been a gradual one, and has had its several successive stages. Scripture represents the call of Abraham, the exodus of Israel from Egypt and covenant of Sinai, the establishment of the kingship and temple worship in Israel, and the messages of the prophets, as so many stages in the history and progress of religion; and the coming of Christ and the foundation of the Christian church is the final stage of its development. Now, later all the earlier stages, Christianity, while it implies the communication of new truth, is essentially a fact or work of history—the establishment of the perfect fellowship of man with God, which is that mediated by Jesus Christ, and the reconciliation effected by His death. It is this conception of Christianity that makes possible a scientific exhibition of it in the form of a system of doctrines as distinct from the simple interpretation of its records. If, according to a notion that early entered and long pervaded the church, Christianity is merely a new law, a revelation of hitherto unknown truths to be believed, precepts to be obeyed, and promises to be hoped for, Christianity has nothing to do but to expand the revelation, ascertain ing the meaning of its several statements, and classifying them according to their subjects or character. Any attempt to gain a scientific knowledge of the realities with which these statements have to do must proceed on general philosophical principles, and not on a specifically Christian foundation. Now this conception of Christianity was the prevailing one up to the time of the Reformation; and consequently the pre-Reformation theology, and much of later theology too, consists either of the mere expositio of certain dicta of authority, biblical or ecclesiastical, or of purely legal rationalization, applying to these the principles of the philosophy current at the time. Only when the Reformers brought out the principle that Christianity is not
knowledge of it, or because we have no means of reducing these materials to their true and natural order. If there are sufficient materials of knowledge about Christianity, and a method by which these may be reduced to a system, the conditions of a scientific dogmatics may be said to exist.

The sources of dogmatic have been variously enumerated by different branches of the church and schools of thought, and the determination of the genuine ones involved the most important issues as to the whole character of the system. We may begin with the lowest and most universally accepted, and then proceed to those in regard to which there is more difference of opinion, and which determine the peculiarities of the dogmatic of different sects or churches. First, then, we may place the testimony of nature to God, which is admitted by nearly all theists to be real and valuable, so far as it goes, and which is clearly recognized in Scripture. The Socinians in the 16th and 17th centuries denied the possibility of any knowledge of God without revelation, but this position, which was zealously defended by the orthodox, has been given up by those who are the nearest modern representatives of the Socinians, and may be said to be held now only by those who would deny all knowledge of God whatever. This natural knowledge of God has sometimes been supposed to be properly Christian dogmatics, and is granted for separate treatment under the title of natural theology, but since most of the truths reached by it are also expressly taught in Scripture, it seems impossible to exclude from their consideration in the Christian system the prior light that nature throws on them. Hence the most orthodox divines admit that reason has as one of its functions in theology that of establishing or confirming some of its doctrines, which are therefore distinguished by many, especially of the Lutherns, as articul'is mixta, being supported by reason and revelation together, from the artisulis pura, which are known by revelation alone. This source of theological knowledge includes the manifestations of the being and character of God, and the nature and destiny of man in the phenomena of the external world, and in the intellect, conscience, and religious affections of man. The importance of it arises from the fact that this natural knowledge of God alone connects the doctrines of revelation with the actual reality of consciousness and experience, and gives to the whole of theology a basis in ascertainable and verifiable fact. Unless we know, on grounds as legitimate as those of any secular science, that God is, and that He is true and good, we cannot rationally receive any revelation from Him, and our whole dogmatics would be a mere castle in the air.

But most Christians, while recognizing the reality and importance of the manifestation of God in nature, consider that this alone is inadequate, in the present condition of mankind, to bring us into that relation to Him which is the true and perfect religion, and all but those who deny the supernatural entirely believe that God has made a special revelation of Himself in Christ. The person of Jesus of Nazareth is for all such the centre of God's saving discovery of himself and of His will to sinners of mankind, in His life and death we have an image of the character of God, and in His teaching, statements of religious truth that are of primary authority. On this account it may be truly said that the person and teaching of Christ is the fountainhead of revealed theology. It would be quite possible to maintain that this is the only source of theological knowledge beyond the teaching of nature; but nearly all who entertain such views of Christ also believe that we have in the writings of His disciples an authoritative record of His words and deeds, and a divinely-taught explanation of their meaning. Hence the Scriptures, at least of the New Testament, are recognized as themselves a direct source of dogmatic material. Some have limited this recognition of an inspired book to the New Testament, as Schleiermacher; but this position virtually rests on the idea that Christ himself is really the only source of religious truth, and that the New Testament Scriptures are not a real communication from God, but only an authentic human record of the revelation He has made of Himself in Christ. When the notion of a truly divine and authoritative Scripture is really admitted, it is impossible, in view of the use made of the Old Testament in the New, to deny the authority of these earlier Scriptures. The coming of Christ was not a sudden isolated appearance, unprepared for and alone, like a lightning-flash in a dark night, it was rather like the rising of the sun after a long and gradually lightening twilight. The way was prepared for Him by a series of historical revelations recorded in the sacred books of the Jewish people, which have from the days of the apostles onwards been regarded as divine by the Christians. It is this continuous line of revelation, from the beginning onwards, that gives Christianity its universality in point of time, as the perfect form of the true religion that has always in some shape or other existed in the world. On this view, the Scriptures of the Old and New Testaments, as testifying of Christ, are the more immediate source of dogmatic materials, and thus is the fundamental Protestant position. The Church of Rome goes further, and maintains, not only that the Divine Spirit has inspired the writers of Scripture to convey to us an authoritative record of God's revelation in Christ, but also that the Spirit so dwells in the church as to enable her to develop that revelation, supplementing it by tradition, authenticating it by her authority, and interpreting it by decsion on controverted points. Hence, for the Romanist, tradition, decrees of councils, and the decrees of the popes, opinions of fathers and doctors of the church, are equally with Scripture authoritative sources of doctrine. In this, however, Protestants hold that they err as much in the way of excess, as Rationalists, who deny the authority of the Bible, err in the way of defect. Those Protestants, however, who have taken the most profound and spiritual view of the subject, and who have taken the most profound and spiritual view of the subject, have been ready to allow that there is provision made in Christianity for what Romanists seek to attain by the authority of the church. They admit that something more is needed than naked human reason for the right interpretation and application of the word of God, but they find this, not in an infallible church, but in the work of the Divine Spirit, enlightening the mind of believers in and with the word (testamentum Spiritus Sancti). The recognition of this, which was very fully and strongly made by the Reformers, not only gives to Protestant theology a firmer position as against the claims of Rome than it can have without it, but also enables us to give their due place to the elements of truth, exaggerated and distorted, in the Romanist doctrines of the authority of the church, fathers, and councils. If we have the witness of the Spirit, giving us an assurance of the character and meaning of Scripture, we must admit that our fellow Christians have the same guidance also, and that believers have had it in all ages. Hence we may reasonably allow great weight to the opinions of men who have given evidence of being guided by the Spirit, and more especially to those doctrines that have been established as scriptural by the great body of the spiritually enlightened in different ages. Thus the teaching of fathers and theologians, and the consent of the Christian church, are important helps and guides to the Protestant theologian; only he does not, like the Roman Catholic, attach absolute

1 Ps. xxi. 1-6; Rom. i. 19-21, Acts xiv. 15-17, v. 24-29. 2 Controverse, Christian Dogmatics, sec viii.
authority to any of them; and he esteems them, not simply because of their antiquity or their official position, but in proportion to the evidence they have given of being really guided by the Divine Spirit, who is the Spirit of holiness, love, peace, and godliness.

This inward spiritual enlightenment of the believer corresponds very nearly to what has been called Christian consciousness, to which a prominent place has been assigned among the sources of theology by many modern divines. The currency of the phrase is due mainly to Schleiermacher; and the form of it proceeds from his fundamental principle, that religion consists properly in feeling, by which we have an immediate consciousness of the divine—a "God-consciousness." Whatever justification this view may have had, as a needed protest against the previously dominant intellectual view, that made religion virtually an affair of the understanding only, it is now generally admitted that Schleiermacher went to an extreme on the other side, and now compulsion, amount of religion can be given that does not include the exercise of thought and will, as well as of feeling. In so far, therefore, as the phrase Christian consciousness represents in its form the one-sided conception of Schleiermacher, it is insufficient; and that which really corresponds to it is the Christian life, with its full complex of beliefs, emotions, and volitions. This, being the work of the Divine Spirit in the soul, may and must be that the process might be reversed and the facts deduced from the most general principles. It is only in a few sciences, e.g., mechanics, that such a degree of perfection has been attained as to enable them to enter on the deductive process. Now it is a question debated by some of the ablest divines, whether theology can adopt this method. It is not denied by any that the inductive method, or that of empirical reflection, as it is called in Germany, is competent; but some maintain that, while this is so, that of speculation is also legitimate and possible, and that it must be followed, if we are to have a theology in the highest and most proper sense of the term. Those who take this position are for the most part of the Hegelian school; and we have a favourable specimen of the way in which it may be maintained in a truly believing spirit in Rothe. But the considerations adduced by Julius Muller against the possibility of such a method, if we are to avoid a pantheistic view of the universe, seem conclusive. The real and thorough-going recognition of personality and free will, both in God and man, makes it impossible to arrive at the phenomena of Christianity by any process of a priori demonstration; and more particularly, neither the fact of sin on the one hand, as the act of the free will of man, nor of grace on the other, as the work of God's free will, can be exhibited in their essential character in such a method. No science that has to do with the events of a real history in which rational and moral agents are recognized as acting with true liberty can be constructed by a priori deduction of logical consequences from abstract necessary first principles. The dogmatic theologian therefore, who maintains the freedom alike of the human and of the divine will, is shut up to the a posteriori method of induction. Even though the existence and attributes of God could be satisfactorily demonstrated by reasoning from necessary truths and laws of thought, as Anselm, Descartes, Clarke, and others thought possible, yet when we come to inquire what God has done, and on what principles He acts, we must, if the world's history is not a mere nature-process, learn from experience and testimony the facts, and ascend inductively from them to the principles or laws that direct them. The inductive method, therefore, is the one proper for Protestant evangelical dogmatics. This is recognized by writers so different in many respects as Dr.

1 This view of the nature and function of Christian consciousness is that taken by Martensen, Dogm., sect. 29; J. T. Beck, Einleitung in das System der Christlichen Lehre; Osterwe, Dogm., sect. 10.

2 Theologische Ethik, sect. 2.

3 Die Christliche Lehre vom der Stunde,—Einleitung.
Chalmers, Julius Müller, Hodge, and it has been practically followed by most evangelical divines. They have indeed sometimes diagnosed the real nature of their method by the arrangement of topics adopted, for the almost universal practice has been to begin the systematic exposition of Christian doctrine with the lustiest and most recondite part of the subject, which would come first in a really deductive treatment, and to descend from them to those that are more immediately verified by experience. This has tended to produce the impression that these systems are properly chains of logical demonstration, especially as doctrines once held to be established are often appealed to as forming part of the proof of other doctrines. In many cases, however, this appearance is deceptive; and the system, though wearing a deductive garb, is not really of that nature. Each of the doctrines established on its own proper basis of Scripture testimony and Christian experience; and the order of progress, from above downward, does not show the order in which the doctrines have been ascertained, either by the church in general or by the individual theologian, but only the order in which it is thought best that they should be exhibited and taught.

Besides these two distinct methods, the speculative or deductive, and the empirico-inductive, a third is recommended by Beck, and approved also by Oosterzee, called by the former the real-genetic. This proceeds on the assumption that the object of theological knowledge is faith, i.e., according to Beck's use of the term, spiritual life in the soul apprehending as its object God in Christ. This faith or spiritual life has, he points out, a principle of development and growth, and theology grows by following the growth of faith in the soul. But the life of faith in us is not perfect, it is liable to hindrances and abnormal development; hence this by itself is not a safe guide for theology. There is, however, a perfect archetype (Ur-bild) of the true and normal development of faith in the soul, and that is to be found in revelation. The revelation of which we find the record in Scripture has the same course of development as the subjective life of faith in the soul; and the growth of revelation is the perfect pattern of what the growth of faith within us should be. In order, therefore, to be a representation of the faith or spiritual life of the Christian in its ideal condition, theology has to follow the development of revelation as presented to us in Scripture, and must first go back to its primary source, and trace from thence its growth and development. Hence the designation of the true dogmatic method as real-genetic. Now whether or not the results of theological inquiry will come out in this particular form depends on the truth or falsehood of a number of positions, and these can only be established by the examination of facts and evidence bearing on the case. This method, therefore, does not in principle differ from the inductive or empirical one; it is only a special form which that method will assume, if the views of Becks as to the relation of revelation to the life of faith in the soul are true and borne out by evidence. It does not, therefore, seem proper to regard this as a distinct kind of method, and we may legitimately claim those who follow it as disciples in general of the inductive school.

On the whole, there appears no reason why the principles of inductive philosophy, which have been so fruitful in their application to the sciences of external nature, should not be applied to materials bearing on the relation of man and the world to their Author, that are furnished by the phenomena of nature, the dictates of conscience, the facts of revelation, and the experience of the Christian life. Surely, too, the endeavour to do this is neither a hopeless nor an impossible one. Those who have objected most strongly to the application of logic to theology, such as Isaac Taylor and Bishop Hampden, will be found at bottom to object chiefly to the use of a merely verbal and deductive system of logic, and not to that inductive method which is the mighty instrument of the progress of modern science. But it must be admitted that the processes of theologians have too often been, and too often still are, of that merely formal and logical kind that cannot really increase our store of knowledge. If dogmatism is to hold its ground as a true science at all, it must frankly and consistently adopt the inductive method; and it must take as the objects of its analysis, classification, and induction, not merely the statements of Scripture, but the religious realities which those statements, as well as our own experience, make known to us.

Further, if a scientific character is to be vindicated for Progress in dogmatism, it must also accept the position of a variable and progressive study. This does not imply that nothing is certain within its domain, or that there must be a constant flux and reflux of opinion throughout its entire history. It is as much characteristic of science as it has certain well-established principles and results, which are not to be overthrown by any future inquirers, as that it is constantly advancing to further requirements and discoveries. Those who claim an absolutely fixed and unprogressive character for theology, though they may seem to do honour to its divine authority, really degrade it from the rank of a science; and if they retain any reverence for it at all, can only do so on the principles and in the spirit of Roman Catholicism. Thus Macaulay's brilliant statements to that effect, which are sometimes quoted by those who defend an immobile orthodox theology, imply as their basis either a contemptuous dismissal of theology altogether as a tissue of uncertainties, or a lurking belief that the one unchanging system is to be found in the faith of the Church of Rome. What has tended, and still tends very powerfully, to obscure the idea of progress in dogmatic theology is the want of a clear apprehension of the distinction between religion and theology, and the notion that the Bible is directly a revelation of theological dogmas, which need only to be correctly interpreted and arranged in logical order. If this were so, then we should be able at once to construct a complete system of theology, by simply applying the rules of grammar and logic to Scripture; and this could be done as correctly and well in the 2d century as in the 19th or 19th. There would be no room, or the very narrowest conceivable, for progress. In that case, then, if we are found that students dealing thus with Scripture came to widely different conclusions as to the system of doctrine to be drawn from it, we should be obliged to conclude that the revelation was not complete or unambiguous, and therefore that it must either be supplemented and checked by a living authority in the church to determine its true meaning, or that no certain knowledge in regard to doctrine can be attained. The former is the Roman Catholic, the latter the sceptical or anti-dogmatic alternative, but both alike proceed from the same premises, and indicate the imposibility of carrying them out without either giving up the practicality of dogmatic, or seeking it in an infallible church.

But this difficulty disappears when the Bible is regarded as a revelation, not solely or directly of doctrine, but of religion. On this view, it is the inspired record of the great historical events by means of which the religious fellowship of man with God has been established, and gradually elevated to its perfect form in Christianity, and

---

1 Institutes of Theology, bk. ii. ch. 10. Ubi supra.
2 Syol. Thed., Intro. ch. i.
of the inward experience of that fellowship in a new life produced by a moral and spiritual renovation of the soul of man. Doctrines, or general principles bearing on the relation of God to man, are indeed contained in the Bible, but only as they are involved in the great realities that the Bible makes known to us. The Bible is to the theologian what the telescope is to the astronomer, or the microscope to the physiologist. Many of the laws of these sciences could not have been known without the help of these instruments,—not because the telescope discovers to us laws of astronomy, or the microscope enables us to see the principles of physiology, but because they bring within our ken the phenomena from which these laws and principles may be ascertained. So the Bible does not directly reveal dogmatic principles; but its function is to reveal to us that great work of renovation by God in Christ, from which the principles of Christian dogmatism are to be derived. On this view, while the Christian religion is ever one and the same, unalterable in all ages, Christian theology, or the scientific knowledge of that religion, is constantly progressive. All its truths are indeed contained implicitly in the Bible; but they have to be drawn from it, not by a mere process of interpreting and systematizing the words of Scripture, but by apprehending and experiencing the realities made known to us by the words, and so coming to understand what they are and in what relations they stand one to another. It is in this way that all the great doctrines in theology have been established,—not merely by the application of grammar and logic to the text of Scripture, but by the apprehension and experience of the renovating change, and the comparison and understanding of its different parts. So, for example, the doctrine of the Logos was formulated by men like Justin Martyr, who, after vainly searching for truth in all the schools of philosophy, found that there is in Christianity, when sincerely received, a light that dispels the darkness and doubt of the mind. So Augustine learned the doctrines of original sin and divine grace, by finding in his own experience the power of inward corruption on the one hand, and the deliverance wrought by the gospel on the other. So Luther discovered the truth of justification by faith, through learning by sore and bitter conflicts how impossible it was to find peace of conscience, as long as he trusted to any works of his own, and how fully he obtained it by faith in Christ. In this way the system of dogmatic has been built up, one doctrine after another being added, as it was discovered and verified by the experience of the church. None of these developments was any addition to the Christianity of true disciples of the Lord; that remains substantially the same in all ages, and contains implicitly all true doctrines of religion. But all Christians are not conscious of what is involved in their religion and experience, and some are very imperfectly aware of it. The men who have made their mark in theology have been those who have been led by circumstances, and enabled by their intellectual powers, to discern elements in Christian life not previously seen; and the body of the church, having at last found them, have verified and accepted the results of their experience. In this way dogmatic theology hitherto has been progressive, and no man or church has a right to say that the goal has been reached beyond which no further progress is possible.1

There is one condition always to be borne in mind, with which alone such progress is sound and genuine. It is that what is added to the system of doctrine be really an expression of the Christianity which is revealed in Scripture. Anything that is not such may be a fable of men, or an abnormal development of spiritual life, but it is not really a discovery of Christian truth. There have been opinions held and widely prevalent that are of this character, and it is part of the work of the theologian to detect and remove what is false as well as to build up what is true. There have been false developments of doctrine; there have been exaggerations and maladjustments of important truths. It is not probable that any minute and elaborate system consists of pure and absolute truths unmixed with any error. The work of progress in theology, therefore, must sometimes consist of undoing what has been laboriously built up in past ages. But if any true progress is possible now, it is not to be expected that all the old beliefs will have to be swept away, and an entirely new system put in their place. For if nothing had been ascertained in the course of the ages during which so many great minds have been directed to the study of theology, there would seem to be little hope of anything certain being discovered now. Those who think theology to be a progressive science can most comfortably the some progress has been made already, and some conclusions have been reached that are not to be overthrown by any new inquiries. They do not look for an entire reversal of old beliefs, and a new theory of the universe and its relation to God to be put in their place; they expect that what has been most generally agreed upon in former ages will be maintained and confirmed, and that any new truth that may be brought to light will fit in to the old foundations; though in some cases former modes of statement may have to be reconsidered and adjusted to larger and deeper views, and exaggerated or one-sided doctrines may have to be given up or modified. There are some doctrines in every system that are merely sectarian, adopted by one particular branch of the church, but not recognized by others as correct expressions of Christian faith and life, e.g., the Anglican dogma of baptismal regeneration, or the Lutheran tenet of the communication of attributes in the person of Christ, or the supralapsarian and sublapsarian theories of Calvinists; in regard to such points there is no just ground of confidence of their permanence; they are like plausible but unproved hypotheses in science. But there are many leading doctrines which, ever since they have been distinctly formulated, have been accepted by the vast mass of Christians in all branches of the church; these may be said to be established results of theological investigation, which no further progress of the science is likely to overth temporal confidentiality.

The progressive character of dogmatic, and the manner its progress in the past, may be seen from a brief sketch of its history from the end of the apostolic age to the present day. The apostolic writings themselves do not properly fall within the range of such a history; for they are of the nature of human science but of divine revelation. No doubt several of them present to us conceptions and trains of thought that are very analogous to the systems of later times, and have sometimes been employed as the basis of dogmatic systems. But the inspired writings do not stand in the same line as the thinkers who came after them; their aim in writing was not the scientific one of investigating the principles of Christianity in their mutual relations, but the more primary religious one of presenting Christianity itself to the world. This they have been enabled to do, by the working of the Spirit in them, with a power and fulness and insight that throw such light on the scientific study of Christian doctrine; but their writings are not doctrinal systems, and do not come into the line of the rise and progress of the human science of dogmatism. Its history begins with the attempts of men to comprehend the revelation of Christianity, and presupposes that revelation complete, thought not completely

---
understood, as its starting point. From that point onward it may be regarded as passing through six pretty well defined periods or stages.

I. The first may be called the apologetic age, extending from the apostolic time to the death of Origen (254 A.D.), in whom it may be said to have culminated. During this period the intellect of the church was gradually awakening and coming into activity; but it was only by degrees, and in the course of several generations, that its efforts led to any properly doctrinal results. The very earliest Christian literature is simply practical and hortatory, chiefly in the form of epistles (Apostolic Fathers). From the middle of the 2d century, however, the need was felt of defending the church's faith against argumentative attacks, whether popular, literary, or philosophical. Hence the chief mental power of the Christian community was turned in the direction of "apologies," by which these attacks were repelled, and attention was directed mainly to the evidences of the truth and divinity of Christianity. Thus, however, indirectly led to the articulate statement of many of the most essential doctrines of Christianity, and to the beginning of a dogmatic system. The great apologetic question was generally and rightly conceived in the form of a search for some true and reliable teaching about God and divine things, and the Johannine idea of Christ as the light of the world, the Logos or Word of God, naturally occurred to the apologists as that which most exactly met the want. Thus the doctrine of the Logos, in some at least of its aspects, was brought out. Then in the conflicts with Gnosticism, which may be said to be as really apologetic as those with Judaism and heathenism, certain aspects of Christianity were very distinctly brought into consciousness, such as the creation of all things by God, the reality and divinity of Christianity. The great apologetic question was therefore gradually awakening in the church's mind, and coming into activity; but it was only by degrees, and in the course of several generations, that its efforts led to any properly doctrinal results. The very earliest Christian literature is simply practical and hortatory, chiefly in the form of epistles (Apostolic Fathers).

II. The second great period in the history of dogmatic, extending from Origen (who died 254) to John of Damascus (who died 744), is distinguished from the first by its being occupied mainly with controversies within the church, and thus may be called the polemic age. As the gospel spread more and more throughout the world, and gained the victory over paganism in the minds and hearts of the most enlightened of the day, the influence of Christianity against external assaults gradually ceased to be the all-engrossing duty of the church's theologians, and at the same time heresies so thoroughly and manifestly antichristian as those of the Gnostics ceased to have any prevalence among Christians, and other divergent views, of a less openly hostile nature, began to appear. As the doctrine of the Logos had been one of the first that the church was led to think out in the apologetic period, it not unnaturally became the point at which varying conceptions first came into conflict. On this, as on many other subjects, the Christian redemption is so full and many-sided that its entire contents could not be grasped at once and by all minds, or that some were led to accept some aspects of it more readily than others, and to give these an exaggerated predominance. Hence the progress of Christian thought to the right understanding of divine truth has been through a series of controversies and oscillations from one extreme to another. This process may be said to have begun about the middle of the 3d century, from which time to the end of the 7th there stretches a continuous series of controversies on questions relating to God and the Trinity, the incarnation and person of Christ, original sin, and regenerate grace. In the course of these, successive forms of opinion on these subjects were discussed, condemned, and stamped as heresies—such as the Sabellian, Arian, Apollinarian, Macedonian, Nestorian, Pelagian, Monophysite, Semi-pelagian, Monothelite doctrines. In sharp contrast with these opposing heresies, and sometimes in a narrow strait between them, the doctrine of the church was defined more and more precisely. As authoritative expressions of this doctrine we have the first six ecumenical councils, with the provincial ones in the West that condemned Pelagianism and Semi-pelagianism, and the creed of Nicaea (325) as enlarged and altered at Constantinople (381), with the decrees of Chalcedon (451) against Monophysitism, Orange and Valenta (529) against Semi-pelagianism, and Constantinople (1st Trullan, 680) against Monothelitism. This long series of keen and varied controversies on the loveliest doctrines represents a vast amount of intellectual activity in the field of dogmatic, and some of the greatest names in the church's history belong to this period. Athanasius, Basil, the two Gregories, the two Cyril, and Chrysostom in the East, and Ambrose, Augustine, and Hilary in the West, are but a few of the more outstanding and best known of the church's teachers during these controversies. On the whole it may be said that they have done their work satisfactorily and well, in establishing the true Christian view on the special doctrines they had to discuss; and the decisions of the church on these points have been very generally accepted in after times. The Reformers adopted either tacitly or expressly the whole body of them as in accordance with Scripture; and even in the immense upturning of opinions on all theological doctrines that has been going on in modern times, the faith of Nicaea has been maintained by the majority of theologians. Even the more detailed creed of Chalcedon is questioned by comparatively few, though the still more minute discussions and definitions after that have ceased to command the respect and interest of the modern church. But while the theologians of this polemic period were thus successful in establishing and defining some of the more important doctrines of Christianity, and by so doing contributed very valuable materials for dogmatic, they did little or nothing to produce a body of divinity in a scientifi...
of dogmatic propositions in his work Πρωτολογία, which remained for the Eastern Church the supreme authority in theology for a thousand years after. There has been, however, no living onward movement in the comprehension of Christian doctrine in the Greek Church; and if on this account that great section of the Orthodox, so called, is strictly so called, is usually reckoned to extend only from the 8th century to the middle of the 15th. But the times thought. The doctrines of the church were established from the 11th century to the middle of the 15th, and it was only until the 16th, though in after ages, though in its more distinct articulation than before,—particularly that of the atonement, by Anselm; and the keen and subtle analysis to which all doctrines and conceptions were subjected has produced many distinctions that have been found useful in later times as conducing to clearness of thought.

The decline and fall of scholasticism was due to the gradually awakening consciousness of the unsoundness of the principles on which it rested. The nominalistic controversy shook men's faith in the absolute identity of thought and being, reason and authority; and the identification of theology and philosophy came to an end. The latter refused to be any longer the mere handmaid of the church; and from the assertion of its freedom the history of modern philosophy dates. This was necessarily a fatal blow to the scholastic theology; and at the same time the great religious movement of the Reformation made a reconstruction of the system of church doctrine necessary.

IV. The age of the Reformation, occupying the greater portion of the 16th century, may be said to form by itself a fourth period in the history of dogmatic, for it was animated by a spirit that distinguishes it both from the preceding and from the following time. The Reformation was a movement too full of spiritual life and activity in many directions to be adequately described by any single phrase; but for the present purpose it may comprehensively enough be said to be the assertion of the principle of the direct and personal relation of the believer to God. This involved the sweeping away of all ecclesiastical authority and mediation, and the assertion of the sole authority of God's word and of justification by faith, which have been called the formal and material principles of Protestantism. This also necessarily brought with it a new conception of theology. Christianity was no longer a law, and saving faith was no longer the intellectual assent to certain doctrines; Christianity was a new life, offered in the gospel and received by the soul's trust (fides) in Christ. Hence, when the Reformers came, as some of the greatest of them did, to give a systematic statement of Christian doctrine, they not only rejected those tenets which had been held in the medieval church on no higher authority than that of tradition and ecclesiastical decisions, but they also found that they could exhibit a much more organic unity in the body of Christian doctrine, because they regarded it not as a necessary means or step towards spiritual life, but as the outcome and systematic presentation of that life which is obtained and preserved directly by faith in Christ. The great theological works of the Reformation age were not for the most part written purely in the interest of science or system, but for more practical purposes, for the defence of the new doctrines against attacks made upon them, or for the guidance of ministers in the practical teaching of the people. But it is nevertheless true that in these ways were produced works which had more of the symmetry and unity of a complete system than any that had previously appeared. This can only be accounted for by assuming that the Reformers had laid hold of the right principle of theology, and that the new life of the Reformation had carried them above and beyond the mistaken view of Christianity that had long been the predominant conception of dogmatic. The Loci Communes Theologicorum, Melanchthon (1st ed. 1521, final form 1550), and the Institution...
Religions Christianity of Calvin (1st ed. 1559, final form 1559), are the two chief systematic works of this period, and have formed the starting-points of the Lutheran and Reformed dogmatics respectively. The system expounded in them is summarily set forth in the several Protestant Confessions of this era, and various special doctrines were elaborated and defended by other leaders of the Reformation. The Reformers accepted the doctrinal statements of the ancient creeds and of the first four general councils as scriptural and true; they also adopted with great earnestness the Augustinian doctrines of grace, while they added to them the principle with which Luther's name is inseparably associated of justification by faith, and that of the supreme authority of the Bible as the rule of faith and life,—both of these being in their view witnessed and guaranteed by the testimony of the Holy Spirit. Maintaining these principles, they rejected the authority of the church, the multiplication and magical efficacy of the sacraments, the merit of good works, monastic vows, penance, purgatory, and other corruptions of the Middle Ages. In their hands theology lost the merely objective character that it had borne in patristic and medieval times, and was brought into closer connection with religious and Christian life, by the recognition and cultivation of its subjective side. The vital matter with them was, not to have right opinions about the Trinity and the hypostatic union, but to be sure of the true way of salvation by Christ. Their writings are pervaded by a warmth of spiritual life, as well as by a freshness of theological thought, that mark them as the genuine products of a creative age in the history of Christian doctrine. The Reformation age may be said to have closed with the final fixing of the Protestant doctrines in the generally-accepted symbolical books, which took place for the Lutheran church in the adoption of the Formula Consensus in 1580, and for the Reformed churches in the decisions of the Synod of Dort in 1618–19. Even earlier, however, a declaration may be observed from the lofty and free spirit of the first Reformers; and a somewhat different character began to mark the theology of both the branches of the Protestant church.

V. A fifth period in the history of dogmatics, which may be called the confessional one, extends from the beginning of the 17th till near the end of the 18th century. During this time the doctrinal systems, of which the foundations had been laid by Melancthon and Calvin, were elaborated and carried into details with great learning and acuteness; the various doctrines were most carefully and precisely defined, distinguished, and defended. The 17th century was an age of theological controversy. The Roman Catholic Church had recovered from the shock of the Reformation, and by the aid of the Jesuits and the powerful reaction inaugurated by them, had regained strength not only materially but intellectually. Controversialists like Bellarmine, Peterius, and Bossuet taxed the learning and ingenuity of Protestantism to meet them. There were also many less necessary and profitless controversies among Protestants themselves; and almost every theologian was led to devote his energy to the attack of what he held to be error, and the maintenance of true doctrine. Much valuable argument was brought into use in the course of these discussions, and the system of dogmatics was more fully worked out than it had been before. The great dogmatic works of the 17th century, such as those of John Gerhard, Calvius, Quenstedt, and Ewer in the Lutheran church, and of Francois Turrettini, Muentzer, and De Masto among the Reformed, are more minute, precise, and full in their exhibition of the doctrines of the faith than the writings of the Reformers, and they contain a great deal of vigorous and profound thought. Never probably have the doctrines which they handle been so ably and thoroughly discussed. They were, however, treated somewhat in the scholastic method that had prevailed before the Reformation. The theologians of the 17th century did indeed clearly perceive and firmly maintain the principle of the sole authority of Scripture, which was one of those involved in the revolt against the authority of the church and hierarchy of Rome. Hence, in point of matter, their systems are vastly superior to those of the schoolmen, freer from traditional and sacerdotal dogmas, and far more in harmony with apostolic teaching. But they failed to apprehend a deeper principle that was implicitly contained in the Reformation movement, viz., that Christian doctrine, instead of preceding Christian life as a necessary means to it, must come after its actual experience. Sound doctrine was regarded as the preliminary condition of spiritual life; and as it had thus to be established apart from the living experience of Christianity in the soul, it must rest on purely external authority. This was found in an extreme and one-sided view of the inspiration of Scripture, as equivalent to verbal or literal interpretation, and in an uncritical and indiscriminate use of proof texts from all portions of Scripture, without due regard to their historical connection and scope. These became to many of the divines of that age very much what the sentences of the fathers and councils had been to the schoolmen, and an undue weight was sometimes allowed to the apocryphal and canonical books in which Protestant doctrine had been expressed. An excessive subtlety and minuteness of definition were also often adopted, and when these were made matters of faith in different parts of the church, numerous schisms and separations took place. The rigid exclusiveness of the Lutheran divines on the basis of the Formula Concordiae, the intolerant zeal of the Anglicans for episcopacy and ceremonies, the extreme doctrinal minuteness of the Formula Consensus Ecclesiæ of 1675, and the narrowness of some of the English Puritans and Scottish Presbyterians are instances of this tendency, and the disastrous effects of many of these are well known.

The issue of this form of theology was very similar to that of the scholastic system. It was gradually undermined by the spirit of rationalism calling in question the validity of its minute definitions. This tendency had been active from the time of the Reformation in various forms, and though for long it was controverted and excluded from the Protestant Churches, in the course of the 18th century it brought about a general dismantlement of their dogmatics. It was found that there was not sufficient evidence to maintain the too minute and detailed systems of the 17th century, a more critical study of the Bible, and the orthodoxy that had rested on a insecure foundation was for a time almost entirely overthrown. In nearly all the churches there came, in various forms, an age of indifference and even unbelief in the old doctrines of the gospel; and this was generally accompanied with a declension in spiritual life. It was in Germany that the sceptical movement took the most pronounced form; and there, accordingly, the break with the theology of the 17th century has been most complete. In this country the triumph of rationalism has never been so absolute, and the transition to a new era in the history of theology has not been so marked.

VI. But a new period has undoubtedly come since the modern beginning of the present century. A reaction has set in against the rationalism that overthrew the older dogmatics. In some cases, indeed, this has taken the form of a simple reversion and re-establishment of the old systems of doctrine, as in the school of Hengstenberg, Havernick, Philipps, and others, who maintain the Lutheran orthodoxy in all its rigidity, and in many British and American divines, who reproduce the Calvinistic system in its precise 17th century form. But by many the need is felt of more thoroughly
The modern era of dogmatic may be said to have been opened by Schleiermacher's *Christliche Glaube* (1821), a work of great genius, learning, and power, which did good service in putting an end to the previously prevalent rationalism and bare scientific treatment of the dogmas. Schleiermacher exercised great influence on theological thought; and though he did not succeed in emancipating himself from the pantheistic principles of his philosophy, his mode of conceiving Christianity and its relation to theology has been fruitful of good results. By a large number of diverse theories, he has tried to be unusually free from systematic bases, as was practically done formerly, the whole system of theology on the one doctrine of the inspiration of Scripture; and a broader foundation, as well as a more living conception, has been sought for it, by recognizing as its subject-matter, not merely the sayings of Scripture, but that living Christianity which is the direct object of the Bible. This is really a taking up and carrying out more fully of the principles of the Reformation, and it is in this line that dogmatic seems to be cultivated with most prospect of success and stability. There is in the present day much confusion in this as in many other departments of theology, and system of the most diverse contents and on the most diverse principles are produced in abundance; but the line in which such men as Nitsch, Martensen, Julius Muller, Ebrard, Osterzec, Ritschi, and others have been labouring is that which in order to maintain the substance of what has been given in former ages, is free to welcome modifications and develop the more basically based principles.

Literature.—The literature of dogmatic is exceedingly rich and varied, and only the more important and influential works can be mentioned here. Before the Reformation, however, though there are many treatises of primary importance on particular doctrines, and though the more comprehensive works have an historical value, yet there is no complete system constructed on sound principles, so as to be of much direct use. Calvin's *Institutes* (Religio Christianae) is the first great work, embracing the whole subject, that is still of direct and primary importance. It is distinguished by a depth of insight into the principles of Christian doctrines, a comprehensive grasp and clear arrangement of their details, a reverence and sobriety in the interpretation and application of Scripture, and a spirit of Christian earnestness and purity that have never been surpassed. Of the later dogmatic systems in the Reform. of Church, some are brief compendia, among which the *Theologia Medulla* of William Ames, the English puritan, is specially distinguished for precision of thought and power of construction; others are much larger, and greatly exceed in the length and minuteness of their discussions the work of Calvin. Among them are Francis Turretin's *Institutio Theologiae Elenctica* (1679), remarkable for the logical power with which he maintains the strict Calvinistic doctrines on all the points involved in his dogma. Another great work is Peter Van Mastricht's *Theodicea Pratica Theologiae* (1685-97), is a favourable specimen of the Dutch theology of the time—learning, accurate, and at the same time profound. It was the first of the modern schools, as it is called, of dogmatic writers, and exercised great influence on the popular theology of this country, Hermann Witsius's *Christiana Doctrina* is a very able and suggestive production. The Arminian system is well represented by the *Theologia Christiana* of Philip Limborch (1668), a work written in a clear, biblical, and conciliatory style.

The Lutheran dogmatic works are even more colossal and voluminous than the Reformed, the greatest of them, John Gerhard's *Logi Theololicae* (1680-92), shows a spirit of purity, as well as great learning, exactness of thought, and logical skill. He occupies a middle position between the more rigidly orthodox such as Hutter and Calovius, and the so-called syncretism of Calixtus. Of the same general character are the *Institutiones Theologicae* of John Francis Buddeus (1724). A very fair idea of the contents of the Lutheran dogmatic works may be obtained from Schmitt's *Die Lehre von den dogmatischen Systemen der evangelisch-Lutherischen Kirche* (1853), which contains mainly of quotations from the old divines on the different doctrines of the system, and from Luther's *Compendium der dogmatik*. In this country no important systematic treatise on dogmatic as a whole appeared till the publication of Dr George Hall's *Lectures on Divinity* in 1831, a work distinguished for the clear and confident statement of doctrines and exposition of their evidence, though lacking somewhat in spiritual warmth. Dr Chalmers's *Institutes of Theology* (1849) have this last quality in a very high degree, and follow a moderate line in forming dogmatic links with Church experience than had been usual, but the system is very imperfectly filled up, and is marked more by brilliant and suggestive thoughts as splendidly illustrated, than by thorough and minute investigation.

**DOGWOOD** (according to Prior, Ang. Sax. *dal*, a brooch pin), the name applied to plants of the genus *Cornus*, of the natural order *Cornaceae* or cornels. The common dogwood, *prick-wood, skewer-wood, or so-called dogberry, *C. sanguinea*, is a shrub reaching a height of 5 or 9 feet, common in hedges, thickets, and plantations in Great Britain. Its branches are dark-red; the leaves egg-shaped, pointed, about 2 inches long by 1½ broad, and turning red in autumn; and the flowers dull white, in terminal cymes. The fruits are of a black purplish, are bitter, and one-seeded, and contain a considerable percentage of oil, which in some places is employed for lamps, and in the manufacture of soap. The wood is white and very hard. Bark of other species of the genus is used for making ladder steps, spool-work, skewers, forks, and other implements, and gunpowder charcoal. The red berries of the dwarf species, *C. sanguinea*, of the Scotch Highlands are eaten, and are reputed to be tonic in properties. *C. racemosa*, the Cornelian Cherry, a native of Europe and Northern Asia, bears a pulpy and edible fruit, which when ripe contains much tannin. It is the Akenia of the Greeks, and the Kizillik of the Turks; by the latter the wood is employed for giving a red dye. The bark of the handsome Flowering Dogwood, *C. florinda*, and of other American species, is valued as a stomachic and febrifuge, and is administered as a substitute for Peruvian bark. The Jamaic Dogwood, the root-bark of which is poisonous, is the species *Paeonia officinalis*, of the natural order *Paeoniaceae*.

**DOL** (a town of France, in the department of Ille-et-Vilaine, about 15 miles by rail from St. Malo, on an eminence in the midst of a marshy plain, protected from the inroads of the sea by a dyke of the 12th century, which extends for a distance of 22 miles. A quiet, sombre, agricultural little place, with nothing more remarkable in its modern life than the coin-market which is held in the old Carmelite church of Notre-Dame-sous-Dol, it preserves, in the remains of its ramparts and church, the memory of the time when it was one of the most important fortresses.
on the frontier between Brittany and Normandy. The streets are still rendered picturesque by the dark houses of the 14th and 15th centuries, which form deep arcades by the projection of their upper stories; and, high above all, in spite of its five hundred years, rises the grey granite of the cathedral, which formerly ranked as the metropolitan church of all Brittany, and still keeps fresh the name of that old Bishop St Samson, who, having fled, as the legend tells, from the Saxon invaders of England, selected this spot as the site of his monastery. To the architect it is interesting for the English character of its design, and to the antiquarian for its stained glass windows of the 15th century, its tombs, and its carvings. The town was twice besiegè by William the Conqueror, had three to defend itself during the wars of the League, and in 1590 witnessed the defeat of the republican forces by the Vendéens who had taken refuge within its walls. About a mile and a half from the town is the pierre du champ dolant, a menhir about 30 feet above the ground, not far off stands the great granite rock of Mont Dol, about 200 feet in height, and surrounded by the chapel of Notre Dame de l'Espérance, and about 10 miles to the south is the castle of Combourg where Chateaubriand spent his early days. Population in 1875, 3355.

DOLABELLA, PUBLIUS CORNELIUS, a Roman general notorious for his profligacy, was born about 70 B.C. His vicious character made itself apparent even in his early years. Before he attained his majority he is said to have been more than once guilty of capital crimes, from the punishment of which he was only delivered through the advocacy of Cicero. In the year 53 he forced his wife Fabia to leave him, and married Tullia, the daughter of Cicero, who strongly opposed the union. Dolabella's motive in establishing this connection was to prevent Cicero from giving evidence in favour of Appius Claudius, whom he had accused of having violated the sovereign rights of the people. In the following year, his numerous creditors having begun to clamour, he was forced to quit Rome, and betook himself to the camp of Caesar, to the great regret of his father-in-law. During Caesar's absence in Spain, Dolabella commanded the fleet in the Adriatic, but he did not gain any distinction. He took part in the battle of Pharsalus (48), after which he returned to Rome, in the expectation, delusive as it proved, that Caesar would give him a substantial reward for his services, and so enable him to pay his debts. To gain immunity from the urgent demands of his creditors, he procured his election to the tribunate, which he had no sooner done than he introduced a bill (proposito) proposing that all debts should be cancelled. This was strongly resented by his colleagues, and two parties were formed, between whom more than one bloody encounter took place in the streets of the city. On Caesar's return from Alexandria he saw the expediency of removing Dolabella from Rome, and accordingly took him as one of his generals in the expedition to Africa and Spain. Dolabella was ambitious of the consulship, and obtained a promise of it from Caesar for the year 44. The latter, however, influenced partly by the strong opposition of Antony, assumed the office himself, and deferred the fulfilment of his promise to Dolabella until he should set out on his expedition against the Parthians. The assassina-
tion of Caesar occurring before this arrangement could be carried out, Dolabella at once seized the insignia of the consulship, and, by making friends with Brutus and the other assassins, was confirmed in the office he had usurped. To ingratiate himself still further with the republican party, he caused an altar erected in honour of Caesar to be thrown down, and many of those who had sought to offer sacrifices on it to be crucified or thrown from the Tarpeian rock. He did not hesitate at once to change sides, however, when Antony made it his interest to do so by offering him the command of the expedition against the Parthians and the province of Syria. An unduly protracted and circuitous march was signalized by rapacious extortion, which became still more rapacious when at length Dolabella reached Syria. His crowning iniquity was the murder of Trebonius at Smyrna, which, according to Cicero's account, was preceded by two days' torture for the purpose of discovering the locality and amount of the treasure contained in the town. On hearing of this gross abuse of power, the senate outlawed Dolabella, and declared him a public enemy. Cassius was appointed to supersede him, proceeded to Asia Minor, and had taken Laodicea, when Dolabella in despair caused himself to be killed by one of his own soldiers, 43 B.C.

DOLCE, LUDOVICO, or LETI, (1580-1585 or 1569), one of the most laborious and multifarious writers of Italy in the 16th century, was a native of Venice, and belonged to a family of honourable tradition but decadent fortune. He received a good education, and early undertook the task of maintaining himself by his pen. He was destitute of outward events than such a life usually is, may be briefly summed up in one word,—he wrote Translations from Greek and Latin, epics, satires, histories, plays, and treatises on language and art followed each other in rapid succession, till the whole number amounted to upwards of 70 works. In his own day his industry was rewarded by no small amount of fame, but he is now mainly memorable as the author of Maratona, a tragedy from the life of Herod, which was recast in French by Tristan and by Voltare, and still keeps a place on the stage. Four licentious comedies, H. Rosso (1541), II Capitano (1548), II Marto (1560), II Ragazzo (1560), and seven of Seneca's tragedies complete the list of his dramatic efforts. In one epic—to translate the title-page,—"he has marvelously reduced into ottava rima and united into one narrative the stories of the Iliad and the Æneid," in another he devotes 39 cantos to a certain Frasuleto, son of Palmerio, in a third he celebrates the first exploits of Count Orlando, and in a fourth he sings of the Paladin Sacramonte. A life of the emperor Charles V and a similar account of Ferdinando I, published respectively in 1560 and 1566, are his chief historico-figurative productions; and among his minor treatises it is enough to mention the Observationes sulla lingua volgare, 1560, the Dialogo delle pittura, 1557, and the Dialogo nel quale si ragiona del modo di accrescere la memoria, 1553.

See Tiraboschi, Storia, etc., iv., Klein, Geschichte de Ürämaren, vol. v.

DOLCI, CARLO, or CARLINO (1616-1686), a painter of considerable celebrity, was born at Florence in May 1616. He was the grandson of a painter on the mother's side, and became a disciple of Jacopo Vignali; and when only eleven years of age he attempted a whole figure of St John, and a head of the infant Christ, which received extraordinary approbation. He afterwards painted a portrait of his father, and displayed a new and delicate style which brought him into notice, and procured him extensive employment at Florence from which he has disengaged himself, and in and other parts of Italy. Dolci used his pencil chiefly in sacred subjects, and bestowed much labour on his pictures in his manner of working he was remarkably slow. It is said that his brain was affected by seeing Luca Giordano, in 1652, despatch more business in four or five hours than he could have executed in as many months, and that he hence fell into a state of hypochondria, which compelled him to relinquish his art, and soon brought him to the grave. His works are not very numerous. He generally painted in a small size, although there are a few pictures by him as large as life. He died at Florence in January.
1686, leaving a daughter (Agnes), who arrived at some degree of excellence in copying the works of her father.

Dolci had somewhat the same rank in the Florentine that Sassoferrato does in the Roman school. Without the possession of much genius, invention, or elevation of type, both these artists produced highly wrought pictures, extremely attractive to some tastes. The works of Dolci are easily distinguishable by the drapery of the composition, and by an agreeable tint of colour, improved by judicious management of the chiaro-scuro, which gives his figures a striking relief; he affected the use of ultramarine, much loaded in tint. "His pencil," says Pilkington, "was tender, his touch inexpressibly neat, and his colouring transparent; though he has often been censured for the excessive labour bestowed on his pictures, and also for giving his caricatures more of the appearance of ivory than the look of flesh." All his best productions are of a devout description; they frequently represent the patient suffering of Christ or the sorrows of the Mater Dolorosa. Dolci was, in fact, from early youth, exceedingly pious; it is said that during passion week every year he painted a half-figure of the Saviour. His sacred heads are marked with pathetic or at least strongly sentimental emotion. There is a want of character in his pictures, but the general tone accords with the idea of the passion portrayed. Among the best works of this master are the St Sebastian; the Four Evangelists, at Florence; Christ Breaking the Bread, in the marquis of Exeter's collection at Burleigh; the St Celcis in Dresden; an Adoration of the Magi; and in especial St Andrew praying before his crucifixion, in the Pitti Gallery, his most important composition, painted in 1646; also several smaller pictures, which are highly valued, and occupy honourable places in the richest galleries.

DOLE, a town of France, at the head of an arrondissement in the department of Jura, 28 miles N. of Lons-le-Saulnier, occupying the declivity of a hill on the right bank of the Doubs, which is there accompanied by the canal of the Doubs, which is there accompanied by the canal of the Rhone and the Rhine. It is the seat of a tribunal of primary instance, and has a Jesuit college, an agricultural society, a school of design, a theatre, a museum, and a public library of upwards of 40,000 volumes. The principal public buildings are the court-house, originally a Franciscan monastery dating from 1572; the church of Notre Dame, a Gothic structure of the 16th century; the Hôtel-Dieu, the prison, the barracks, two hospitals, and the ancient tower of Vergy. Among the manufactures of the town are straw hats, bunsery, chemicals, leather, and agricultural implements; and it carries on a good trade in agricultural produce, wool, iron, and marble. Dole is believed to have been a station on the Roman road from Lyons to the Rhine, and it still preserves what seem to be remains of an aqueduct, a bridge, and a theatre, of Roman construction. From 1423 to 1481 it was the seat of a university; but there can have been but little study in the year 1479 when the town was taken by Louis XI, and so completely sacked that only Jean Vury's house, as it is still called, and other two buildings were left standing. It subsequently came into the hands of the Spaniards, and in 1530 was fortified by Charles V. In 1635 it was able to hold out against the prince of Condé; but in 1693 and 1674 it was captured by the French, and on the latter occasion was deprived of its defences. Till Besançon was incorporated with the province, Dole ranked as the capital of Franche Comté, and was the seat of a parlement.

DOLET, ÉTIENNE (1509-1546), a French scholar and printer, whose fame is due as well to the painful romance of his life as to the high intellectual tradition, of what authority it is hard to say, makes him the illegitimate son of Francis I.; and it is evident that he was at least connected with some family of rank and wealth. From Orleans, where he was born, he was taken to Paris about 1521; and after enjoying there the instruction of Nicolas Béraldus, the teacher of Coligny, he proceeded in 1526 to Padua. The death of his friend and master, Simon de Villanova, led him, in 1529, to accept the post of secretary to Jean de Languec, French ambassador to the republic of Venice; but he managed, in spite of his new occupation, to attend the lectures of the Venetian scholar Battista Egnazio, and to write Latin love poems to some Venetian Elena, who died, however, before he left the city. Returning to France in 1530 he proceeded to Toulouse for the study of law; but there he soon became involved in the violent disputes then raging between the different "nations" of the university, roused the anger of the public authorities by his keen condemnation of some of their measures, was thrown into prison, ran the risk of being assassinated, and was finally banished by a decree of the parlement. In 1535 he entered the lists against Erasmus in the famous Ciceronian controversy, by publishing, through Battista Gryphe at Lyons, a Dialogus de Ignatione Ciceroniana; and the following year saw the appearance of his two folio volumes Commentariorum Linguæ Latinae. In 1537 he obtained from Francis I. a privilege to print during ten years any works in Latin, Greek, Italian, or French which were the products of his own pen or had received his supervision; and accordingly, on his release from an imprisonment occasioned by his justifiable homicide of a painter Campanini, he commenced at Lyons his typographical and editorial labours. That he was not altogether unaware of the dangers to which he was exposed from the bigotry and fierce-heartedness of the times is shown not only by the tone of his mottoes—Prière mes, Seigneur, des colomnes des hommes, and Durior est spectare virtutem quam incognitam conditum—but also by the fact that he endeavoured first of all to conciliate the theological wolves by publishing a Cato christanus, or Christian moralist, in which he made profession of his creed. The Catholicity of his literary appreciation, in spite of his ultra-Ciceronianism, was soon displayed by the variety of the works which proceeded from his press—ancient and modern, sacred and secular, from the New Testament in Latin to Rabelais in French. But long before the term of his privilege expired his labours were interrupted by the machinations of his enemies, who neither shrank from bringing against him what was then the most terrible of all accusations, nor relented in their pursuit till their purpose was completely realized. From a first imprisonment of fifteen months their victim was released by the advocacy of Pierre Duchatel, bishop of Tulle; and from a second he escaped by his own ingenuity; but, venturing back from Piedmont, whether he had fled in order that he might print at Lyons the letters by which he appealed for justice to the king of France, the queen of Navarre, and the parlement of Paris, he was again arrested, hurried up to the capital, branded as a relapsed atheist by the theological faculty of the Sorbonne, and on the 3d of August 1546 put to the torture, strangled, and burnt in the Place Maubert. On his way thither he is said to have composed the punning pentameter—Non dolet ves Dolet, sed pia turba dolet. As if in prophetick mockery of their own proceedings, the doctors of the Sorbonne based their decision on the three words Rien du tout or "Nothing at all," inserted by Dolet in a passage of the Aetna of Plato, which even without them denied, if not so emphatically, the immortality of the soul; and this they did in spite of the fact that according to their own showing, his works must have been full of most damnable heresies, and could hardly have been a slender fuel to the hangman's fire. Whether Dolet is to be classed with the representatives of Protestantism or with the advocates of
DOL—DOL 345

anti-Christian rationalism has been frequently disputed; by the principal Protestant of his own time he was not recognized, and by Calvin he is formally condemned, along with Descartes and his master, Robert Fludd. He having uttered excusable blasphemies against the Son of God, but, to judge by the religious character of a large number of the books which he translated or published, such a condemnation is altogether misplaced. His repeated advocacy of the reading of the Scriptures in the vulgar tongue is especially noticeable.

To the works already mentioned the following must be added—A volume published by Simon Fonet, without the author's knowledge, containing Gratiani in T totalmente divinum, emendatorum libri duo, novissimae versionis, and emendatorum aliorum libri, 1534; Du ius maris libri, 1537, De quibusdam Claudii Doleti, 1539 (a collection of Latin poems on the death of his son, translated into French as L'Amant-Vainqueur de Claude Dolet, 1539), La manière de bien traduire une langue in a langue, and De la ponctuation française, 1541; Le Manuel du Chef-Chanteur et le trompoy luy de si bien confusser, both translated from Erasmus's Latin, 1544; Bref Discours de la République française, 1544, Second Entier, 1545, a poem giving an account of events, "that was reprinted in 1560 by Techen. See Nee de la Rochelle, Vie d'Eustache Dolet, Paris, 1739; Joseph Boulanger, "Eustache Dolet," in the Revue de Paris, 1822, and a separate work, Eustache Dolet, sa vie, etc., Paris, 1857, A. F. Dole, Essais sur la Typographie de la presse ou trait de Dolet was published in 1839, by A. H. Trouayard from the registers of the University of Paris.

DOLGELLY, a market and assize town of Merionethshire, North Wales, situated at the junction of the Arian with the Severn, and at the northern base of Cadar Idris, 19 miles S. W. of Llanidloes, and 9 miles E. of Barmouth, with both of which it is connected by rail. The town consists of a series of small squares and narrow streets, the houses being built of stone. It contains a market hall, a hospital, county hall, and parish church. An old building, described as the Parliament House, is said to have been the place in which Owen Glendower assembled his parliament in 1404.

DOLMIEU, Didot-Guy-Sylvain-Tancrède Gratet (1750–1801), a celebrated geologist and mineralogist, was born at Dolomieu, near Tour-du-Pin, in the department of Isère in France, June 24, 1750. He was admitted in his infancy a member of the Order of Malta. When he was 15 years of age he squabbled with a knight of the galley on which he was serving, and in the duel that ensued killed him. In consonance with the statutes of his order, Dolomieu was condemned to death for his crime, but in consideration of his youth the grand master granted him a pardon, which, at the instance of Cardinal Thomas, confirmed by Pope Clement XIII, and after nine months imprisonment he was set at liberty. Throughout that period he had solaced himself with the study of the physical sciences, and during his subsequent residence at Metz he continued to devote himself to them. In 1775 he published his Recherches sur la pesanteur des corps à différentes distances du centre de la terre, and two Italian translations of mineralogical treatises by Cronstedt and Bergmann. These works gained for him the honour of election as a corresponding member of the Academy of Sciences at Paris to obtain leisure to follow his favourite pursuits. Dolomieu now threw up the commission which, since the age of fifteen, he had held in the cabaniers, and in 1777 he accompanied the baili De Rohan to Portugal. In the following year he visited Spain, and in 1780 and 1781 Sicily and the adjacent islands. Two months of the year 1782 were spent in examining the geological structure of the Pyrenees, and in 1783 the earthquake of Calabria induced him to go to Italy. The scientific results of these excursions are given in his Voyage aux îles de Lipar, Memoire sur le tremblement de terre de la Calabre; et catalogue raisonné des produits de l'Etna, and other works. In 1789 and 1790 he bade himself with an examination of the Alps, his observations on which form the subject of numerous memoirs published in the Journal de Physique. The mineral dolomite, which was named after him, was first described by Dolomieu in 1791. He returned to France in that year, bringing with him rich collections of minerals. On September 14, 1792, the Duc de la Rochefoucault, with whom he had been for twenty years on terms of the closest intimacy, was assassinated at Forges, and Dolomieu retired with the widow and daughter of the duke to their estate of Roche Guyon, where he wrote several important scientific papers.

The events of the 9th Thermidor (July 27, 1794) having restored the country to some tranquillity, Dolomieu recommenced his geological tours, and visited various parts of France with which he had been previously unacquainted. He was in 1796 appointed engineer and professor at the school of mines, and was chosen a member of the Institute at the time of its formation. At the end of 1797 he joined the scientific staff which in 1798 accompanied Bonaparte's expedition to Egypt. He had proceeded as far as Cairo when ill health made his return to Europe necessary, and on March 7, 1797, he set sail from
Alexandria. His ship proving unseaworthy put into Taranto, and as Naples was then at war with France, all the French passengers were made prisoners. On May 22, they were carried by ship to Messina, whence, with the exception of Dolomieu, they embarked for the coast of France. Dolomieu had been an object of the hatred of the Neapolitan court since 1753, when he revealed to the grand master of his order its designs against Malta, and the columns of his enemies on that island served now as a pretext for his detention. He was confined in a pestilential dungeon, where, clothed in rags, and having nothing but a little straw for a bed, he languished during 21 months. To the complaint that if unsupplied with some necessary he should die, his jailer replied, "What does it matter to me if you die? I have to give account to the king of nothing but your bones." Dolomieu, however, did not abandon himself to despair. Deprived of writing materials, he made a piece of wood his pen, and with the smoke of his lamp for ink he wrote upon the margins of a Bible, the only book he still possessed, his Traité de philosophie minéralogique et Mémoire sur l'espace minérale. Friends entreated, but in vain, for his liberty; it was with difficulty that they succeeded in furnishing him with a little assistance, and it was only by virtue of a special clause in the treaty between France and Naples that, on March 15, 1801, he was released. On his arrival in France he commenced the duties of the chair of mineralogy at the museum of natural history, to which, after the death of Daubenton, he had been elected in January 1793. His course of lectures concluded, he revisited Switzerland. Returning thence he reached the residence of his brother-in-law at Château-Neuf, in the department of Saône-et-Loire, where he was seized with a fever, to which in a few days he succumbed, November 25, 1801. Dolomieu’s geological theories are remarkable for originality and boldness of conception. The materials constituting the primordial globe he held to have arranged themselves according to their specific gravities, so as to have constituted a fluid central sphere, a solid crust external to this, next a stratum of water, and lastly the atmosphere. Where water penetrated through the crust, solidification took place in the underlying fluid mass, which enlarging in consequence produced rифes in the superincumbent rocks. Water rushing down through the rifts became decomposed, and the resulting effervescence occasioned submarine volcanoes.

The crust of the earth he believed to be continually increasing in thickness, owing to the deposition of aqueous rocks, and to the gradual solidification of the molten interior, so that the volcanic eruptions and other geological phenomena of former must have been of far greater magnitude and frequency than those of recent times.

DOLPHIN (Delphinus delphis), the common name of a species of whale belonging to the family Delphinidae. It usually measures from 6 to 8 feet in length, and is thickest near the centre, where the dorsal fin rises to a height of 9 or 10 inches, and whence the body tapers towards both extremities. The forehead descends abruptly to the base of the slightly flattened beak, which is about 6 inches long, and is separated from the forehead by a transverse depression. The mouth is armed with sharp, slightly curved teeth, of uniform size, varying in number from 40 to 50 on each side of either jaw, and those above locking exactly with the teeth below. The aperture of the ear in dolphins is exceedingly minute; the eyes are of moderate size and the nose-duct is crescent-shaped. The colour of the upper surface is black, becoming lighter on the flanks, and perfectly white on the parts beneath. Like many other cetaceans, the dolphin is gregarious, and large herds are often seen following ships in full sail, and displaying themselves on the surface of the water as if delighted at the near proximity of man. In such excursions they exhibit the most remarkable agility, individuals having been known to keep to such a height out of the water as to fall upon the deck. Their aquatic gambols and apparant relish for human society have attracted the attention of mariners at all ages, and have probably given rise to the many fabulous stories told of dolphins by ancient historians. Their appearance at sea was formerly regarded as a good omen by sailors, for although it presaged a tempest, yet by thus giving warning of its approach, it enabled them, in those days when the mariner’s compass was unknown, and navigators had consequently to keep within sight of the coast, to steer for a place of safety. The dolphin is exceedingly voracious, feeding on fish, cuttlefishes, and crustaceans. On the south coast of England it is said to live chiefly on piddock and mender, and when in pursuit of these it is often taken in the fisherman’s nets. The female brings forth a single young one, which she nurses with the greatest care. Her milk is both abundant and rich, and during the operation of suckling the mother floats in a slightly sading position, so as to allow of the necessary respiration in herself and her young. The dolphin was formerly supposed to be a fish, and as such was allowed to be eaten by Roman Catholics on those occasions when the use of flesh was prohibited, and it seems to have been esteemed as a great delicacy by the French. It is said to show great fondness for music, and according to the ancient fable, Arcn was said to have escaped on the back of a dolphin which he had first charmed by his music. It is an inhabitant of the temperate regions of the North Atlantic and the Mediterranean Sea, and has been observed as far north as the coast of Greenland. It is much more common in English than in Scottish waters. Among the seafaring population of Britain the name “dolphin” is most usually given to the beautifully coloured fish Coryphas io hippurus—the dorado of the Portuguese, and it is to the latter the poet is alluding when he speaks of “the dying dolphin’s changing hues”—while the true dolphin is usually spoken of as the “bottle-nose” or “bottle-head.” This species occurs as a fossil in the sandy downs of the French coast.

DOMAT, or DAUMAT, JEAN (1625-1696), a celebrated French jurisconsult, born at Clermont in Auvergne, on the 30th November 1625. He was closely in sympathy with the Port-Royalists, was intimate with Pascal, and at the death of that celebrated philosopher was intrusted with his private papers. He is principally known from his elaborate legal digest, in four volumes 4to, under the title of Lois Civiles dans leur Ordre Naturel Suivies du Droit Public (1689),—an undertaking for which Louis XIV. settled on him a pension of two thousand livres. This is one of the most important works on the science of law that France has produced. Domat endeavoured to found all law upon ethical or religious principles, his motto being L’homme est fait par Dieu et pour Dieu. An English translation of the Lois Civiles by Strahan, was published in 1722, and passed through several editions. Besides the Lois Civiles, Domat made in Latin a selection of the most common laws in the collections of Justinian. This work, however, did not appear until after his death, when it was published separately (Paris, 1700, Amsterdam, 1703) under the title of Legum Detectae, and was subsequently appended to the Lois Civiles. It was translated into English by Strahan. Domat died at Paris on the 14th March 1696.

See in the Journal des Savants for 1843 several papers on Domat by Victor Cousin, giving much information not otherwise accessible.
DOMBROWSKI, Jan Henryk (1755–1818), Polish general, was born at Pierzowice in the palantine of Cracow, August 29, 1755. He was of noble family, and his father was an officer in the Saxon army. Brought up in Saxony, he entered and for some years served in the army; but when, in 1791, the Polish Diet recalled all Poles serving abroad, he returned to his native land. Placed then under the orders of Pomatowski, he took part in the campaign of 1792 against the Russians. In 1793 he distinguished himself in command of the right wing under Kosciusko assisted in the defence of Warsaw, and reunited the scattered Polish forces after its fall. He was compelled, however, to capitulate and to surrender himself prisoner of war at Radzywycz, November 18. Swaroff offered him a post in the Russian army, but this he declined, and for two years he lived in retirement. In 1796 the rank of lieutenant-general in the Prussian army was offered to him by the king, but this he likewise declined. He then went to Paris. The formation of a Polish legion was at this time in contemplation by the French authorities, and in January 1797 Dombrowski was formally authorized by the Government of the Cisalpine Republic to organize it. Thus task he executed in Milan. In command of his legion he played an important part in the war in Italy, entered Rome in May 1799, and distinguished himself greatly at the battle of Trebiu (June 19, 1799). On this occasion he narrowly escaped death, being struck by a ball the force of which was broken by a volume of Schiller which he carried with him. He next served under Saint-Cyr and Masséna, but being severely wounded he was for some time incapacitated for action. After Marenco he was intrusted by Napoleon with the organization of two new Polish legions; and at the head of the new levies he captured, in January 1801, the fortified post of Casa Branca, near Peschiera. After the peace of Amiens he passed, as general of division, into the service of the Italian republic. Summoned by Napoleon after the battle of Jena to promote a rising in Poland, he returned there, took command of the Polish army, and distinguished himself at the siege of Daftunci (1807). He fought and was wounded at Friedland, and took an active part against the Austrians in the campaign of 1809. In the Russian campaign of 1812 he commanded a division of the great French army, and was wounded at the passage of the Beresina. He fought under General Marmont at the battle of Leipzig (1813), and in the following year returned to Poland. He was one of the generals entrusted by the emperor Alexander with the reorganization of that Polish army, and was made in 1815 general of cavalry and senator patuite of the new kingdom of Poland. He retired, however, in the following year to his estates in Posen, and employed himself in preparing for publication his History of the Polish Legions in Italy, which was published some years after his death. General Dombrowski died at his seat of Wina-Gora in Posen, in June or July 1818.

DOME is usually understood to mean a roof which is round or polygonal horizontally, and of which any vertical section in either a round or a pointed arch. There happen to be none of elliptical or any other section than these. But some, especially in the East, have what is called an ogival outline, convex below and concave towards the top, and these are generally called cupolas, though there is no real distinction. Most of the great European domes have an opening or eye at the top, on which stands a lantern, except in the Piazza del Duomo, where the eye is open. Until modern times all the domes worth notice were of masonry, i.e., stone, brick, tiles, or pots, which last were used for lightness. Probably the first large wooden dome was St Paul's, of which the construction is peculiar, the inner dome visible in the church being of brick only 18 inches thick, except near the bottom where it grows out of a cone of the same thickness going up outside it and carrying the stone lantern, which looks right down into the church through an eye in the internal dome. Outside the cone is built a wooden dome covered with lead. The domes of St Peter's at Rome and Florence Cathedral are of two stone shells near together, and connected by some vertical ribs, and also carrying lanterns. But Wren's construction is infinitely stronger, since a cone sufficiently tied at the bottom cannot give way until it is absolutely crushed, while the bursting pressure of a weight on the top of a dome increases the bursting force enormously. St Peter's dome is cracked in several places, and held together by bands, and it is covered with lead, and therefore looks no better than St Paul's, and indeed on the whole not near so well, for various reasons which may be seen in architectural books; and the lantern is smaller in proportion.

The only full mathematical investigation of the theory of domes with practical results, that we know of, is in a paper by Sir Edmund Beckett (then Mr Denison) in the Memoirs of the Royal Institution, in 1807, and two shorter ones by Mr E. T. T. Tenne, architect, in the Civil Engineer's Journal of March 1808, which substantially agree, so far as they deal with the same points. The investigation is long and complicated, and can only be done approximately, because the introduction of the thickness deranges all the ordinary trigonometrical relations, and so we only give the principal results of these calculations. Some more of them are given in Sir E. Beckett's Book on Building. It is easy to prove by strict mathematics that the upper 52° (nearly) of a hemispherical dome would be absolutely stable, or have no tendency to fall in or burst out, without any sensible thickness, if only tied strongly enough round the base, where the tension would be 3 of the weight of the complete hemisphere, disregarding the bonding effect of mortar and friction. The weight of a thin hemispherical shell is the same as that of a cylinder of the same height and thickness standing on the same base, and is twice that of the area which the dome covers, of the same thickness, provided that bears only a small proportion to the diameter. The weight of any zone of the dome is proportional to its height. A hemisphere of ordinary stone 100 feet wide at mid-thickness and 1 foot thick weighs about 1000 tons. It is also demonstrable that a dome spreading at the bottom a little more than a hemisphere, so as not to start vertically, and rather flattened at the top, would stand without any sensible thickness; and a dome would sungly stand, and especially an inverted cone, which will stand even as an independent arch without thickness, for a dome is far more stable than any arch or a barrel vault of the same thickness.

The essential difference between them is that the mathematical element of a dome is not an arch of any uniform breadth, but one whose breadth, and therefore weight, decreases upwards to nothing, being in fact a zone enclosed between two meridians very close together. And it was shown in the R. I. B. A. paper, and also by models exhibited, that a dome is stable with a thickness of only '025 of its diameter, while an independent round arch or a barrel vault requires three times as much thickness, or 312 times of its diameter. Therefore a barrel vault 100 feet wide must be 7 feet thick to be stable, while a dome of that diameter need only be 27 inches; besides which, the strength of the dome can be increased to almost any extent by building in iron bands in the lower courses, while a barrel vault cannot be so helped. Bands would be of no use whatever in a dome above 52° from the top, as the pressure above that point is entirely inward, assuming it to be tied there, and from thence it gradually increases towards the bottom, where the tension is '215 of the weight of the
hemisphere. It may seem paradoxical that it should be less than 65°; but the explanation is that the tension bears a higher proportion to the weight in a thin dome than a thick one, and it was an infinitely thin one which had the tension of 3° of its weight at 52°; and such a dome cannot be carried lower without bands. In a dome of the required thickness ties would have very little to do above 65°.

As the tension at the bottom is rather more than a fifth of the weight, a dome of proper thickness would be stable standing on a conical drum, with a slope inwards of about 1 to 6, or 12°, of which the tangent is 215, if the drum itself has foundations which cannot spread. The thickness requisite, and also the tension at the bottom, may evidently be greatly diminished by gradually tapering the dome upwards. If it is half as thick at the top as at the bottom, with the thickness increasing downwards as the height, it need only weigh \( \frac{3}{8} \) of the lightest uniform dome of the same size, and only need be 20 inches thick at the bottom for 100 feet diameter.

Pointed domes are also much stronger than hemispheres, having lost the flat top which has the greatest bursting pressure. A dome generated by the revolution of an equalateral arch, or one of 60°, requires a thickness only 0·137 diameter, or 16½ inches for 100 feet; and one of 70° requires 20 inches. The tension at the bottom of a 60° dome is only 15 of its weight, which weight, however, is 1·372 of a hemisphere on the same base, their heights being 1·73 to 1.

For the same reason pointed domes are fittest for carrying a lantern, but they are not so much benefited by tapering, having already lost the most oppressive part. The Florence dome, across the flat sides of the polygon, is about 70° of the circle of its curvature. It is shown in the R.I.B.A. paper that both in hemispherical and pointed domes the weight of the lantern they will carry varies practically as the cube of the thickness. Moreover a lanterned dome requires tuing much higher up than a plain one. In short, the cone is the only proper way of carrying a stone lantern. The cone at St Paul's has a great chain round the base, which is probably superficial, as the drum below it seems thick enough to contain the requisite slope, and visibly leans inwards beneath it.

Ribs inside a dome weaken more than strengthen it, as some persons imagine, unless they are themselves deep enough to be stable as independent arches, or unless they decrease in width and weight upwards like a lune, as those in the Pantheon do, which also is so enormously thick at the haunches that it has superbundant stability. Some of the Indian domes are thick enough for arches, and they have neither eyes nor lanterns. Polygonal domes may be considered as composed of a small number of wide lunes, and only differ from round ones in being rather weaker for any given thickness and size.

Domes require no wooden centring to build them on as arches do, until you get near the top, i.e., so long as each stone laid on the ring of stones below it will not slide inwards. And if they are notched to prevent sliding the whole dome may be built without centring. The dome of Monza, in Malta was so built in this century by a common mason, who, must, however, have been a man of genius. There would be no difficulty in building a dome of almost any size of bricks or stones, with the help of hoop iron in all the lower courses up to about 23° from the bottom, and then less up to 52°, and higher if it has to carry a lantern. There is no masonry dome in the world wider than 145 feet. But there have been several larger iron ones, with an easy piece of engineering, insomuch as iron has enormous tensile strength, while stone has very little, and mortar practically none; and all the calculations above mentioned assume the domes to be composed of narrow lunes having no lateral bond or tie; but on the other hand all the stones are assumed to go right through the thickness and not to be liable to crush at the edges. Building the lowest courses with horizontal beds, which some architects suggested, was shown to be exactly the opposite of what is mathematically required, as there would be nothing to prevent their sliding over each other, whereas the essence of dome-construction is that the lower courses should confine the upper. It is not however practically expedient to make the beds lean inwards so much as to involve acute angles of the stones, as such angles in stone will bear very little pressure. Brick domes over wells or tanks, which should always be round for strength, are usually built on mere mounds of earth for centring, and they are always of flat section, or only about the upper half of a hemisphere, and are consequently stable with very little thickness, as the earth round them forms a somewhat larger abutment.

The following inside diameters of the largest domes in the world are given in Sir E. Beckett's Book on Building. —

DOMENICHINO, or DOMENICO, ZAMPIERI (1581–1641), the celebrated painter, born at Bologna on 21st October 1581, was the son of a shoemaker. The diminutive form of Christian name by which he is known indicates his short stature. He was placed, when young, under the tuition of Denis Calvart, but having been treated with great severity by that master, he left him, and became a pupil in the academy of the Caracci, under Agostino. Towards the beginning of the 17th century he went to Rome, at the invitation of his fellow-pupil and intimate Albano, and prosecuted his studies under Annibale Caracci. The faculty of Domenichino was slow in its development. He was at first timid and distrustful of his powers; while his studious, unremitting, and reserved manners were misunderstood by his companions for dulness, and he obtained the nickname of "the Ox" (Buio). But Annibale Caracci, who observed his faculties with more attention, predicted, that the apparent slowness of Domenichino's genius would in time produce what would be an honour to the art of painting. When his early productions had brought him into notice, he studied with extreme application, and made such advance as to raise his works into a comparison with those of the most admired masters of the time. From his acting as a continual censor of his own works, he became distinguished amongst his fellow-pupils as an accurate and expressive designer; his colours were the truest to nature; Mengs, indeed, found nothing to desire in his works, except a somewhat larger proportion of elegance. Thus he might devote his whole powers to the art, Domenichino shunned all society; or, if he occasionally sought it in the public theatres and walks, it was in order better to observe the play of the passions in the features of the people—those of joy, anger, grief, terror, and every affection of the mind—and to commit them vividly to his tablet; thus says Bellori, it was that he succeeded in delineating the soul, in colouring life, and calling forth heartfelt emotions, at which all his works aim. In personal character he is credited with temperance and modesty; but, besides his want of sociability, he became somewhat suspicious, and jealous of his master.
Assumption thou art teaching me.' So novel, and at the same passion, using threatening words and that of Domenichino. powerful illustration of this truthful expression. two works of these masters, Annibale and procured an engraving of this master's picture of the same subject (now in the Gallery of Bologna), copies of which were circulated for the purpose of showing up Domenichino as a plagiarist. There is in truth a very considerable resemblance between the two compositions. The pictures which Zampieri painted immediately afterwards, representing subjects from the life of St Cecilia, only increased the alarm of his competitors, and redoubled their injustice and railing. Disgusted with these cabals, he left Rome for Bologna, where he remained until he was recalled by Pope Gregory XV., who appointed him principal painter and architect to the pontifical palace in this architectural post he seems to have done little or nothing, although he was not unskilled in the art. He designed in great part the Villa di Baldevere at Frascati, and the whole of the Villa Ludovisi, and some other edifices. From 1630 onwards Domenichino was engaged in Naples, chiefly on a series of frescoes (never wholly completed) of the life of St Januarius in the Cappella del Tesoro. He settled in that city with his family, and opened a school. There the persecution against him became far more shameful than in any previous instance. The notorious so-called ' Cabal of Naples'—the painters Corenzio, Liberti, and Caracciolo,—led together as they were to exclude all alien competition, plagued and decried the Bolognese artist in all possible ways; for instance, on returning in the morning to his fresco-work, he would find not infrequently that some one had rubbed out the performance of the previous day. Perpetual worry is believed to have brought the life of Domenichino to a close; contemporary suspicion did not scruple to speak broadly of poison, but this has remained unconfirmed. He died in Naples, after two days' illness, on 15th April 1641.

Domenichino, in correctness of design, expression of the passions, and simplicity and variety in the airs of his heads, has been considered little inferior to Raphael; but in fact there is the greatest gulf fixed between the two. Critics of the last century adulated the Bolognese beyond all reason or foundation; he is now not only by the western countries, Wilton, Burne-Jones, and invention, lacking any innate ideality, though undoubtedly a forcible, resolute, and learned executant. "We must," says Lanzi, "despair to find paintings exhibiting richer or more varied draperies, details of costume more beautifully adapted, or more majestic mantles. The figures are neatly disposed both in place and action, conducing to the general effect; whilst a light pervades the whole which seems to rejoice the spirit, growing brighter and brighter in the aspect of the best countenances, whence they first attract the eye and heart of the beholder. The persons delineated could not tell their tale to the ear more plainly than they speak it to the eye. The Scourging of St Andrew, which he executed in competition with Guido at Rome (a fresco in the church of San Gregorio), is a powerful illustration of this truthful expression. Of the two works of these masters, Annibale Caracci preferred that of Domenichino, who is said that in painting one of the executors the artist actually brought himself into a passion, using threatening words and actions, and that Annibale Caracci, surprised him at that moment, embraced him, exclaiming with joy, 'To-day, my dear Domenichino, thou art teaching me.' So novel, and at the same time so natural, it appeared to him that the artist, like the otor, should feel within himself all that he is representing to others." Domenichino is esteemed the most distinguished disciple of the Caracci, or second only to Guido. Algarotti preferred him to the great masters; and Nicolo Passale considered the painter of the Communion of St Jerome to be the first after Raphael. His pictures of Adam and Eve, and the Martyrdom of St Agnes, in the Gallery of Bologna, are amongst his leading works. Others of superior interest is his first known picture, a fresco of the Death of Adonis, in the Loggia of the Querini Farnese, Rome, the Martyrdom of St Sebastian, in Santa Maria degli Angeli, the Four Evangelists, in Sant' Andrea della Valle; Diana and her Nymphs, in the Borghese Gallery; and the Assumption of the Virgin, in Santa Maria di Trastevere. His portraits are also highly reputed. It is admitted that in his compositions he often borrowed figures and arrangements from previous painters. Domenichino was potent in fresco. He excelled also in landscape painting. In that style (in which he was one of the earliest practitioners) he composed a whole of the figures, giving them much public adoration as any of his other performances. (W. M. R.)

DOMESDAY BOOK, or simply DOMESDAY, is, in its commonest use, the name applied to the Liber Gulielminianus, or Exchequer Domesday, a very ancient record containing a survey of all the lands of England, made in the time of William the Conqueror. It consists of two volumes—a greater and a less. The first is a large folio, written on 362 double pages of vellum, in a small but plain character, each page having a double column. Some of the capital letters and principal passages are touched with red ink, and some have strokes of red ink run across them, as if scratched out. This volume contains the description of the following counties:—Kent, Sussex, Surrey, Southampton, Berks, Wilts, Dorset, Somerset, Devon, Cornwall, Middlesex, Hereford, Bucks, Oxford, Gloucester, Worcester, Hereford, Cambridge, Huntingdon, Bedford, Northampton, Leicester, Warwick, Stafford, Salop, Cheshire, Derby, Notts, York, and Lincoln, together with the anomalous districts of Rutland and the land "inter Ripam et Mer- sham." The second volume is in quarto, written upon 450 double pages of vellum, but in a single column, and in a large but very fair character. It contains the counties of Essex, Norfolk, and Suffolk. This second volume, together with the Exon Domesday, which contains the fuller reports of the western counties, Wilton, Burne-Jones, Scenery, Devonshire, and Cornwall, and the Inquisitions Elenensia, which relates to the lands of the abbey of Ely, seems to be the original record of the survey itself, which appears in the first volume of the Exchequer Domesday in an abridged form. "In both volumes of the Exchequer Domesday," writes Mr Freeman in his History of the Norman Conquest, "each shire is commonly headed with a list of the chief landowners in it. The king comes first, then the great ecclesiastical, and then the great temporal propinquus, followed in many cases by the smaller proprietors lumped in classes 'servantes regis,' 'tani regis,' 'elemosynarii regis,' and the like, the list being numbered, and forming an index to the survey itself, which follows. Lastly, in several shires come the 'Clamores,' the records of lands which were said to be held unjustly, and to which other men laid claim. Then follows the survey itself. The lands of the king or other landowner are arranged under the hundreds in which they were placed, and the necessary particulars of which the survey was to be a record are put down under each manor or other holding. The northern shires are not described in the survey.
thumberland, Cumberland, Westmoreland, and Durham are conspicuous by their absence. Lancashire does not appear under its proper name; but Furness and the northern part of the county, as well as the south of Westmoreland, with a part of Cumberland, are included within the West Riding of Yorkshire. That part of Lancashire which lies between the rivers Ribble and Mersey is subjoined to Cheshire; and part of Rutland is described in the counties of Northampton and Lincoln: The reasons which led to the omission of these northern counties from Domesday are not difficult to be understood. Durham and Northumberland had been laid waste by the merciless hand of conquest. The devastations of the Conqueror himself in the winter of 1069-1070, the various invasions of Malcolm, and the vengeance taken by Odo after the murder of Bishop Walcher in 1080, must have left very little in those districts worth the surveying. Lancashire did not then exist as a separate county. Cumberland and Westmoreland had no being as English shires,—their southern portions then formed part of Yorkshire, and they are surveyed in Domesday as such; whilst their northern portions did not become part of the kingdom of England till the reign of William Rufus, having been held by the Scottish kings as a fief ever since the grant by Edmund the Magnificent, on the final overthrow of the old kingdom of Strathclyde. The notion that the northern portions of Cumberland and Westmoreland were conquered in 1072 by William L is derived from a careless blunder in the work of Matthew of Westminster, who has confounded William Rufus with his father.

The exact time of the commencement of this survey is variously stated. The Red Book of the Exchequer has been quoted as fixing the date at 1086, whereas the Red Book merely states that the survey was undertaken at a time subsequent to the total reduction of the island to the authority of the Conqueror. From the memorandum of the commission of the survey at the end of the second volume, it is evident, however, that Domesday was finished in 1086. Matthew Paris, Robert of Gloucester, the Annals of Waverley, and the Chronicle of Bernondyke give 1083 as the date of the record; Henry of Huntingdon places it in 1084; the Saxon Chronicle in 1085, Simeon of Durham, Florence of Worcester, Roger Hoveden, and Hennynford in 1086, whilst the Epistola Neustria and Diceto state 1087 as the year.

The reason given for taking this survey, as assigned by several ancient records and historians, was that every man should be satisfied with his own right, and not usurp with impunity what belonged to another. But besides this, it is stated by others that all lands who possessed landed estates now became vassals to the king, and paid him so much money by way of fee or homage, in proportion to the lands they held. According to the false Ingulphus, the survey was made in imitation of the policy of Alfred, who, at the time he divided the kingdom into counties, hundreds, and tithings, had an inquisition taken and digested into a register, which was called, from the places in which it was deposited, the Roll of Winchester. But the compilation of such a survey in the time of Alfred may be more than doubted; for, with the exception of the statement of Ingulphus, no chronicle alludes to the existence of this register, nor is any mention of it to be found in the records of the time or in those of a subsequent period. Had it been extant in the century immediately preceding the Norman Conquest, it would have prevented the necessity of giving those minute descriptions of land so common among the later of the Saxon charters. Again, the separation of counties is known to have been a division long anterior to the time of Alfred. The confusion in all probability has arisen from a similarity in the title of the two works. The survey of the Conqueror was called Domesday Book; the register of Alfred had the name of Domes-boc; but the Domes-boc, instead of being a territorial analysis as is Domesday Book, was in reality the code of Saxon laws.

For the execution of the survey recorded in Domesday Book, certain commissioners, called the king's justices, were sent into every county and shire, and juries summoned in each hundred, out of all orders of freemen, from barons down to the lowest farmers. These commissioners were to be informed by the inhabitants, upon oath, of the name of each manor and that of its owner, also by whom it was held in the time of Edward the Confessor; the number of hides; the quantity of wood, of pasture, and of meadow land; how many ploughs were in the demesne, and how many in the tenanted part of it; how many mils and how many fish-ponds or fisheries belonged to it; the value of the whole in the time of King Edward, as well as when granted by King William, and at the time of this survey; and also whether it was capable of improvement or of being advanced in value. They were likewise directed to return the tenants of every degree, the quantity of lands then and formerly held by each of them, what was the number of villains or slaves, and also the number and kinds of their cattle and live stock. These inquisitions, being first methodized in the county, were afterwards sent up to the king's Exchequer. So minute was the survey, that the writer of the contemporary portion of the Saxon Chronicle records—"So very narrowly he caused it to be traced out that there was not a single hide or yardland, not an ox, cow, or hog that was not set down."

By the completion of this survey the king acquired an exact knowledge of the possessions of the Crown. It afforded him the names of all the land-holders; it furnished him with the means of ascertaining the military strength of the country; and it pointed out the possibility of increasing the revenue in some cases and of lessening the demand of the tax-collectors in others. It was, moreover, a register of appeal for those whose titles to their property might be disputed. So accurate has Domesday Book been considered that its authority was never permitted to be called in question; and when it has been necessary to distinguish whether lands were held in ancient demesne or in any other manner, recourse was always had to Domesday, and to it only, in order to determine the doubt. From this definitive authority, from which, as from the sentence pronounced at Domesday, or the Day of Judgment, there could be no appeal, the name of the book is said to have been derived. Stowe indeed assigns another reason for this appellation, namely, that Domesday Book is a corruption of "dowus Dei book," a title given it because heretofore it was deposited in the king's treasury in a part of the church of Westminster or Winchester called domus Dei; the name, however, is plainly English. From the great care formerly taken to preserve this survey, we may learn the estimation in which it was held. In the Dialogus de Scaccario it is said, Liber utile (meaning Domesday) sigilli regis comes est indicibus in theatrio. It was formerly kept at Westminster with the king's seal by the side of the Tally Court in the Exchequer, under three locks and keys, in the charge of the auditor, the chamberlains, and deputy-chamberlains of the Exchequer, till in 1686 it was deposited among other valuable records in the chapter-house. It is now carefully preserved beneath a strong glass case in the Public Record Office, and can be consulted without payment of any fee.

Various local Domesdays exist, as those of York, Norwich, Ipswich, Chester, and Evesham. The most notable among them is in all probability the Domesday of St. Paul's, made in 1181 by the Dean, Ralph de Diceto, and edited by Archdeacon Hale.
In 1783 Domensay Book was published in two volumes, and in 1816 a volume of indices was printed by the Record Commission, to which a very valuable "general introduction was prefixed." During the latter year another volume appeared, containing the Eastern Domensay, and the Liber Numerarius Eleniensis, already noticed; the Westmon Domensay, comprising lands in Winchester between 1107 and 1128, and the Boldon Book, or Survey of the Palatinate of Durham in 1183. Within the last few years the whole of Domensay has been issued in parts, each part comprising a county, and printed by the process of photozincography, under the scholarly superintendence of Mr W. B. Sanders, one of the assistant keepers of the Public Records.

DOMICILE, in law, may be defined generally as the place of a man's permanent abode; but a precise definition of the word is a matter of acknowledged difficulty. Its use in jurisprudence is to fix the legal rights of a person in certain cases where it is used to apply to the law of the country to which he owes allegiance on the one hand, or of the country in which for the moment he happens to be, would be attended with inconvenience. Thus an English citizen who, for purposes of business, health, &c., has for many years permanently resided in France, has, let us suppose, died during a casual visit to Denmark. The question would arise under which of the three systems of law — English, French, or German — the validity of his will, the succession to his estate, &c., would be determined. Or, again, a French subject habitually resident in England, but not naturalized, might sue for a dissolution of his marriage in the matrimonial courts of this country, and it would be generally admitted that our courts in such a case were entitled to exercise jurisdiction, and that their decision ought to be received as determining the status of the persons concerned, just as fully as if they had been natural-born subjects of the Crown. In such cases there is a general agreement that a man's legal character, so to speak, should be determined by his domicile, rather than by his political nationality or his residence for the time being. We shall notice briefly the conditions of residence under which domicile may generally be established.

The Roman jurists defined domicile to be the place "ubi quis larem rumque se fortunam summam constituit: ut etiam eadem cum in loco suo adhuc absens sed pro/pfestus est, peregorni mil/det: quo a reddit peregorni jam destitit." The general result of the definitions to be found in writers on the civil law is to make that place the domicile which may be described as the head quarters of the person concerned, or, as it is expressed in the Code Civil, "la loci ou il a son principal etablissement." But here characteristic difficulties are the civil lawyers: a man's habits of life might point equally to two places as his head-quarters. It might be impossible to say which of them was the principal seat of his business. Which of the two in such a case is the legal domicile? Or can the same person at the same time have two domiciles? The two essential things are residence and the intention of remaining. Story's definition is, "That place properly the domicile of a person in which his habitation is fixed without any present intention of removing therefrom." Change of residence not intended, but a person's permanent residence would not create a new domicile. Cases will readily suggest themselves in which the question of intention may be surrounded with difficulties.

The following summary follows the general rules laid down by Story for determining the domicile of a person (Conflict of Laws, sec. 46). The child takes the domicile of the father, except in the case of an illegitimate child, which takes the domicile of the mother. Minors follow the changes of the father's domicile, and a married woman follows the domicile of her husband. The place of residence is prae para factum. and if a person removes to another place with the intention of making it his permanent residence, that place becomes his domicile. When a person has removed to another place with the intention of remaining there for an indefinite time, that is his domicile, though he may have a general intention of returning at some future time. In general the domicile of a married man is the place where his family permanently resides, even though he habitually transacts his business elsewhere. When a married man has two places of residence, that will be his domicile "which he himself selects or describes or deems to be his home, or which appears to be the centre of his affairs, or where he votes or exercises the rights and duties of a citizen." An unmarried man's domicile is where he transacts his business or exercises municipal duties or privileges. The domicile is therefore fixed by the intention of the individual. A domicile once established remains until a new one has been acquired, but ambassadors resident in a foreign country retain their domicile of nationality.

To these general rules may be added some of the principles laid down in recent cases by the English courts. The distinction between the question of domicile and that of naturalization or allegiance is clearly pointed out in Haldane v. Eckford (Law Reports, 8 Equity, 631) where it is said that to effect a change of domicile it is not necessary that a man should do all in his power to divest himself of his original nationality (sacer patriamus), it being sufficient that there should be a change of residence of a permanent character voluntarily assumed. And in Udny v. Udny (Law Reports, 1 House of Lords, Scotch Appeals) Lord Westbury said: "To suppose that for a change of domicile there must be a change of natural allegiance is to confound the political and civil status, to destroy the distinction between patrim and domicilium." So the lord chancellor: "A man may change his domicile as often as he pleases, but not his allegiance." In the British empire, composed as it is of communities having each its own system of law, there may be innumerable domiciles under one allegiance. In the first of the cases above mentioned the question was as to the domicile of a testator, whose domicile of origin was Scotch, who was a servant of the East India Company for thirty-three years, and who on leaving India went to Jersey, where he lived continuously for twenty-five years till his death. The Scotch domicile reverted on his leaving India, but was held to have been lost by the residence in Jersey, where a new domicile was acquired. This is a fair sample of the cases which frequently arise in British courts on the question of domicile. In the second of the cases mentioned above it was held to be "a settled principle that no man shall be without a domicile, and to secure this the law attributes to every individual as soon as he is born the domicile of his father, if the child be legitimate, and the domicile of his mother, if the child be illegitimate. This is called the domicile of origin, and is involuntary. It is the creation of the law, not of the party. It may be extinguished by act of law, as for example by sentence of death or exile for life, which destroys the status civile of the criminal; but it cannot be destroyed by the will and act of the party. Domicile of

1Some Roman jurists, however, maintained that a man might be without any domicile at all, as for example when he has definitely abandoned his old domicile, and is travelling in search of a new home. It is said that, when a domicile different from that of birth has been acquired and is abandoned, the domicile of birth revests the moment the other is given up. "The native domicile easily revests."
choice is the creation of the party. When a domicile of choice is acquired, the domicile of origin is in abeyance, but is not absolutely extinguished or obliterated. When a domicile of choice is abandoned, the domicile of origin revives, a special intention to revert to it not being necessary. A natural-born Englishman may domicile himself in Scotland, paying occasional required to create domicile of origin. The testator making only domicile, lived law of their domicile, rights in conformity abandonment of the contrary to that domicile not be acted in England, and resided not be valid or acquired, the testator's domicile was Scotch. The intention required to create a new domicile is an intention to settle in a new country as a permanent home, and this is sufficient without any intention to change civil status. In another case (Brunel v. Brunel, 12 Equity, 298), where a French subject had established himself in business in England, and resided there continuously for thirty years, making only occasional visits to France, but had refused to take out letters of naturalization on the ground that he might return to France, and would not give up his status as a French citizen, it was held, notwithstanding, that he had lost his domicile of origin, and had acquired an English domicile.

The effect of domicile on the rights and duties of parties is even more difficult to state Continental jurists draw a distinction between personal and real laws—the former being supposed to fix the legal character of the person and accompany him wherever he may be, the latter dealing with things only. In matters covered by the former, therefore, the domicile prevails; while things are governed by the law of the place in which they are. If the distinction were maintainable it would still be of little use in fixing the extent of the operations of the law of domicile, because one large class of real laws, that dealing with moveables, is universally admitted to be governed by domicile; while a large but undefined class of personal laws would certainly not be acted on by foreign states, e.g., where the law of domicile fixes with incapacity persons professing a religion contrary to that established by the state. There is no uniformity of practices or opinion on this point in modern jurisprudence. Story considers the following to be the best established principles in England and America on the point of personal capacity or status:—

1. The capacity, state, and condition of persons according to the law of the testator's domicile, will generally be regarded as to acts done, rights acquired, and contracts made in the place of their domicile touching property situate therein. If valid or invalid there, they will be valid or invalid everywhere. 2. As to acts done, etc., in other countries touching the property therein, the law of such countries, as to capacity, etc., and not the law of domicile, will generally prevail. Thus "in questions of minority or majority, competency to marry, incapacities incident to coverture, guardianship, emancipation, and duties and disabilities of the donee or grantee, etc., etc., the law of the domicile is applicable."

The operation of the law of domicile is most free from doubt in questions touching personal or movable property. Real property is governed by the lex loci, but personal property has in law no locality. On this point English law is now substantially in harmony with Continental jurisprudence. The principle that personal property is subject to the law of the owner's domicile is fully recognized in the distribution of the estate of a person deceased, whether with or without a will. The capacity of the testator is to make a will, the validity of the will, and its effect, are to be determined by the law of his actual domicile in the case of movable property. In the case of real property, on the other hand, these questions must be decided by the law of the country in which it is situated. It was doubted by Story whether a will valid according to testator's domicile at the time of its execution would be affected by a subsequent change of domicile. A recent case (Lynch v. Government of Paraguay) decided that personal property in England is governed by the law of testator's domicile at the time of his death. In this case the testator, a domiciled Paraguayan, died leaving personal property in England; and between his death and the application for probate of a decree of the Government of Paraguay declared that all the property of the deceased, wherever situate, was the property of the state of Paraguay. The court, nevertheless, held that the property in England must be governed by the law of Paraguay as at the time of the death (2 Probate and Matrimonial Cases, 268). So, when the law, says Story, was that the domicile of the intestate at the time of his death governed his personal property everywhere. The persons entitled, the proportions in which they are to take, etc., must be settled by the law of the domicile, however different that may be from the law of the country in which the goods are.

The following statutes relating to the effect of domicile on wills were passed in 1861:—

24 and 25 Vict. c. 114. Wills made out of the United Kingdom by British subjects (whatever may be the domicile of such person at the time of making the same or at the time of death) shall, as regards personal estate be held to be well executed, if the same be made according to (1), the forms required by the law of the place where the same were made, or (2), the place where such personal estate was domiciled when the same were made, or (3), the laws in force in that part of her Majesty's dominion where he had his domicile of origin. Wills made by any British subject (whether in his domicile shall, as regards personal estate, be well executed if they are according to the forms then required in that part of the United Kingdom in which they are made. No will or other testamentary disposition shall be held to be revoked or become invalid, nor shall the construction thereof be altered by reason of any subsequent change of domicile."

29 and 25 Vict. c. 121 recites that by the operation of the law of domicile the expectation and belief of British subjects dying abroad with regard to the distribution of their property are often defeated, and enacts that when a convention has been made between
DOM—DOM

Her Majesty and any foreign country, it may be declared and shall be declared, that no British subject dying in such country shall be deemed to have acquired a domicile therein, unless he has been resident in such country for one year previous to his death, and has made a declaration in writing of his intention to become domiciled, and British subjects so dying without having so resided and made such declaration shall be deemed for all purposes of testate or intestate succession as to movables to retain the domicile possessed at the time of going to reside in such foreign country. Similar exemptions are conferred on the subjects of foreign states dying in British India. But the Act does not apply to foreigners who have obtained letters of naturalization in any part of Her Majesty's dominions.

DOMINIC, Sr, founder of the Dominican order of monks, was born at Calahorra, a village of Old Castile, in 1170. His family name is said to have been Guzman, an illustrious name connected with many of the most honourable families in Spain. Little is known of his father and mother, but in the mediæval legends his birth is surrounded with portents indicative of his future greatness. His mother dreamed she gave birth to a boy with a torch in his mouth, which, as she put it to the world in fire. At his baptism a new sign was given. A starry radiance encircled the baptismal font. His followers delighted to recognize a similar radiance in his countenance, which drew all hearts to him. His childhood gave evidence of his future devotion and self-scrern. He used to creep from his bed and prostrate himself on the hard boards. At seven years of age he quitted the paternal home for the house of his uncle, who was a churchman, and gave him his first lessons in divine things. At fifteen he went to the university of Salamanca, afterwards translated to Salamanca, where it attained the most famous university in Spain. He applied himself to letters and philosophy, but above all to theology,—opening his mind, according to one of his biographers, to the true knowledge, and his ears to the doctrines, of Holy Scripture. Two stories are told of him at this time, showing the intensity of his character, and indicating the future zealot in behalf of religion and the church. He sold his clothes to feed the poor in a time of famine, and, to a woman who complained that her brother had been made a slave by the Moors, he offered himself to be given in exchange. His career as a student is obscure. He appears to have remained at the university for about ten years, and it is only in 1195, when he was twenty-five years of age, that he begins to emerge into notice. He is then one of the canons of Osma, under the guidance of a new and zealous bishop, whose heart was full of extending the power of the church and reforming its abuses. He gradually became known by his fervour as a preacher and the severity of his austerity, although it was still nearly ten years later before the opportunity came for him to show his true character and abilities. In 1203 the bishop of Osma was delegated to negotiate the marriage of Alphonso VIII of Castile with a Danish princess, and for this he undertook a journey to Denmark with Dominic as his companion. Accustomed to the obedience and reverence everywhere paid to the clergy in Spain, a very different spectacle presented itself to them as soon as they crossed the Pyrenees. He found them in the plains and cities of Languedoc. There a new spirit—half poetical and half spiritual—had sprung up in opposition to the church. The Provençal poets found much of their inspiration in a prevailing excitement at the worldly vices and corruptions of the clergy, as well as in the chivalric loves and lusts of their time. Had in addition to the poets there had arisen in this interesting and beautiful country multitudes of preachers of a new, more simple, and more liberal faith. Peter de Bruyes and Henry the Deacon became the organs of popular indignation against the superstitious observances which the priests everywhere encouraged,—the worshipping of the cross, transubstantiation, prayers, aims, and oblations to the dead, and even infant baptism,—for, as in all such cases of popular movement, the church was attacked not merely in its abuses but in its essential rites and its very existence. The "Poor Man of Lyons" rejected the whole church system, and permitted women to officiate at the altar. The "Paulicians," a sect of Manicheans surviving from the 5th century, had spread from the East through the Greek provinces of Sicily and Italy, and settled amongst the other elements of disturbance in the south of France. "It was discovered," as Gibbon says (c. 54), "that many thousand Catholics of every rank and of either sex had embraced the Manichean heresy;" and the flames consumed twelve canons of Orleans supposed to be tainted with the heresy. The same vassalages of martyrdom and revenge as had been displayed in the East were repeated in the 13th century on the banks of the Rhone." The result of all was a state of heretical insurrection and confusion sufficiently startling to men like St Dominic or even St Bernard, who had left us a description of what he himself observed. "Christians without Christ, holy places denied to be holy, the sacraments no longer sacred, and holy days without their solemnities." (Quoted by Milman, Hist of Latin Christianity, iv 178.)

In such a country, and in such a state of things, St Dominic found his mission as a champion of the church and a preacher of Catholic truth. Painfully impressed by what he saw on his journey to Denmark, he was so aroused by the spectacle of abounding heresy on his return that he resolved to devote himself to the conversion of the inhabitants, and the revival of the church in a land which appeared to him so given over to evil. The Pope had sent legates thither for the correction and repression of the heretics, but after a year's labours they had met with no success, and were on their way back to report the failure of their mission at Rome. Dominic met them on his journey, and, struck at once by their splendid retinue and their failure, he exclaimed,—"How can you expect success with all this secular pomp? These men cannot be touched by words without corresponding deeds. The heretics deceived them by their simplicity. You must throw aside all your splendour, and go forth, as the disciples of old, barefoot, without purse or scrip, to proclaim the truth." He acted without delay on his own principle, and betook himself to the profession of a mendicant preacher. Even the legates were shamed for a time to follow in the wake of the new movement. But their enthusiasm did not last long, and Dominic was left alone in his self-denying labours. It is difficult to describe with any fidelity the character of St Dominic's career, which his medieval biographers have enveloped in a haze of miraculous exaggeration. Apparently at first he confined himself in the main to moral and intellectual influences, preaching against the heretical errors, and inviting the heretics to conferences and reasonings. His modern biographer, Lacordaire, has even ventured to compare this early phase of his work with St Paul's conferences with the Jews, and St Augustine's expostulations with the Donatists and Manicheans. His arguments were of course powerfully enforced by miraculous tokens when otherwise likely to fail of their purpose. Wherever he moved the glory of the supernatural marked him. Signs and portents, most of them too trivial and absurd for mention, gave emphasis to his preaching and triumph to his mission. But withal the success that awaited him as a preacher was disappointing; and the flames of war, kindled by the growing antagonism of the sects and the church, and fomented by the rival apostles which are always at hand to make use of the fury of religious passion, soon swept over the country, and hid from
view the figure of the missionary and the preacher. It was, as Milman says, a stubborn generation, which, besides preaching, and miracles, needed the sword of Simon de Montfort to cure it of its heresies. The atrocious crusade known as the Albigenian war, the violent incident and picturesque display of character on both sides, the pleasant, vociferating, and humiliated Count Raymond, the intrepid and bloodthirsty Montfort—these belong to history rather than to the life of Dominic. What part he really played in the war evades clear historical judgment. Did he share in its atrocities, as religious zealots in similar cases have often done, or did he mourn the interruption of his peaceable labours of conversion, and preach moderation to the conquerors, as well as penance to the heretics? Facts fail us in the matter. All that is known is that he remained through all the friend of De Montfort, and obeyed the call to bless the marriage of his son and the baptism of his daughter. This implies that the darker features of the crusade, and the conduct of its leader, awakened no such horror in him as they ought to have done; and when this is added the glory of this claim of Montfort of instituting the Holy Inquisition, the light which is thus thrown upon his character is far from pleasing. It is in no spirit of apostolic mildness, certainly, that he at last left the country in 1217, after the death of De Montfort. For many years," he says, "I have spoken to you with tenderness, with prayers, and tears, but, according to the proverb of my country, where the benediction has no effect the rod may have much. Behold now we raise up against you princes and prelates, nations and kingdoms, and many shall preach by the sword. This was a poor gospel for a people already desecrated by the armies of the church, and the preacher of it was certainly no apostle of peace. Full of enthusiasm, of eloquence, of dogmatism, with a genius for composition and the great power of inspiring devotion, his followers, Dominic fails in the higher virtues of patience, magnanimity, reasonableness, and moderation. He is a prince of the church, but not a saint in its official calendar.

On leaving Languedoc Dominic repaired to Rome, and spent the remainder of his life in the organization of his order, which received the papal sanction in 1216, and which, under his generalship, had extended in the course of five years throughout most of the countries of Europe. He died at Bologna in 1221, in the fifty-first year of his age. See DOMINICANS.

DOMINICA, in French DOMINIQUE, a British West India island, the largest in the Leeward group of the Lesser Antilles, lying between the French islands of Martinique and Guadeloupe, 34 miles north of the former and about the same distance south of the latter, at the intersection of 15° 30' N. lat. by 61° 30' W. long. It has a length of 29 miles with a maximum breadth of 16, and its area is estimated at 291 square miles. The longer axis is formed by a chain of mountains, which attains in some parts a height of upwards of 6000 feet, and gives the whole island a strongly marked profile and great irregularity of surface. The results and symptoms of volcanic activity are abundant, in the shape of sulphurars, emissions of subterranean vapours, and hot springs; and in the southern part of the island there exists a boiling lake of unascertained depth, in which the water is frequently projected 3 feet or more above the surface by the force of the ebullition. Besides a large number of minor rivulets, upwards of thirty streams of considerable size might be mentioned, and this abundance of natural irrigation develops great fertility in the rich volcanic soil. The hills are in many parts covered with trees, and the better trees of the kind commonly found in the West Indies; and the sugar-cane, coffee, cocoa, cotton, hудigo, oranges, plaitans, and arrow-root are grown in the lowlands. The island is botanically remarkable for the great number of peculiar species which it possesses in comparison with the poverty in this respect of Guadeloupe, Martinique, Montserrat, and Antigua: as many as 24 are mentioned by Grisebach. Game is abundant; the fisheries on the coast are productive; and large quantities of honey and wax are furnished by the wild bees, which were originally introduced from Europe. The coasts of the island are not much indented, and the only anchorage of importance is Prince Rupert's Bay and Roseau, both on the west side. The total tonnage of the ships that annually enter and clear amounts to 18,018 tons, according to the average of the fifteen years from 1850 to 1874 inclusive; and of this total only 3743 tons belong to foreign vessels. The imports in 1874 were valued at £56,714, and the exports of the same year at £67,720,—being a decrease since 1860 of £11,057 and £12,738 respectively. Since 1872 Dominica has formed part of the colony of the Leeward Islands, and sends its representatives to the general legislative council; but at the same time it retains its local governor or president, a separate treasury, and its local legislature, consisting of seven elective members and seven nominees of the crown. In 1874 its public revenue amounted to £218,022, its expenditure to £217,456, and its debt to £4813. In common with the Virgin Islands it has attained complete religious equality by the abolition of the salaries paid from the public funds to the clergy of the Church of England, who had a much smaller proportion of the population under their jurisdiction than the Roman Catholic priests. Of the Carib aborigines there are no representatives; and the present inhabitants, numbering, according to the census of 1871, 27,178, consist mainly of descendants of the former negro slaves, with a certain number of Spanish and English families. The capital is Roseau, or Charlotteville, a fortified port near the southern end of the island, with about 5000 inhabitants. Dominica was so named on its discovery by Columbus in 1493, in commemoration of the date, which happened to be Sunday (Domimca) the 3d of November. It was ceded to England by France at the Peace of Paris in 1763, was captured by the French in 1778, regained by the English in 1783, again seized by the French in 1802, and finally surrendered to Britain in 1814. It was in the neighbouring sea that Rodney obtained his victory over Count de Grasse in 1782.

DOMINICANS, the name by which the disciples of St Dominic became known. The Dominican order was founded, as stated in the article on the founder, in 1216 by a bull of Honorius III. It conformed to the general rule of the Augustinians, but further embraced a rule of absolute poverty or mendicancy, in addition to the usual vows of chastity and obedience. Its members were supposed to be exclusively devoted to preaching and public instruction, and were described as mendicant or preaching friars. The order held its first chapter in the year 1220 at Bologna, under the presidency of the founder. It adopted as its insignia within the cloister a white robe and hood, to which it added outside a black cloak, hence the popular name of black friars by which the Dominicans became known in England. The novitiate was for a year, and candidates were mainly recruited from the schools founded by the order, which became the nurseries of great preachers and great theologians. The order speedily extended itself through the whole Christian world, and popes, cardinals, and learned doctors sprang from it in numbers. Its preachers and teachers addressed all classes, inveighed "the high places of the human intellect," and were soon found, as Missal says, disputing in the universities of Italy and Germany, in Cologne, Rome, and Oxford. Before long they were to claim two of the
greatest luminaries of the prevalent philosophy, Albert the Great and Thomas Aquinas."

DOMINIUS, MARC ANTONIO DE (1565-1624), celebrated as a theologian and natural philosopher, was born at the island of Arbe, in 1566. He was educated in the order of the Jesuits at their college at Loreto, and afterwards studied at the university of Padua. He was employed for some time by the Jesuits as a teacher of rhetoric and mathematics, but he did not join the order. In 1596 he was appointed to the bishopric of Segovia, and in 1602 he was raised to the archbishopric of Spalatro. His endeavours to reform the church soon after made him obnoxious to the papal authorities, and he was compelled to leave his native country. Having become acquainted with Bishop Bedell, whilst the latter was chaplain to Sir Henry Wotton, ambassador from James I. at Venice, he communicated to that prelate his treatise *De Republica Ecclesiasticata*, which was afterwards (1617, 1620) published at London, with Bedell's corrections. The main argument of the work was directed against the supremacy of the bishop of Rome to other bishops. He came to England with Bedell, where he was received with great respect, and preached and wrote against the Roman Catholic religion. In 1619 he published at London Father Paul's *History of the Council of Trent*, with a dedication to King James. He was favourably received by the king, who bestowed on him the deanery of Windsor and other ecclesiastical preferments. But on the promotion of Pope Gregory XIV., who had been his school-fellow and old acquaintance, he was deluded by Gondomar, the Spanish ambassador, into the hopes of procuring a cardinal's hat, and thus of proving an instrument of great reformation within the church. Accordingly he returned to Rome in 1622, recanted his errors, and was at first well received; but he afterwards wrote letters to England recanting his recantation, and, these being intercepted, he was imprisoned by Pope Urban VIII., and died in 1624.

There were suspicions that he had been poisoned. Being convicted of heresy after his death, his body was exhumed and burned, and the ashes were thrown into the Tiber. He is believed to have been the first to promulgate a true theory of the rainbow in a tract *De radiis visus et lucis in astris perspectivis et tride* (Venice, 1611).

DOMITIAN (82-96). Titus Flavius Domitians, the second son of Titus Flavius Vespasianus and Flavia Domitilla, twelfth of the Caesars, and third of the Flavian dynasty, was born at Rome, 24th October 52 A.D. He enjoys an evil prominence as the only tyrant among the succession of good and just princes from the line of Augustus. According to Suetonius, he was brought up in squalor and ignorance, and led a degraded and miserable youth; but it is hardly credible that so good a prince and so indulgent a father in all his other acts should thus have neglected his son's education, and the story of his scandalous youth was more probably invented to suit his after life. When Vespasian was proclaimed emperor, Domitian escaped with difficulty from the burning temple of the Capot, and lay in hiding from the Vitellians till his father's party proved victorious. After the fall of Vitellius he was saluted as Caesar, or prince imperial, by the troops, obtained the city prefectship, and was intrusted with the administration of Italy till his father's return from the East. Intoxicated by this sudden rise from obscurity, he grossly abused the power committed to him, and conducted himself more like a Turkish pasha than the son of a sturdy Sabine soldier. Such were the airs of superiority he assumed that Vespasian, as the story goes, wrote in irony to thank him for not having disowned his own father. Certain it is that though in his father's lifetime he several times filled the office of consul, and after his death was nominally the partner in the empire with his brother, yet he never took any part in public business, but lived in great retirement, devoting himself to a life of pleasure and of literary pursuits till he succeeded to the purple. The death of Titus, if not hastened by foul means, was at least eagerly welcomed by his brother. His succession (13th Sept. 91) was unquestioned, and it would seem as if, when his ambition was sated, and before his fears were aroused, he intended, as far as his weak volitions and mean abilities would allow, to govern well. Like Augustus, he attempted a reformation of morals and religion. As chief pontiff he inquired into the character of the vestal virgins, three of whom were found guilty, while in the case of one the awful penalty of a living entombment was revived. He enforced the laws against adultery, mutilation, and the grosser forms of immorality. He forbade the public acting of minnes. He erected many temples and public buildings and restored the temple of the Capitol, on the galling of which, if Plutarch is to be believed, he expended 12,600 talents, or nearly two and a half millions of our money. He passed many sumptuary laws, one of which is noticeable as showing the increasing dearth of Italy. He was born at Rome, and like the latter emperors, was declared to be the son of a god. His birth was celebrated with great respect, and preached and written by the wasteful and inefficient process of slave labour. An edict was issued forbidding the withdrawal of arable land from the plough, and reducing existing vineyards by one half. Finally, he took a personal share in the administration of justice at Rome, and exercised a jealous supervision over the governors of provinces.

Such public virtues counterbalanced in the eyes of the people all his private vices, gross and glaring as they were from the first. Former emperors had been deified after their death, but Domitian was the first to arrogate divine honours in his lifetime, and cause himself in public documents to be styled *Our Lord and God* Doubless in the poet (such as Martial, who calls the emperor's name the *Ganymede of our second Jove*) this designation was nothing but fulsome flattery, but in the case of the provincials it was a sincere tribute to the impersonation of the Roman Empire, as the administrator of good government, and the peacemaker of the world. Even when Rome and Italy felt his heavy hand, and smothered beneath his proscriptions and extortion, the provincials were undisturbed. Though he took the title of emperor more than twenty times, and enjoyed at least one triumph, his achievements as a general were insignificant. His campaign in 33 against the Chatti was "a mere summer promenade;" in Dacia (87) he received a severe check, and the peace concluded with this nation in 90 was due to the victories of his lieutenant Vespasianus. Juvenal hints that the flaxen-haired Germans who figured in his triumph were purchased slaves. His jealousy was provoked by the successes of Agricola in Britain, and the conqueror of Galgacus and the hero of the battle of the Grampians was recalled to Rome (84) in the midst of his conquests, condemned to retirement, and, as Tacitus is inclined to believe, removed by poison.

The revolt of Antonius Saturninus, the commander of the Roman forces in Upper Germany (93), marks the turning point in his reign. By a fortunate march of the Rhine, which prevented his barbarian allies from coming to his assistance, and by the valor of Norbanus, it was speedily crushed, but the fears of the emperor once aroused seem never again to have slept. A proclamation as bloody as that of Sulla followed, and no man of eminence could feel his life safe. Before this he had sought out victims to gratify his cupidity and replenish his exhausted treasury. Now he struck at all that was conspicuous for talent or virtue, glutted himself with the blood of the Lanni, and sentenced to death his own cousin and nephew by marriage, Flavius Clemens. A conspiracy among his freedmen—set on foot, it is said, by his wife, who knew her own life to be threatened—cut short his career of tyranny and
bloodshed. He was stabbed in his bedroom by a freedman of Clemens named Stephanus, 18th Sept. 96. Had Demetian died after a short reign as his brother he might have left behind him as far a name, and the interesting problem for the historian is to connect the two portions of his reign, and account for the double part he played. Like Hamlet he was born to a question which he felt himself unequal to fill. So long as there was popular cause which he inherited from his brother lasted, and he felt himself secure on his throne, he carried on the traditions of his father's government, denounced delators, and administered even justice. After his unsuccessful campaign and the conspiracy of his general, he was seized with the common disease of absolute monarchs, the fear of assassination and distrust of all around him. The last three years of his reign witnessed the awful spectacle of the acts of a madman endowed with unlimited power.

DON, anciently Tanais, a river of European Russia, which ranks immediately after the Volga and the Dnieper. It rises in the Ivan lake, a small basin in the government of Tula, which also sends a portion of its waters to the Volga by means of the Shat, a tributary of the Upa; its course has a general southern direction through the governments of Rusan, Tamboff, Oroff, Voronesh, and the Country of the Don Cossacks; its total length, inclusive of its various tributaries, is 1355 miles; and its drainage area is calculated at 170,000 square miles. The Ivan lake lying 588 feet above the level of the sea, the average fall in the river is about 53 inches to the mile. In the upper division of its course, which may be regarded as extending to the confluence of the Voronesh, the Don flows for the most part through a low-lying and fertile country, though in the government of Rusan its banks are rocky and steep, and in some places become even precipices. The strata which it traverses belongs to the Devonian formation. In the middle division, or from the mouth of the Voronesh to the point where it makes its nearest approach to the Volga, it cuts its way to the S E; for the most part through Cretaceous rocks, which in many places rise on either side in steep and elevated banks, and at intervals encroach on the channel. After passing Kachalinskaia it turns to the S W, and maintains this direction till it falls into the Sea of Azoff, the first part of this division being still in the Cretaceous formation, but the latter part lying in an Upper Tertiary district. A short distance below the town of Rostoff it breaks up into several channels, of which the largest and most southern retains the name of the river, while the others are known respectively as the Mervi Donets, the Mokroga, Koloucha, and the Staraya Kuterma. Before it receives the Voronesh, the Don has attained a breadth of from 500 to 700, or even in a few places 1000 feet, while its depth varies from 4 to 20 feet; by the time it has reached its most eastern point, the depth has increased to from 7 to 80 feet, and the ordinary breadth to from 700 to 1000 feet, with an occasional maximum of 14,000 feet; in the lowest division the depth is frequently 70 feet, and the breadth in many places 1860 feet. Shallow reaches are not uncommon, and there are at least seven considerable shoals in the south-western part of the course. The river can be used for rafts as far up as the confluence of the Scoura; it becomes navigable after the addition of the Voronesh and has four regular stations for traffic at Vilkoff, Pavloff, Masloff, and Mamon, in the middle part of its course; but partly owing to obstructions of the channel, and partly to the scarcity of ship-timber in the Voronesh government, it does not attain any great importance as a means of communication till reaching the Terek, which takes place at Akasi, where it remains open on the average 250 days in the year, at the mouth of the Medveditza for 239, and at Novo-Cherkassk for 246.

DON COSSACK COUNTRY (in Russian, Donskogo Vostochnaia Zemlya, the Land of the Don Army), the south-west portion of European Russia, situated in the basin of the Don, and bounded in part by the Sea of Azoff. Its area, according to the military survey, is 59,650 square miles, or 135,761 square verst, but according to Schweizer 62,574 square miles, or 142,401 square verst. The coast of the river consists of an irregular steeper broken in some places by undulating elevations or small hills, and traversed by the channels and ravines of the numerous tributaries and sub-tributaries of the principal river. The district to the north is especially flat, forming in fact, as is shown by the characteristics of its flora, a part of the great Aralo-Caspian depression. Cretaceous formations appear throughout the whole “country,” Tertiary and Carboniferous formations especially to the south of the Donetz. Coal and anthracite are found in considerable abundance in several places, and iron ore occurs near the Mius, the Donets, and the Khoper. Limestone, chalk, and slate are common; and salt is obtained from various lakes. The upper soil is in general black earth, the subsoil usually clay. Agriculture is still in a backward state owing to the military prejudices of the Cossacks; but the virgin fertility of the ground, and the proximity of such seaports as Taganrog and Rostoff conduct greatly to its development. Wheat is the most generally cultivated cereal, but rye is largely black earth, the subsoil usually clay. Agriculture is still in a backward state owing to the military prejudices of the Cossacks; but the virgin fertility of the ground, and the proximity of such seaports as Taganrog and Rostoff conduct greatly to its development. Wheat is the most generally cultivated cereal, but rye is largely grown in the northern and millet in the southern districts. Flax and hemp have been introduced, and maize is sown in the gardens. Stock-rearing is extensively prosecuted; in 1860 there were about 373,000 horses, 991,000 cattle, and 2,242,000 sheep. The horses show a mixture of various Asiatic strains, those of the southern districts being the best. The cattle are usually of Calmuck or Tatar race, but sometimes of Hungarian or Dutch; and the sheep are, with slight exception, Russian, Calmuck, or Wallachian. The land of the Don Cossacks was divided in 1802 into the following seven districts—Cherkessk, First Don, Second Don, Ust-Medveditzki or Mouth of the Medveditza, Khoper, Donets, and Mamon; and in 1806 a new district, or obouz, was formed of the nomading Calmucks. The six first-mentioned are divided into stanitzas, to each of which belongs a definite territory; the Mius district is occupied by regular landholders; and the Calmucks are arranged according to hundreds, or setsnia. The population in 1859 of the whole Zemlya was 996,870, and in 1857, 1,010,135. Novo-Cherkassk is the seat of government and the residence of the directing officer of the Don army. In ancient times the Greeks had a colony at Tanais on the Sea of Azoff, and
various factories on the Don; and the Scythians and Sarmatians nomadized throughout the district. Afterwards came the Alans, the Huns, the Bulgarians, the Avars, and the Kazaras, the last even building the small town of Sarkel; then followed the Pechenegs, the Polovans, and finally the Tatars, whose power was gradually diminished during the 16th and 17th centuries by the encroachments of the Russian Cossacks.

DON JUAN, a legendary personage whose story, originating in Spain, has found currency in various poetic and dramatic forms throughout most of the countries of Europe. The character has a certain historic basis in so far as it is localized at Seville in the time of Peter the Cruel, or, according to another version, of Charles V. Don Juan, who belonged to the illustrious Toreno family, lived a life of unbridled licentiousness. In an attempt to abduct Girald, daughter of the governor of Seville, he was encountered by her father, whom he subsequently killed in a duel. In mocking defiance of the spirit world, in whose existence his sensuality had destroyed all faith, he visited the tomb of the murdered man in the vault of San Francisco and challenged his statue to follow him to supper. The invitation was accepted; the animat ed statue appeared at table among the guests, and burned the blasphemous sceptic to hell. In a few later dramatic versions of the story some features are introduced belonging to another personage of the same name, Don Juan de Marana, who, having sold himself to the devil, passed the greater part of his life in debauchery and crime. His mother, however, had provided that masses should be said for his salvation, and, being conveyed through the influence of these, he ended his days in a monastery, where he subjected himself to the severest penance.

As a dramatic type Don Juan is essentially the impersonation of the scepticism that results from sensuality, and is thus the complement of Faust, whose scepticism is the result of speculation. In its literary treatment it has received various degrees of intensity. In the hands of the earlier Spanish dramatists it becomes, without their intending it, a solemn and impressive moral beacon, while Byron's Don Juan is a gay adventurer, with nothing in common with the legendary personage except his name and his libertinism. The first introduction of the story into dramatic literature seems to have been in Lope de Vega's Money makes the Man, where the incident of a walking statue occurs; but the earliest occasion on which the story was dramatized as a whole was in the Burlador de Sevilla (The Deceiver of Seville) of Gabriel Telles, who published his secular works under the name Tiso de Molina. The Don Juan of this play is almost heroic in his fearlessness, indulging his cold grim humour without restraint even in the realized presence of the supernatural; but his unrestrained depravity revolts the moral sense. From Spain the drama was soon after 1620 transferred to Italy, where a translation of it was produced at Naples. A few years later it was transferred to Paris, where it was frequently acted, sometimes in the form of a translation of the work of Telles, and sometimes in more or less free imitations, of which several were produced. A new aspect was given to the character in Molière's Don Juan, ou le Faon de Pierre (1665), where the hero, though as heartily deprecating as in the Spanish original, loses some of the stern elements both of his wickedness and of his humour, and becomes more seductive and more amusing. Into English literature the story was first introduced by Shawell's Libertine (1676), a grossly indecent and, from a literary point of view, worthless play. The continued popularity of the legend in the country of its birth is attested by the fact that it has furnished the groundwork for many—Don Juan Tenorio (1844), and two poems—El Deyo del Diablo and Un Testo di Bronce (1845)—by the celebrated poet Zorrilla. During the present century it has been a favourite subject with French writers of the romantic school, having been dealt with by Dumas the elder, Musset, Levassor, Malville, and others. Its capacity for musical treatment has been tested by two composers of the first rank. Gluck made Don Juan the hero of a ballet, and Mozart's opera, Don Giovanni, the libretto of which was furnished by Da Ponte, has probably done more to popularize the story in the Molére as distinct from the severer early Spanish form than any other setting, literary or musical, it has ever received.

DONAGHADEE, a market town of Ireland, in county Down, situated near the mouth of Belfast Lough on the Irish channel, is the nearest port to Ireland to Great Britain, being 214 miles S.W. of Portpatrick in Wigtownshire. It consists of two principal streets, and possesses a harbour which admits vessels of 16 feet in draught. On the north-east side of the town there is a natural jetty, with a powder magazine left from the old military road. The town is frequented for sea-bathing in the summer months. Population (1871), 2236.

DONALDSON, John William, a philologist and biblical critic, born 1812, died February 10, 1861. He was educated at the London University and at Trinity College, Cambridge, of which college he was afterwards elected a fellow. He graduated in the year 1834, being placed in the second class of the mathematical tripos, and second in the classical tripos, when G. J. Kennedy was senior, and W. Forbush, the author of Hortensius, third class. After his degree he devoted himself with unremitting energy to classical philology, and the New Cratylus, which appeared five years later, is not only a work of wonderful erudition for so young a man, but forms a landmark in the history of philology in England. In 1841 he was elected to the head-mastership of King Edward's school at Bury St. Edmunds, a position which he held for over ten years. On resigning this post he returned to Cambridge, where his time was divided between literary work and private tuition. At the time of his death, which was accelerated by over-study, he was engaged in the preparation of a Greek lexicon.

The New Cratylus, the work on which Dr Donaldson's fame mainly rests, is an attempt to apply the general principles of comparative philology to the Greek language. The book consists of two parts—a general introduction, in which the philosophy of language and the ethnographic affinities of the ancient Greeks are discussed, and a treatise on the grammatical structure and etymology of Greek. It is mainly founded on the comparative grammar of Bopp, but a large part of it is original, and it is but just to the English philologist to observe that the great German's grammar was not completed till ten years after the first edition of the Cratylus. In the Varroanna, which followed in 1844, the same method is applied to the classification and analysis of Latin and the other Italian dialects. It includes a critical commentary on the remains of old Latin, Umbrian, and Oscan. If we consider the recent birth and rapid strides of philology it is not wonderful that these early essays should have been superseded by the riper labours of such men as Curtius, Schleicher, and Mommsen. Distinguished as Donaldson's works are by wide and varied learning, much ingenuity, and independence of thought, they are deficient in sobriety of judgment, and, most of all, in the ability to distinguish between certain inference and uncertain conjecture. More especially are these defects apparent in the ethnographical theories of the Varroanna. To take a single instance, the origin and affinities of the Etruscan language, problems which have yet to be solved are stated no less confidently than those of modern French.
DON

Before discussing his other works it is necessary to mention an unfortunate controversy which this book provoked. The charge of plagiarism was brought against the author by the late Professor Key, and a war of pamphlets followed as violent as those which were common in the days of Bentley and Porson. Without attempting to decide on the merits of this dispute, it is enough to state that though the obloquies of Donatello to Key ought in the first instance to have been more explicitly acknowledged, yet the structures of the latter were needlessly sweeping and aggressive.

We pass on to Donaldson's work as a biblical critic. In 1854 he published his Jashar, or Fragments of original Hebrew songs inserted in the Masoretic text of the Old Testament. The book was written in Latin, as an appeal ad aumen, to the learned world in general, and especially to German theologians. It is an attempt to reconstitute the lost book of Jashar from the remains of old songs and historical records, which, according to the author, are preserved in the existing text of the Old Testament. Here, too, we notice the same merits and defects as in the Cratylus, the same ingenuity and learning, the same rash and overconfident speculation. The bold views of the author on the nature of inspiration, and the free handling of the sacred text, provoked a storm of theological odium, but the only one of his numerous assailants who deserves mention is Dr Perowne. A full analysis of the book will be found in Smith's Biblical Dictionary, s. v "Jashar."

Of his numerous other works the most important are The Theatre of the Greeks, The History of the Literature of Ancient Greece (a completion of K. O. Muller's work), an edition of Tzerd, and a Hebrew, a Greek, and a Latin Grammar. Among his occasional writings the article "Philology" in the 8th edition of this Encyclopaedia is the most important. Though much of what he wrote has already become obsolete, Donaldson will long be remembered as one of the pioneers of philology in England.

DONATELLO (1386-1466), the diminutive of Donato, was the son of Niccolo Bardi, and was born in Florence in 1386. In the struggle between the rival parties of the Albizzi and the Medici, the father took part with the former, and was involved in their ruin. He must have been a man of considerable property, judging from the decree by which his houses are confiscated. His son Donatello found protection and shelter and the means of early training from the Martelli family, and to this connection must be ascribed Donatello's introduction to the great Cosmo de' Medici, pater patriae, who during the life-long relation between himself and the artist, did everything to ease, by kindness towards the son, the recollection of the sufferings which the house of Medici had inflicted on the father. He learned the goldsmith's trade under the father of the renowned Lorenzo Ghiberti, and the goldsmith's trade then included all kinds of bronze creations. At the age of seventeen he set out for Rome with his friend Brunellesco.

At Rome the two young men maintained themselves by working as goldsmiths during the first half of the week, devoting the second half to the study of the ancient monuments, and to making excavations in search of lost works of art. The Romans, we are told, believed them to be treasure-seekers. The Romans of Donatello's time still reflected the feelings with which their forefathers, nearly three centuries before, had wondered when the agents of Henry of Blois, bishop of Winchester, dug up and carried away from their city similar artistic treasures. On their return to Florence, rich in artistic knowledge and treasures, the careers commenced in which Brunellesco in which Brunellesco and Donatello destined to hang above the Florence cathedral the dome of the Pantheon, and Donatello impart to the multitudinous creations of his chisel, the truthfulness and grace and power for which he was so largely indebted to his ancient models. There exist 40 works of Donatello unquestioned authenticity, and 31 respecting which controversies have arisen; and 25, recorded by his contemporaries but no longer found, must be added to the number. When it is borne in mind that many of these works are life-size or colossal statues, or large bas-reliefs crowded with figures, an idea may be formed of the extent of his labours, prosecuted untringly during a life which extended to eighty years. He was fortunate in the precise period of his labours. During the whole of the previous century Florentine art had concentrated its efforts on the creation of its grand architectural monuments. In the second half of the 15th century sculpture was cultivated, but chiefly to adorn the palaces and gratify the vanity of the rich. Donatello, placed between the two periods, could devote his genius to the execution of the great plastic works required for the decoration and adornment of the state. Hence the statues of the church of St Michele, those on Giotto's belfry, the pulpit of St Lorenzo, those in the baptistery, as well as all the other works which still remain exactly where first placed—unhappily no longer the case with the St George—possess an exceptional beauty; for no sculptor ever studied more carefully than Donatello, the exact relation of a work to its local destination. The varied and characteristic elements of Donatello's art, what he borrowed from the antique, what peculiar tricks of drapery he took from his immediate predecessors, how, from his first habit of painting his figures he passed to the phase of purely sculptured effects, how he was influenced by his friend Brunellesco in his treatment of proportion and perspective, how he imparted a more pictorial character by the greater flatness of the figures to his bas-reliefs, all this forms one of the most interesting chapters in the history of Renaissance sculpture. Besides Florence he worked also at Rome, Padua, Venice, Siena, Modena, Mantua, and Ferrara; and he visited Rome a second time. In Padua he produced, in 1432, the equestrian statue of Gattamelata with some minor works, and as almost his latest work we may consider the statue of St Louis of France, executed for St Croce. To English students of art it may be satisfactory to learn that, in the opinion of Semper, the South Kensington museum possesses seven undoubted specimens of Donatello, besides one, the Magdalen seated on clouds, probably by a scholar, and a virgin and child of doubtful origin. Donatello, though best known as a sculptor, was likewise a painter,—at least was admitted as such into the academy of St Luca in 1412. We find him paid for architectural drawings and opinions respecting the dome of the Florence cathedral in 1420, and he was sent as military engineer to the siege of Lucca in 1430. His first trade of goldsmith was never abandoned. Thus varied and versatile, we cannot but form the highest opinion of one respecting whom Vasari has said that he threw the same love of art into every work great or small, and that he always of the more than laudable. His life-long attachment to his patron Cosmo was only equalled by his lavish kindness to his friends; for we read that the large sums received by him were kept in an open box in his workshop, and that his friends when wanting money were invited and expected to help themselves, no questions being asked or receipts given. In his last years he was provided for by Piero, the son of Cosmo. He died at Florence in 1466. Donatello's greatest works, his Baptists, David, Judith, St George, and Mark, are declared by some recent critics not to rise into the highest sphere of true Christian art. The sculptor, we are told, wasainted in a deep faith of Michelangelo himself, who, when gazing with generous admiration
on the St Mark, exclaimed, "So noble a figure could indeed write a gospel."

DONATI, GIOVANNI Battista, professor of astronomy at the Royal Institution of Florence, was born at Pisa, December 15, 1829, and died at Florence, September 20, 1873. In 1852 he became an assistant at the Florentine observatory, of which in 1864 he was appointed director. On June 2, 1855, he discovered the comet which bears his name (see vol. ii. p. 815). Other comets were discovered by him on June 5, 1855, November 10, 1857, and July 23 and September 9, 1861. He made numerous spectroscopic observations of comets and the solar disc, and in 1862 published diagrams of three or four lines in the spectra of fifteen stars. The new observatory on the hill of Arcetri, near Florence, was erected under his superintendence, and was directed by him. At the time of his death Donati had just returned from Vienna, where he was the representative of Italy in the international meteorological congress.

DONATISTS, a powerful sect which formed itself in the Christian church of northern Africa in the beginning of the 4th century. In its doctrine it sprang from the same roots, and in its history it had in many things the same character, as the earlier Novatians. The predisposing causes of the Donatist schism were the belief, early introduced into the African church, that the validity of all sacramental acts depended upon the personal character of the agent, and the question, arising out of that belief, as to the eligibility for sacramental office of the traditors, or those who had delivered up their copies of the Scriptures under the compulsion of the Diocletian persecution; the existing cause was the election of a successor to Menas, bishop of Carthage, who died in 311. Menas had held moderate views as to the question of the treatment of the traditors, and accordingly a strong factional party had formed itself in Carthage in opposition to him, headed by a wealthy and therefore influential widow, named Lucilla, and connived at by Secundus of TimgA, private of Numidia. There were thus two parties each anxious to secure the succession to the vacant seat. The friends of the late bishop fixed their choice on Cecilian, the archdeacon, and secured his election and his consecration by Felix, the bishop of Aptungs, before the other party were ready for action. It had been customary, though probably it was not essential, that the Numidian bishops should be present at the election and consecration of the bishop of Carthage; Cecilian's party had not waited for them, knowing them to be in sympathy with their opponents. Soon after Cecilian's consecration, however, Secundus and seniority of the Numidian bishops arrived at Carthage, and steps were at once taken to displace the new bishop. A synod was formed before which Cecilian was summoned, his consecration was declared invalid, on the ground that Felix had been a traditor; and finally, having refused to obey the summons to appear, he was excommunicated, and Mamas, a dependent of Lucilla's, consecrated in his stead. Thus the schism became overt, and in a very short time there were rival bishops and rival churches in most of the cities of North Africa, as well as in Carthage.

The inevitable appeal to the civil power to settle the dispute was first made by the Donatists, who were incited to do so by receiving proof, in their exclusion from certain privileges conferred on the African church, that the sympathies of Constantine were with the other party.

They accordingly petitioned the emperor to appoint a commission to try the case, indicating a preference for Gallic bishops, among whom there were no traditors, the Diocletian persecution not having extended to Gaul. The result was that a commission was issued to five Gallic bishops, under the presidency of Miltiades, bishop of Rome. The number of references was afterwards increased to twenty, and the case was tried at Rome in 313. Ten bishops appeared on each side, the leading representatives of the Donatists being Donatus of Carthage, and Donatus was found guilty of various ecclesiastical offences. An appeal was taken and allowed; but the decision of the synod of Arles (314) not only confirmed the position of Cecilian, but greatly strengthened it by passing a canon that ordination was not invalid because performed by a traditor, if otherwise regular. Felix had previously been declared innocent after an examination of records and witnesses at Carthage. Further appeal to the emperor in person was heard at Milan in 316; when all points were finally decided in favour of Cecilian. As a necessary consequence of this the power of the state was directed to the suppression of the dissident party. Persistent Donatists were no longer merely banished, they were rebels, and incurred the confiscation of their church property and the forfeiture of their civil rights.

The attempts to destroy by force a factional sect had its usual result in only increasing its fanaticalism and consolidating its sectarianism. Majorinus, the Donatist bishop of Carthage, dying in 315, was succeeded by Donatus, surnamed Magnus, a man of great force of character, under whose influence the schism gained fresh strength from the opposition it encountered. Force was met with force, and the Circumcellionists, bands of fugitive slaves and vagrant (rescellam celias) peasants, were enlisted as the champions of Donatism, and their violent reached such a height as to threaten civil war. In 321, Constantine, seeing probably that he had been wrong in abandoning his usual policy of tolerance in this case, sought to reverse his steps by granting the Donatists liberty to act according to their consciences, and declaring that the points in dispute between them and the orthodox should be left to the judgment of God. This wise policy, to which he consistently adhered to the close of his reign, was n.4 followed by his son and successor in the Western Empire, Constans, who, after repeated attempts to win over the sect by bribes, resorted to persecution. The renewed excesses of the Circumcellionists, among whom were ranged fugitive slaves, debtors, and political malcontents of all kinds, had given to the Donatist schism a socialistic aspect; and its suppression may therefore have seemed to Constans even more necessary for the preservation of the empire than for the vindication of orthodoxy. The power which they had been the first to invoke having thus declared so emphatically and persistently against them, the Donatists were led to adopt the theory known in more recent times as that of spiritual independence, which Donatus Magnus formulated in the question, "What has the emperor to do with the church?" (Quaest. imperatorum cum ecclesia.) Such a theory naturally accorded in the sect, and their outrage were in turn made the justification for the most rigorous measures against the whole Donatist party indiscriminately. Many of their bishops fell victims to the persecution, and Donatus and several others were banished from their sees.

With the accession of Julianus (361) an entire change took place in the treatment of the Donatists. Their churches were restored and their bishops reinstated, with the natural result of greatly increasing both the numbers and the fanaticism of the sect. A return to the earlier policy of repression was made under Valentinian I. and
Grotian, by whom the Donatist churches were again closed, and all assemblies of adherents of the sect forbidden. It was not, however, till the commencement of the 5th century that the sect began to decline, owing partly to the occurrence of a division within it, but still more to the arguments used against it by the greatest theologian of the early church. The division arose out of a quarrel between Maximian, a deacon in Carthage, and Primian, the successor of Parmenieus in the (Donatist) bishopric. Maximian, being excommunicated, formed a party which, as Neander puts it, "stood in precisely the same relation to the body of the Donatists as the Donatists themselves did to the Catholic church." The dispute was a source of weakness in itself, and still more by the unanswerable arguments it furnished to the Catholic party, who during the reign of the emperor Honorius made repeated and determined efforts to secure the extinction of the schism. In 405 an imperial edict was issued commanding the Donatists, under the severest penalties, to return to the Catholic church. Meanwhile the more appropriate weapon of argument was being effectively wielded by the Catholic party, under the leadership of one of the ablest controversialists the Christian church has ever known, Augustine, bishop of Hippo, after several years' negotiation, found it possible to arrange a great conference between the Donatists and the orthodox, which took place under the orders of the emperor at Carthage in 411. There were present two hundred and eighty-six Catholic and two hundred and seventy-nine Donatist bishops. Before entering on the proceedings the Catholics pledged themselves, if defeated, to give up their sees, while in the other event they promised to recognize the Donats as bishops on their simply declaring their adherence to the Catholic church. The latter proposal, though it was received with scorn at the time, had perhaps ultimately as much influence as the resistless logic of Augustine in breaking the strength of the schism. The discussion, which lasted for three days, Augustine and Aurelius being the chief speakers on the one side, and Primian and Petilian on the other, turned exclusively upon the two questions that had given rise to the schism,—first, the question of fact, whether Felix had been a traditor, and secondly, the question of doctrine, whether a church by tolerance of unworthy members within its pale lost the essential attributes of purity and catholicity. On the second point, to which alone absorbing interest attaches itself, the Catholic view was stated and defended by Augustine with a force of argument, an aptness of quotation from Scripture (often, however, founded on misinterpretation), and a beauty of language that all but compel assent. Nowhere else in polemical theology are there to be found more valuable statements as to the connection between the divine and the human elements in the communication of grace, and as to the relative importance of the two attributes of catholicity and purity respectively as tests of the true church. It is to be observed, however, that on the side of Augustine as well as on that of his opponents there is the inevitable confusion of thought that arises from failure to apprehend the distinction between the visible and the invisible church.

The decision of Marcellinus, the imperial commissioner, was in favour of the Catholic party on both questions, and it was at once confirmed on an appeal to the emperor. As in the case of the similar decision almost exactly a century earlier, there followed the severest penal measures against the schismatics, the clergy being banished and the laity subjected to heavy fines. The extinction of the schism, which all the arguments of Augustine had failed to effect, was at last to be brought about by persecution. The Donatists continued to maintain an independent existence until the 7th century, when they disappear from history, along with the whole Christian church of North Africa, before the invading Saracens.

DONATUS, Alciatus, a grammarian and rhetorician, who taught at Rome in the middle of the 4th century A.D., had the honour of numbering St Jerome among his pupils, and was the author of a number of professional works. We still possess his _Ars grammatica_, consisting of three parts, _De litteris, syllabalis, pedibus et tonis, De octo partibus orationis, _and De barbarismo, sobescismo, schematibus, et tropis_; the larger portion of his commentary on Terence, in a greatly interpolated condition; and a few fragments of his notes on Virgil preserved and severely criticised by Servius. The first of these works, and especially the section _De octo partibus_, though possessing little claim to originality, and in fact evidently based on the same authorities which were used by Charisius and Diomedes, attained such popularity as a school-book that in the Middle Ages the writer's name was at once confirmed on an appeal to the emperor. But it was not however without a quarrel between the emperor at Rome and the author at Naples in 1535, that the work was at once confirmed on an appeal to the emperor.

DONAUWOERTH, a town of Bavaria, in the circle of Swaba-Neuburg, 25 miles N. of Augsburg, on the left bank of the Danube, at the confluence of the Wornitz. It is of some importance as a river port, and the centre of a considerable agricultural trade; but its main interest is historical. Having grown up in the course of the 11th and 12th centuries under the protection of the castle of Mangoldstein, it became in the 13th the seat of the duke of Upper Bavaria, who, however, soon withdrew to Munich to escape if possible from the manes of his wife Maria of Brabant, whom he had there beheaded on an unfounded suspicion of infidelity. The town received the freedom of the emperors in 1308, and maintained its position in spite of the encroachments of Bavaria till 1607, when the interference of the Protestant inhabitants with the abbott of the Holy Cross called forth an imperial law authorizing the duke of Bavaria to inflict chastisement for the offence. In the Thirty Years' War which soon after broke out, it was stormed by Gustavus Adolphus in 1632, and captured by King Ferdinand in 1634. In the vicinity the Bavarians and French were defeated by Marlborough and France
Louis of Baden in 1704. The imperial freedom restored to the town by Joseph I. in 1705 was again lost by re

of Yorkshire, 32 miles S. of York and 156 miles N. of London by railway, in the line of the ancient Roman road of Ermine street or, as some write, Watling street, is situated on the right bank of the Don, over which and an arm of it called the Cheesewold it has two bridges. The parish church of St George, occupying the site of an older structure of the same name destroyed by fire in 1553, was finished in 1588 at a cost of £15,123; its tower is 172 feet high. Among the other public buildings are Christ Church and St James's, the mansehouse, market-hall, guildhall, theatre, grammar school, infirmary, and jail. The commerce of Doncaster is mainly agricultural, and the corn market is of considerable importance. The manufactures are iron and brass ware, sacks and jute, spun flax, ropes, and agricultural machines. About a mile to the southeast of the town is the race course, which is nearly circular, and has a circumference of 1 mile 7 furhongs and 70 yards; the principal races held annually commence on the Tuesday after the 10th of September. The grand stand, erected in 1777, has been frequently altered and improved, but has lost much of its importance by the erection of minor stands. Races have long been held at Doncaster, and there was a stand on the course before the year 1615. The St Leger race takes its name from Lieut.-Gen. St Leger, who originated it in 1776; but it was not so named till 1778. Doncaster received its first charter from Richard I. in 1399, after landing at Ravenpur, Bolingbroke, subsequently Henry IV., lodged for a time in the town. In 1671 the population of the municipal borough was 18,763.

The area is 1691 acres.

Doncaster, a maritime county in the extreme northeast of Ireland, in the province of Ulster, bounded on the N. and W. by the Atlantic Ocean, on the E. by Lough Foyle, and the counties of Londonderry and Tyrone, and on the S. by Donegal Bay and the counties of Fermanagh and Leitrim. It covers an area of 18704 square miles, or 1,197,134 acres, of which 22,880 are under water.

Coast.—The county possesses a large extent of sea-coast indented by numerous inlets. Ballyshannon harbour, the most southern of them, is small, and has a bar at its mouth, as have Donegal and Inver harbours farther west. Kilbegs has been well sheltered, and capable of receiving large vessels. On the western coast are Bruckles or M'lSney's Bay, and Teelin harbour, suitable for small vessels; and on the north is Sheephaven, within which is Dunfanaghy Bay, where the largest ships may lie in safety, as they may also in Malvoy Bay and Lough Swilly farther east. Lough Foyle, which divides Donegal from Londonderry, is a noble sheet of water, but is shallow and dry at ebb tide, contracted at its entrance, and encumbered with shoals. A few miles from Malin Head, the most northerly portion of the mainland of Ireland, the varied and extensive Lough Swilly runs far into the interior. From these two longs much land has been reclaimed. Numerous islands and rocks stud the coast. The largest island is North Aran, about fifteen miles in circumference, with a lofty hill in its centre, and a gradual declivity down to the sea. On the northern coast are Tory Island, on which is one of those angular round towers marking the holy places of ancient times, and, farther east, Innishblad the ultima Thule of Ireland. The inhabitants of the islands obtain a precarious livelihood by fishing, kelp-burning, and rude husbandry, but are often reduced to extreme destitution.

Mountains.—Mountains and irregular groups of highlands occupy the whole interior of the county, and a considerable portion is bog and moor land. Arrigal mountain attains an elevation of 2462 feet above the level of the sea, and commands from its summit a fine view over a considerable portion of the country. Bluestack (2313 feet), Muckish mountain (2190 feet) in Kilmacrenan barony, and Sleeve Snaght (2019) in Inishowen are, next to Arrigal, the highest mountains. The eastern and southern portions of the county are comparatively level, and contain the most fertile land. Occasionally the mountain land is cut by the streams, which form the eastern districts and most of the barony of Bannagh. From Sheephaven to Lochmores and the north-western coast, granite forms the surface rock, and quartz is very abundant, often forming mountains of considerable elevation. Carboniferous or mountain hiras

stones occurs round Donegal Bay. The geological aspect of the county affords many indications of internal wealth, but very few attempts have been made to ascertain the mineral resources of the district. The minerals hitherto discovered are lead and iron. Steatite is worked to some extent at Garvan. Manganes, copper pyrites, and clay for potteries and brick-making are also found. Silicious sand, raised in Muckish Mountain, was formerly conveyed in large quantities to Belfast and Scotland for the manufacture of glass. Indications of coal have been observed near Lough Swilly, and at Inver on the southern coast; and marble of fine quality exists in many places. Among the mountain streams the pearl mussel (Unio margaritifera) is sometimes found. There are several mineral springs, the chief of which is the sulphureo-chalybeate water at Ballymard near the town of Donegal.

Rivers.—With the exception of the tidal river Foyle, which forms the boundary between this county and Tyrone and Londonderry, the rivers, though numerous, are of inferior size. The branches of the Foyle which rise in Donegal are the Derg, issuing from Lough Derg, and the Finn, rising in the beautiful little lake of the same name in the highlands, and passing through some of the best cultivated land in the county. The Foyle, augmented by their contributions, and by those of several other branches from Tyrone and Londonderry, proceeds northwards, discharging its waters into the southern extremity of Lough Foyle, at the city of Londonderry. It is navigable for vessels of large burden to this place, and thence by lighters of fifty tons as far as Lifford. Boats of fourteen tons can proceed up the Finn river as far as Castletown. The fine river Erne flows from Lough Erne through the southern extremity of the county into the southern extremity of Donegal Bay. Its navigation is prevented by a fall of 12 feet, generally called the Salmon Leap, in the neighbourhood of Ballyshannon, and by rapids between Ballyshannon and Belleek, on the confines of Fermanagh. The Gaugh, the Awn Es, and the Eak are the only other streams of any note.

Lakes, or rather tarns, are very numerous in Donegal.

Arms of Doncaster

DON—DON 361
The most remarkable, and also the largest, is Lough Derg, comprising within its waters several small islets, on one of which, Station Island, is the cave named Saint Patrick’s Purgatory, a celebrated place of resort for pilgrims and devotees. The circumference of the lake is about nine miles, and the extent of the island to which the pilgrims are ferried over is less than one acre. The landscape around Lough Derg is desolate and sombre in the extreme, barren moors and heathy hills surrounding it on all sides.

Agriculture.—The modes of agriculture present little that is peculiar to the country, and the spade still supplies the place of the plough where the rocky nature of the surface prevents the application of the latter implement. The soil of the greater portion of the county, i.e., the granite, quartz, and mica slate districts, is thin and cold, while that on the Carboniferous limestones is warm and fertile. Owing to the hilly nature of the soil, agriculture has not made much progress, although in certain districts (Gweedore, for instance) much land has been brought under cultivation, through the enterprise of the proprietors. In 1871 about 43½ per cent. of the land was return as bog and waste, about 35 per cent. under pasture, and 21 per cent. under tillage. As an indication of the stationary condition of the husbandry of Donegal, it may be stated that the number of acres returned as under crops in 1853 was 236,097, while in 1876 it was 236,015.

The following statistics will show the details of the agricultural acreage and the numbers of the inhabitants, especially as regards the imperial returns of 1876. In 1876 the county contained 255,158 persons, in 1861, 237,390, and in 1871, 218,334, of whom 106,089 were males and 112,254 females—thus showing a decrease within these 20 years of 14½ per cent. In 1875 the population was estimated at 305,657. After Cavan, Donegal is the most Catholic county in Ulster. In 1871, 75 per cent. of the inhabitants belonged to that persuasion, while 12½ per cent. were Episcopalians and 10½ per cent. Presbyterians. Education in the same year was conducted in 7 superior and 407 primary schools. There were, however, 95,280 persons above five years of age who were returned as illiterate, and 18,629 who could speak Erse only. The Donegal dialect is said to be the purest of the Irish language.

The county returned no fewer than twelve members to the Irish parliament,—two for the county at large, and two for each of the insignificant boroughs of Ballyshannon, Donegal, Killybegs, Lifford, and Johnstown. Since the union with Great Britain, it has been represented in the imperial parliament by two county members only.

Wheat and barley are quite an inconsiderable crop, and in this as well as in other respects Donegal is much behind the rest of Ulster in the extent of its crops. It bears, however, a more favourable comparison as regards its live stock, possessing, as it does, the largest number of cattle and sheep of any county in the province, and after Cavan the largest number of poultry.

As regards the division of the land, according to the Return of 1876, the county was held, in 1874, by 2174 separate owners, whose estates amounted in the aggregate to 1,723,536 acres, valued at £340,632. These were 1171 proprietors of less than 1 acre of ground, forming a proportion of 54 per cent. of the total proprietors,—that of all Ulster being 45 per cent. The average size of the properties was 539 acres, and the value per acre, £1. 9s. 9d., while the averages for Ulster were respectively 399½ acres and 15s. 8½d. Sixteen proprietors owned more than 15,000 acres each, and together an aggregate equal to about 45 per cent. of the whole. They were the following:—Marquis of Conyngham, 123,960 acres; Earl of Lorn, 54,553; H. G. Murray Stewart, 30,916; W. H. M. Shawt (Glenmore), 39,564; A. J. R. Stewart (Castlemore), 39,360; John Leslie, 28,827; George Harvey, 25,593; Lord G. A. Hull, 24,189, Messrs Musgrave, 23,673; Sir Samuel H. Hayes, Bart., 22,825; Thomas Connolly, 22,736; Church Temporalities Commission, 21,498; Wybrenah Oliphant (Bally

Lifford, the county town (population 660), and formerly a parliamentary borough, is practically a suburb of Strabane, in the neighbouring county of Tyrone. But Lifford (population 2958) is the most populous and important town in the county. It stands on both sides of the river Erne, but does not derive much advantage from its favourable situation in consequence of the fall of the river, usually called the Salmon Leap, above the town, and the bar at the mouth of the harbour. Lettekeny at the head of Lough Swilly, with 2116 inhabitants, is, next to Ballyshannon, the largest town in the county. Donegal (population 1422), is situated at the foot of a range of hills in the midst of scenery of great natural beauty, with a mineral spa in the neighbourhood, and sea-bathing close to the town.

History.—The greater part of Donegal was once called Tyrconnell, or the country of Conal; and it was sometimes called O’Donnell’s country, after the head chieftains of the district. The chieftains of note were O’Donnell, O’Boyle, O’Gallagher, O’Gormley, O’Breslin, &c. Tyrconnell is connected with some of the earliest events recorded in Irish history or tradition. The celebrated O’S dull, who was crowned king of Donegal, and thepee of their inauguration the rock of Dun in Kilmaurs. The celebrated Lied John O’Donnell, one of the most distinguished chieftains of the race, in conjunction with the Earl of Tyrone, became a formidable opponent to the Government of Elizabeth; but being ultimately defeated, he sailed to Spain to solicit fresh succours, was there seized with the English, and was hanged at Valinold. Rory O’Donnell, who was promoted to the chieftainship by the English Government, and created Earl of Tyrconnell, a title
now extinct, became afterwards disaffected to the Government and fled to Rome, where he died in exile, his estates having been previously confiscated by James I. In 1648, Sir Cahir O'Caholy, Lord of Innishannon, deposed by hopes of aid from Spain, raised an insurrection against the English Government in Ulster. He burnt Londonderry and purchased a good-sized fort there, and when the Lord Deputy Chichester having offered a reward for his head, he retired to the wilds of Kilmeangan, and was shot by a Scotch dragoon on his escape from the risk of Donoughmore's estates being confiscated and transferred to Chichester, the ancestor of the earls and marquesses of Donegall. Shortly afterwards, the confiscation of Ulster with English and Scotch undertakers and the proceeds, in pursuance of the scheme of James I, was partially carried out, and the baronies of Loughjeg and Banough were allotted to John Murray, Sir James Cunningham, Sir John Stewart, and others, the district of Portglenone, the London Greasers' Company obtaining Muff in Innishannon, Sir Roger Bloyley, Sir John Kingsmill, and other English settlers in the plantation districts of Lisfar, Sir William Stewart, Sir John Kingsmill, Sir George Macarne, Captain Hart, Sir M. McKowne, Turibgh Roe O'Boyle, MacSwine Bunagh, MacSwine Fannet, and other settlers and natives the district of Kilmeangan. Since the period of the settlement of Ulster, no forgeries have taken place in this country. The landlords remained loyal in the rebellion of 1641, and also during the war of the Revolution.

This district was formed into the county of Donegal in the reign of Queen Elizabeth, in 1555, by the Lord Deputy Sir John Perynt. Antiquities--The most noticeable architectural remains of ancient times in the county are to be found at the head of Lough Swilly, where, situated on the summit of a hill 502 feet high, some remarkable remains exist of a fortress or palace of the Northern Irish kings. These ruins are known as the Grannagh Castle, and evidently date from a period prior to the 12th century. On Tory island there is one of the best specimens of a round tower and some other interesting remains.

Numerous ruins of ancient castles along the coast prove that much attention was formerly paid to the defence of the country from foreign invasion. The principal among these is the ancient stronghold of the O'Clery, near Ballyshannon, Donegal Castle, built by the O'Donnells, formerly the chief residence and seat of the head of the clan. It was destroyed, however, by the Earl of Tyrone, and seen to advantage from the summit of the hill. The castle is situated on a steep hill above the river, and the remains consist of a strong tower and walls.

Near the Castle of Doe, or McSwiney's Castle, at Horn Head, is a natural portion in the roof of a cave, called McSwiney's Gun, formed by the workings of the ocean into the overhanging cliff. When the wind blows from the north, and the tide is at half flood, the gun is seen to spout jets of water to a height of 100 feet, attended with explosions heard occasionally in favourable weather at an immense distance.

The castle of Dunlewey, on the coast of Lough Swilly, is supposed to have been erected by the O'Donnells, and is said to have been taken by Sir Robert Ker, the 12th Earl of Mar, on the 22nd of July, 1609. The castle was afterwards burned.

Traces of religious houses, some existing only in tradition or documentary records, are also numerous. Ashle Aberry, on a small island near Ballyshannon, was a place of great extent. The ruins of Donegal, founded in 1747, are also said to be of its ancient grandeur. It is a place where the celebrated collection of ancient Irish plays was written, known by the name of the Annals of the Four Masters, and sometimes called the Annals of Donegal, compiled in the year 1642, by Michael O'Clery and his coadjutors.

Dongola, or Donkoli, a town of Egypt, in the district of the same name in the province of Nubia, situated on the left bank of the river Nile, about 15 miles above the Third Cataract. It is frequently styled Dongola Mokarak, or New Dongola, to distinguish it from Dongola Agua, or Old Dongola, a now deserted village 75 miles further up the river, which was formerly a flourishing fortified town, but fell into ruins after the devastation of the Mamelukes. Ksar Dongula, or Castle Dongula, and El Ordeh, or The Barracks, are also names in use. The town grew up round the military and administrative buildings established about 1520 by the Egyptian Government, and it is now a thriving commercial centre, with well-formed bazaars, an indigenous factory, and a large trade with the European and Indian nations. The town has lately been much frequented by the celebrated German naturalist Ehrenberg Population about 6000.

Donizetti, Gaetano (1797-1848). There is a strange parallelism observable in the lives of the three most celebrated Italian composers of the present century. Rossini, Bellini, and Donizetti had no sooner established their reputations on the Italian stage than they left their own country for Paris, at that time the centre of the musical world. All three settled in France, and all three were anxious to adapt the music of their particular times and artistic traditions of their adopted country. The difference which exists between Rossini's Tell and his Semiramide may, although in a less striking degree, be noticed between Donizetti's Fille du Régiment and one of his earlier Italian operas. But here the parallel ends. As regards artistic genius Donizetti can by no means be compared with his illustrious countrymen. He has little of Bellini's melancholy sweetness, less of Rossini's sparkle, and is all but devoid of spontaneous dramatic impulse. For these shortcomings he atones by a considerable though by no means extraordinary store of fluent melody, and by his rare skill in writing for the voice. The duet in the last act of the Fille du Régiment and the celebrated envoi of L'Elisir d'Amore, must account for the unpainted vitality of many of his works on the stage.

The life of Donizetti may be told in few words. He was born at Bergamo in 1797, the son of a military officer of limited means. Originally destined for the bar, he showed at an early age a strong taste for art. At first, strangely enough, he mustook architecture for his vocation, and only after an unsuccessful trial in that direction did he discover his real talent. He entered the conservatoire of his native city, where he studied under Simon Mayr, the fertile operatic composer. His second master was Mattei, the headmaster of the celebrated music school of Bologna, where Donizetti resided for three years. After his return to Bergamo the young composer determined to devote himself to dramatic music, but his father insisted upon his giving lessons with a view to immediate gain.

The disputes arising from this cause ultimately led to Donizetti's enlisting in the army. But this desperate step proved beneficial against all expectation. The regiment was quartered at Venice, and here the young composer's first dramatic attempt, an opera called Enrico Conte di Borgogna, saw the light in 1818. The success of this work, and of a second opera brought out in the following year, established Donizetti's reputation. He obtained his discharge from the army, and henceforth his operas followed each other in rapid and uninterrupted succession at the rate of three or four a year. Although he had to contend successively with two such dangerous rivals as Rossini and Bellini, he succeeded in taking firm hold of the public, and the brilliant reception accorded to his Anna Bolena at Milan earned him his name beyond the limits of his own country. In 1833 Donizetti went for the first time to Paris, where, however, his Maria Furtiari failed to hold its own against Bellini's Farnanym, then recently produced at the Théatre Italien. The disappointed composer went to Naples, where the enormous success of his Lucia di Lammermoor compelled him for his failure in Paris. For Naples he wrote a number of works, none of which is worth notice. In 1810 the censorship refused to pass his Poliuto, an Italian version of Corneille's Polyxena, in consequence of which the disgusted composer once more left his country for Paris. Here he produced at the Opéra Comique his most popular opera, La Fille du Régiment, but again with little success. It was not till after the work had made the round of the theatres of Germany and Italy that the Parisians reconsidered their unfavourable verdict. A serious opera, Les Matyrs, produced about the same time with the Daughter of the Regiment, was equally unsuccessful.
ful, and it was reserved to La Favorita, generally considered as Donzetti's masterpiece, to break the evil spell. His next important work, Linda di Chamounix, was written for Vienna, where it was received most favourably in 1842, and the same success accompanied the production of Don Pasquale after Donzetti's return to Paris in 1843. Soon after this event the first signs of a fatal disease, caused to a great extent by overwork, began to show themselves. The utter failure of Don Sebastiano, a large opera produced soon after Don Pasquale, is said to have hastened the catastrophe. A paralytic stroke in 1844 deprived Donzetti of his reason; for four years he lingered on in a state of mental and physical prostration. A visit to his country was proposed as a last resource, but he reached his native place only to die there on April 1st, 1846. The sum total of his operas amounts to 64, the more important of which have been mentioned in the course of this notice. The large number of Donizetti's works at the same time accounts for many of their chief defects. His rapidity of working made all revision impossible. It is said that he once wrote the instrumentation of a whole opera within thirty hours, a time hardly sufficient, one would think, to put the notes on paper. And yet it may be doubted whether more elaboration would have essentially improved his work; for the last act of the Favorita, infinitely superior to the preceding ones, is also said to have been the product of a single night.

DONNE, John (1573-1631), poet and divine of the reign of James I, was born in London in 1573 of Catholic parents. His father was a wealthy and influential merchant, a Welshman by descent; his mother claimed relationship with Sir Thomas More and Heywood the epigrammatist. Brought up under tutorage at home until his tenth year, he proceeded to Oxford, and was entered at Hart Hall about 1588. At the university his learning was extraordinary, and he was compared for juvenilia erudition, with Pico della Mirandola. In 1588 he was removed to Trinity College, Cambridge, but he took no degree there or at Oxford, his scruples as a Catholic standing in the way. In 1590 he went up to London and was admitted into Lincoln's Inn. His father presently died, and left his son £5000. Until he came of age, he was under his mother's care. It is supposed that this was the period to which he refers in Pseudo-Martyr, in which an increasing conviction of the truth of Protestantism struggled with the old faith and familiar surroundings. Walton has given an interesting account of Donne's change of faith, which probably took place about 1592. Before this he must have been writing some of the sonnets of the Divine Poems, and of these not the worst, are obviously written by a sincere Catholic. The rebound from Catholic asceticism was a severe trial to an ardent nature; it seems that he plunged into various excesses, and that his father's legacy was rapidly squandered. In 1593, however, he had already laid the foundation of his poetical reputation. The first three of his famous Satires exist in a MS. dated 1593, and the rest appear to have been composed at various times before 1601. In 1594 he commenced his travels, wandering over Europe, and accompanying the earl of Essex at the taking of Cadiz in 1596, and again in the expedition of 1597. It has been thought that he was engaged in military service in Holland in 1596. He did not return to England until he had seen Italy, and was planning an excursion into Palestine, when the difficulty of travelling in the East diverted his thoughts to Spain. In both Italy and Spain he took considerable pains to master the language and existing literature of his country; the notes to his works testify. It is possible that the fantastic Spanish school of conceits, which takes its name from Gongora, may have affected the style of Donne. Returning to
so far suffered that he was persuaded by his friends to go abroad, and to spend more than a year in Germany. In 1619 he returned, with the expectation of the deanery of Canterbury. This he did not gain, but in 1620 he was appointed dean of St Paul's. To the kindness of the Earl of Dorset he owed the vicarage of St Dunstan in the West. In 1624 he was elected procurator to Convocation, and the same year was attacked by an illness that threatened to prove immediately fatal, but from which he rallied. He continued in health for some years, and for the last time before Lent 1630, an oration which the king called "the Dean's own funeral sermon," and which was printed, under the title of Death's Duet, in 1632. On the 31st of March 1631, he died, having previously prepared himself in his winding sheet to have his portrait taken. He was buried in St Paul's cathedral. Very few of Dr Donne's writings were published during his lifetime. It is supposed that an edition of the Satires may have been printed before the close of the 16th century, but if so, it has entirely disappeared. His poems were first collected in 1633, and afterwards in 1635, 1639, 1649, 1650, 1651, and 1659, of which editions the second and last appear to be tolerably trustworthy. Of his prose works the Joviusella appeared in 1633; the L.L.L. Sermons, with an admirable life of the author by Izaak Walton, in 1640, the Essays in Divinity in 1650, and the Letters to Several Persons of Honour in 1651. No very excellent modern biography of the poet or edition of his works has been issued. Dr A. B. Grosart's privately printed edition of the poetical works is very complete.

It is singularly difficult to pronounce a judicious opinion on the writings of Donne. They were excessively admired by his own and the next generation, praised by Dryden, paraphrased by Pope, and then entirely neglected for a whole century. The first impression of an unbiassed reader who dips into the poems of Donne is unsatisfactory. He is repulsed by the intolerably harsh and crabbed versification, by the recitative choice of theme and expression, and by the oddity of the thought. In time, however, he perceives that behind the fantastic garb of language there is an earnest and vigorous mind, an imagination that harbours fire within its cloudy folds, and an insight into the mysteries of spiritual life which is often startling. Donne excels in broad flashes of wit and beauty, and in sudden daring phrases that have the full perfume of poetry in them. Some of his lyrics and one or two of his elegies excepted, the Satires are his most important contribution to literature. They are probably the first poems of their kind in the language, and they are full of force and picturesqueness, and obscure and knotty language only serves to give peculiar brilliancy to the not uncommon passages of noble perspicacity. To the odd terminology of Donne's poetic philosophy Dryden gave the name of metaphysics, and Johnson, borrowing the suggestion, invented the title of the metaphysical school to describe, not Donne only, but all the amorous and philosophical poets who succeeded him, and who employed a similarly fantastic language, and who affected odd figurative inversions.

(E. W. G.)

DONOVAN, EDWARD, naturalist, was author of many popular works on natural history and botany. In 1792 appeared the first volume of his Natural History of British Insects, which extended to sixteen volumes, and was completed in 1816. Although now superseded, this compilation did good service in its time. During the same period Donovan published Natural Histories of British Birds, in 3 vol. (1799-1819), and British Fishes, in 5 vol. (1802-1808), of British Shells, in 5 vol. (1800-1804), a series of illustrated works on The Insects of India, China, New Holland, &c., in 3 vol. (1798-1805), and Excursions in South Wales and Monmouthshire (1809).

To these works must be added his periodical entitled The Naturalist's Repository, a monthly publication, of which three volumes were completed (1823-1825), and an Essay on the Minute Parts of Plants in general. Donovan was author of the articles on natural history in Ree's Cyclopaedia. In his old age this hard-working student and writer published a Memoir respecting my Publications in Natural History, in which he complains of the small profits accruing to him from the sale of his books. We have searched in vain for any biographical particulars of Donovan,—the only facts apparently recorded being that he was a fellow of the Linnean Society, and that he died in London, February 1, 1837.

DORAT, JEAN. See DAURAT.

DORCHESTER (the Dorum, the Doroom of the Romans), a parliamentary and municipal borough and market town of England, capital of the county of Dorset, situated on an eminence on the right bank of the Frome, 8 miles N. of Weymouth, and 129 miles from London by the old coach road, but some 20 miles farther by railway. It stands within a wide open tract of land, containing 3,400 acres, held under the duchy of Cornwall, called Fordington Field. It is governed by a mayor, four aldermen, and twelve councillors, and returns one member to parliament. The population of the borough in 1871 was 6915, the area 635 acres. The town, consisting chiefly of three spacious streets, is neat and pleasantly situated, and is nearly surrounded by fine avenues. St Peter's church is an ancient edifice in the Perpendicular style, containing some curious monuments. The grammar school has two exhibitions to St John's College, Cambridge, and one to each university. Of the other public buildings the principal are the town-hall, with market-house, shire-hall, county prison, and county hospital; there is also a small county museum, containing many local objects of much interest. The cavalry barracks in the vicinity may also be noticed. There are also several almshouses and other charities, and a savings-bank. Market days, Wednesday and Saturday. The woollen manufacture of Dorchester was once considerable, and it was noted also for its ale, of which there are still some popular breweries. It is a place of considerable trade, and large sheep and lamb fairs are held there annually. The borough includes four parishes—All Saints, St Peter's, Holy Trinity, and Fordington. In the vicinity there are some interesting remains, including an amphitheatre, the most perfect of its kind in England. The seats for the spectators are formed of masses of chalk, rising 30 feet above the arena. This amphitheatre when perfect is supposed to have been capable of accommodating 13,000 spectators. The camp called Poundbury, to the N.W. of the town, is probably Roman, and well worthy of examination. Durnovaria was one of the principal stations in England of the Romans, by whom it was surrounded with a wall and fosse, part of the former being still standing. Here Judge Jeffreys's "bloody assize" was held in September 1685, when 292 prisoners were sentenced to death.

DORDOGNE, an inland department in the S.E. of France, taking its name from the river which traverses its centre from east to west, and formed from nearly the whole of Périgord, a part of Agénais, and small portions of Limousin and of Angoumois. It is bounded on the N. by the Haute Vienne, W. by Charante and Charente Inferieure, S.W. by Gironde, S. by Lot-et-Garonne, and E. by Lot and Corrèze, and lies between 44° 45' and 45° 42' N. lat., and from 0° 1' 51" to 1° 26' 49" W. long. Its surface is beautifully variegated, comprising small mountains,—some
of which are covered with vines and crowned with wood, and others rocky and barren. — Large plateaux, and a few pleasant valleys. In the north is wild and sterile, and in the west is covered with forests of pine, but the splendid valley watered by the Dordogne is rich in vines, fruit trees, and cereals. The climate is generally agreeable and healthy, but rather humid, especially in the south. Dordogne as watered by 11 rivers, and more than 600 streams, all tributaries of the Dordogne except the Bandiat and the Dropt. The Dordogne itself is formed by the union of two mountain streams, the Dor and the Dogne, which rise in Mont d'Or, Pay-de-Dôme, and unite after a short course. Sufficient corn is grown in the department for home consumption. The cultivation of the vine occupies about a tenth of its surface, and its red and white wines are in high repute. Its truffles are considered the best in France. In the forests the prevailing trees are the oak and chestnut. The fruit of the latter is much used both as food by the people and for fattening hogs. The walnut is extensively cultivated for making oil. Dordogne is rich in various kinds of minerals; iron is very abundant, and there are found also copper, lead, manganese, coal, marble, alabaster, lithographic stones, lime of gypseum, &c. The chief branches of industry are the working in metals, particularly iron and steel, the manufacture of paper, and boat-building; but there are also produced coarse woollens, sergees, leather, earthenware, hosiery, vinegar, brandy, and liqueurs.

Dordogne is divided into the arrondissements Périgueux, Bergerse, Nontron, Ribéac, and Sarlat, with 47 cantons and 532 communes. The chief town is Périgueux. The total area is 3545 square miles, and the population in 1872 numbered 460,142.

Doria, Andrea (1466–1560), the famous Genoese admiral, was born at Oneglia in 1466. He belonged to a noble family, several of whose members, both before and after his time, distinguished themselves in the history of Genoa. Having lost both his parents in his youth, he embraced the military profession, and served in the papal guards and under various princes of Italy. It was not until he was fifty years of age that he entered into the service of Francis I. of France, who gave him the command of his fleet in the Mediterranean. In this position he preserved that spirit of independence which is so natural to a sailor and a republican. When the French attempted to render Savoia, long the object of jealousy of Genoa, its rival in trade, Doria monstredly against the measure; this irritated Francis to such a degree that in 1558 he ordered his admirar Barbéins to sail for Genoa, then in the hands of the French troops, to arrest Doria, and to seize his galleys. Doria, however, retreated with all his galleys to a place of safety, and closing with the offers of the emperor Charles V., returned his commission to Francis, and husted the imperial colours. To deliver his country, now weary of the French and the imperial yoke, from the dominion of foreigners, was Doria's highest ambition; and the favourable moment had presented itself. Genoa was afflicted with the pestilence, the French garrison was ill paid and greatly reduced, and the inhabitants were sufficiently disposed to second his views. Before the close of the same year (1558) he sailed to the harbour with thirteen galleys, landed five hundred men, and made himself master of the gates and the palace with very little resistance. The French governor with his feeble garrison retired to the citadel, but was soon forced to capitulate; upon which the people speedily levelled the citadel with the ground. It was now in Doria's power to have declared himself the sovereign of his country; but, with a magnanimity of which there are few examples, he assembled the people in the court before the palace, disclaimed all pre-eminence, and recommended to them to settle what form of government they chose to establish. The people, animated by his spirit, forgot their factions, and fixed, with his approval, that republican form of government which, with little variation, subsisted until 1815. His disinterested patriotism won for him the appointment of censor for life and the title of "Father and Liberator of his Country." Doria afterwards engaged in an expedition against the Turks, from whom he took Coroa and Patras. He also co-operated with Charles V., in the reduction of Tunis and Goullete. In 1547 two successive attempts were made against his life by Fieschi and a Genoese emigrant of the name of Giulio Cibo. He resigned his command in 1556, and died at Genoa in November 1560, being then ninety-four years of age.

DORIANS, the name by which one of the two foremost races of the Hellenic or Greek people was commonly known, the other being the Ionics. These two races, if the term may here be rightly used, stand out in marked contrast, as exhibiting different types of character, which have their issue in different modes of thought and forms of government. But when from a consideration of their political and intellectual development we endeavour to work our way backward to the origin and early history of these races, we find ourselves confronted by traditions which show little consistency, or which even exclude each other. The writer who speaks with the greatest confidence on this subject is the perfectly truthful man who well earned his title to be known as the father of history; but Herodotus, although thoroughly to be trusted as to all that he relates from his own experience, could not rise much above the standard of his age in dealing with alleged matters of fact, nor could he see that the eking out of theory by conjecture is an illegitimate process. Herodotus then, in speaking of the Athenians and Spartans as standing at the head severally of the Dorian and Ionian races, states positively that the Ionian was a Pelasgic, the Doran a Hellenic people; that the former had always been stationary, while the latter had many times changed its abode. In the time of Deucalion, he asserts, the Dorians, or rather the tribe or tribes which were afterwards to be called Doriens, inhabited Phthiotis, by which he probably understands the southern portion of the great Thessalian plain. Afterwards, under their eponymous Dorus, they occupied their Hues, which he describes as the region under Ósas and Olympia. They had thus migrated from the most southerly to the most northerly parts of the great plain which is drained by the Peneius. The next migration was to the highlands of Pindus, the chain which runs down at right angles from the Cambunian range, or the westward extension of Olympus. Here, he says, they were known not as Doriens, but as Macedonians. A later southward migration brought them into Dryopis, whence they made their way into the Peloponnese, and it would seem were then only first known as Dorans (Herod. i. 56).

If we examine the statement thus boldly advanced, we shall find at each step that the ground becomes more uncertain. We may indeed, in order to establish that the Pelasgic race was closely akin to the Greek, and that their language stood Hellenic before Hellenic, we may judge from the Pelasgan populations which he found at Placa, Scylace, and Creston, the Pelagians generally must have spoken a barbarous dialect, i.e., a dialect unintelligible to a Greek. He is thus driven to assume, first, that the Attic tribes had been Pelasgic before they became Hellenic, and that the change was accompanied by a change of language (Herod. i. 57). Elsewhere (ii. 51) he speaks of the Athenians as being already Greek or Hellenic before
the Pelasgians became their neighbours, and adds that the latter came in time to be reckoned Hellenic also. We thus see, without going further, how vague and uneasy were the notions of Herodotus; but we have to note further that the account here given of the Dorians and Ionians is said to apply to the time of Croesus, and thus, down to his age, the Ionians had been stationary in their original abodes, these abodes in his day being assuredly not in the Peloponnesus. Yet he can assert elsewhere that the Peloponnesians had been their original home, and that they had been expelled from it by the Achaeans (i. 115). But, apart from the fact that the poets of the Iliad and the Odyssey know nothing of any expulsion of Ionians from Peloponnesus, the difficulties are increased if we betake ourselves to the tribal genealogies which the Greeks regarded as undoubtedly historical documents. We have then, on the one side, the assertion that the Ionians were originally non-Hellenic and Pelasgians; on the other, the Taphian genealogy speaks of Dorians, Achaeans, Ionians, and Eolians, as being all sprung from Hellen,—Xouthus, the son of Hellen, being the father of Ion and Achaeus. But, as such statements are as virtually nomadic tribes; and the story even went that they received their name, Pelasgi—Pelargoi, or Storms, from their wandering habits. It is difficult to resist the inference of Sir G. Cornewall Lewis that this radical inconsistency in the views respecting the Pelasgians is a proof that they rest on no historical basis (Credibility of Early Roman History, i. 282). Further, there is the extreme unlikelihood that the tribes afterwards known as Donans should for a certain period have been called Macedonians, or rather, as Herodotus implies, that they should move more than once from their name. The assertion that they were called Macedonians involves a fresh contradiction, for elsewhere Herodotus asserts that the Macedonians were not Hellenic at all, although they were governed by chiefs of genuine Greek descent. Nor is our position improved if we choose to prefer the statements of the genealogies to the preference to those of Herodotus or other historians, on the ground that the national tradition by which these genealogies were handed down must be trustworthy, for the descent in one genealogy is often directly contradicted by that of another, and not unfrequently, and indeed even generally, the genealogy betrays the nature of the materials from which it has been made up. Thus, for instance, Dorus, the eponymus of the Dorians, has as his sister Protogeneia (the Early Dawn), who, being wedded to Zeus, the god of the gleaming heaven, becomes the mother of Aethlius, the toiling sun, who is the father of Endymion, that is, of the sun-god who asks to sleep in Latmus, the land of forgetfulness. Finally, we have to note the fact that, in the Hellenic world as elsewhere, tribes bearing the same name were found separated by great distances; and in such cases traditions always sprang up, not merely asserting their connection, but also fabricating such traditions as the Achaeans in Thessaly and Achaeans in the Peloponnesus; and it was said, not merely that the former passed southwards across the isthmus of Corinth, but that they were led by the barbarian Pelops from Phrygia. The same process connected the Peloponnesian Dorians with the Dorian clans who dwelt between Cita and Parnassus, and spoke of the latter as the stock from which the Spartans sprang, to the great benefit of the insignificant clan, who thus acquired a foremost rank in the Hellenic world.

All that we can do, then, is to bring together the genealogies which refer in any way to Dorus and his supposed descendants the Dorians, and then gather from historians and geographers the various regions in which Dorians were found during ages which may reasonably be regarded as historical. The result of the former process will scarcely appear satisfactory. We have noticed one genealogy which represents Dorus as the son of Hellen; but in the Eolian genealogy he is the son of Apollo and Puthis, and is slain by Aetolus in the land which from him was called Aetolia (Grube, Hist. Gr., i. 140). The great tradition which connects the Dorians of the Peloponnesus with their more noteworthy namesakes is the legend which relates the return of the Heraclids, or descendants of Heracles, who, after the death of that hero, had been compelled to take refuge in Athens. Hyllus, in this exile, as adopted by the Dorain king, Latmus, the father of Pamphylus and Dymna, who with Hyllus became the eponyms or name-givers of the three tribes found in Dorian communities generally, and known as Hyllleans, Pamphylians, and Dymnians, Hyllus being more particularly illustrious as the forefather of Eurybathe and Procles, the progenitors of the two houses from which the Spartan kings were always elected. But this legend, like the rest, was variously related, and, according to the version of Plato, the return of the Heraclids would be rather a return of the Achaeans to the Peloponnesus.

We cannot, however, question the fact that the Dorian race was widely extended, that it was found, like the Ionians, in various portions of the Hellenic world, separated by considerable distances of land or sea, and that the people who bore this name were singularly active in the work of colonization. They are found not only in all parts of the Peloponnesus but in the islands of the Aegean, and on the coasts of Asia Minor; and from the foremost Dorian cities went forth, it is said, the colonists who were to carry the Hellenic name and Hellenic culture far to the east and the west. Thus Corinth became the mother city of Corcyra and Syracusa, and from these sprang EpiGLISHUS, Camarina, Ambracia, Potidaea. The Dorians of Crete and Rhodes sent forth the settlers of the Sicilian Gela, and Gela in turn became the parent of the neighboring Acraga, or Agrigentum, while to Megara is assigned the origin of Byzantium, the chief culture home of Romans and of Ottoman Sultans. These several communities exhibit a general likeness in their dialect, their art, and their polity. Their civilization assumed a magnificent phase in the splendour of Corinth and the great Dorian cities of Italy and Sicily. Their powers of resistance were attested by the success with which their colonies were planted in regions occupied by powerful and hostile tribes, who failed to overthow them simply because they lacked the Dorian power of cohesion. Yet with the Dorians this power was subjected to strictly defined bounds of action. All Dorian cities might feel a pride in belonging to the great Doric stock, and the city which claimed certain prerogatives in its colonies; but each city was for them nevertheless an absolute unit, with whose independence no other city had any right to interfere, even though this interference might have for its object the establishment of a pan-Hellenic union. Any movements in this direction were sure to raise the keenest and most persistent opposition of the Doric Greeks, and thus we can understand the nature of the quarrel which was fought out between Sparta and Athens, and which ended in the ruin of the great Ionian city, whose imperial rule must otherwise have checked, and may perhaps have rooted out,
this fatal instinct of isolation. The Spartans, who stood at the head of the Dorian portion of the Greek world, are regarded by K. O. Muller, in his History of the Dorians, as exhibiting in their institutions and government the true type of the race. This theory is strenuously combated by Grote, History of Greece, p. ii. ch. 6; and at the least it must be said that if they displayed the true Dorian type, that type must have been completely lost among all the other Dorian tribes. The Spartans occupied Laconia strictly as an army of occupation, and carrying out inflexibly their rigid system, they opposed an uncompromising resistance, not only to luxury, but generally to art, refinement, and speculation (Cox, History of Greece, L. 72). No such condition of things is found even in Crete, from which Sparta was supposed to have derived her special institutions. Not only is their reputation as models of Dorism altogether undeserved, but it probably would have been exceedingly distasteful to the countrymen of Leonidas, Archidamus, and Agesilaus. (G. w. c.)

A short few miles to the S. is to be ascribed to the board. The only other Greek communities in like plight were those of Arcadia or both Doris and Arcadia remained king. S.

S. of Doris altogether undeserved, but strictly as an army of occupation, and carrying out in the rear of the invasion of Xerxes we know nothing, Ermeus, and then the they had none; nor is there more to be said than that they here by the late Thomas Hope, the author of a handsome edifice rebuilt in 1873; and and on the east, of the Etohans on the west, Locrians on the south, the whole being barely thirty miles in length by ten at its greatest width. The inhabitants were divided into the four townships of Boion, Cythion, Erneaus, and Fundus. Of their history down to the time of the invasion of Xerxes we know nothing, and probably they had none; nor is there more to be said than that they have consulted their interests by submitting to the Persian king. This confederacy of four little townships was honoured by the Spartans as their metropolis, or the home from which the Dorians had come who achieved the conquest of the Peloponnesus—a tradition which has been noticed in the article Dorians. The political insignificance of Doris is to be ascribed to the fact that it had no seaboard. The only other Greek communities in like plight were those of Arcadia or the Peloponnesian highlands, and both Doris and Arcadia remained far in the rear of Hellenic development generally.

DORKING, a market town of West Surrey, England, situated on a small brook, a tributary of the Mole, 29 miles S. of London by rail. The town is well built and clean, and occupies a picturesque position in a sheltered vale near the base of Box Hill. The parish church of St Martin's is a handsome edifice rebuilt in 1873; and St Paul's district church, erected in 1857, is a building of some pretension. Lims of exceptionally good quality is burnt to a large extent in the neighbourhood, and forms an important article of trade; it is derived from the Lower Chalk formation. Dorking has long been famous for a finely-flavoured breed of fowl, distinguished by their having five claws. Several elegant mansions are in the vicinities of the town, notably that of Deepdene, containing a gallery of sculpture collected here by the late Thomas Hope, the author of Anatomist. The Roman road which crossed from the Sussex coast to the Thames, passed close to Dorking. The population of town is about 4800; that of parish in 1871 was 8367.

DORLEANS, Louis, (1542–1629), a minor French poet and political pamphleteer, and a prominent partisan of the Catholic League, was born in 1542, probably at Paris, though one of his biographers states that Orleans was his birthplace. He studied under Jean Daurat, and after taking his degree in law began to practise at the bar with but slight success. He added little to his reputation by writing the poems, and it was only after the daring step of arresting the royalist members of parliament, that he was brought into prominence by being appointed its advocate-general. He maintained the position and claim of the League in language that was always strong and often insolent, going so far as to express regret that the king of Navarre and the prince of Condé had not been assassinated. He was, however, courageous enough to intercede with the duke of Mayenne for the inhabitants of Paris, but without effect. After this failure he continued the publication of violently-worded pamphlets intended to render the accession of Henry impossible. One of these, Le Banquet et Après-dîne du Comte d'Arville, in which he accused Henry of insincerity in his return to the Roman Catholic faith, was so scandalous as to be disapproved of by many members of the League. When Henry at length entered Paris Dorlés was among the number of the proscribed. He took refuge in Antwerp, where he remained for nine years. At the expiration of that period he received a pardon, and returned to Paris, where he had not been long before he was imprisioned for sedition. The king, however, had determined to set him free after he had been three months in the Conciergerie, and this generous conduct had the effect of attaching him ever afterwards to the cause of Henry. His last years were passed in obscurity, and he died in 1629 at the age of eighty-seven. Dorlés's political pamphlets are now exceedingly scarce. His chief poem, Énarré (Paris, 1572), is a poor imitation or translation of part of the Orlando Furioso.

DORMOUSE, the common name of a family of small rodents (Myoxidae), generally regarded as intermediate between mice and squirrels. It contains 12 species, distributed over the temperate parts of the great Palearctic region from Britain to Japan, and throughout the greater portion of Africa. The Common Dormouse (Myoxus avellarius) occurs in most parts of Europe, and is the only species found in Britain. It is an active little creature, measuring about three inches long, with a thick bushy tail of nearly similar length. Its posterior legs are slightly longer than those in front, and both face and hind feet form prehensile organs, whereby the dormouse climbs along the twigs of the low bushes among which it lives, and in which it builds a neat round nest formed of leaves. It is a shy and timid animal, choosing the recesses of woods for its habitation, and seldom showing itself by day; in confinement, however, it is readily tamed and becomes very familiar. It feeds, as its specific name implies, on hazels, and is also partial to berries, haws, and grain. These it eats, either sitting on its haunches or suspended by its hind feet, and holding them between its forepaws like a squirrel. In autumn it grows very fat, and lays up a store of food for winter use,—retiring at the commencement of the cold season to its nest, and curling itself up into a ball, when it becomes dormant. A warmer day than usual restores it to temporary activity, and then it supplies itself with food from its autumn hoard, again becoming torpid till the advent of spring finally rouses it. Owing to this hibernating habit it is known as the Sleeper, while the name dormouse has reference to the same peculiarity. The young of the dormouse are generally four in number, and these, according to Bell, are produced twice a year. They are born blind, but in a marvellously short period are able to eat for themselves, and their hibernation begins later in the season than with the adult form. The fur of the dormouse is of a tawny colour above, and paler beneath, with a white patch on the throat. The Fat Dormouse (Myoxus gills) is larger than the British species, and is the one most commonly found in Southern Europe.

DORNBERN, or Dornbrunn, a straggling but well-built town of Tyrol, situated in the Leutasch valley, six miles S. of Bregenz, situated on the right bank of a stream known as the Dornbirn Ach, which flows into the Lake of Con-
DOR—DOR

DOROBOUSH, a town of Russia in Europe, in the government of Smolensk, about 55 miles E. of the city of the same name, on the banks of the Dnieper, in 54° 55' N. lat. and 33° 17' E. long. It has twelve churches, and still preserves its ancient earthen fortress, with its ramparts and ditch, within the precincts of which are situated the cathedral, the courthouse, and two victualling stores. Its manufactures are of no importance, but it maintains an extensive trade with various parts of Russia, and even with foreign countries, in tallow, leather, and hemp. First mentioned in 1300 as the object of a contest between Alexander of Smolensk and Andrew of Viasna, Doroobush continued through the 13th century to share in the vicissitudes of the neighbouring principalities, passed in the 15th successively into the power of the Lithuanians and the Poles, and was finally united with Russia in 1667. It was partially burned by the French on their retreat from Moscow. Population in 1873, 7905 of whom only a very few are Catholics and Jews.

DOROGOGR, or Dorono, a town of Roumania, in the northern part of Moldavia, about 80 miles north-west of Jassy, on the Shaska, a tributary of the Pruth. It has about 10,000 inhabitants, a large transit trade with the products of Northern Europe, and several important annual fairs; but its buildings are of a poor description.

DOROHHEUS, a professor of jurisprudence in the law school of Berytus in Syria, and one of the three commissioners appointed by the emperor Justinian to draw up a book of Institutes, after the model of the Institutes of Gaius, which should serve as an introduction to the Digest already completed. His colleagues were Tribonian and Theophylus, and the work was accomplished in 533. Dorotheus was subsequently the author of a commentary on the Digest, which is called the Index, and was published by him in 542. Fragments of this commentary, which was in the Greek language, have been preserved in the Covlta, appended to the body of law compiled by order of the emperor Basilus the Macedonian and his son Leo the Wise, in the 9th century, known as the Basilica, from which it seems probable that the commentary of Dorotheus contained the substance of a course of lectures on the Digest delivered by him in the law school of Berytus, although it is not cast into a form so precisely didactic as the Index of Theophylus.

DORP, a town of Russia, in the government of Dusseldorf, 17 miles north-east of Cologne, which, like Barmen and many other towns in the valley of the Wupper, has since 1849 rapidly grown into importance as a centre of manufacturing industry. Tobacco, paper, steel, and iron wares are the principal objects of its activity. In 1872 the population amounted to 10,689.

DORPAT, in German frequently Dorpt, in Russian Derpt or Yaroslaff, in Estonian Tartoma, a city of Russia in Europe, in the government of Livonia, situated on both banks of the Embach, 157 miles north-east of Riga, in 59° 23' N. lat. and 26° 23' E. long. The principal part of the town lies to the south of the river, and the more important buildings are clustered round the two eminences known as the Donberg and the Schlosberg, which, in the Middle Ages, were occupied by the citadel, the cathedral, the episcopal palace, the monastery, and the houses of the wealthier inhabitants. Owing to the great conflagration of 1777, the actual town is almost entirely of modern erection; and its fortifications have been transformed into promenades. Besides one Roman Catholic, three Lutheran, and two Russian churches, a hospital, and an orphanage, a veterinary institute founded in 1846, the economical society of Livonia, an Estonian learned society, and a medico-surgical society, it possesses a famous university, with an observatory, a botanical theatre, a botanical garden, and a library of about 250,000 volumes, which are housed in a restored portion of the cathedral, burned down in 1596. This university, which renders the town the great intellectual centre of Livonia, preserves the Teutonic traditions of its earlier days, and is much more German than Russian in its culture. It was founded by Gustavus Adolphus in 1632, but in 1699 teachers and students removed to Parnau on the advance of the Russians, and on the occupation of the country by Peter the Great again took flight to Sweden. In spite of the stipulation of the treaty of 1710 and the efforts of the Livonians it was not till 1802 that its restoration was effected under the patronage of Alexander I; but since that date its history has been one of considerable prosperity. It possesses 42 ordinary professors, a total teaching staff of 73 members, and upwards of 7000 students. The astronomical department is especially famous, owing partly to the labours of Otto Struve, and partly to the possession of Fraenhofer's great refracting telescope, presented by the emperor Alexander I. The town is still a centre of learning, and much manufactures.

D'ORSAY, ALFRED GUILLAUME GABRIEL, COUNT (1798-1852), a celebrated leader of society in Paris and London, who added to the attractions of dandyism those of high intellectual and artistic gifts, was born at Paris in 1798. He was the son of General D'Ossay, from whom he inherited the exceptionally handsome person which contributed so much to his social success. Through his mother he was grandson by a morganatic marriage of the king of Wurttemberg. In his youth he entered the French army, and served as a garde du corps at Wurttemberg. In 1821 he was appointed to the staff of the Duke of Lorraine, and stationed at Venice on the Rhone, he formed that acquaintance with the earl of Blessington and his family which affected the whole course of his future life. The acquaintance quickly ripened into intimacy, and at the invitation of the earl he accompanied the party on their tour through Italy. In the spring of 1822 he met Lord Byron at Genoa, and the published correspondence of the poet at this period contains numerous references to the count's gifts and accomplishments, and to his peculiar relationship to the Blessington family. A diary which D'Ossay had kept during a visit to London in 1821—2 was submitted to Byron's inspection, and was much praised by him for the knowledge of men and manners and the keen faculty of observation it displayed. On the 4th December 1827, Count D'Ossay married Lady Harriet Gardiner, a girl of fifteen, the daughter of Lord Blessington by his first marriage. The union, if it ripened his character, made the Blessington family less ostensibly equivocal than before.
was in other respects an unhappy one, and a separation took place soon after the death of Lord Blessington, which occurred in 1839. When the widowed countess returned to England she was accompanied by Count D'Ossay, and the two lived under the same roof, first at Seacombe Place and then at Kensington Gore. Their house soon became a resort of the fashionable literary and artistic society of London, which found an equal attraction in host and hostess. The count's charming manner, brilliant wit, and artistic faculty were accompanied by benevolent moral qualities, which endeared him to all his associates. His skill as a painter and sculptor was shown in numerous portraits and statues representing his friends, which were marked by great vigour and truthfulness, if wanting the finish that can only be reached by persistent discipline.

Count D'Ossay had been from his youth a zealous Bonapartist, and one of the most frequent guests at Gore House was Prince Louis Napoleon. It was to Paris, therefore, that he naturally resorted in 1849, after the breaking up of the establishment at Gore in consequence of his bankruptcy. The countess of Blessington, who had accompanied him, died a few weeks after their arrival, and he endeavoured to provide support for himself by adopting the profession of a portrait painter. He was deep in the counsels of the prince president, but the relations between them was less cordial after the coup d'etat, of which the count had by anticipation expressed his strong disapproval. His appointment to the post of director of fine arts was announced only a few days before his death, which occurred on the 4th August 1862.

Much information as to the life and character of Count D'Ossay is to be found in Maiden's "Literary Life and Correspondence of the Countess of Blessington" (1865). Plate IV.

DORSET, an English county, situated on the south-western coast. In British times, previous to the landing of Caesar, it was inhabited by a tribe which Polyaenus calls the Durotriges, and which, upon no good authority, but not without probability, has been identified with the Marns, the occupants of a part of the opposite coast (extremi hominum Marns, &c. viii. 727), the two appellations being apparently of similar import, and referring to their location on the sea-shore. Under the Romans this country constituted a portion of Britanniae Minor, and the Saxons called it Dorseta, or Dorseta (a word involving the same root, Dwr, water), and included it in the kingdom of Wessex.

On the north Dorsetshire is bounded by Somersetshire and Wilts, on the east by Hampshire, on the west by Devonshire and a part of Somersetshire, whilst the British Channel washes the whole of its southern coast. Its form is very irregular; the northern boundary has a considerable angular projection in the middle; its southern coast runs out into various points and headlands; and the western inclines towards Devonshire with an uneven line. Its greatest breadth from north to south is about 35 miles, and its length from east to west 55. Its circumference, including 627,255 acres, is nearly 160 miles. In 1871 the population was found to be 195,537—having increased from 114,452 in 1801 and 175,054 in 1841. 111,731 acres were under corn-crops, and 60,653 under green-crops. The males numbered 99,618, the females 99,921.

Dorset is divided into 35 hundreds, containing more than 300 parishes, 8 boroughs, 22 liberties, and 12 market towns, the principal of which are Dorchester, Bridport, Sherborne, Lyme-Regis, Shaftesbury, Weymouth and Melcombe-Regis, Poole, and Blandford. Only 10 members are returned to parliament, instead of 20 as before the first Reform Act. The county itself sends three; Dorchester, Bridport, Poole, Shaftesbury, and Wareham one each, and Malcombe-Regis and Weymouth two between them. Dorsetshire forms a part of the sea of Salisbury. It originally fell under the wide jurisdiction of the ancient sees of Dorchester in Oxfordshire and of Winchester, till the foundation of the bishopric of Sherborne, 765 A.D., and when that see was transferred to Salisbury it still remained a part of it, till in 31st Henry VIII it was annexed to the newly-erected bishopric of Bristol, and so continued till 1836, when its ancient connection with Salisbury was revived, and still continues.

Branches of the London and South-Western Railway, or in connection with it, enter the county from Southampton, Salisbury, and Bath, meet near Wimborne, and continue to Poole, Weymouth, Dorchester, and Weymouth, which last two places are also reached by a branch of the Great Western from Yeovil, with a drop-line to Bridport at Maiden-Newton. The main line of the London and South-Western likewise touches the north of the county near Weymouth, Gillingham, and Wimborne.

The surface of Dorsetshire is hilly and uneven. Throwing out for the present the consideration of the coast-line in Purbeck, Portland, and to the westward, and proceeding in the direction of from S.E., to N.W., we find a descending series of formations, commencing from the Tertiaries, which occupy an almost equilateral triangle, and include the towns of Wareham, Poole, Wimborne, and Cranborne; passing through a band of Chalk some ten or twelve miles in breadth, in which the chief town Dorchester and Blandford are situated, and which is fringed by a thin belt of Greensand; and thence to the Culmbe beds in the north-east, and the sands at Bridport and the south-west. The three systems thus roughly indicated have been popularly divided into the Sands, the Chalks, and the Clays. It is, of course, the last which has won for this county the somewhat exaggerated, and not uncontested, designation of "the garden of England," though the rich wide vale of Blackmore, and the luxuriant pastures and orchards of the extreme west may fairly support the claim. The Downs of the Chalk district, formerly so celebrated as sheep-walks, have been rapidly disappearing of late years under the influence of a more scientific system of agriculture, though still the stock of sheep pastured in the county amounts to between 600,000 and 600,000. Even in the sandy region, cultivation is advancing, and detached portions are improved, though there is still much waste land, dreary and barren, hardly supporting, even in the summer months, a few sheep and cattle, and supplying the scattered cottars with heath and turf for fuel.

Dorsetshire is not generally speaking a well-wooded county, though much fine timber may be seen, not only in the richer and deeper soils, but elsewhere in the sheltered valleys of the Chalk district, and more especially upon the Greensand. The views from some of the higher hills, which constitute, as it were, the back-bone of the county, are often vastly extensive, ranging on many points from the Needles to the very verge of the Mendip and Quantock Hills, where they sink into the Bristol Channel.

The Dorsetshire air is remarkably mild and salubrious, and in some summer spots of the coast, such as Abbotsbury, even tropical plants are found to flourish. Weymouth has long been celebrated as a watering-place, and owing to the general calmness of the sea there, its pleasant situation, and commodiousness for bathing, still it maintains considerable consequence. The sea-side villages of Swanage, Lulworth, and Charmouth also, though more difficult of access, and affording less accommodation for visitors, abound with many quiet and enjoyable charms.

The chief port of the county is Poole, situated on an estuary formed by the mouth of the Frome. Its entrance is defended by Brownses Castle, — not, however, a military fort.
DORSET

pet, but simply a castellated mansion,—and it is very secure in all winds. It was formerly the chief place for equipping ships for the Newfoundland fishery, and a brisk trade was carried on from it with Spain, Portugal, and the Mediterranean; but it is now chiefly occupied with a coasting trade, and the export of potter's clay. Swanage, Weymouth, Bridport, and Lyme have harbours capable of admitting small vessels only. The magnificent breakwater at Portland, of which the first stone was laid by Prince Albert in 1849, provides a harbour of refuge which is nearly land-locked, and a secure anchorage of almost unlimited extent, and of easy access to the largest class of vessels.

The principal rivers of Dorsetshire are the Frome, the Stour, the Piddle, and the Ivel. The Frome rises in the north-western part of the county, near Everditch, and passing by Dorchester, reaches Poole, and falls into its bay. The Stour enters this county from Wilts'hire, near Gillingham, and, pursuing a southern and south-eastern direction, enters Hampshire. The Piddle rises in the north, and, flowing to the south-east, falls into Poole Bay. The Ivel, anciently the Yeo, has its source from several springs near Horethorn, in a hill north-east from Sherborne, from which town it flows into Somersetshire, and falls into the Parrett, near Yeovil.

Although neither coal nor any metallic ores have ever been found in Dorsetshire, the stone quarries of Purbeck and Portland have long been celebrated Purbeck, though called an island, is more properly a peninsula, of an irregular oval form, about twelve miles in length and seven in breadth. It consists, according to Mantell, of Cretaceous, Wealden, and Oolite strata in their regular order of succession, and highly inclined in their direction towards Swanage Bay, where they are easily detected. At Handfast Point the chalk is discovered, its lower division dipping at a considerable angle; then comes a layer of firestone, next gault, and then greensand—all inclined, then, at Swanage Bay, a thick widden bed, to the south of which are the Purbeck Hills, with their peculiar strata, and, a little further on, the Portland Oolite. The soil is altogether calcareous, and for the most part a continuous mass of either white or a brownish limestone, the latter having a mixture of shell-shales. The quarries on the south side of the island afford an inexhaustible fund of natural curiosities. The best quarries are at Kingston, Worth, Langton, and Swanage. The Swanage stone is white, full of shell, takes a polish, and looks like alabaster. All over the heaths, both here and on the mainland, blocks of indurated Tertiary grit, commonly called firestone, are found, and have been occasionally employed in the building of some of the neighbouring churches; and at Downsbay and Quay, in the parish of Worth, and elsewhere, the beautiful Purbeck marble, so conspicuous in the monuments and shafts of many of our cathedrals and finest churches of the 13th century, and now often sought for their restoration, has been extensively quarried. One of the most valuable products of Purbeck is a white clay used for making pipes, and very largely applied to the manufacture of china. Large quantities of it are dug, and many vessels loaded with it for Staffordshire in the port of Poole.

The Isle of Portland, as it is called, is also a peninsula, rising at its highest point, the Verno, to nearly 500 feet above the sea-level, and sloping gradually to near the water's edge at its extreme southerly point, the Bill. Its famous quarries, about 100 in number, are scattered in directions rather heaps of rubble and unsalable stone. They are Crown-property, and, except where the stone is taken for Government purposes, are leased to various firms, who pay a royalty of so much per ton. Some 50,000 tons are annually raised and exported. The stratum of stone that is worked for sale lies nearly parallel with the upper surface of the island, and without much earth or rubbish on it. The Portland stone (or freestone as it is sometimes called) is well known for its almost white colour, and as composing the materials of the most splendid erections in London, as well as in other parts of the British empire. The connection of Portland with the mainland occurs at some 10 or 11 miles' distance, at Abbotsbury, where a most remarkable beach of raised shingle, called the Chesil (Anglo-Saxon Chesell) or Pebble Beach, touches the shore, being thus far separated from it by a narrow estuary, famous for its swannery, called the Fleet.

The entire length of the beach is from 16 to 18 miles, with an average height of about 40 feet, and a breadth of some 180 or 190 yards, the pebbles constantly decreasing in size from 1 to 3 inches in diameter at Portland, to the size of peas at its termination.

Agriculture throughout the county has made very important advances within the last few years—steam-cultivation and improved implements having been largely introduced, and the growth of root-crops abundantly stimulated by the use of artificial manures. The precious crops of flax and hemp for the supply of the rope and twine works of Bridport are less cultivated than formerly. On the larger farms in the Chalk district a peculiar custom prevails of under-letting the daunes at so much per cow, the farmer finding the stock and the food, and the dairyman disposing of the produce. The horned sheep of Dorsetshire, long celebrated, have now become established as a useful and lucrative breed. Professor Bell, in his History of British Quadrupeds, gives a figure of this, as the typical English sheep, of "a handsome, though somewhat old-fashioned breed, principally esteemed for its producing lambs earlier than any other in this country." "To the eye of him who seeks for beauty in harmony and proportion (he adds) this sheep is one of the handsomest in any part of England. The strong well-formed body and limbs, the clear white fleece, the finely-curved horns, and other points will to him constitute a more pleasing combination of character than is to be found in those breeds which have become more changed from the old stock by repeated transmission of peculiarities, which, however advantageous to the breeder, whether for the sake of the fleece or the flesh, cannot be considered as adding to the abstract beauty of the animal." There are still many fine flocks of this characteristic breed existing in the county, though many farmers prefer the Southdowns or Hampshires, as better adapted to their particular holdings. There is a small breed in Portland, which fattens too highly upon richer pastures, but the mutton of which is an especial dainty, weighing only about 8 lb. a quarter.

The old hardy race of long-horned cattle, formerly common in the hilly districts, are fast disappearing, and Devon, short-horns, and Herefords are almost exclusively now bred. Great quantities of butter are sent to the London market. The skimmed-milk cheese is often much esteemed, though little of it is exported from the county.

Vast numbers of mackerel are taken near Abbotsbury, and along the shore from Portland to Bridport. The season for taking them is from the middle of March till midsummer, in nets or seine nets.

The manufactures of Dorset are not extensive. The principal are those of flax and hemp in the neighbourhood of Bridport and Beaminster, and of pottery and tiles in Bridport. The district near Poole, in which the most of them are made, is also called, and also gloving, are carried on in some of the villages, but the manufactures of lace, and of thread-buttons, formerly flourishing at Blandford and elsewhere, may be said to be now entirely obsolete. At Sherborne these industries have been succeeded by extensive silk-mills.
DORSET

Few, if any, parts of England possess a more abundant treasure of prehistoric remains, than are to be found throughout this county, though the grander monuments of the Roman occupation have not produced the same result. In the flat and fertile districts, where cultivation has been most complete, the manifestations of their former abodes are often surprisingly evident. Vestiges of peaceful British occupation may constantly be traced on portions of the Downs, where and there are still uncultivated, whilst a series of magnificently-fortified camps is found wherever the most prominent heights, and probably served as camps of refuge for the harried tribes and their cattle in times of war and invasion. The grandest of these, called Maiden Castle, is supposed to be the Dumnon of Ptolemy, the stronghold or Acropolis of the Durotriges, whose gigantic ramparts may be seen outlined against the sky between the Weymouth and Bridport roads, about two miles south from Dorchester. Its inner area covers about 44 acres, its outer area about 116, the difference being absorbed in its stupendous double, and sometimes triple, entrenchments, some 60 feet high, and extraordinarily steep. Other grand examples of these hill-fortresses may be seen at Egerton and Filsdon to the westward, at Chaldon and Flowers-barrow to the eastward, and at Rawlbury, or Bulbarrow, Hod (including an equilateral Roman camp), and Hameldon, overlooking the valley of the Stour, and at Badbury, Woodbury, &c., in the more central parts of the county. It has been conjectured with great probability that some of these last were among the oppida subdued in the expedition of Vespasian: and it is not unlikely that in that remarkable chain of tumuli, or barrows, which are visible along the crest of the Ridgeway, now tunnelled for the lines of railroad which connect Weymouth and Dorchester, may have been deposited the ashes of certain nameless heroes who fought the battles either of invasion or resistance. Such barrows are widely distributed elsewhere through the county, and when opened have usually been found to contain little more than burnt bones, corroded metal, and rude cinerary urns, with occasional marks of subsequent Roman interments. A few monoliths, cromlechs, and stone circles have also been recorded.

Of the period of Roman occupation many relics exist. The Via Icenana, or Icknield Street, with various vicinal offshoots, passes through the centre of the county, and connects its chief town Dorchester, or Durnovaria, with Old Sarum and Exeter. An indisputable though scanty fragment of the Roman wall of Dorchester still exists, and the avenues, called the walks, which surround the town appear to follow its ancient course, the trees being planted sometimes on the easter and sometimes in the vaultum. A tesselated pavement, some 20 feet square, was exhumed in 1858 in the grounds of the county prison, and is preserved in its chapel; and various fragments of a similar character, as well as many coins of the later emperors, and other metallic and fictile antiquities, have been and still are not infrequently brought to light, wherever the ground is disturbed. Roman pavements have been found elsewhere,—one at Rampisham in 1795, one at Frampton of unusual size and beauty in 1794, and others at Weymouth, Sherborne, Dewlish, &c. The amphitheatre at Dorchester railway station has been generally attributed to the time of Agricola, and constructed very probably for the amusement of the Roman soldiers by the enforced labour of their captives. It is more perfect than any other remaining in this country, and has been calculated to suffice for nearly 13,000 spectators. The Roman stations in Dorsetshire which antiquarians pretty nearly agree in identifying are Loundini or Loundina, Lyme Regis; Caen-Arica, Charmouth; Durnovaria, Dorchester; Caunton, Weymouth, or a place in the immediate neighbourhood; Monton, or Hamworthy; Bolsehano, Poole; Bindollast, Wimborne, or (Sir R. O. Hoare) GussageCheckout; Iernona, Bere. Of medieval castles no consider-
Cicely, daughter of Sir John Baker of Sissinghurst in Kent, and in 1557 he entered public life as member of parliament for Westminster. In the following year he sat for Euston Grinstead in Sussex, and the record of his activity is still to be found in the Journals of the House of Commons. Queen Elizabeth, who had just come to the throne, was attracted by the handsome person, high culture, and evident ability of her young poet-kinsman, who was accordingly, to quote his own words, "selected to a continual private attendance upon her own person," which did not, however, prevent him from appearing again in the Parliament of 1563 as member for Aylesbury in Buckinghamshire. A visit to the Continent in 1565 was interrupted by an unexplained imprisonment at Rome, and terminated by the news of his father's death, which took place on 21st April 1566. On his return he was knighted in the queen's presence, and obtained the title of Lord Buckhurst, by which he continued to be known though the most of his life. Apartments were provided for him in the queen's palace at Shene, where his mother was in charge, but the simplicity of his mode of life is shown by the fact that, when in 1568, he had to entertain Odet de Coligny, Cardinal de Châtillon, at the queen's command, he failed to satisfy the luxurious desires of his guest, and thus fell under her majesty's displeasure. In 1571 he was sent to France to congratulate Charles IX. On his marriage with Elizabeth of Austria in 1575 he was one of the poets who tried Thomas Howard, earl of Norfolk; and in 1586 he was employed to convey to Queen Mary of Scotland the sentence of death. A more difficult task was found for him in 1587, as ambassador to the Hague he was expected "to expostulate in favour of peace with a people who knew that their existence depended on war, to reconcile those to delay who felt that delay was death, and to heal animosities between men who were enemies from their cradles to their graves." With what fearlessness, fidelity, and sagacity he discharged his duty, has been told in detail by the historian of The United Netherlands, who asserts that there is not a single line in all the ambassador's correspondence which does not reflect honour on his name. But his expostulations with the queen on her paralyzing policy, and his independent conduct towards the royal favourites Leicester, procured him, on his return to England, instead of approbation and reward for his services, an order confining him to his house for nine or ten months in token of her majesty's displeasure. On the death of the earl, however, he was again received into favour; in 1588 he was presented with the Order of the Garter; in 1591 he was elected chancellor of the university of Oxford, his claims having been supported by a royal letter; and, in 1599, on the death of Lord Burghley, he succeeded to the office of Lord High Treasurer of England. In the following year he had to pronounce sentence as High Steward on the earl of Essex, who had been his rival for the chancellorship and his opponent in politics. The change of the dynasty which took place in 1603 left his position unimpaired, his office of Lord Treasurer was confirmed to him by King James, and on 13th of March 1604, he was created earl of Dorset. He died suddenly on April 19th 1608, while sitting at the council table in Whitehall, and left his earldom to his son Robert Sackville.

In the history of English literature Thomas Sackville occupies an honourable position. We no longer possess any of the "sonnets finely sauced" for which, in his student days, he was praised by Jasper Heywood, but we may still read the Ferrez and Ferrez by which he takes rank as the first writer of genuine English tragedy, the Induction to the Mirror of Magistrates, and the Complaint of Henry Duke of Buckingham. The first was written with the assurance of Thomas Norton, during Sackville's connection with the Inner Temple, was acted before Queen Elizabeth in 1591, appeared without the author's permission in 1595, and again in authorized editions in 1570–1 and 1590. The second is a stately allegorical poem of the kind so much in vogue in the reign of Elizabeth, with elaborate personifications of sorrow, death, old age, &c, intended to stand as preface to a series of poems descriptive of the tragic fates of famous men; and the Complaint was to form the first of the series. They all display a lively fancy, and no small command of pure and sonorous English, but hardly awaken any regret that the author soon laid aside the poet's for the diplomatist's pen.

DORSET, CHARLES SACKVILLE, SIXTH EARL OF (1657–1706), eldest son of Richard Sackville, the fifth earl, and Frances Cranfield, eldest daughter of Lionel, earl of Middlesex, was born January 24, 1637, and succeeded his father in 1677. His youth, spent partly in London and partly in Italy, was filled with all the make-up and libertine excesses of the period, but, owing doubtless to the nobler qualities which he none the less displayed, the graceful sobriquet found more favour with the public than the dissolute crew. He was high-spirited, generous, and humane, as years passed on his character ripened and refined, and he who had been the worthy rival of Charles II. lived to be laughed at by Dryden for fidelity to his wife. Though present as a volunteer under the duke of York during the Dutch war in 1665, and afterwards sent on more than one mission to the court of France, he took comparatively an unimportant part in politics until the commencement of the troubles which ended in the Revolution of 1688. Deceived in 1667 of his office as lord-tenant of Sussex, for his refusal to comply with James II.'s arbitrary demands, he soon after became one of the active members of the opposition, and in 1688 assisted the flight of the Princess Anne. After James had left the country, Dorset was a member of the council for the preservation of the public peace; and on William's accession he was appointed lord chamberlain. In 1691 he accompanied the new king to Holland, and, though he was afterwards involved in the accusations of infidelity brought forward by Preston, he retained and deserved the royal favour to the last. He died at Bath in January 1705–6, and was succeeded in the earldom by Lionel Cranfield Sackville, his only son by his second wife, Mary, daughter of James Compton, earl of Essex. Dorset keeps his place in the list of English poets in virtue of a few lyrical and satirical pieces, which, though extravagantly praised by his contemporaries, and, even according to Macaulay, displaying the easy vigour of Suckling and wit as splendid as that of Butler, are after all of no great moment in themselves, and only suggestive of what in happier circumstances the writer might have done. The best known is a pleasant careless song—To all you Ladies now at Lord—written at length shortly before that engagement with the Dutch, in which Admiral Opdam's ship was blown up. As a patron of literature, however, Dorset stands unrivalled,--judicious, impartial, and munificent. To him Prior was indebted for his education, Montagu for promotion, and Wycherly for support against the disfavour of the public. Though compelled bytlown Lord Chamberlain to deprive Dryden of his official laureate, he took care to make good from his private purse the pecuniary loss involved in the dismissal.

See Prior's dedication of his poems to the duke of Dorset; Johnson's Lives of the Poets; Walpole's Royal and Noble Authors; Macaulay's History of England, vol. i chap viii.

DORT, or DORDRECHT, an important commercial city of Holland, at the head of a district in the province of South Holland, 10 miles S.E. of Rotterdam, on the railway between that city and Breda. The island of the Meuse or Merwe on which it stands is said to have been separated
D O R — D O R

Dort, a town of Germany, capital of a circle of the same name, in the district of Arnsberg, and Prussian province of Westphalia, is situated on the Emscher, in 51° 31' 25" N. lat. and 7° 27' 9" E. long. Among the chief structures may be mentioned the large railway station, the workshop and factories of which give employment to upwards of 1000 hands, the Renoldskirche, with a choir built in 1421-1450, the old Marenkirche, and the Gothic Dominican church. To the W. of the station is one of the ancient linden trees of the Kongshoof, where the meetings of the supreme court of the formidable Verhandelung, or secret tribunal of the Middle Ages, were held. In the vicinity of Dortmund are coalworks, in the working of which several thousands of persons are engaged. Since the discovery of iron-ore in the coal district, in 1850, many forges and blast-furnaces have been erected. The manufactures include tobacco, iron and steel, machinery, porcelain, earthenware, oil and flour, woollen, linen, and cotton fabrics. In 1875 the town had 47 breweries, which furnished more than 65 millions of gallons of beer. The population in 1875 was 57,742.

Dortmund, the Thurtmann, Trutenma, Trutsmaria, Tremonia, and Dortmunde of early history, assumes importance in the year 806. In 1005 it was the scene of an ecclesiastical council, and in 1018 and 1250 of imperial diets. The town was walled in the 12th century, and in 1521-22 successfully withstood the troops of the archbishop of Cologne, who besieged it for 21 months. About the middle of the 18th century it joined the Hanseatic League. At the close of the Thirty Years' War the population had become reduced to 3000. In 1659 Dortmund lost its rights as a free town, and was annexed to Saxony. The French occupied it in 1806, and in 1808 it was made over by Napoleon to the grand duke of Berg, and became the chief town of the department of Ruhr. Through thecession of Westphalia by the king of the Netherlands, May 31, 1815, it became part of Prussia.

DOR, or John Dory (Zea faber), an Acantophyryan fish belonging to the family Scorbutula, held in such esteem by the ancient Greeks that they called it Zeus after their principal divinity. Its English name is probably a corrupt from the mainland in 1421, by an inundation which swept away 72 villages, and about 100,000 inhabitants. Concerning its origin there is no authentic information, but it is certainly one of the oldest cities of Holland, and probably dates from the 10th century. It was surrounded by walls in 1231 by Florent IV., count of Holland, who made it his residence, and granted it many important privileges. In 1437 the entire town, including the church of Notre Dame, founded in 1366, and other public buildings, was destroyed by fire. One of the first towns in the Netherlands to embrace the Reformed religion, and to throw off the yoke of the Spanish king, it was chosen in 1572 as the meeting-place of the deputies by whom the independence of the United Provinces was first asserted; and in 1618 and 1619 it became intimately associated with the theological history of Europe, as the seat of the great synod which declared against the Arminian party. Among its celebrities are the De Witts and Ari Scheffer the artist. The town hall is a handsome building, and the principal church is an old Gothic structure 300 feet long by 125 wide, with a heavy square tower, and numerous monumental stones, some of great antiquity. The hall in which the synod was held is now demolished. The houses are generally of an antique fashion, with the gables turned outward, and many of them date from the period of the Spanish occupation. Dort possesses a good harbour, from which two canals lead to the centre of the town. It carries on an extensive trade in corn, flax, salt fish, wheat oil, and the timber which is brought down the Rhine, and it has shipbuilding docks, saw-mills, sugar-refineries, tobacco-factories, linen bleacheries, salt-works, and white-lead works. Population in 1850, 28,878, and in 1874, 25,577.

DORT, SYNOD OF, an assembly of the Reformed Dutch Church, with deputies from France, Switzerland, the Palatinate, Scotland, and England, called to decide the theological differences existing between the Arminians (or Remonstrants) and the Calvinists (or Counter Remonstrants), was held at Dort or Dordrecht in the years 1618 and 1619. During the life of Arminius a bitter controversy had sprung up between his followers and the strict Calvinists, led by Frances Gomar, his professional colleague at Leyden; and, in order to decide their disputes, a synodical conference was proposed, but Arminius died before it could be held. At the conference held at the Hague in 1610, the Arminians addressed a remonstrance to the States-general in the form of five articles, which henceforth came to be known as the five points of Arminianism. This conference had no influence in reconciling the opposing parties, and another, held at Delft in the year 1613, was equally unsuccessful. In 1614, at the instance of the Arminian party, an act was passed by the States-general, in which toleration of the opinions of both parties was declared, and further controversy forbidden, but this act only served, by roasting the jealousy of the Calvinists, to fan the controversial flame into greater fury. Gradually the dispute pervaded all classes of society, and in nearly all the towns both parties began to hold large meetings, and to indulge in threatening words and gestures, until finally, in Nov. 1617, Prince Maurice of Orange, in order finally to decide this controversy, called a synod which met at Dort in Nov. 1618. This synod was strictly national—called by the national authority to decide a national dispute, and not intended to have more than a national influence. The foreign deputies were invited to attend, only to assist by their advice in the settlement of a controversy which concerned almost the entire town alone, and which the Netherlands church alone could decide. At the fourth sitting it was decided to cite Simon Episcopius and twelve other Remonstrants to appear within 14 days before the synod; to state and justify their doctrines. It was also agreed to allow the Arminian deputies to take part in the deliberations, only on condition that they forbore to consult with, or in any way assist, their cited brethren, but this they refused. During the interval between the citation and the appearance of the accused, the professional members of the synod were instructed to prepare themselves to be able to confute the Arminian errors, and the synod occupied itself with deliberations as to a new translation of the Bible, for which a commission was named, made arrangements regarding the teaching of catechisms, and granted permission to the missionaries of the East Indies to baptize such children of heathen parents as were admitted into their families. At the 25th sitting Episcopius and the others cited appeared, when Episcopius surprised the deputes by a bold and outspoken defence of his views, and even went so far as to say that the synod, by excluding the Arminian deputies, could now only be regarded as a schismatic assembly. The Remonstrants were asked to file copious explanations of the five points in dispute, but objecting to the manner in which they were censured, they were, at the 57th sitting, dismissed from the synod as convicted "hars and deceivers." The synod then proceeded in their absence to judge them from their published writings, and came to the conclusion that as ecclesiastical rebels and trespassers they should be deprived of all their offices. The synodical decision in regard to the five points, and the sentence against the Remonstrants, was at the 144th sitting, read in Latin before a large audience in the great church. The Remonstrants were required to subscribe the condemnation, and many of them refusing were banished. The synod was concluded on 29th April 1619, by a magnificent banquet given by the chief magistrate of Dort.

DORTMUND, a town of Germany, capital of a circle of the same name, in the district of Arnsberg, and Prussian province of Westphalia, is situated on the Konschel, in 51° 31' 25" N. lat. and 7° 27' 9" E. long. Among the chief structures may be mentioned the large railway station, the workshop and factories of which give employment to upwards of 1000 hands, the Renoldskirche, with a choir built in 1421-1450, the old Marenkirche, and the Gothic Dominican church. To the W. of the station is one of the ancient linden trees of the Kongshoof, where the meetings of the supreme court of the formidable Verhandelung, or secret tribunal of the Middle Ages, were held. In the vicinity of Dortmund are collieries, in the working of which several thousands of persons are engaged. Since the discovery of iron-ore in the coal district, in 1850, many forges and blast-furnaces have been erected. The manufactures include tobacco, iron and steel, machinery, porcelain, earthenware, oil and flour, woolen, linen, and cotton fabrics. In 1875 the town had 47 breweries, which furnished more than 65 millions of gallons of beer. The population in 1875 was 57,742.

DOR, or John Dory (Zea faber), an Acantophyryan fish belonging to the family Scorbutula, held in such esteem by the ancient Greeks that they called it Zeus after their principal divinity. Its English name is probably a corrupt
tion of the French jaune doré, and has reference to the prevailing golden-yellow colour of the living fish. The body in the dory is much compressed, and is nearly oval in form, while the mouth is large and capable of extensive protrusion. It possesses two dorsal fins, of which the anterior is armed with long slender spines, and the connecting membrane is produced into long tendril-like filaments, while a row of short spines extends along the belly and the roots of the anal and dorsal fins. The colour of the upper surface is olive brown; the sides are yellowish, and are marked with a prominent dark spot, on account of which the dory divides with the haddock the reputation of being the fish from which Peter took the tribute money. It is an inhabitant of the Atlantic coasts of Europe, the Mediterranean, and the Australian seas. It is occasionally abundant on the coasts of Devon and Cornwall, and is also found, though more sparingly, throughout the British seas. It is exceedingly voracious, feeding on mollusks, shrimps, and the young of other fish; and Couch states that from the stomach of a single dory he has taken 25 founders, some 2½ inches long, 3 fatherlachia half grown, and 5 stones fish between an inch and a half in length. They are often taken in the fishermen's nets off the Cornwall and Devon coast, having entered these in pursuit of pilchards. They are seldom found in deep water, preferring sandy bays, among the weeds growing on the bottom of which they lie in wait for their prey, and in securing that they are greatly assisted by their great width of gape, by their power of protruding the mouth, and by the slender filaments of the first dorsal fins, which float like worms in the water, while the greater part of the body is buried in the sand, and thus they entice the smaller fishes to come within easy reach of the capacious jaws. The dory often attains a weight of 12 lb., although these usually brought into the market do not average more than 6 or 7 lb. It is highly valued as an article of food.

DOTIS. See Tots.

DOUAL, or DORAY, an ancient and once strongly-fortified town of France, at the head of an arrondissement, in the department of Nord, situated on the Scarpe, at a railway junction 18 miles S. of Lille. Its triple line of fortifications, partly the work of Vauban and partly of more modern structure, includes a considerably larger space than is requisite for the area of its buildings; the streets are consequently spacious, and the number and size of the gardens unusually large. Besides a variety of administrative offices, the town possesses a court of appeal, which holds its sessions in the palace of the ancient parlement of Paris; a collegiate church, founded by cardinal Allen, for the education of English Roman Catholic priests; the Government school of artillery, a school of drawing and music, a museum of natural history and antiques, enriched with sculptured stones and inscriptions from Bevans, a botanical garden, collection of paintings, and a public library of upwards of 40,000 volumes, and among the rest about 300 manuscripts. The church of Notre Dame dates from the 12th and 14th centuries, and preserves a remarkable painting, containing 254 figures, which formerly belonged to the abbey of Auch, and was apparently the work of an English artist. The museum, which contains a great number of curiosities, is still extant as an artillery magazine; and the town-house ranks as one of the historical monuments of France, and is architecturally interesting for its ogival windows and its belfry and spire. Railways and canals open up to Douai an extensive trade in corn, wine, brandy, cattle, wool, flax, and other agricultural products, and it manufactures lace, gauze, cottons, linens, thread, earthenware, soap, salt, and beer. The origin of the town is a matter of dispute, but it rose into importance in the Middle Ages under the Counts of Flanders, passed afterwards into the possession of the dukes of Burgundy, and thus became subject to the Spanish crown. In 1607 it was captured by the French under Louis XIV.; and though the allies under Marlborough and Eugene obtained possession in 1710, it was retaken by the French in 1711, and finally incorporated with France in 1714. Population in 1872, 21,703.

DOUARNENEZ, a town and watering-place of France, in the department of Finistère, to the S. of a bay of the same name. Its sardine fishery, which is carried on from the end of June to the beginning of December, gives occupation to about 800 boats, and between 3000 and 4000 men; the average number of sardines caught each year is 360,000,000, worth 9,000,000 francs. Population, 7180 in 1872.

DOUBLEDAY, Thomas, an English author in political and general literature. He early adopted the views of his friend William Cobbett, and was active in promoting the agitation which resulted in the passing of the Reform Act of 1832. As secretary of the Northern Political Union of Whigs and Radicals, he took a prominent part in forwarding the interests of Lord Grey and the reforming party. In 1838-59 he was a member of the council of the Northern Reform Union; and to the last he was a keen observer of political events. He succeeded his father as partner in an eminent firm of soap manufacturers at Newcastle, but devoted his attention more to literature than to mercantile affairs. On the failure of the firm he obtained the regentship of St Andrew's parish, Newcastle, a post which he held until appointed secretary to the coal trade. He died at Barnham, near Newcastle, December 18, 1870.

DOUBS, an eastern frontier department of France, so named from its chief river, is formed of the ancient German principality of Montbéliard (Montelpierch), and of part of the province of Franche-Comté. It is bounded E.S.E. by Switzerland, N. by the territory of Belfort and by Haute-Saône, and N.W. and S.W. by Haute-Saône and Jura, and lies between 45° 33' 10" and 47° 33' 43" N. lat., and 5° 3′ and 7° E. long. The surface is chiefly mountainous, four parallel chains of the Jura crossing it from S.W. to N.E. in the loftiest and most easterly chain the principal summit, Mont d'Or, has an altitude of 4800 feet, in the most westerly the highest points do not exceed 1000 feet. The river Doubs rises at the foot of the Noir Mont, in the arrondissement of Pontarlier, and, after twice traversing the department, passes through Jura, enters Sâone-et-Loire, and joins the Saône at Verdun, after a course of 257 miles. It is navigable from Yvovoycourt, near Montbéliard, to its mouth. Near Morteau it forms a cañon 88 feet in height. From Yvovoycourt to Dôle it constitutes a part of the navigable canal between the Rhone and Rhine. The Doubs is well watered by smaller rivers and rivulets. The climate, owing to the differences of elevation, is variable, but it is generally cold and rainy, and the waters are severe. The soil is stony and rocky, and at the higher levels there are numerous peat-bogs. The department may be divided into three regions. The highest, on which the snow usually lies
from six to eight months in the year, is in part barren, but on its less exposed slopes is occupied by forests of fir trees, and affords good pasturage for cattle. In the second or lower region the oak, beech, walnut, and sycamore flourish; and the valleys are susceptible of cultivation. The region of the plains is the most fertile, and produces wheat, rye, maize, hemp, pulse, and grapes and other fruits. Agriculture is in a backward state, but the increasing and drier farming receive much attention. Greyfriars receive to the value of seven millions of francs is produced yearly. The most important manufactures are watches, of which about 300,000 are annually made, cotton and woollen cloths, hardware, cutlery, paper, glass, and leather. There are several iron foundries, and distilleries for brandy and aleuthe; and the trade in cattle, hides, and timber is considerable. Among the mineral products are iron, coal, lignite, marble, building stone, gypsum, glass-sand, and grindstones. Doubs is divided into the arrondissements of Besançon, Pontarlier, Ronne-le-Dames, and Montbéliard, comprising 27 cantons and 629 communes. The capital is Besançon. Of the total area of 522,755 hectares (1,291,300 acres), about 462,353 acres are arable, 299,329 under wheat, 19,848 vineyard, 215,684 meadows, and 229,294 heath. The population in 1872 was 291,251.

DOUGLAS, Francis (1762–1834), an English antiquarian, born in 1762, was the son of one of the six clerks of Chancery. After completing his education he entered his father’s office, but quitted it after a short time, and devoted himself to the collection and study of antiquities. He became a prominent member of the Society of Antiquaries, and maintained an active correspondence with most of the leading antiquaries of his day. For a time he held the post of keeper of manuscripts in the British Museum, but he was compelled to resign it owing to a quarrel with one of the trustees. In 1807 he published his Illustrations of Shakespeare and Ancient Manners (2 vols. 8vo), which contained some curious information, along with a great deal of trifling criticism and mistaken interpretation. An unfavourable notice of the work in the Edinburgh Review greatly irritated the author, and made him unwilling to venture any further publications. He contributed, however, a considerable number of papers to the Archaeologia and Gentleman’s Magazine. In 1829 he published a Dissertation on the various Designs of the Dance of Death, the substance of which had appeared forty years before. He died on the 30th March 1834. By his will he left his printed books, illuminated manuscripts, coins, &c., to the Bodleian Library; his own manuscript works to the British Museum, with directions that they should not be opened until 1900; and his paintings, carvings, and miscellaneous antiquities to Sir Samuel Meyrick, who published an account of them, entitled The Dowonian Museum.

DOUGLAS, the commercial capital of the Isle of Man, and a favourite watering-place, stands on a fine semicircular bay on the east coast of the island, at the junction of the Dho and Glass, in 54° 10' N. lat. and 4° 26' W. long. The older streets, as usual with seaport towns, are irregular and narrow, but the modern ones, on terraces rising beyond the old town, are handsome and spacious. Among the public buildings may be noticed Castle Mona (now converted into a hotel), the “tower of refuge,” on a dangerous rock in the bay, the court-house, the house of industry, the public hospital, and the theatre, which has accommodation for 1000 persons. The ancient parish church of Brundian, partially rebuilt in 1773, has been replaced by a more modern building. There are four chapels and district churches—St Matthew’s, St George’s, St Barnabus’s, and St Thomas’s; and the Roman Catholics, Wesleyan and Primitive Methodists, Congregationalists, and Scotch Presbyterians also have places of worship. The salubrity of the climate, the peculiar characteristics of the surrounding scenery, and the cheapness of living render Douglas a favourite resort. There is communication daily in summer with Liverpool, Fleetwood, and Barrow, twice or thrice weekly with Ireland, and occasionally with Glasgow. The harbour is dry at low water; but vessels drawing not more than 10 feet may enter during neap tides, and those drawing not more than 14 feet during spring tides. A splendid new pier, at which passengers can land and embark at all heights of tide, was erected in 1872, and a spacious promenade, enclosing the greater part of the shore, in 1876. The principal industries are the coasting trade and fisheries.

DOUGLAS, GAWAIN or GAVIN (a. 1474–1522), bishop of Dunkeld, and the ancient classical poet of Scotland, was the third son of Archibald, earl of Angus, known in Scottish history as “Bell-the-Cat.” His mother was Elizabeth, daughter of Robert Lord Boyd, high chamberlain of Scotland. The year when he was born has not been recorded, but it is almost certain that it was 1474, or the beginning of 1475; and of his father’s seat the one most likely to have been his birthplace was Douglas Castle, Lannarkshire.

1 Being intended for the church, Douglas studied at the university of St Andrews, where his name appears in the lists of alumni between 1493 and 1494. In 1504, on his vowing to holy orders, he was shortly afterwards appointed rector of Haust, or Prestonkir, and parson of Linton in East Lothian. In 1501 he was elected dean or provost of the collegiate church of St Giles’s, Edinburgh, an office of dignity and emolument.

2 In the battle of Flodden (1513), when James IV., and many of the Scottish nobility and ecclesiastics were killed, the earl of Angus lost his two eldest sons, which so affected him that he retired to St Mains, a religious house in Galloway, where he soon after died. He was succeeded by his grandson, Archibald, a handsome young nobleman, who attracted the attention of the wadredow Queen Margaret, sister of Henry VIII. of England, and they were married within eleven months after the death of the king. While this precipitate connection incensed the nobility and caused much jealousy of the Douglas family, it seemed to open up a way for the preferment of Gavin Douglas. By the influence of the queen, Douglas was "postulated" by the Pope to the abbacy of Aberbrothock, or Arbroath. He met with such opposition, however, from a rival claimant, that his appointment was never completed, and he was unable to obtain his abbacy. Douglas was next recommended by the queen to the Pope for the archiepiscopate of St Andrews, then vacant; and, relying upon the validity of this appointment, he attempted by force to obtain possession of the castle of St Andrews. He was, however, unsuccessful, and ultimately was passed over in favour of Andrew Forman. At length, by the united influence of the queen and the Pope, he was nominated for the bishopric of Dunkeld, which shortly afterwards became vacant. The people were so indignant at the marriage of the queen with Angus that the Parliament deprived her of the regency of the kingdom and the charge of the young King James V., and appointed the duke of Albany to be regent in her room. One of the first acts of the duke, who came from France to assume the reins of government, was to bring Douglas to trial for intriguing for ecclesiastical benefices with the queen and the pope without the

3 Brechin has been stated as the birth-place of Douglas by Mr D. Black in his history of that town (2d ed. p 287), but no authority for this is quoted.

4 The authority for the former designation is Mylin’s Mils. Visit Episcop Dunkeld, by surrendring which Douglas is by Bishop Rake, and other reasons, rector of Rorn, and by Douglas and others, rector of Hawick. His latter designation is found in the MS. of his Traditions of Virgil, preserved in Trinity College, Cambridge.—Works. 1. p 173.
The marriage of the queen with the earl of Angus proved an unhappy one, and, in consequence of his ill-treatment of her, the queen separated from her husband and joined with the regent against the Douglases. Angus fled to the borders for a time, and in 1521 his uncle Gavin was deprived of his bishopric. The bishop then took shelter at the court of Henry VIII, but in 1522 he died of the plague at London, in the forty-eighth year of his age. His remains were interred in the Hospital Church of the Saviour.

The works of Bishop Douglas, though not numerous, are important. They consist of—(1) The Palace of Honour, a poem written in 1501,—an allegorical description of many gorgeous cavalcades of famous persons troop to a magnificent palace somewhat like Chaucer's Temple of Fame, in the execution of which Douglas has displayed much originality of treatment; (2) Another allegorical poem called The Heart, or the heart of man, descriptive of the progress of life from youth to age; (3) A short poem called Conscience, and (4) A Translation of the Enfer of Vergil, with the supplemental book of Mapheus Pegasus. To each book a short prologue is prefixed, of which the one before the 12th, "Where splendid Douglas paints the blooming May," is perhaps the finest effort of his muse.

This Translation of Vergil, by which Douglas is best known, is a work of which Scotland will always be proud, as it was the first metrical translation of a classical author made in Britain, and the precursor of many others. Although it is very diffuse, from the difficulty its author had in adapting the Doric language of his country to the purpose of translation, by the same reason it is a work of considerable philological value in tracing the history of the literary language of Scotland. Although Douglas was the first native writer who applied the name "Scottus" to the language he employed, he has Scottized many Latin words, and imported many expressions from the French; while his admiration of Chaucer has induced him to swell himself of some of the grammatical forms used by that poet. Still, his translation, written in the broad and widely spread dialect common at an early period to the north of England and Scotland, will always form one of the most important landmarks in Scottish philology. In concluding it Douglas unfortunately took farewell of poetic composition, and entered the arena of political strife, as the following extract shows.—

"Thy pen and instruments full yore
On Vergille post I fix for evermore
Near from thine synk matters to discourse.
My muse shall now be close contemplation
And silent as doth the byrd in cage
On whom thy yoke and servitude is long.
And of my days near pass the half date
That nature sith me granteth, wele I wate;
Thus, an I feild doun awayed the ballance,
Here I recenge yowkens observance,
And wyl dowe my labours evermore
And yow offering, I doo adone Godis worst.

Several early MSS of Douglas's Translation of Vergil exist. One is preserved in the library of Trinity College, Cambridge, copied by his amanuensis, Matthew Geddes, from the bishop's own copy of the first edition, which is in the library of the same college. There are also copies in the library of the University of Edinburgh, and one in that of the Marquis of Bath at Longleat. Of the printed editions one was issued by William Copland at London in 1553, one was printed by Robert Smollett in 1711, and one was presented to the members of the Bannatyne Club in 1559. The Palace of Honour was first printed at London by William Copland, without date, but probably in 1552, and an edition, printed by "Johnes Ros for Ilunse Charters," appeared at Edinburgh in 1579, of which only two copies are known to exist. This edition was reprinted for the Bannatyne Club. The works of Bishop Douglas were first collected and published at Edinburgh in 1874, under the editorship of Mr John Snell, with a life prefixed, and a glossary appended.

DOUGLAS, Stephen Arnold (1813–1861), an American statesman, was born at Brandon, in the State of Vermont, on the 25th April 1813. His father, a physician, died when he was still an infant, and in his youth he had to struggle with poverty. He was apprenticed to a cabinetmaker, but his health failed, and he quitted the employment after a year and a half. He next studied for three years at the academy of Camandaqua, giving special attention in the latter part of his course to law. In 1833 he went to seek his fortune, and settled in Jacksonville, Illinois. Here he supported himself for a few months by acting as an auctioneer's clerk and keeping a school. Called to the bar in March 1834, he quickly obtained a large and lucrative practice, and so early as the following year was elected attorney-general of the State. In December 1835 he was elected a member of the legislature, in 1837 he was appointed registrar of the land office at Springfield, and in December 1840 he became secretary of state of Illinois. He was a judge of the supreme court of Illinois from 1841 till November 1843, when he resigned the office in order to stand a candidate for Congress in the Democratic interest. In 1837 he had failed to secure his return by a majority of 30,000, on this occasion he was successful, being elected by a majority of 400. He took an active share in the Oregon controversy, assailing its principle determination not to yield one inch of the Territory to Great Britain, and advocating its occupation by a military force. He was also a leading promoter of the measures which resulted in the annexation of Texas and the Mexican war. Being chairman of the Territorial committee at first in Congress and then in the Senate, to which he was elected in March 1847, it fell to him to introduce the bills for admitting Iowa, Wisconsin, Minnesota, California, and Oregon into the Union, and for organizing the Territories of Minnesota, Oregon, New Mexico, Utah, Washington, Kansas, and Nebraska. On the recently disputed question of the permission of slavery in the Territories, Douglas advocated, if he was not the first to promulgate, what came to be known as the "popular sovereignty doctrine," by which each territory was to be left to decide the matter for itself in the same manner as a State. The bill for organizing the Territories of Kansas and Nebraska, which Douglas reported in January 1854, caused great popular excitement, as it repealed the Missouri compromise, and declared the people of "any State or Territory" free to form and regulate their domestic institutions in their own way, subject only to the constitution of the United States. There was great indignation throughout the free states, and Douglas, as the chief promoter of the measure, was hanged or burned in effigy in many places. In 1852, and again in 1856, he was a candidate for the presidency in the National Democratic Convention, and though on both occasions he was unsuccessful, he received strong support. In 1857 he distinguished himself by his vigorous opposition to the admission of Kansas into the Union under the Lecompton constitution, which he maintained to be fraudulent. In the following year he was engaged in a close and very exciting contest for the senatorship of Abraham Lincoln, who was the Republican candidate.

DOUR, a town of Belgium, in the province of Hainaut, by D. Douglas in the department of Manche, whose asserted discoveries in Africa have in large measure been relegated to the region of romance. At an early period his imagination seems to have been fired by narratives of travel and adventure, and accordingly, when he fell heir to a wealthy relation, he at once proceeded to gratify his desire for personal acquaintance with foreign lands. He certainly wandered far and wide; and, according to his own profession, he visited India, Kashmir, Khurasan, Persia, Asia Minor, and many parts of Europe. After spending some time in Paris, and being admitted a member of the Société de Géographie, he proceeded in 1826 to Brazil, with the intention apparently of carrying on scientific explorations: from this purpose, however, he was diverted by the political circumstances of the country; and to replenish his funds he started business at Montevideo in partnership with a M. Laboissière. Towards the close of the following year, probably in October, after a short residence at Rio Janeiro, he left Brazil for the Portuguese possessions on the west coast of Africa, where his presence in March 1828 is proved by the mention made of him in certain letters of Castillio Branco, the governor-general of Loanda. In May 1831 he reappeared in Brazil. Claiming to have pushed his explorations into the very heart of Africa, as far as the 27th degree of longitude E. of Greenwich, or, in other words, into what is now known as the great equatorial lake region. His story was readily accepted by the Société de Géographie at Paris, which hastened to recognize his services by assigning him the great gold medal, and appointing him their secretary for the year 1832. On the publication of his narrative:

—Voyage au Congo et dans l'intérieur de l'Afrique équatoriale— which occupied four large volumes, and was accompanied by an elaborate atlas, the public enthusiasm might well run high. In company with his wife (a sister of his old Montevidean partner), and attended by about 400 native porters, the happy traveller had advanced from kingdom to kingdom rather like a monarch making a progress through his tributary states, distributing largesses and receiving homage, than like a humble adventurer defraying his expenses from his private purse. Everything went smooth for a time; the interior of Africa was described in text books and depicted in maps according to the discoveries of Douville; but in the August number of the Foreign Quarterly Review for 1832 the most sweeping charges of ignorance and fraud were launched against the author, and this attack was followed up in the Jouve des deux Mondes for November, by Thomas Lecardaire, who asserted that, during part of the time which he claimed to have spent in Africa, Douville had been a familiar object in the streets of Rio Janeiro. The tide of popular favour turned; and, in spite of the explanations furnished by Douville in Ma défense, 1852, and Trente mois de ma vie, ou quanse nous avons et quanse nous avons après mon voyage au Congo, 1833, the general decision was openly against him. Mlle. Aurdrun, a lady to whom he was about to be married, committed suicide from grief at the disgrace; and, after vainly attempting to obtain satisfaction from Lecardaire by duel, the poor adventurer himself withdrew in 1833 to Brazil, and proceeded to make explorations in the valley of the Amazon. According to Dr Gardner, in his Travels in the Interior of Brazil, he was murdered in 1837 on the banks of the São Francisco for charging too high for his medical assistance. His Brazilian manuscripts fell into the hands of M. S. Rang, by whom they were transmitted to M. Ferdinand Denys. While modern exploration has nothing to support the wider pretensions of Douville, no less an authority than Captain Burton asserts that his descriptions of the country of the Congo are life-like and
picturesque; that his observations on the anthropology, ceremonies, customs, and maladies of the people are remarkably accurate; and that even the native words inscribed into the text of his narrative “are for the most part given with unusual correctness.”

DOUG, or Dow, Gerhard (1613–1680), a celebrated Flemish painter, was born at Leyden on the 7th April 1613. His first instructor in drawing and design was Bartholomew Bolendo, an engraver, and he afterwards learned the art of glass-painting under Peter Krouwelonk. At the age of fifteen he became a pupil of Rembrandt, with whom he continued for three years. From the great master of the Flemish school he acquired his skill in colouring, and in the more subtle effects of chiaroscuro, and the style of Rembrandt is reflected in several of his earlier pictures, notably in a portrait of himself at the age of twenty-two, in the Bridgewater Gallery, and in the Blind Tobit going to meet his Son, at Wardour Castle. At a comparatively early point in his career, however, he had formed a manner of his own distinct from, and indeed in some respects antagonistic to, that of his master. Gifts of an unusual clearness of vision and precision of manipulation, he cultivated a minute and elaborate style of treatment, and probably few painters ever spent more time and pains on all the details of their pictures down to the most trivial Hire; but he also have spentfive a large, and his work was so fine that he found it necessary to manufacture his own brushes. Notwithstanding the minuteness of his touch, however, the general effect was harmonious and free from stiffness, and his colour was always admirably fresh and transparent. He was fond of representing subjects in lantern or candle light, the effect of which he reproduced with a fidelity and skill which no other master has equalled. He frequently painted by the aid of a concave mirror, and to obtain exactness looked at his subject through a frame crossed with squares of silk thread. His practice as a portrait painter, which was at first considerable, gradually declined, attests being unwilling to give him the time that he deemed necessary. His pictures were always small in size, and represented chiefly subjects in still life. Upwards of two hundred are attributed to him, and specimens are to be found in most of the great public collections of Europe. His chief d'œuvre is generally considered to be the Woman sick of the Palsy, in the Louvre. The Evening School, in the Amsterdam Gallery, is the best example of the candle-light scenes in which he excelled. In the National Gallery favourable specimens are to be seen in the Poultière's Shop and Portrait of Himself. Doug's pictures brought high prices, and it is said that President Van Spring of the Hague paid him 1000 florins a year simply for the right of pre-emption. Dow died in 1650. His most celebrated pupil was Franciscus Michi.

DOVE (Dutch, Duif; Danish, Dve; Icelandic, Dyfa, German, Taube), a name which seems to be most commonly applied to the smaller members of the group of birds by ornithologists usually called Pigeons (Columba), but no sharp distinction can be drawn between Pigeons and Doves, and in general literature the two words are used almost indiscriminately, while no one species can be pointed out to which the word Dove, taken alone, seems to be absolutely proper. The largest of the group to which the name is applicable is perhaps the Ring-Dove, or Wood-Pigeon, also called in many parts of Britain Coot and Queest (Columba palumbus, Linnaeus), a very common bird by throughout these islands and most parts of Europe. It associates in winter in large flocks, the numbers of which (owing partly to the destruction of predatory animals, but still more to the modern system of agriculture, and the growth of plantations in many districts where before were none) have of late years increased enormously, so that their depredations are very serious. In former days, when the breadth of land in British under green crops was comparatively small, these birds found little food in the dead season, and this scarcity was a natural check on their multiplication: even the extended cultivation of turnips and plants of similar use the case is altered, and perhaps at no time of the year has proved more plentiful than in winter. The Ring-Dove may be easily distinguished from other European species by its larger size, and especially by the white spot on either side of its neck, forming a nearly continuous "ring," whence the bird takes its name, and the large white patches in its wings, which are very conspicuous in flight. It breeds several times in the year, making for its nest a slight platform of sticks on the horizontal bough of a tree, and laying therein two eggs—which, as in all the Columbidae, are white.

The Stock-Dove (C. anatina, Temminck) much resembles the Stock-Dove, but is of a lighter colour, with two black bars on its wings, and a white band forming a tuft on each side of its tail. In its wild state it haunts most of the rocky parts of the coast of Europe, from the Faroe to the Cyclades, and, seldom going inland, is comparatively rare. Yet, as it is without contradiction the parent-stock of all our domestic Pigeons, its numbers must far exceed those of both the former put together. In Egypt and various parts of Asia it is represented by what Mr Darwin has called "Wild Rences," which are commonly accounted good "species" (C. cincta, C. examines, C. intermedia, C. leucotos, and so forth), though they differ from one another far less than do nearly all the domestic forms, of which more than 150 kinds that "breed true," and have been separately named, are known to exist. Very many of these, if found wild, would have unquestionably been ranked by the best ornithologists as distinct "species," and several of them would undoubtedly have been placed in different genera. These various breeds are classified by Mr Darwin in four groups as follows:—

**Group I.** composed of a single Race, that of the "Pouters," having the gullet of great size, barely separated from the crop, and often inflated, the body and legs elongated, and a moderate bill. The most strongly marked example, the Imperial English Pouter, is considered to be the most distinct of all domesticated pigeons.

**Group II.** includes three Races—(1) "Carriers," with a long pointed bill, the eyes surrounded by much loose skin, and the neck and body much elongated, (2) "Runters," with a long, massive bill, and the body of great size, and (3) "Turbits," with a short, broad bill, much bare skin round the eyes, and the skin over the nostrils swollen. Of the first four and of the second five subraces are distinguished.

**Group III.** is confessedly artificial, and to it are assigned five Races—(1) "Fan-tails," remarkable for the extraordinary development of their tails, which may consist of as many as forty-two rectrices in place of the ordinary twelve, (2) "Turbits" and "Owls," with the feathers of the throat diverging, and a short thick bill, (3) "Tumbler," possessing the marvellous habit of tumbling backwards during flight, or, when on the ground, from having a short, concave bill, (4) "Full-backs," in which the feathers are reversed, and (5) "Jacobins," with the feathers of the neck forming a hood, and the wings and tail long.

**Group IV.** greatly resembles the normal form, and comprises two Races—(1) Transmitters, with a tuft of feathers at the base of the neck curling forward, the face much feathered, and a very peculiar voice, and (2) Pigeons scarcely differing in structure from the wild stock.

Besides these some three or four other little-known breeds exist, and the whole number of breeds and sub-breeds 1.

---

almost defies computation. The difference between them is in many cases far from being superficial, for Mr Darwin has shown that there is scarcely any part of the skeleton which is constant, and the modifications that have been effected in the proportions of the head and orbital apparatus are very remarkable. Yet the proof that all these different birds have descended from one common stock is nearly certain. Here there is no need to point out its bearing upon the "Theory of Natural Selection" which that eminent naturalist and Mr Wallace have rendered so well known. The antiquity of some of these breeds is not the least interesting part of the subject, nor is the use to which one at least of them has long been applied. The Dove from the earliest period in history has been associated with the idea of a messenger (Genesis viii. 8-12), and its employment in that capacity, developed successively by Greeks, Romans, Muslims, and Christians, has never been more fully made available than in our own day, as witness the "Pigeon-post" established during the recent siege of Paris.

Leaving, then, this interesting subject, space does not permit our here dwelling on various foreign species, which, if not truly belonging to the genus Columba, are barely separable therefrom. Of these examples may be found in the Indian, Ethiopian, and Neotropical Regions. Still less can we here enter upon the innumerable other forms, though they may be entitled to the name of "Dove," which are to be found in almost every part of the world, and nowhere more abundantly than in the American Region. Mr Wallace (Ibis, 1865, pp. 365-400) considers that they attain their maximum development in the Papuan Subregion, where, though the land-area is less than one-sixth that of Europe, more than a quarter of all the species (some 300 in number) known to exist are found—owing, he suggests, to the absence of forest-haunting and fruit-eating Mammals.

It would, however, be impossible to conclude this article without noticing a small group of birds to which in some minds the name Dove will seem especially applicable. This is the group containing the Turtle-Doves—the three-honoured emblem of tenderness and conjugal love. The common Turtle-Dove of Europe (Turtur auriatus) is one of those species which is gradually extending its area. In England, not much more than a century ago, it seems to have been chiefly, if not solely, known in the southern and western counties. Though in the character of a straggler only, it now reaches the extreme north of Scotland, and is perhaps nowhere more abundant than in many of the midland and eastern counties of England. On the continent the same thing has been observed, though indeed not so definitely; and this species has within the last twenty years or so appeared as a casual visitor within the Arctic Circle. The probable causes of its extension cannot here be discussed; and there is no need to dwell upon its graceful form and the delicate harmony of its modest colouring, for they are proverbial. The species is migratory, reaching Europe late in April and retiring in September. Another species, and one perhaps better known from being commonly kept in confinement, is that called by many the Collared or Barbary Dove (T. variegata)—the second English name probably indicating that it was by way of that country that it was brought to us, for it is not an African bird. This is distinguished by its cream-coloured plumage and black necklace. Some uncertainty exists to say about its original home, but it is found from Constantinople to India, and is abundant in the Holy Land, though there a third species (T. senegalensis) also occurs, which Canon Tristram thinks is the Turtle-Dove of Scripture. (A. E.)

DOVER (the ancient Dubris), principal county port of England, is situated close to the South Foreland, 72 miles from London, in a main valley of thechalk hills corresponding with the opposite cliffs between Calais and Boulogne. Its dominant object is the castle, on the east heights. Within its walls stands the Roman pharos; the Romano-British fortress church, remaining not only as a ruin, but (excepting roof) integrally in situ, forming a primitive Christian relic, unique in Christendom; some remains of the Saxon fort; and the massive keep and subsidiary defences of Norman building. These ancient works provide for a garrison of 750; but they are now covered by the superior fort of Burggeys, a position of great strength for 221 men. The western heights, where is still the foundation of a consort Roman church, form a circuit of elaborate fortifications, with provision for 2000 troops. Between these, and stretching inland, lies the town, of which the following are the principal features. 1. The harbour, once at the eastern, is now at the western extremity,—its three considerable basins being fit for mail steamers and ordinary trading vessels. 2. The admiralty wall is a massive structure of solid concrete and masonry extending about one-third of a mile into the sea, affording lee and landing accommodation for vessels of almost any burthen, made for ultimate connection by break-water with a horn east of the castle, so inclining the bay as a vast harbour. 3. The visiters' quarter consists of ranges of good houses along the length of the seaboard and elsewhere, notably a fine elevation newly built on a western spur of the Castle Hill. 4. Of old Dover, within its walls and gates, but little remains, except a remnant of the Saxon collegiate church of the canons of St Martin, and the parish church of St Mary the Virgin—rebuilt and enlarged in 1843-44, but preserving the three bays of the Anglo-Saxon church, with its western narthex, on which had been superimposed the Norman tower, still preserving its rich front to the street. 5. A later Norman church stands under the Castle Hill, which has been partially restored, but its parochial status trans-
D O V — D O W

331

fered to the new parish church of St James. There are
the two other modern churches—Holy Trinity and Christ-
church, and, further up the valley, the parish church of
Charlton (originally Norman) and Backwell (Early En-
lish), which, including the Castle Church, completes the
former number of seven for the town. There are also 13 chapels
of nondenominational worship, representing most denomina-
tions, and placed in various parts of the borough. 6. The
remains of the once (12th century) splendid foundation
of St Martin’s Priory include the great gate, the house
rectory with campanile, and the spacious strangers’
rectory, lately converted into the college school-room.
7. Just across the High Street stand the tower and
truncated fabric of the noble hall of the hospital Mason
Dien, founded (13th century) for the reception of pilgrims
of all nations, long used as a Crown victualling office, but
latterly purchased by the corporation and adapted for a
town hall, with prison cells as basements, and other prison
buildings annexed, the former chapel of the society serving
now as a court of sessions. 8. The ground works of a round
(Holy Sepulchre) church of the Templars is on the opposite
heights, approaching the citadel. 9. Among the centres
of educational work are a proprietary college, occupying
the site and remaining buildings of St Martin’s Priory, for a
cheap but sound education of town boys, and for
boarders in the masters’ houses, and also a strong array of
national schools, worked up to a high mark, according
to HM. Inspectors’ reports, and providing means for a good
practical education of about 3400 children. In physical
conditions the place is exceptionally healthy, the registrars-
generals’ returns showing them in some years to be little
below those of the Malvern Hills. The steep shore and
open downs make it agreeable for bathing and summer
resort; and it has constant sea-going interest from the Con-
tinental mail service, and the course of vessels up and
down channel lying within two miles of the shore.
Objects of interest within easy reach are—the St Foredale
electric light-houses; the (ford Norman) church of St
Margaret’s; the Templars’ Manor, Ewell, St Radegund’s
Abbey, the Preceptory of Knights of St John, Swingfield;
rich Norman votive chapel, Barlrestone. There are two
lines of railway to London—one traversing the Wend of
Kent, the other following the old Roman road, via Canter-
bury and Rochester. Dover returns 2 members to Parlia-
ment, and is governed by a mayor, 6 aldermen, and 18
councillors. The area of the borough is 1296 acres.
Population (1871), 32,690.

DOVER, a city of the United States, capital of
Delaware, on Jones Creek, 9 miles inland from Delaware
Bay, and 48 miles south of Wilmington. It is a regular
brick-built place, with broad, well-shaded streets, being a
State house, a court-house, six churches, an academy, and
several other public buildings, and causes on a brisk trade
in preserved fruits. Population in 1870, 1003, of whom
301 were people of colour.

DOVER, George James Welldrove Agar Ellis, Baron
(1797–1833), born on the 14th January 1797, was the
east son of the second Viscount Childen. He was
educated at Christ Church, Oxford, and in 1818 he was
returned to Parliament as member for Heytesbury. He
afterwards represented Seaford (1820), Ludgrove (1826),
and Oakhampton (1830). In party politics he took little
interest; but he was a zealous and enlightened advocate
in Parliament and elsewhere of state encouragement being
given to the cause of literature and the fine arts. In 1824
he was the leading promoter of the grant of £37,000 for
the purchase of Mr Angerstein’s collection of paintings
which formed the foundation of the National Gallery.
On the formation of Lord Grey’s administration, in November
1830, he was appointed chief commissioner of woods and
forests. The post was one for which his tastes well fitted
him, but he was compelled by delicate health to resign it
after two months’ occupancy. In June 1831, during the
lifetime of his father, he was raised to the House of Lords
under the title of Baron Dover. His services to the cause
of learning and the fine arts, as well as his own distinction as
an author, led in 1833 to his election to the presidency of
the Royal Society of Literature. He died in the 10th
July 1833 Lord Dover’s literary works were chiefly his-
torical, and included The True History of the Iron Mask,
extracted from Documents in the French Archives (1826),
Historical Inquiries respecting the Character of Clarendon
(1827), and A Life of Frederick the Great (1831). He also
edited the Ellis Correspondence and Walpole’s Letters to Sir
Horace Mann. He left in manuscript a volume written
for the instruction of his son, which was published
posthumously under the title Lives of the Most Eminent
Sovereigns of Modern Europe. A fourth edition of this
work appeared in 1850.

DOW, Lorenzo (1777-1834), an American preacher,
noted for his eccentricities of dress and manner, was born
at Coventry, Connecticut, U.S., October 16, 1777. He
received but a limited education, and was much troubled
in his youth by religious perplexities; but he ultimately
joined the Methodists, and was appointed a preacher (1799).
The same year, however, his official connection with that
body ceased, and he came over to preach to the Catholics
of Ireland. He attracted great crowds to hear and see
him, and was often persecuted as well as admired. He
also visited England, introduced the system of camp meet-
ings, and thus led the way to the formation of the Primitive
Methodist Society. These visits were repeated in 1805
Dow’s enthusiasm sustained him through the incessant
labours of more than thirty years, during which he preached
in almost all parts of the United States. His later efforts
were chiefly directed against the Jesuits. His Pelagian
Works were published in 1814. Among his other writings
are The Stranger in Charleston, or the Trial and Confess-
of Lorenzo Dow (1822), A Short Account of a Long Trip
(1829), and the History of a Conaposta. He died
February 2, 1834.

DOWLETABAD, a city and fortress of India, in
the north-western corner of the Nizam’s Dominions, near one
of the right-hand tributaries of the Godavary. Though
still the centre of an administrative district, the city has sunk into comparative insignificance since the rise of Armagh, about ten miles to the east; but the fortress remains, from its natural position, one of the most remarkable in the country. It occupies the conical top of a great granite rock, which rises abruptly from the plain to a height of at least 300 feet, and is encompassed at the foot by a ditch upwards of 30 feet wide. The only means of access to the summit is afforded by a narrow bridge, with passage for not more than two men abreast, and a long gallery, excavated in the rock, which has for the most part a very gradual upward slope, but about midway is intercepted by a steep scram, the top of which is covered by a grazing destined to time of war to form the hearth of a huge fire kept burning by the garrison above. In spite, however, of its natural strength and its various artificial defences, the fortress has frequently been taken. When about the year 1293 the Mahometans invaded this part of the Deccan, Deogurh, as the city was then called, was the wealthy residence of a powerful rajah. In 1306 it was occupied by Mallek Nab, the emperor of Delhi's general; and in the early part of the same century Mahomet III, in his anxiety to make it the capital of his kingdom and worthy of its new name of Dowvetabad, or Aboe of Prosperity, endeavoured, but in vain, to cause a wholesale transmigration of the inhabitants of Delhi. About the year 1595 it surrendered to Ahmed Nisam, shah of Ahmadnagar; and on the fall of his dynasty it was taken possession of by Mallek Amber, an Abyssinian slave. His successors reigned till 1604, when it was taken by the Moguls, who transferred the seat of government to Aurungabad. In the 18th century it passed into the possession of Nizam el Malik.

DOWN, a maritime county of Ireland, in the province of Ulster, occupying the most easterly part of the island, is bounded N. by the county Antrim and Belfast Lough, E. and S. by the Irish sea, and W. by the county Armagh. Its area, including Ballymacarret, a suburb of Belfast (1670 acres), covers 967 square miles, or 612,409 acres. The coast-line is very irregular, and is indented by several loughs and bays. The largest of these is Strangford Lough, a fine sheet of water studded with 260 islets, 54 of which have names, and all of which are finely wooded or rich in pastureage. The lough runs for ten miles northwards, and the ancient castles and ruined abbeys on the islets render the scene one of singular interest and beauty. Further south Dundrum Bay forms a wider expanse of water. In the south-west Carlingford Lough separates the county from Louth. On its north-east shore lies the village of Rosstrevor, now the resort of invalids from all parts of the United Kingdom.

Mountains.—Between Strangford and Carlingford loughs the county is occupied by a range of hills known in its south-western portion as the Mourne Mountains, which give rise to the four principal rivers—the Bann, the Lagan, the Annacloy, and the Nevery. The highest peak in the Mourne range is named Slieve Donard. It is 2796 feet above the level of the sea, and is exceeded only by one peak, Lugdoo, in the Wicklow range, and the higher peaks in Killarney.

Springs.—Down is celebrated for its holy wells and mineral springs. The chalybeat are more numerous than the sulphurous, but both abound. There are springs at Ardmullan, Granshaw, Dundonnell, Magheralin, Dromore, Nevery, Banbridge, and Terkeely. The Struel springs, a mile south-east of the town of Downpatrick, are celebrated for their healing properties. Fifty years ago these were regarded as possessing not only chemical wealth in rare abundance, but miraculous powers; and the decline of public credulity in the latter was coincident with the failure of the wells. To this day, however, the wells, which are four in number, are visited, and certain religious observances maintained, sometimes for a week. Circuits on the knees are made round the wells; and amongst the ignorant the reputation of the sacred waters remains unimpaired.

The scenery of the county is pleasantly diversified, the people are intelligent and comparatively well educated, the landed proprietors are resident, and there is a thriving independence which may be looked for in vain outside the province of Ulster.

Minerals.—There are several quarries of fine sandstone. The best is that on Scrabo Hill, near Newtownards, where a very close-grained, clear-coloured, and hard and durable stone is raised. Limestone is not very general. Near Comber, on the shores of Strangford Lough, is a very hard and sparkling kind of reddish granular limestone. But the greatest magazine of this rock is in the vicinity of Moura, where the stone lies very near the surface. Granite occurs in many places in detached masses, but the great body of it is confined to the southern and western regions, chiefly in the Mourne Mountains. Crystals of topaz and beryl are found in the granite of Slieve Donard. Indications of lead have been discovered near Castlereagh, Killough, Newtownards, and Warrenpoint; and traces of copper in the Mourne Mountains near Rosstrevor.

Soil.—The predominating soil is a loam of little depth, in most places intermixed with considerable quantities of stones of various sizes, but differing materially in character according to the nature of the subsoil. Clay is mostly confined to the eastern coast, and to the northern parts of Castlereagh. Of sandy soil the quantity is small; it occurs chiefly near Dundrum. Moor grounds are mostly confined to the skirts of the mountains. Bogs, though frequent, are scarcely sufficient to furnish a supply of fuel to the population.

According to Owners of Land Return (1876), there were, in 1873, 3056 separate proprietors, owning a total area of 608,214 acres, valued at £775,518. The number of owners of less than 1 acre numbered 1460, or 40 per cent, that of all Ulster being 48 per cent. The average size of the properties was 165½ acres, and the average value per acre was £21.5s.6d., as against 259½ acres and 16s.8½d. respectively for Ulster. As in the neighbouring counties of Antrim and Armagh, the value of the land in Down is considerably higher than that of the rest of the province. Eighteen proprietors owned upwards of 6000 acres each, and among them an aggregate extent equal to 46½ per cent. of the total area,—the principal holders being—Marquis of Downshire (Hillsborough), 64,356 acres; the Kilmerley Trustees, 37,454; Earl of Annesley (Castlewellan), 23,567; Marquis of Londonderry (Newtownards), 23,554; Colonel W. B. Forde (Seaford), 19,882; Earl Dufferin (Clondeboy), 18,328; Hon. R. Meade's trustees (Dromore), 13,492; R. N. Batt (Belfast), 12,010; and Lord A. E. Hill-Trevor, 10,940.

Agriculture.—Of the total area of the county, which is 610,740 acres (exclusive of Ballymacarret), there are 333,541 acres under tillage, 187,604 in pasture, and 12,027 under wood. Although comparisons as to yields of crops between different periods is now fallacious, inasmuch as the increased and increasing importation of wheat into Ireland has altered the system of agriculture, it may be mentioned that, while in five years the cultivation of wheat has fallen from 244,451 acres to 119,597 in Ireland, during the same period in Down the decrease was from 32,734 acres to 21,272. There are many landed proprietors who hold large tracts in their own hands. The great bulk of the proprietor ship is orderly and industrious. Their dwellings are better constructed and furnished than those for a similar class in other parts of Ireland. The pro-
ceases of agriculture, owing in a great degree to the example set by the resident gentry, are skilfully carried on. The land is well cultivated. The farms are in some districts small, and the effect of emigration has been to consolidate the holdings.

The breed of horses is an object of much attention, and some of the best racers in Ireland have been bred in this county. The native breed of sheep, a small hardy race, is common to the mountains. The various other kinds of sheep have been much improved by judicious crosses from the best breeds. Hogs are reared in great numbers, chiefly for the Belfast market, where the large exportation occasions a constant demand for them, and those of very superior quality being prepared in that town.

The following figures give the average of the principal crops and the numbers of live stock raised in the years 1873 and 1876 respectively:

Along with Tyrone, the county grows the largest extent of flax in Ireland, and the largest extent of the oil-seed flax. The county is divided into the boroughs of Downpatrick, Hillsborough, Newry, and Newtownards; and the large stock Down possesses, a greater number of horses than any other Irish county with the exception of Cork.

Fisheries—These are not developed as they might be. The Kilkeel herring fishery realized £1203 in 1871, £2000 in 1872, £13,249 in 1873, £2000 in 1874, and £15,060 in 1875. There are fishing stations at Donaghadee, Strangford, Newcastle, and Carlingford; the total number of vessels in 1875 was 678, and of men and boys 2537.

In 1850 there were 1468 vessels and 4640 hands.

Administration—The county is divided into 14 baronies, 70 parishes, and 123 townlands. It forms part of the united dioceses of Down, Connor, and Dromore; and it belongs to the military district of Belfast. The assizes are held at Downpatrick; quarter sessions at Banbridge, Downpatrick, Hillsborough, Newry, and Newtownards; and there are 26 petty sessions districts.

The poor-law unions of Downpatrick, Kilkeel, and Newtownards are wholly within the county, and those of Banbridge and Newry partly in Down and partly in Armagh. The total sum expended in poor-law administration in 1875 was £21,076, and the average daily number of paupers 1280.

The county prison and infirmary are in Downpatrick, but the county lunatic asylum is in Belfast. Down returns 14 members to Parliament—2 for the county at large, 1 for Downpatrick, and 1 for Newry. Portions of the boroughs of Belfast and Lisburn are in Down county, but they are regarded more properly as parts of Antrim and Armagh respectively.

Previous to the Act of Union Down returned 14 members to the Irish Parliament—2 for the county at large, and 2 each for the boroughs of Banbridge, Downpatrick, Hillsborough, Newry, Newtownards, and Kilkeel.

Population.—The general decrease of population in the province of Ulster between the census of 1851 and that of 1871 indicates a percentage of 8%, while that of this county amounts to 13%. This decrease may be ascribed in some part to the migration of the people to Belfast and the neighbouring manufacturing towns, as well as to the emigration to foreign countries. In 1851, the inhabitants of Down (exclusive of the part of Belfast) numbered 320,617; in 1861, 320,302; in 1871, 277,294, of whom 130,457 were males and 146,837 females.

At the last census it appeared that 31% per cent. belonged to the Roman Catholic persuasion, the numbers being—Catholics, 88,003; Episcopalian, 60,865; Presbyterian, 116,017; and others, 15,406. There were at the same time 140,866 persons of five years and upwards who could read and write, 57,140 who could read but could not write, and 45,792 who were illiterates. There were 20 superior schools in the county, and 527 primary schools.

The following are the principal towns—Newtownards, population 5552, Banbridge, 5600, Downpatrick, 4155; Holywood, 3573, Gilford, 2729; Bangor, 2560; Dromore, 2108; Donaghadee, 2226; Comber, 2056; Portaferry 1938; Rathfriland, 1827; Warrenpoint, 1806; Killyleagh, 1772; Kilkeel, 1335; and Ballymaloe, 1229.

Newry, partly in Down and partly in Armagh county, has a population of 14,213.

History and Antiquities—From the period of the English settlement to the Irish revolt in 1633, Down formed two counties, Newtownards in the north and Down in the south. The English settlers at that time were driven into the maritime baronies of Ards, Leigh, and Moone, of which they in part retained possession. The remainder of the district fell into the hands of Irish families, the O'Neills of Clancboy, the MacArtans, MacMorris, and MacGinnesses, whose possessions, however, reverted to the crown on the attainder of Shane O'Neal, in the latter half of the 16th century; but having afterwards submitted to the Government, they retained their former estates. In 1660 the O'Neal estates were again restored, and granted to Sir Hugh Montgomery and Mr Hamilton, who planted Scotch colonists on the land. The estates of the remaining old Irish, and Anglo-Norman families were mostly forfeited in the rebellion of 1641, or subsequently at the Revolution.

The county is not noted for its interesting ruins. At Strabane, near the borders of Antrim, there is a group of ten or twelve pillar stones in a circle, about 10 feet in height. A very curious cairn on the summit of Slieve Croob is 80 yards in circumference at the base and 80 at the top, where is a platform on which carns of various heights are found standing. The village of Anadorn is famous for a cairn covering a cave which contains ashes and human bones. Cromlechs, or altars, are numerous, the most remarkable being the Giant's Ring, which stands on the summit of a hill near the borders of Antrim. This altar is formed of an unwrought stone 7 feet long by 61 broad, resting in an inclined position on rude pillars about 3 feet high. This solitary landmark is in the centre of an inclosure about 3 miles in circumference, formed of a rampart about 20 feet high, and broad enough atop to permit two persons to ride abreast. Near Downpatrick is a road, or mound of earth, three-quarters of a mile in circumference, its exterior consisting of three artificial ramparts, the largest of which is 30 feet broad. In its vicinity are the ruins of Saul Abbey, said to have been founded by St Patrick, and Inch Abbey, founded by Sir John de Courcy in 1180. The number of monastic ruins is also considerable. The most ancient and celebrated is the abbey or cathedral of Downpatrick, supposed to have been founded by St Patrick soon after his arrival here in 432, and said to contain his remains, together with those of St Columba and St Bridget. It was restored in 1790, when the adjoining round tower was taken down.

DOWNPATRICK, a municipal and parliamentary borough and market-town of Ireland, capital of the county of Down, 18 miles S.E. of Belfast, and 74 N.W. of Dublin. Downpatrick lies in a valley formed by hills of some elevation, near the south-west extremity of Strangford Lough, and is divided into the English, Irish, and Welsh quarters. It consists of four main streets meeting near the centre, the principal of which are the Irish and English streets. In the former all business is carried on; the latter is well built, and contains many private residences.
DOXOLOGY, a hymn in praise of the Almighty. The name is often applied to the Trisagion, or "Holy, Holy, Holy," the scriptural basis of which is found in Isaiah vi. 3; to the Hallelujah of several of the Psalms and of Rev. xix.; and to the last clause of the Lord's Prayer according to Saint Matthew, which critics are generally agreed in regarding as an interpolation. It is used, however, more definitely as the designation of two hymns distinguished by liturgical writers as the Greater and Lesser Doxologies. The origin and history of these is impossible to trace fully. The germ of both is to be found in the Gospels; the first words of the Greater Doxology, or Gloria in Excelsis, being taken from Luke x. 14, and the form of the Lesser Doxology, or Gloria Patri, having been in all probability first suggested by Matt. xxviii. 19. The Greater Doxology, in a form approximating to that of the English prayer-book, is given in the Apostolical Constitutions (vii. 47). That is the earliest record of it, unless, indeed, the Apocryphal Constitutions be taken to be of a later date than the Alexandrine Codex, where the hymn also occurs. Alcuin attributes the authorship of the Latin form—the Gloria in Excelsis—to St Hilary of Poitiers (died 365), but this is at best only a plausible conjecture. The quotations from the hymn in the De Virginitate of Athanasius, and in Chrysostom (Hom. 69 in Matt.), include only the opening words (those from St Luke's gospel), though the passage in Athanasius shows by an interpolation that only the commencement of the hymn is given. These references indicate that the hymn was used in private devotions; as it does not appear in any of the earliest liturgies, whether Eastern or Western, its introduction into the public services of the church was probably of a later date than has often been supposed. Its first introduction into the Roman liturgy is due to Pope Symmachus (496–514), who ordered it to be sung on Sundays and festival days. The Mozarabic liturgy provides for its eucharistic use on Sundays and festivals. In these and other early liturgies the Greater Doxology occurs immediately after the commencement of the service; in the English prayer-book it is introduced at the close of the communion office, but it does not occur in either the morning or evening service. The Lesser Doxology, or Gloria Patri, combines the character of a creed with that of a hymn. In its earliest form it ran simply—"Glory be to the Father, and to the Son, and to the Holy Ghost, world without end, Amen," or "Glory be to the Father, and to the Son, and by the Holy Ghost." Of the Arrian heresy these forms were probably regarded as indifferent, both being equally capable of an orthodox interpretation. When the Arians, however, finding the second form more consistent with their views, adopted it consistently and exclusively, its use was naturally discon- tenanced by the Catholics, and the other form became the symbol of orthodoxy. To the influence of the Arian heresy this also obviously due the addition of the clause—"as it was in the beginning, is now, and ever shall be," the use of which was, according to some authorities, expressly enjoined by the Council of Nicæa. There is no sufficient evidence of this, but there exists a decree of the second Council of Vaison (529), asserting its use as already established in the East propter hæreticorum statutum, and ordering its adoption throughout the churches of the West. In the Western Church the Gloria Patri is repeated at the close of every psalm, in the Eastern church at the close of the last psalm.

DOYEN, GABRIEL FRANÇOIS (1726–1806), an eminent French painter, was born at Paris in 1726. His passion for art prevailed over his early education, and at the age of twelve years and seven months he became a pupil of Vanloo. Making rapid progress, he obtained at twenty the grand prize, and in 1748 set out for Rome. He studied the works of Annibale Carracci, Cortona, Giro Romano, and Michelangelo, then visited Naples, Venice, Bologna, and other Italian cities; and in 1755 returned to Paris. At first unprecitated and disregarded, he resolved by one grand effort to conquer a reputation, and in 1758 he exhibited his Death of Virginia. It was completely successful, and procured him admission to the Academy. Among his greatest works are reckoned—the Miracle des Ardenes, painted for the church of St Genève at St Roch (1773); the Triumph of Thetis, for the chapel of the Invalides; and the Death of St Louis, for the chapel of the Military School. In 1776 he was appointed professor at the Academy of Painting. Soon after the beginning of the Revolution he accepted the invitation of Catherine II. and settled at St Petersburg, where he was loaded with honours and rewards. He died there June 5, 1806.

DRAÇO, a celebrated Athenian legislator who flourished in the 7th century B.C. By a strange irony of fate his name has passed into a proverb for an inexorable lawgiver, whose laws were written with blood and not with ink. Modern Greek historians, such as Thirlwall, Grote, and Curius, have clearly shown that such a character is an utter perversion of fact. Of Draco's famous code not a single line remains, and all we know of it is derived from a few scattered notices occurring mostly in late Greek authors. Of these the most important is a passage in Plutarch's life of Solon. After stating that Solon abolished the whole of Draco's legislation, except in cases of murder, on account of its harshness and severity, Plutarch adds by way of commentary—"For nearly all crimes there was the same penalty of death. The man who was convicted of idleness, or who stole a cabbage or an apple, was liable to death no less than the robber of temples or the murderer." To the same effect is a traditional saying of Draco by which he justified the rigour of his laws. The least offence, he said, seemed to him deserving of death, and he could devise no greater for the worst crime. It is obvious that the statement of Plutarch is not meant to be accepted as a literal statement of fact, and it is probable that to the most bloodthirsty of Draco's laws parallels might be quoted from English statutes against vagrancy and theft. All that Draco did was to put into writing the customary laws of his time and nation. It was natural that these laws, the growth of a rude and primitive age, should strike writers of the Augustan age as indiscriminative and inhuman, and that he made no change in the constitution of Athens we have the express testimony of Aristotle. The judicial changes which he effected, so far from aggravating, 11
tended to mitigate the severity of early Athenian law. Before his time all cases of homicide were tried by the Areopagus and we are justified in inferring that death was the universal penalty. To Draco is generally attributed the establishment of the ἱέραμα, a body of fifty-one elders, who sat in four different courts,—one for cases of accidental homicide, a second for justifiable homicide, a third for cases where another homicide had been committed abroad by a prisoner who had been banished by one of the above-named courts, and a fourth for cases of desolad. Such an institution as itself enough to explode the traditional conception of Draco, and we may now proceed to discuss the true character of his legislation. At Athens, as at Rome, the kings were the depositaries and administrators of law. With the extinction of the regal power this prerogative passed into the hands of the aristocracy as represented by the archons. It was in the nature of things that such a monopoly should be abused. The remedy for this abuse which the commons sought was a published code of laws. It was attained at Rome by the law of the Twelve Tables, and at Athens by the code of Draco, 621 B.C. In both of these orders, which he termed "cases the promulgated law was merely an enunciation of the common law. The only value of the story which he told us was the work of Draco. Of his life we know absolutely nothing with the exception of a most improbable story related by Suidas. In Suidas's Lexicon, under the word "Draco," we are told that he composed his code in his old age, and was smothered to death in the theatre at ᾿Εργα with the caps, chitons, and cloaks which were thrown at him by an enthusiastic audience. The only value of the story is that it may show the feelings with which he was regarded by the commons of his own day.

DRAGON (קרבזא, sharp-sighted), the name given by the ancients to a fabulous monster represented by them as a huge winged lizard or serpent. They regarded it as the enemy of mankind, and its overthrow is made to figure among the greatest exploits of the gods and heroes of heathen mythology. A dragon watched the garden of the Hesperides, and its destruction formed one of the seven labours of Hercules. Its existence does not seem to have been called in question by the older naturalists, figures of the dragon appearing in the works of Gesner and Aldrovandi, and even specimens of the monster—evidently formed artificially of portions of various animals—having been exhibited. The only creatures ever known to have existed, at all comparable to this imaginary monster, are the Pterodactyli, remains of which are found in the Jurassic and Cretaceous formations. These were huge reptiles, provided with true wings somewhat resembling those of bats. The name "dragon" is now applied to a highly interesting, but very harmless, group of small flying lizards forming the genus Draco, belonging to the Agamidae, a family of Saurian Reptiles. They inhabit India and the islands of the Malay Archipelago, and 18 species of them are known. They are small creatures, measuring about 10 inches long, including the tail, which in some cases is more than half of the entire length. The head is small, and the throat is provided with three pouches which are spread out when they lie on the trunks of trees. They are, however, chiefly remarkable for the wing-like cutaneous processes with which their sides are provided, and which are extended and supported by greatly elongated ribs. These form a sort of parachute by which the animals are enabled to glide from branch to branch of the trees on which they reside, but, being altogether independent of the fore limbs, they cannot be regarded as true wings, nor do they enable the lizard to fly, but merely to make extensive leaps. When not in use they are folded by the side after the manner of a fan, and can be drawn out and altered with considerable agility. They also use their wing-like expansions in clasping the branches of trees, where they are fond of lying basking in the sun, and feeding on whatever insect may come in their way. When threatened with danger they are said to feign death.

DRAGON-FLY (German, Wasserjungfer; Swedish, Trollslända; Danah, Guledmed; Dutch, Scherpenkendelst, French, Demoiselle), the popular English name applied to the members of a remarkable group of insects which formed the genus Libellula of Linnaeus, the first mention of which seems to be in the works of Pliny. In some parts of the United States they appear to be known as "Devil's Darning Needles," and in many parts of England are termed "Horse-stungers." It is almost needless to say that (excepting to other insects upon which they prey) they are perfectly innocuous, though some of the larger species can inflict a momentarily painful bite with their powerful jaws. Their systematic position is at present contested and somewhat uncertain. By most of the older systematists they were placed as forming part of the heterogeneous order Neuroptera. Fabricius, however, elevated them to the rank of a distinct order, which he termed Odonata, and whatever may be the difference of opinion amongst authors at the present day, that term is almost universally employed for the group which he transferred all the groups of so-called Neuroptera with incomplete metamorphoses, hence including the dragon-flies, as a division of Orthoptera, a term which he termed Pseudonuroptera. Gerstacker more recently also retains them in the Orthoptera, terming those groups in which the earlier states are incomplete metamorphoses, hence. It is not necessary to enter into an examination here of the merits or demerits of those various systems, and it will suffice to say that all are agreed in maintaining the insects as forming a group marked by characters at once extraordinary and isolated in their nature.

The group Odonata (using the term as a matter of convenience) is divided into three families, and each of these again into two sub-families. The families are the Agri- ouada, Brachilura, and Libellulidae,—the first including the sub-families Calopterygina and Agrionina, the second Gomphina and Libellulina, and the third Cordulina and Libellulina.

The structure of a dragon-fly being so very remarkable, it is necessary to enter somewhat extensively into details. The head is comparatively small, and excavated posteriorly, connected very slightly with the prothorax, on which it turns almost as on a pivot. The eyes are a single, enormous, often contiguous and occupying nearly the whole of the upper surface of the head, but sometimes (Agriouada and Gomphina) widely distant; occupied by innumerable facets, which are often larger on the upper portion. In front of them is a portion termed the vertex, which sometimes (Libellulina) forms a slender, narrow, and nearly equal length of the head, but sometimes (Agriouada and Gomphina) divided almost to its base into two portions, or more frequently entire or nearly so; on each side of it are two usually enormous hypertrophied pieces, which form the "palpi," and which are often furnished with an articulated spine (or terminal joint), the whole structure serving to retain the prey. Considerable diversity of opinion exists...
with respect to the composition of the mouth parts, and by some authors the “palp” have been termed the side pieces of the lower lip. In a dead dragon-fly the parts are closed on each other, and, for a just appreciation of their structure and power, it is necessary to take a living example in the fingers by the thorax, slight lateral pressure on which causes the insect to display the formidable arrangement. The prothorax is extremely small, containing (with some authors the “triumvirate,” which is either open or traversed by nerves; but in many Agrionidae this space, instead of being triangular, is oblong or elongately quadrature, or with its upper edge partly straight and partly oblique. This feature of type in neurotisation is not one of the least important of the peculiarities exhibited in these insects.

The internal structure is comparatively simple. The salivary glands appear to be absent, and the whole digestive apparatus consists of an elongate canal extending from mouth to anus, comprising the esophagus, stomach, and intestine, with certain dilatations and constrictions; the characteristic Malugalian vessels are stated to number about forty, placed round the posterior extremity of the stomach. Dragon-flies eat their prey completely, and do not content themselves by merely sucking its juices; the harder portions are rejected as elongate, nearly dry, pellets of excrement.

But the most extraordinary feature in the economy, —one which has attracted the attention of naturalists from remote times,—is the position of the genital organs, and the corresponding anomalous manner in which the pairing of the sexes and impregnation is effected. In the male the intromittent organ is (as stated above) situated in a slit on the under surface of the second abdominal segment; it is usually very crooked or sinuous in form, and is accompanied by sheaths, and by external hooks or secondary appendages, and also by seminal vessels. But the ducts of the vessels connected with the testes unite and open on the under surface of the ninth segment; hence, before copulation can take place, it is necessary that the vessels in the second segment be charged from this opening, and in the majority of cases this is done by the male previously to seeking the female. In the latter sex the entrance to the oviduct and genital organs is on the under surface of the eighth segment of the male. The act of copulation may be briefly stated as follows. The male, when flying, seizes the prothorax of the female with the strong appendages at the extremity of the abdomen, and the abdomen of the latter sex is then curved upward so as to bring the under side of the eighth segment into contact with the organs of the second segment of the male. This act must have been observed by all, though few non-entomologists are acquainted with the reasons for this most extraordinary position. In the more powerful Libellulidae, &c., the act is of short duration, and it is probable that copulation and polyandry exist, for it possibly requires more than one almost momentary act to fertilise all the eggs in the ovaries of a female. But in many Agrionidae, and in some others, the male keeps his hold of the prothorax of the female for a lengthened period, retaining himself in flight in an almost perpendicular manner, and it may be that the deposition of eggs and pairing goes on alternately. There is, however, much yet to be learned on these points. The gravid female usually lays her eggs in masses (but perhaps sometimes singly), and the operation may be witnessed by any one in localities frequented by these insects. She hovers for a considerable time over nearly the same spot, rapidly dipping the apex of her abdomen into the water, or at any rate touching it often in places where there are no water-weeds, so that in all probability the eggs fall at once to the bottom. But in some of the Agrionidae the female has been often noticed...
AQUATIC DRAGON-FLY

by trustworthy observers to creep down the stems of aquatic plants several inches below the surface, emerging after the act of oviposition has been effected; and in the case of Leptes spenor, Von Siebold saw the male descend with the female. The same exact observer noticed also in this species that the female makes slight incisions in the stems or leaves of water plants with the double serrated apparatus (vulva) forming a prolongation of the ninth segment beneath, depositing an egg in each incision. He has seen two pairs thus occupied beneath the surface on one and the same stem.

FIG. 1 — The antenatal portion of the body of Leptes spenor freed from the puparium.

The duration of the sub-aquatic life of a dragon-fly is no doubt variable, according to the species. In the smaller forms it is probably less than a year, but precise evidence is wanting as to the occurrence of two broods in one year. On the other hand, it is certain that often a longer period it emerges from the egg to the time when it leaves the water to be transformed into the aerial perfect insect. The number of moults is uncertain, but they are without doubt numerous. At probably about the antepenultimate of these operations, the rudimentary wings begin to appear as thoracic budgins, and in the full-grown nymph these wings overlap about one-half of the dorsal surface of the abdomen. In structure there is a certain amount of resemblance to the perfect insect, but the body is always much slouther and shorter, in some cases most disproportionately so, and the eyes are always separated, even in those genera (e.g., Lestinae) in which the eyes of the imago are absolutely contiguous, the moat that can be seen in the larva is a prolongation towards each other, and there are no oceli. The legs are shorter and more fitted for crawling about water plants and on the bottom. In the mouth parts the mandibles and maxillae are similar in form to those of the adult, but there is an extraordinary and unique modification of the lower lip. This is attached to an elongate and slender mentum articulated to the posterior portion of the lower surface of the head, slightly widened at its extremity, to which is again articulated the labium proper, which is very large, flattened, and gradually dilated to its extremity; but its form differs according to group as in the perfect insect. Thus in the Aeshnominae it is deeply cleft, and with comparatively slender side-pieces (or palpi), and strongly developed articulated spines, in the Lestinae it is at the most notched, with narrow side-pieces and very strong spines; in the Libellulidae it is entire, often triangular at its apex, and with enormously developed palpi without spines, but having the opposing inner edges furnished with interlocking serrations. The whole of this apparatus is commonly termed the mask. In a state of repose it is applied closely against the face, the elongated mentum directed backward and lying between the anterior pair of legs; but when an approaching victim is seen the whole apparatus is suddenly projected, and the prey caught by the raptorial palpi, in some large species it is capable of being projected fully half an inch in front of the head. The prey, once caught and held by this apparatus, is devoured in the usual manner. There are two pairs of thoracic spiracles, but respiration is mostly affected by a peculiar apparatus at the tail end, and

FIG. 2.—The tail being extricated.

The number of moults is uncertain, but they are without doubt numerous. At probably about the antepenultimate of these operations, the rudimentary wings begin to appear as thoracic budgins, and in the full-grown nymph these wings overlap about one-half of the dorsal surface of the abdomen. In structure there is a certain amount of resemblance to the perfect insect, but the body is always much slouther and shorter, in some cases most disproportionately so, and the eyes are always separated, even in those genera (e.g., Lestinae) in which the eyes of the imago are absolutely contiguous, the moat that can be seen in the larva is a prolongation towards each other, and there are no oceli. The legs are shorter and more fitted for crawling about water plants and on the bottom. In the mouth parts the mandibles and maxillae are similar in form to those of the adult, but there is an extraordinary and unique modification of the lower lip. This is attached to an elongate and slender mentum articulated to the posterior portion of the lower surface of the head, slightly widened at its extremity, to which is again articulated the labium proper, which is very large, flattened, and gradually dilated to its extremity; but its form differs according to group as in the perfect insect. Thus in the Aeshnominae it is deeply cleft, and with comparatively slender side-pieces (or palpi), and strongly developed articulated spines, in the Lestinae it is at the most notched, with narrow side-pieces and very strong spines; in the Libellulidae it is entire, often triangular at its apex, and with enormously developed palpi without spines, but having the opposing inner edges furnished with interlocking serrations. The whole of this apparatus is commonly termed the mask. In a state of repose it is applied closely against the face, the elongated mentum directed backward and lying between the anterior pair of legs; but when an approaching victim is seen the whole apparatus is suddenly projected, and the prey caught by the raptorial palpi, in some large species it is capable of being projected fully half an inch in front of the head. The prey, once caught and held by this apparatus, is devoured in the usual manner. There are two pairs of thoracic spiracles, but respiration is mostly affected by a peculiar apparatus at the tail end, and

FIG. 3.—The whole body extricated.
there are two different methods. In the 

Agrionidae there are three elongate flattened plates, or false gills, full of tracheal ramifications, which extract the air from the water, and convey it to the internal tracheae (in Calopteryx these plates are excessively long, nearly equaling the abdomen), the plates also serving as means of locomotion. But in the other groups these external false gills are absent, and in their place are the valves, which by their sudden opening and closing force in the water to the rectum, the walls of which are furnished with branchial lamellae. The alternate opening and closing of these valves enables the creature to make quick jerks or rushes (incorrectly termed "leaps") through the water, and, in conjunction with its mouth parts, to make sudden attacks upon prey from a considerable distance. The lateral angles of the terminal abdominal segments are sometimes produced into long curved spines. The figures on last page indicate this process as observed in 

Agrion cyanum.

For a considerable time after its emergence a dragon-fly is without any of its characteristic colours, and is sciacid and weak, the wings (even in those groups in which they are afterwards horizontally extended) being held vertically in a line with the abdomen. By degrees the parts harden, and the insect essays its first flight, but even then the wings have little power and are semi-opaque in appearance, as if covered with a bluish bloom, whereas that of the abdomen, when the other end can be cut off, is brilliantly metallic blue, green, bronzy green, blue, or black, but the colours in the other groups vary much, and often differ in the sexes. Thus in Libellula depressa the abdomen of the fully adult male is covered with a bluish bloom, whereas that of the female is yellow; but several days elapse before this condition is attained, and a comparatively young male is yellow like the female. The wings are typically hyaline and colourless, but in many species (especially Calopteryx and Libellula) they may be wholly or in part opaque and often black, due apparently to gradual oxygenization of a pigment between the two membranes of which the wings are composed; the brilliant iridescent, or metallic lustre, so frequently found is no doubt due to interference—the effect of minute irregularities of the surface—and not produced by a pigment. A beautiful little genus (Chalcopteryx) of Calopteryx from the Amazon is a gem in the world of insects, the posterior wings being of the most brilliant fiery metallic colour, whereas the anterior remain hyaline.

These insects are pre-eminent lovers of the hottest sunshine (a few are somewhat crepuscular), and the most powerful and daring on the wing in fine weather become inert and comparatively lifeless when at rest in dull weather, allowing themselves to be captured by the fingers without making any effort to escape. Many of the larger species (Aeshna, Dr.) have a habit of affecting a particular twig or other resting place like a fly-catcher among birds, darting off after prey and making long excursions, but returning to the chosen spot. Mr Wallace, in his Malay Archipelago, states that the inhabitants of Lombok use the large species for food, and catch them by means of lined twigs.

They are distributed over the whole world excepting the polar regions, but are especially insects of the tropics. At the present day about 1700 species are known, dispersed unequally among the several sub-families as follows: Agrionina, 490 species; Calopterygina, 170; Gomphina, 210; Aeshnina, 150; Cordulina, 100; Libellulina, 850. In Europe proper only 100 species have been observed, and about 46 of these occur in the British islands. New Zealand is excessively poor, and can only number 8 species, whereas they are very numerous in Australia. Some species are often seen at sea, far from land, in calm weather, in troops which are no doubt migratory; our common Libellula quadruncula, which inhabits the cold and temperate regions of the northern hemisphere, has been frequently seen in immense migratory swarms. One species (Pantala flavescens) has about the widest range of any insect, occurring in the Old World from Kamchatka to Australia, and in the New from the Southern States to Chili, also all over Africa and the Pacific islands, but is not found in Europe. The largest species occur in Aeshnina and Agrionina, a member of the former sub-family from Borneo expands to nearly 65 inches, and with a moderately strong body and powerful form; in the latter the Central American and Brazilian Megaloprepus cernulatus and species of Mecistogaster are very large, the former expanding to nearly 7 inches, and the latter to nearly 8 inches, but the abdomen is not thicker than an ordinary grass-stem and of extreme length (fully 5 inches in Mecistogaster). Among living entomologists the dragon-flies have received, and are receiving, great attention, especially from the Baron de Selys-Longchamps of Liège, and from Dr H. A. Hagen, formerly of Königsberg, now of Cambridge, Massachusetts.

It is impossible to prepare dragon-flies for the cabinet so as to retain all the brilliant colours the bodies have in life. They are excessively brittle when dry, and in the smaller species it is advisable to run a bristle into the under side of the thorax, pushing it down till it reach the extremity of the abdomen, when the other end can be cut off close to the thorax. But the larger species should be disembowelled through a slit along the under surface of the abdomen, and then filled (but not too tightly) with clean white cotton wool. The colours stand a much better chance of not greatly altering if the insects be not killed until some hours after they are captured, so as to allow the contents of the intestinal canal to be naturally passed away, for it is the decomposition of the food that assists materially to alter or obliterate the colour and markings.

Among fossil insects dragon-flies hold a conspicuous position. Not only do they belong to what appears to have been a very ancient type, but in addition, the large wings and strong and dense reticulation are extremely favourable for preservation in a fossil condition, and in many cases all the intrinsic details can be as readily followed as in a recent example. In this country they have been found more especially in the Purbeck beds of Swannage, and the Vale of Wardour and Aylesbury, in the Stonesfield slate series, and in the Lias and Rhaetic series of the west of England. But the richest strata appear to be those of the Upper Miocene series at Geisingen, in the Rhine valley; the Middle Miocene at Ragghel, in Croatia; the Eocene of Aix, in Provence; and more especially the celebrated Secondary rocks furnishing the lithographic stone of Solenhofen, in Bavaria. This latter deposit would appear to have been of marine origin,
and it is significant that, although the remains of gigantic dragon-flies discovered in it are very numerous and perfect, no traces of their sub-aqueous conditions have been found, although numerous as a rule are numerous in most of the other strata, hence the insects may be regarded as having been drowned in the sea and washed on shores. Many of these Selenofen species differ considerably in form from those now existing, so that Dr Hagen, who has especially studied them, says that for nearly all it is necessary to make new genera. A notice of fossil forms should not be concluded without remark that indications of at least two species have been found in amber, a number disproportionately small if compared with other insects entombed therein, but it must be remembered that a dragon-fly is, as a rule, an insect of great power, and in all probability those then existing were able to extricate themselves if accidentally entangled in the resin.

See De Selys-Longchamps, Monographie des Libellulides d'Europe, Brussels, 1840; Synopses des Aegronomies, Colyoptères, Gomphides, et Cordulides, with Supplements, from Brussels to 1855 to 1877; De Selys-Longchamps and Hagen, Recueil des Odonates d'Europe, Brussels, 1856; Monographie des Cordulides et Gomphides, Brussels, 1854 and 1858; Charpentier, Libellulides européens, Leipsic, 1840.

**DRAGON'S BLOOD**, a name applied to the resins obtained from several species of plants. *Calamus Draco* (Willd.), one of the Rotiang or Rattan Palms, which produces much of the dragon's blood of commerce, is a native of Further India and the Eastern Archipelago. When young it grows erect, but with age it becomes climbing. The leaves are pointed, about a foot long, of a palm-leaves, and inferior kind, sold in lumps of considerable size and fixed and volatile oils, and in the pulp according to F. Johnston (Phil. Trans., 1859, p. 154), the composition C15H22O. If heated it gives off fumes of benzoin acid. In Europe it was once valued as a medicine on account of its astrigent properties, and is now used for colouring plasters, dentifices, and varnishes; in China, where it is mostly consumed, it is employed to give a red facing to writing paper. The drop dragon's blood of commerce, called *castor* by Piny (N. H. xxxii. 38), and *sangre de dragos* by Barbosa, was formerly and is still one of the products of Socotra, the Dioscorea insula of ancient geographers; it was known to the Arabs by the term *kitur*, from which the name of the island may have been derived (see A. Strenge, Atta Geographic, Arbores, 1875). It is the special exudation of a leguminous tree, *Pterocarpus Draca*, which grows at elevations between 800 and 2000 feet above sea-level (see Wellsted, Journ. R. Geog. Soc., 1835, p. 198). Jacquin states (Select. Stirpium Amor. Hist., p. 253, 1765) that the tree grows in the woods of Tripolis, off Carthage, and that its dragon's blood, obtained from it by incision, was at one time imported into Spain for medicinal purposes. The dragon's blood of the Canary Islands is a tonic and astrigent resin procured from the surface of the leaves and from cracks in the trunk of *Dracena Draca*, a tree of the natural order Liliaceae. The hardened juice of a euphorbiaceous tree, *Croton Draca*, a resin resembling kino, is the *sangre del drago* or dragon's blood of the Mexicans, used by them as a vulnerary and astrigent.

*Rumphius, Herbarium Amboinensis, p. v. 114-119, tab. Ixxv., 1747; Feuerberg and Hauy, Pharmacographia, 1874.*

**DRAGUIGNAN,** the chief town of the department of Var, in France, and of an arrondissement of the same name, on the River Fos, a branch of the Martuby, lies at the foot of the wooded height of Malmont, in 43° 33' 18" N. lat. and 6° 27′ 56″ E. long. The prefecture, palace of justice, theatre, hospital, and prison are the most important public buildings. The town possesses a communal college, a training school for teachers, a botanical garden, a fine promenade, a library of about 18,000 volumes, collections of coins, pictures, and natural history objects, and an archaeological society. The inhabitants, who in 1872 numbered 8177, are engaged in agriculture and the manufacture of woven, coarse cloth, earthenware, silk, soap, candles, oil, brandy, copper wares, and leather.

**DRAINAGE.** See Agriculture, Architecture, Building, and Sewage.

**DRAKE, Sir Francis** (c. 1545 - 1595), a celebrated English admiral, was born near Tavistock, Devonshire, about 1545 according to most authorities, but Barrow, in his life, says the date may have been as early as 1539. His father, a yeoman and a zealous Protestant, was obliged to take refuge in Kent during the persecutions in the reign of Queen Mary. He obtained a naval chaplaincy from Queen Elizabeth, and is said to have been afterwards vicar of Uphor Church, in the Medway. This, however, must be a mistake, as there is no evidence of any church ever having existed at Uphor. Young Drake was educated at the expense and under the care of Sir John Hawkins, who was his kinsman; and, after passing an apprenticeship on a coasting vessel, at the age of eighteen he had risen to be purser of a ship trading to Biscay. At twenty he made a voyage to Guinea; and at twenty-two he was made captain of the “Judith.” In that capacity he was in the harbour of San Juan de Ulloa, in the Gulf of Mexico, where he behaved most gallantly in the actions under Sir John Hawkins, and returned with him to England, having acquired great reputation, though with the loss of all the money which he had embarked in the expedition. In 1570 he obtained a regular privateering commission from Queen Elizabeth, the powers of which he immediately exercised in a cruise in the Spanish Main. Having next projected an attack upon the Spanish Indies to indemnify himself for his former losses, he set sail in 1572, with two small ships named the “Fasha” and the “Swan.” He was afterwards joined by another vessel; and with this small squadron he took and plundered the Spanish town of Nombre de Dios. With his men he penetrated across the isthmus of Panama, and committed great havoc among the Spanish shipping. From the top of a tree which he climbed while on the isthmus he obtained his first view of the Pacific, and resolved “to sail an English ship in these seas.” In these expeditions he was much assisted by a tribe of Indians, who were then engaged in a desultory warfare with the Spaniards. Having embarked his men and filled his ships with plunder, he bore away for England, and arrived at Plymouth on the 9th August 1573.

His success and honourable demeanour in this expedition gained him high reputation; and the use which he made of this riches served to raise him in the estimation of his countrymen.

Drake was at this time about 28 years of age. After the death of his
patron he returned to England, where Sir Christopher Hatton introduced him to Queen Elizabeth, and procured him a favourable reception at court. In this way he acquired the means of undertaking his great expedition which has immortalized his name. The first proposal he made was to undertake a voyage into the South Seas through the Straits of Magellan, which no Englishman had hitherto ever attempted. This project having been well received at court, the queen furnished him with means; and his own fame quickly drew together a sufficient force. The fleet with which he sailed on this enterprise consisted of only five small vessels, and their united crews mustered only 166 men. Having sailed on the 13th December 1577, he on the 25th made the coast of Barbary, and on the 29th Cape Verde. He reached the coast of Brazil on the 5th of April, and entered the Rio de la Plata, where he parted company with two of his ships; but having met them again, and taken out their provisions, he turned them adrift. On the 29th May he entered the port of St Julian's, where he continued two months for the sake of laying in a stock of provisions. On the 20th August he entered the Straits of Magellan, and on the 25th September passed them, having then only his own ship. On the 25th November he arrived at Macao, which he had appointed as the place of rendezvous in the event of his ships being separated; but Captain Winter, his vice-admiral, had repassed the straits and returned to England. He thence continued his voyage along the coast of Chili and Peru, taking all opportunities of seizing Spanish ships, and attacking them on shore, till his men were satiated with plunder; and then coasted along the shores of America, as far as 45° N. lat., in an unsuccessful endeavour to discover a passage into the Adriatic. Having landed, however, he named the country thence on the 29th November New Albion, and took possession of it in the name of his queen. His ship unfortunately struck upon a rock, but the loss of part of his crew and cattle was more than amply made good by the additional stores which he took on shore, till his men were satiated with plunder. On the 12th July, and on the 16th reached the coast of Cape Verde. He reached the Ionian Islands, where he watered. In 1587 he went to Lisbon with a fleet of thirty sail; and having received intelligence of a great fleet being assembled in the bay of Cadiz, and destined to form part of the Armada, he with great courage entered the port on the 1st April, and there burnt upwards of 10,000 tons of shipping,—a feat which he afterwards joyously called "angeing the king of Spain's beard." In 1588, when the Spanish Armada was approaching England, Sir Francis Drake was appointed vice-admiral under Lord Howard, and made prize of a very large galley, commanded by Don Pedro de Valdez, who was reputed the projector of the invasion, and who struck at once on learning his adversary's name.

It deserves to be noticed that Drake's name is mentioned in the singular diplomatic communication from the king of Spain which preceded the Armada:—

"Eseto ne perego hello defendere Belgias; Quae Dacus ejusdem non restitatur, eperit; Quae pater everit jubibo ter condere cellis: Belgis Pape fac restitatur ad anguem."

To these lines the queen made this extempore response:—

"Ad Grcmca, bone rex, sante mandata calendae."

In 1589 Drake commanded the fleet sent to restore Don Antonio, king of Portugal, the land forces being under the orders of Sir John Norris; but they had hardly put to sea when the commanders differed, and thus the attempt proved abortive. But as the war with Spain continued, a more formidable expedition was fitted out, under Sir John Hawkins and Sir Francis Drake, against their settlements in the West Indies, than had hitherto been undertaken during the whole course of it. Here, however, the commanders again disagreed about the plan; and the result in like manner disappointed public expectations. These disasters were keenly felt by Drake, and were the principal cause of his death, which took place on board his own ship, near the town of Nombre de Dios, in the West Indies, January 28, 1595.

See Lives of Drake by Samuel Clarke (1671) and John Barrow, Jun. (1843).
Drama (from δρᾶμα) signifies action. The term is applied to compositions which imitate action by representing the personages introduced in them as real and as employed in the action itself. The varieties of the drama differ more or less widely, both as to the objects imitated and as to the means used in the imitations. But they all agree as to the method or manner which is essential to the dramatic art, viz., imitation of the way of action.

The desire to give expression to feelings and conceptions is inseparable from human nature. Man expresses his thoughts and emotions by gestures and by speech, or by a combination of both; and these expressions he soon learns in the society of other men—and more especially on joyous or solemn occasions—to vary or regulate according to his own instincs. Another way of expression, often combined with the other, is imitation. To imitate, says Aristotle, is instinctive in man from his infancy; and from imitation all men naturally receive pleasure. Gesture and voice are means of imitation common to all human beings; and the aid of some sort of dress and decoration is generally within the reach of children, and of the childhood of nations. The assumption of character, whether real or fictitious, is therefore the earliest step towards the drama. But it is only a preliminary step; nor is the drama itself reached till the imitation extends to action.

Action, which man is not wont to attribute (except figuratively) to any but members of his own species and to the superior Beings or beings in whose existence and power he believes, implies an operation of the will and an execution of its resolution, whether or not amounting to a fulfillment of its purpose. It implies a procedure from cause to result. Action must therefore present itself to the human mind as having its source in a human or superhuman will. Every imitation of action by action is in germ a drama. But to this point not all nations have advanced.

After this step has been taken, it only remains for the drama to assume a form regulated by literature, of which art it thus becomes a branch. We may then speak of a dramatic literature; but this only a limited number of nations has come to possess. A nation may, however, have a drama without a dramatic literature; it may even continue in possession of the former after having ceased to cultivate the latter. On the other hand, both before and after the drama of a nation has assumed a literary form, it may allow one or more of its adventitious elements—music, dancing, decoration—predominantly to assert themselves, and thus eventually to bring about the formation of new, or the revival of discarded, dramatic species. But as a branch of literature the drama necessarily includes speech among its means of imitation; and its beginnings as such are accordingly, in the history of all literatures known to us, preceded by the beginnings of at least of other forms of poetic composition, the lyric and the epic, or by those of one of these forms at all events. It is in the combination of both that the drama in its literary form takes its origin in the case of all national civilizations in which it has found a place and with which we are more than superficially acquainted.

The art of acting is the indispensable adjunct of the dramatic art, while the aid of all other arts is merely an accident. But though really inseparable from one another, the courses of the dramatic and the histrionic arts do not at all times run parallel. The actor is only the temporary interpreter of the dramatist, though he may occasionally be left to supply some of the proper functions of his text-giver. On his side, the dramatist may in practice, though he cannot in theory, dispense with the actor's interpretation, but though the term literary drama is sometimes used of works kept apart from the stage, it is in truth a misnomer, since, properly speaking, no drama is such till it is acted.

The whole body of the laws and rules of the drama, Laws and could it be written down with completeness, would rules of the include, together with the ends proper to the art, the drama. means by which it is able to accomplish them. But neither the great authorities of dramatic theory—Aristotle or Lessing—nor the resolute apologists of more or less transitory fashions—a Corneille or a Dryden—have exhausted the exposition of the means which the drama may prove or may prove capable of employing. The multitude of technical terms and formulæ which has gathered round the practice of the art has at no time seriously interfered with the operation of creative power, whose inventive activity the existence of, accepted systems has frequently—in the Greek drama, for instance, and in the Spanish—served to stimulate. On the other hand, it is self-evident that no dramaturgic theory has ever given rise to a single dramatic work of enduring value, unless the creative force was there to animate the form.

The task of this creative force begins with the beginnings, Subject, of the dramatist's labours. For it is in the dramatic idea, and that the germ of the action of a play lies—not in the subject, which is merely its dead material. The story of the Scottish thane as it stood written in the chronicle, is the subject, not the action, of Macbeth. To convert a subject—whatever its kind or source—into the action or fable of a play is the primary task, which in its progressive development becomes the entire task, of the dramatist; and though the conception may expand or modify itself with the execution, yet upon the former the latter depends. The range of subjects open to a dramatist may be wide as the world itself, or it may be limited by usage, by imperious fashion, by the tastes and tendencies of a nation or an age, by the author's own range of sympathies, by a thousand restrictions of an historical, moral, or aesthetic origin, it may be virtually confined (as with the earlier Greek tragoliana) to a body of legend, or (as with the English comedians of the Restoration) to the social experiences of a particular epoch. But in all cases the transformation of the subject into the action is equally indispensable; and an imperfect transformation is (as in the old Chronicle Histories) the work of a rule, or (as in ninety-nine out of a hundred modern plays "founded upon fact") that of a careless method of dramatic production.

What, then, are the laws which determine the nature of Unity of all actions properly such, however they may vary either in action subjects or in form? In the first place, a dramatic action must possess unity—and that requirement at once distinguishes it from the subject which has suggested its idea. The events of real life, the facts of history, the incidents of narrative fiction, are like the waves of a ceaseless flood; that which binds a group or body of them into a single action is the bond of the dramatic idea, and this it is which the dramatist has to supply. Within the limits of a dramatic action all its parts claim to be connected together as contributions to a single stream; and upon the degree in which they are true to this purpose their primary dramatic significance depends. The unity of action which the drama should possess, therefore, means that everything in it should form a link in a single chain of cause and effect. This law is incumbent upon every kind of drama—alike upon the tragedy which solves the problems of a life,
and upon the farce which sums up the follies of an afternoon.

Such is not, however, the case with certain rules which have at different times been set up for this or that kind of drama, but which have no absolute validity for any kind. The supposed necessity that an action should consist of one event is an erroneous interpretation of the law that it should be, as an action, one. For an event is but an element in an action, though it may be an element of decisive moment. The assassination of Caesar is not the action of a Caesar tragedy; the loss of his treasure is not the action of The Miser. Again, unity of action does not exclude the introduction of one or even more subsidiary actions as contributing to the progress of the main action. The sole indispensable law is that these should always be treated as what they are—subsidiary only; and herein lies the danger in the use of that favourite device of the modern drama—bye or under-plots. On the other hand, a really double or multiple action, logically carried out as such, is inconceivable in a single drama; though there is many a play which as parts only two plays knotted into one. Every one is familiar with the dramatist who towards the drop of the curtain seems to be counting on his fingers whom he has killed or what couples he has to marry. Thirdly, unity of action need not imply unity of hero—for hero (or heroine) is merely a term signifying the principal personage of the action. And inasmuch as an action may consist in the joint contention of more than one against the same obstacle—as in the instance of The Seven against Thebes, or Romeo and Juliet—it is only when the change in the degree of interest excited by different characters in a play results from a change in the conception of the action itself, that the consequent duality (or multiplicity) of heroes recalls a faulty uncertainty in the conception of the action they carry on. Such is the objection applying to the crucial case of Schiller's Don Carlos. Lastly, the entirely arbitrary restrictions of unity of time and of place are not, like that of unity of action, absolute dramatic laws. Their object is by representing an action as visibly continuous to render its unity more distinctly or easily perceptible; but the effect of their observance cannot be to render it more really one. Thus they may in one sense be regarded as devices to avoid the difficulty experienced by the human mind in regarding an action as one when the eye beholds its different parts occurring in what are supposed to be different places, or when the process of its advance from cause to effect extends over what is supposed to be a considerable period of time. But the imagination is capable of constructing for itself the bridges necessary to preserve an action, conceived of as such, its character of continuousness. In another sense these rules were convenient usages conducing to a concise and clear treatment as actions of subjects in themselves of a limited nature; for they were a Greek invention, and the repeated resort to the same group of myths made it expedient for a Greek poet to seek the subject of a single tragedy in a part only of one of the myths open to him. The observance of unity of place, moreover, was suggested to the Greeks by certain outward conditions of their stage—as assuredly as it was adopted by the French in accordance with the construction and usages of theirs, and as the neglect and its consequences was in their case encouraged by the established form of the English scene. The palpable artificiality of these laws needs no demonstration, so long as the true meaning of the term action be kept in view. Of the action of Oedipus at Coluchus, King Oedipus takes place at Sicyon and part at Corinth, and yet the whole is one in itself, while the limits of time over which an action extends cannot be restricted by a revolution of the earth round the sun, or of the moon round the earth.

In a drama which presents its action as one, this action must be complete in itself. This law, like the first, distinguishes the dramatic action from its subject. The former may be said to have a real artistic, while the latter has only an imaginary real, completeness. The historian, for instance, aims indeed at a complete exposition of a body of events and transactions, and may even desire to show their working to a definite end; but he is aware that this aim can never be more than partially accomplished, since he may present only what he knows, and all human knowledge is partial. But art is limited by no such uncertainty. The dramatist, in treating an action as one, comprehends the whole of it in the form of his work, since to him who has conceived it, all its parts, from cause to effect, are equally clear. Accordingly, every drama should represent in organic sequence the several stages of which a complete action consists, and which are essential to it. This law of completeness therefore lies at the foundation of all systems of dramatic construction.

Every action, if conceived of as complete, has its causes, systems of growth, height, consequences, and close. There is no binding law to prescribe the relative length at which these several stages in the action should be treated in a drama, or to enforce a more or less exact correspondence between the successive presentation of each, and technical divisions, such as acts or scenes, which dramatic practice may find it convenient to adopt. Neither is there any law to assert any obligatory regulation of the treatment of such subsidiary actions as may be introduced in aid of the main plot, or of such more or less directly connected episodes which may at the same time advance and relieve its progress. But experience, as the parent of usage, has necessarily from time to time established certain rules of practice, from which the dramatist, working under customary forms, will find it neither easy, nor in most cases advantageous, to swerve too widely; and from the adoption of particular systems of division for particular species of the drama—such as that into five acts for a regular tragedy or comedy, which Roman example has caused to be so largely followed—has naturally resulted a certain uniformity of relation between the conduct of an action and the outward sections of a play. Essentially, however, there is no difference between the laws regulating the construction of a Sophoclean or Shakespearean tragedy, a comedy of Molière or Congreve, and a well-built modern farce. And this, because all exhibit an action complete in itself.

The introduction or exposition forms an integral part of Prologue the action, and is therefore to be distinguished from the pro- and epilogue logues in the more ordinary sense of the term, which, like the the beginn also the of accounts of action, and is a mere address to the public from author or actor occasioned by the play. Prologue and epilogue, greatly as they may have at times contributed to the success of a drama, are mere external adjuncts, and have as little to do with the construction of a play as the bill which announces it, or the musical prelude which disposes the mind for its reception. The introduction or exposition belongs to the Parts of action itself; it is, as the Hindu critics called it, the seed or from circumstance from which the business arises. Cleaness is a necessary introduction or exposition being its primary requisite, many expositions have been at times adopted to secure this feature. Thus, the Egyptian prologue, though curiosity of the play, takes a narrative form, and places itself half without, half within the action of which it properly is part. The same purpose is served by the separate inductions in many of our old English plays, and the preludes or prologues, or by whatever name they may call 1853.

themselves, in numberless modern dramas of all kinds—from *Hamlet* down to the favourites of the Ambigu and the Adelphi. Another such expedient is that of the inductive dumb-shows, which sought to secure rapidity together with impressiveness of exposition by the process of pantomimic summary. Such, again, are the opening scenes in French tragedy between hero and confidant, and those in French comedy and its derivatives between observant valet and knowing lady’s-maid. But it is clear how all such expedients may be rendered unnecessary by the art of the dramatist, who is able outwardly also to present the introduction of his action as what it is—an organic part of that action itself; who seems to take the spectators as medicius res while he is really building the foundations of his plot; who can dramatically account for an idiot of woe without giving back to Leda’s egg; who touches in the opening of his action the chord which is to vibrate throughout its course—“Down with the Capulets! Down with the Montagues!”—“With the Moor, says thou.”

The introduction ends with the opening of the movement of the action, a passage which may prove highly effective to mark with the utmost distinctness (as in *Hamlet*, where it is clearly to be sought in the actual meeting between the hero and the ghost), but which in other instances is advantageously marked by the insertion of subsidiary action or episode (as in *King Lear*, where the opening of the movement of the main action would follow too sharply upon its exposition, were not the beginning of the subsidiary action of Glotre’s and his sons opportune introduced between them). From this point the second stage of the action—its growth—progresses to that third stage which is called its height or climax. All that has preceded the reaching of this constitutes that half of the drama—usually its much larger half—which Aristotle terms the *Basis*, or the foundation of the knot. The varieties in the treatment of the growth or second stage of the action are infinite, and it is here that the masters of the tragic and the comic drama—notably those unequaled weavers of intrigues, the Spaniards—are able most fully to exercise their inventive faculties. If the growth is too rapid, the climax will fail of its effect—and it is, therefore, at this stage that subsidiary actions and episodes are most largely used; if it is too slow, the interest will be exhausted before the greatest demand upon it has been made—a fault to which comedy is specially liable; if it is involved or inverted, a vague uncertainty will take the place of an eager or agreeable suspense, the action will seem to halt, or a fall will begin prematurely. In the contrivance of the climax itself lies one of the chief tests of the dramatist’s art; for while in the transactions of real life their climax is often only a matter of assumption, in the action of a drama its climax should present itself as self-evident. In the middle of everything, says the Greek poet, lies the strength; and this strongest or highest point it is the task of the dramatist to make manifest. Much here depends upon the niceties of constructive instinct; much (as in all parts of the action) upon a thorough dramatic transformation of the subject. The historical drama here presents peculiar difficulties, and perhaps the example of *Henry VIII.*, as compared with Shakespeare’s other historical plays, may be held to furnish an instructive example of defective (because hasty) workmanship.

From the climax, or height, the action proceeds through its fall to its close, which in a drama with an unhappy ending we still call its catastrophe, while to terminations in general we apply the term dénouement. This latter name would, however, more properly be used in the sense in which Aristotle employs its Greek equivalent *λήξις*—the cutting of the knot—of the whole of the second part, and not of the climax downwards. If, in the management of the climax, everything depended upon making the effect, in the fall everything depends upon not marring it. This may be ensured by a rapid progress to the close, but neither does every action admit of such treatment, nor is it in accordance with the character of those actions which are of a complicated kind. With the latter, therefore, the fall is often a return—έπειθής, in Aristotle’s phrase, a change into the reverse of what is expected from the circumstances of the action (σχεδεία),—as in *Conradina*, where the Roman story lends itself so admirably to such demands. In any case the art of the dramatist is in this part of his work called upon for the surest exercise of its tact and skill. The effect of the climax has been to concentrate the interest; the fall must therefore, above all, avoid dissipating it. The use of episodes is not even now excluded; but they must be of a more directly significant kind than is necessary in the earlier stages of the drama, even where serving the purpose of relief they must help to keep alive the interest previously raised to its highest pitch. This may be effected by a return or revolution; or again, by the raising of obstacles between the height of the action and its expected consequences, by the suggestion in tragedy of a seemingly possible recovery or escape from them (as in the wonderfully powerful construction of the latter part of *Macbeth*), by the gradual removal in comedy, or wherever the interest of the action is less intense, of such difficulties as the growth and climax have occasioned. In all kinds of the drama discovery will remain, as it was in the judgment of Aristotle, a most effective expedient; but it should be a discovery which has been foreshadowed by that method of treatment which in its consummate master, Sophocles, has been termed *lukros*. Nowhere should the close or catastrophe be other than a Close or consequence of the action itself. Sudden revulsions from catastrophe, the conditions of the action—such as the *deus ex machina*, or the revising officer of the emperor of China, or the nabob returned from India bring about—condemn themselves as unsatisfactory makeshifts. However sudden, and even, in manner of accomplishment, surprising, may be the catastrophe, it should not be unprepared, but like every other part of the action should preserve its organic connexion with the whole. The sudden suicides which terminate so many tragedies, and the paternal blessings which close an equal number of comedies, should be something more than a signal for the fall of the curtain.

The action of a drama, besides being one and complete in itself, ought likewise to be probable. The probable action of a drama is not that of actual or historical experience—it is a conditional probability, or in other words the consistency of the course of the action with the conditions under which, and with the characters by which, the dramatist has chosen to carry it on. As to the former, he is fettered by no restrictions save those which he imposes upon himself, whether or not in deference to the usages of certain accepted species of dramatic composition. Ghosts appear neither in real life nor in dramas of real life, but the introduction of supernatural agency is neither enjoined nor prohibited by any general dramatic law. The use of such expedients is as open to the dramatic as to any other poet; the judiciousness of his use of them depends upon the effect which, consistently with the general conduct of his action, they will exercise upon the spectator, whom other circumstances may or may not predispose to take it as an acceptance. The ghost in *Hamlet* belongs to the action of the play; the ghost in *Pericles* is not intrinsically less probable, but the apparition seems to spring, so to speak, less naturally out of the atmosphere around it. Dramatic probability has, however, a far deeper meaning than this. The *Examenides* is probable with all its primitive mysteriousness, and *Macbeth* with all its barbarous witchcraft. The proceedings of the feathered builders of Cloudbuckingtown VII — 50.
are as true to dramatic probability as are the pranks of Oberon's fairies. In other words, it is in the consistency of the action with the characters, and of the characters with themselves, that this dramatic probability lies. The dramatist has to represent characters affected by the progress of an action in a particular way, and contributing to it in a particular way, because, if consistent with themselves, they must be so affected, and so act.

Upon the invention and conduct of his characters the dramatist must therefore expend a great proportion of his labour. His treatment of them will, in at least as high a degree as his choice of subject, conception of action, and method of construction, determine the effect which his work produces. And while there are aspects of the dramatic art under which its earlier history already exhibits an unsurpassed degree of perfection, there is none under which produces. And while there are aspects of the dramatic art under which its earlier history already exhibits an unsurpassed degree of perfection, there is none under which its advance is more perceptible than this. Many causes may have contributed to this result; the chief is to be sought in the multiplicity of the opportunities for mankind's study of man. The theories of the Indian critics on the subject of dramatic character are a scaffolding more elaborate than the edifice it surrounds. Aristotle's remarks on the subject are scanty, and it may be unhistorical asserting that the strength of the dramatic literature from whose existence we are, abstracted his maxims to present their characters, as it were, ready made—whether in the case of tragic heroes and heroines, or in that of comic types, often moulded according to a long-lived system of local or national selection. It is in the Germanic drama, and in its master Shakespeare above all, that the individualization of characters has been carried to its furthest point, and that their significance has been allowed to work itself out in closest connection with the progress of the dramatic action to which they belong.

But, however, the method and scope of characterization may vary under the influence of different historical epochs and different tendencies or tastes of races or nations, the laws of this branch of the dramatic art are everywhere based on the same essential requirements. What interests us in a man or woman in real life, or in the impressions we form of historical personages, is that which seems to us to individualize them. A dramatic character must therefore, whatever its part in the action, be sufficiently marked in its distinctive features to interest the imagination; with these its subsequent conduct must be consistent, and to these its participation in the action must correspond. In order that such should be the result, the dramatist must first have distinctly conceived the character, whatever may have suggested it to him. If, for instance, he has taken it, as the phrase is, from history or from contemporary life, he must transform it, just as he must transform the subject of the action into the action itself. His task is not to paint a copy of any particular man, but to conceive a kind of man—of which a particular individual may have occurred to him as a suggestive illustration—under the operation of particular circumstances. His conception, growing and modifying itself with the progress of that action, will determine the totality of the character he creates. The likeness which the result bears to an actual or historical personage may vary, from secondary points of view, concern the success of his creation: upon its dramatic influence with a different sense from that in which Shakespeare used the words, it may be possible to say of every dramatic character which it is sought to identify with an actual personage, "This is not the man." The mirror of the drama is not a photographic apparatus.

Distinctiveness, as the primary requisite in dramatic characterization, is to be demanded in the case of all personages introduced into a dramatic action, but not in all cases in an equal degree. Schiller, in adding to the dramatiae personae of his Oedipus superscriptions of their chief characteristics, labels Esco as "an ordinary person," and his suffices for Esco. Between Bassanio's two unsuccessful rivals in the trial of the caskets there is difference enough for the dramatic purpose of their existence. But with the great masters of characterization a few touches, of which the true actor's art knows how to make the most, are not to be sought in the fulness or variety of its characterization. This relative deficiency the outward conditions of the Greek theatre—the remoteness of actor from spectator, and the consequent necessity for the use of masks, and for the raising and therefore conventionalizing of the tones of the voice—undoubtedly helped to occasion. Later Greek and Roman comedy, with a persistency furnishing a remarkable illustration of the force of habit, limited their range of characters to an accepted gallery of types. Nor is it easy to ignore the fact that these examples, and the influence of national tendencies of mind and temperament, have inclined the dramatists of the Romance nations to attach less importance to characterization of a closer and more varied kind than to interest of action and effectiveness of construction. The Italian and the Spanish drama more especially, and the French during a great part of its history, have in general shown a disposition to present their characters, as it were, ready made—whether in the case of tragic heroes and heroines, or in that of comic types, often moulded according to a long-lived system of local or national selection. It is in the Germanic drama, and in its master Shakespeare above all, that the individualization of characters has been carried to its furthest point, and that their significance has been allowed to work itself out in closest connection with the progress of the dramatic action to which they belong.

But, however, the method and scope of characterization may vary under the influence of different historical epochs and different tendencies or tastes of races or nations, the laws of this branch of the dramatic art are everywhere based on the same essential requirements. What interests us in a man or woman in real life, or in the impressions we form of historical personages, is that which seems to us to individualize them. A dramatic character must therefore, whatever its part in the action, be sufficiently marked in its distinctive features to interest the imagination; with these its subsequent conduct must be consistent, and to these its participation in the action must correspond. The mirror of the drama is not a photographic apparatus.
DRAMA

takes part,—that is to say, the influence it exerts upon the progress of the action should correspond to its distinctive features, the conduct of the play should seem to spring from the nature of its characters. Hence even the minor characters should not idly intervene, and, before they intervene significantly, we should be prepared by some previous notion of them. The chief characters, on the other hand, should predominate over or determine the course of the action, its entire conception should harmonize with their distinctive features; it is only Frometheus whom the gods bind fast to a rock, only a Juliet who will venture into a living death for her Romeo. Thus in a sense chance is excluded from dramatic action, or rather, like every other element in it, bends to the dramatic idea and in view of this predominance of character over action, we may appropriately use such expressions as a tragedy of love or jealousy or ambition, or a comedy of character—by which is merely meant one whose preponderating interest lies in the effectiveness with which its conduct impresses upon the mind the conception of its chief character or characters.

The term manners (as employed in a narrower sense than the Aristotelian) applies to that which colours both action and characters, but does not determine the essence of either. As exhibiting human agents under certain conditions of time and place, and of the various relations of community existing or conceivable among men, the action of a drama, together with the characters engaged in it and the incidents and circumstances belonging to it, must be more or less suited to the external conditions assumed. From the assumption of some such conditions not even those dramatic species which indulge in the most sovereign licence, such as Old Attic comedy or burlesque in general, can wholly emancipate themselves; and even supernatural characters and actions must adapt themselves to some antecedents. But it depends altogether on the measure in which the nature of an action and the development of its characters are affected by considerations of time and place, or of temporary social systems and the transient distinctions they produce, whether the imitation of a particular kind of manners becomes a significant element in a particular play. What is of vanishing importance in one may be of unobjectionable value in another. The Hindu caste-system is an antecedent of every Hindu drama, and the peculiar organization of the Chinese society of nearly every Chinese with which we are acquainted. Greek tragedy itself, though treating subjects derived from no historic age, has established a standard of manners from which in its decline it did not depart with impunity. The imitation of manners of a particular age or country may or may not be of moment in a play. The conjunction of the Crusades is merely a felicitous choice for the time of action of Nathus the Wise; but the dramatic conflict of Mira\nna in Barnhardal derives half its life from the background of the Seven Years' War. In some dramas, and in some species of drama, time and place are so purely imaginary and so much a matter of indifference that the adoption of a purely conventional standard of manners, or at least exclusion of any definitely fixed one, is here desirable. The dual reign of Theseus at Athens (when ascended) does not date A Midsummer Night's Dream; nor do the coasts of Bohemia localize the manners of the characters of Autolycus. Where, on the other hand, as more especially in the historic drama, or in that kind of comedy which directs its shafts against the ridiculous vices of a particular age or country, the likeness of the manners represented to what is more or less known possesses significance, there the dramatist will use care in his colouring. How admirably is the French court specialized in Henry IV, how completely are we transplanted among the burghers of Brussels in the opening scenes of Eymond / What a picture of a claque we have in the Fréres
racleus of Molère; what a reproduction of a class in the pot-house politicians of Holberg! Yet even in such instances the dramatist will only use what suits his dramatic purpose; he will select, not transfer in mass, historic features, and discriminate in his use of modern instances. The details of historic fidelity, and the lesser shades distinguishing the varieties of social usage, he will introduce at his choice, or leave to be supplied by the actor. Where the reproduction of manners becomes the primary purpose of a play, its effect can only be of an inferior kind; and a drama purely of manners is a contradiction in terms.

No complete system of dramatic species can be abstracted from any one dramatic literature. They are often the result of particular antecedents, and their growth is often affected by peculiar conditions. Different nations or ages use the same name, and may preserve some of the same rules, for species which in other respects their usage may have materially modified from that of their neighbours or predecessors.

Who would undertake to define, except in their successive applications, such terms as tragedy-comedy or melodrama? Yet this does not imply that all is confusion in the terminology as to the species of the drama. In so far as they are distinguishable according to the effects which their actions, or those which the preponderating parts of their actions, produce, they may primarily be ranged in accordance with the broad difference established by Aristotle between tragedy and comedy. Tragic and comic effects differ in regard to the tragic and comic emotions of the mind which they excite; and a drama is tragic or comic according as such effects are produced by it. The strong or serious emotions are alone capable of exercising upon us that influence which, employing a bold but marvellously happy figure, Aristotle termed purification, and which a Greek comedian, after a more matter-of-fact fashion, thus expressed:

"For whosoever a man observes his fellow
Bear wrongs more grievous than his self has known,
More easily he bears his own misfortunes."

i.e., the petty troubles of self which disturb without elevating the mind are driven out by the sympathetic participation in greater griefs, which raises while it excites the mind employed upon contemplating them. It is to these emotions—which are and can be no others than pity and terror—that actions and characters to which we call tragic appeal. Those which we term comic address themselves to the sense of the ridiculous, and their subjects are those vices and moral impieties, the representation of which is capable of touching the springs of laughter. Where, accordingly, a drama excludes all effects except those of the former class, it may be called a pure tragedy, when all except those of the latter, a pure comedy. In those dramas where the effects are mixed, it is the nature of the main action and of the main characters (as determined by their distinctive features) which alone enables us to classify such plays as serious or humorous dramas—or as tragic or comic, if we choose to preserve the terms. But the classification admits of a variety of transitions, from pure tragedy to mixed, from mixed tragedy to mixed comedy, and thence to pure comedy and her sister farce. This method of distinction has no concern with the mere question of the termination of a play, according to which Philostratus and other authorities have sought to distinguish between tragic and comic dramas. The serious drama which ends happily (the German Schauspiel is not a species co-ordinate with tragedy and comedy, but only one subordinate to the former, if, indeed, it be necessary to distinguish it as a species at all. Other
are as true to dramatic probability as are the pranks of Oberon's fairies.

In other words, it is in the consistency of the action with the characters, and of the characters with themselves, that this dramatic probability lies. The dramatist has to represent characters affected by the progress of an action in a particular way, and contributing to it in a particular way, because, if consistent with themselves, they must be so affected, and must so act.

Upon the invention and conduct of his characters the dramatist must therefore expend a great proportion of his labour. His treatment of them will, in at least as high a degree as his choice of subject, conception of action, and method of construction, determine the effect which his work produces. And while there are aspects of the dramatic art under which its earlier history already exhibits an unsurpassed degree of perfection, there is none under which its advance is more perceptible than this. Many causes have contributed to this result; the chief is to be sought in the multiplication of the opportunities for mankind's study of man. The theories of the Indian critics on the subject of dramatic character are a weafolding more elaborate than the edifice it surrounds. Aristotle's remarks on the subject are scanty; and it may be unhesitatingly asserted that the strength of the dramatic literature from whose examples he abstrated his maxims is not to be sought in the variety of its characterization. This relative deficiency the outward conditions of the Greek theatre—the remoteness of actor from spectator, and the consequent necessity for the use of masks, and for the raising and therefore conventionalizing of the tones of the voice—undoubtedly helped to occasion. Later Greek and Roman comedy, with a persistency furnishing a remarkable illustration of the forces of habit, limited their range of characters to an accepted gallery of types. Nor is it easy to ignore the fact that these examples, and the influence of national tendencies of mind and temperament, have inclined the dramatists of the Romance nations to attach less importance to the characterization of a closer and more varied kind than to interest of action and effectiveness of construction. The Italian and Spanish drama more especially, and the French during a great part of its history, have in general shown a disposition to present their characters, as it were, ready-made, whether in the case of tragic heroes and heroines, or in that of comic types, often moulded according to a long-lived system of local or national selection.

It is in the Germanic drama, and in its master Shakespeare above all, that the individualization of characters has been carried to its furthest point, and that their significance has been allowed to work itself out in closest connection with the progress of the dramatic action to which they belong.

But, however the method and scope of characterization may vary under the influence of different historical epochs and different tendencies or tastes of races or nations, the laws of this branch of the dramatic art are everywhere based on the same essential requirements. What interests us in a man or woman in real life, or in the impressions we form of historical personages, is that which seems to us to individualize them. A dramatic character must therefore, whatever its part in the action, be sufficiently marked in its distinctive features to interest the imagination; with these its subsequent conduct must be consistent, and its effect on the action in the action itself. His task is not to paint a copy of any particular man, but to conceive a kind of man—which of a particular individual may have occurred to him as a suggestive illustration—under the operation of particular circumstances. His conception, growing and modifying itself with the progress of the action, will determine the totality of the character he creates. The likeness which the result bears to an actual or historical personage may very probably, from secondary points of view, concern the success of his creation; upon its dramatic effect this likeness can have no influence whatever. In a different sense from that in which Shakespeare used these words, it should be possible to say of every dramatic character which it is sought to identify with an actual personage, "This is not the man." The mirror of the drama is not a photographic apparatus.

Distinctiveness, as the primary requisite in dramatic characterization, is to be demanded in the case of all personages introduced into a dramatic action, but not in all cases in an equal degree. Schiller, in adding to the dramatis personae of his Perso superscriptions of their chief characteristics, labels Sacco as "an ordinary person," and this suffices for Sacco. Between Iassandros two unsuccessful rivals in the trail of the caskets there is difference enough for the dramatic purpose of their existence. But with the great masters of characterization a few touches, of which the true actor's art knows how to avail itself, distinguish even their lesser characters from one another; thus every man is in his humour down to the comic element thereby enormously increase the dramatic interest of the action. Elaboration is necessarily reserved for characters who are the more important contributors to the action, and the fulness of elaboration for its heroes. Many expedients may lend their aid to the higher degrees of distinctiveness. In characters designed to influence the whole of the action it must be a matter of the greatest importance; in others in due relation to their contribution towards the course of the plot. Much is gained by a significant introduction of hero or heroine,—so Antigone is dragged in by the watchman, Gloucester enters alone upon the scene, Volpone is discovered in adoration of his golden saint. Nothing marks character more clearly than the use of contrast,—of Othello with Iago, of Octavius with Max Piccolomini, of Joseph with Charles Surface. Nor is direct antithesis the only effective kind of contrast; Cassius is a foil to Brutus, and Leonora to her namesake the Princess. But besides impressing the imagination as self-concious, a conception distinct in itself, each character must tend toward the central unity of the action. A consistency between its conduct in the action and the features it has established as its own. This consistency does not imply uniformity; for, as Aristotle observes, there are characters which, to be represented with uniformity, must be presented as uniformly un-uniform. Of such end instantly complex characters the great critic cites no instance, nor indeed are they of frequent occurrence in Greek tragedy; in the modern drama Hamlet is their unrivalled exemplar; and Weiligen in Goethe's Gott, and Alcante in the Misanthrope, may be mentioned as other illustrations in dramas widely different from one another. It should be added that those dramatic literatures which freely admit of a mixture of the serious with the comic element thereby immensely increase the opportunities of varied characterization. The difficulty of the task at the same time enhances the effect resulting from its satisfactory solution; and if the conception of a character is found to bear a variety of tests resembling that which experience shows life to have at hand for every man, its naturalness, as we term it, becomes more obvious to the imagination. Naturalness is only another word for what Aristotelian terms propriety; the artificial rules by which usage has at times sought to define particular species of character are in their origin only a convenience of the theatre, though they have largely helped to conventionalize dramatic characterization. Lastly, a character should be directly effective with regard to the dramatic action in which it has its own place.
takes part—that is to say, the influence it exerts upon the progress of the action should correspond to its distinctive features, the conduct of the play should seem to spring from the nature of its characters. Hence even the minor characters should not only influence, but, before they intervene significantly, we should be prepared by some previous notion of them. The chief characters, on the other hand, should predominate over or determine the course of the action, its entire conception should harmonize with their distinctive features; it is only a Pyrame and Thisbe with the gods bound fast to a rock, only a Juliet who will venture into a living death for her Romeo. Thus in a sense chance is excluded from dramatic action, or rather, like every other element in it, bends to the dramatic idea.

And in view of this predominance of character over action, we may appropriately use such expressions as a tragedy of love or jealousy or ambition, or a comedy of character—by which is merely meant one whose preponderating interest lies in the effectiveness with which its conduct impresses upon the mind the conception of its chief character or characters.

The term manners (as employed in a narrower sense than the Aristotelian) applies to that which colours both action and characters, but does not determine the essence of either. As exhibiting human agents under certain conditions of time and place, and of the various relations of community existing or conceivable among men, the action of a drama, together with the characters engaged in it and the incidents and circumstances belonging to it, must be more or less suited to the external conditions assumed. From the assumption of some such conditions not even those dramatic species which indulge in the most sovereign licence, such as Old Attic comedy or burlesque in general, can wholly emancipate themselves, and even supernatural characters and actions must adapt themselves to some antecedents. But it depends altogether on the measure in which the nature of an action and the development of its characters are affected by considerations of time and place, or of temporary social systems and the transitory distinctions they produce, whether the imitation of a particular kind of manners becomes a significant element in a particular play. What is of vanishing importance in one may be an adjunct of inestimable value in another. The Hindu caste-system is an antecedent of every Hindu drama, and the peculiar organization of Chinese society of nearly every Chinese with which we are acquainted. Greek tragedy itself, though treating subjects derived from other age, has been rooted in a standard of manners from which in its decline it did not depart with impunity. The imitation of manners of a particular age or country may or may not be of moment in a play. The conjunction of the Crusades is merely a felicitous choice for the time of action of Nathan the Wise; but the dramatic conflict of Theseus vs. Barabola derives half its life from the background of the Seven Years' War. In some dramas, and in some species of drama, time and place are so purely imaginary and so much a matter of indifference that the adoption of a purely conventional standard of manners, or at least the admission of any definitely fixed one, is here desirable. The duel reign of Theseus at Athens (when ascertained) does not date A Midsummer Night's Dream; nor do the coasts of Bohemia localize the manners of the customers of Autolycus. Whereas, on the other hand, as more especially in the historic dramas, or in that kind of comedy which directs its shafts against the ridiculous wealth of a particular age or country, the likeness of the manners represented to what is more or less known possesses significance, there the dramatist will use care in his colouring. How admirably is the French court specialized in Henri V., how completely are we transplanted among the burghers of Brussels in the opening scenes of Eymons? What a picture of a clique we have in the Précieux ridicules of Molière; what a reproduction of a class in the pot-house politicians of Holberg! Yet even in such instances the dramatic plot only uses what suits his dramatic purpose; he will select, not transfer in mass, historic features, and discriminate in his use of modern instances. The details of historic fidelity, and the lesser shades distinguishing the varieties of social usage, he will introduce, at his choice, or leave to be supplied by the actor. Where the reproduction of manners becomes the primary purpose of a play, its effect can only be of an inferior kind, and a drama purely of manners is a contradiction in terms.

No complete system of dramatic species can be abstracted from any one dramatic literature. They are often the result of particular antecedents, and their growth is often affected by peculiar conditions. Different nations or ages use the same name, and may preserve some of the same rules, for species which in other respects their usage may have materially modified from that of the neighbours or predecessors. Who would undertake to define, except in their successive applications, such terms as tragic, comic or melodrama? Yet this does not imply that all is confusion in the terminology as to the species of the drama. In so far as they are distinguishable according to the effects which their actions, or those which the preponderating parts of their actions, produce, they may primarily be ranked in accordance with the broad difference established by Aristotle between tragedy and comedy. Tragic and comic effects differ in regard to the tragic and emotions of the mind which they excite, and a drama is comic, tragic or comic according as such effects are produced by it. The strong or serious emotions are alone capable of exercising upon us that influence which, employing a bold but marvellously happy figure, Aristotle termed purification, and which a Greek comedian, after a more matter-of-fact fashion, thus expressed:

"For whosoever a man observes his fellow
Bear wrongs more grieved than himself has known,
More easily he bears his own misfortunes,"

i.e., the petty troubles of self which disturb without elevating the mind are driven out by the sympathetic participation in greater griefs, which raises while it excites the mind employed upon contemplating them. It is to these emotions—which are and can be no others than pity and terror—that actions and characters which we call tragic appeal. Those which we term comic address themselves to the sense of the ridiculous, and their subjects are those vice and moral infirmities, the representation of which is capable of touching the springs of laughter. Where, accordingly, a drama excludes all effects except those of the former class, it may be called a pure tragedy; when all except those of the latter, a pure comedy. In those dramas where the effects are mixed, it is the nature of the main action and of the main characters (as determined by their distinctive features) which alone enables us to classify such plays as serious or humorous dramas—or as tragic or comic, if we choose to preserve the terms. But the classification admits of a variety of transitions, from pure tragedy to mixed, from mixed tragedy to mixed comedy, and thence to pure comedy and her slighter sister farce. This method of distinction has no concern with the mere question of the termination of a play, according to which Philostratus and other authorities have sought to distinguish between tragic and comic dramas. The serious drama which ends happily (the German Schauspiel) is not a species co-ordinate with tragedy and comedy, but only one subordinate to the former, if, indeed, it is necessary to distinguish it as a species at all. Other
distinctions may be almost infinitely varied according to the point of view adopted for the classification. The historical sketch of the drama attempted in the following pages will best serve to indicate the successive growth of national dramatic species, many of which by asserting their influence in other countries and ages than those which gave birth to them, have acquired a more than national significance.

The art of acting, whose history forms an organic though a distinct part of that of the drama, necessarily possesses a theory and a technical system of its own. But into these it is impossible here to enter. One claim, however, should be vindicated for the art of acting, viz., that though it is a dependent art, and most signal in its highest forms, yet its true exercise implies a creative process. The conception of a character is determined by antecedents not of the actor's own making; and the term originality can be applied to it only in a relative sense. Study and reflection enable him, with the aid of experience and of the intuition which genius bestows, but which experience may in a high degree supply, to interpret, to combine, and to supplement given materials. But in the transformation of the conception into the represented character the actor's functions are really creative; for here he becomes the character by means which belong to his art alone. The distinctive features to the character, making the mental and physical features recognized by him in its groundwork—the consistency which he maintains in it between groundwork and details—the appropriateness which he preserves in it to the course of the action and the part borne in it by the character—all these are produced by himself, though suggested by the conception he has derived from his materials. As to the means at his disposal, they are essentially of two kinds only; but not all forms of the drama have admitted of the use of both, or of either in the same completeness. All acting includes the use of gesture, what is appropriate to the expression of particular affections and of the mind and of their combinations, of emotions and passions, of physical and mental conditions—joy and grief, health and sickness, waking, sleeping, and dreaming, madness, collapse, and death—of particular ages of life and temperaments, as well as of the distinctive characteristics of races, nationality, or class. While under certain conditions—as in the masked drama—the use of bodily movement as one of the means of expression has at times been partially restricted, there have been, or are, forms of the drama which have altogether excluded the use of speech (such as pantomimes), or have restricted the manner of its employment (such as operas). In the spoken drama the laws of rhythm regulate the actor's use of speech, but under conditions of a special nature. Like the orator, he has to follow the laws of pronunciation, modulation, accent, and rhythm (the last in certain kinds of prose as well as in such forms of verse as he may be called upon to reproduce). But he has also to give his attention to the special laws of dramatic delivery, which vary in soliloquy and dialogue, and in such narrative or lyrical passages as may occur in his part.

The totality of the effect produced by the actor will in some degree depend upon other aids, among which those of a purely external kind will not be lost sight of. But the significance of costume in the actor, like that of the other elements of scenery in an action, is a wholly relative one, and is to a large measure determined by the claims which custom enables the theatre to make, or forbids its making, upon the imagination of the spectator. The actor's real achievement lies in the transformation which the artist makes of his own efforts; nor is there any apt term more congenial in the use it can make of its means, or so happy in the directness of the results it can accomplish by them.

The origin of the Indian drama may unhesitatingly be described as purely native. The Mahometans when they overran India brought no drama with them; the Persians, the Arabs, and the Egyptians were without a national theatre. It would be absurd to suppose the Indian drama to have owed anything to the Chinese or its offshoots. On the other hand, there is no real evidence for assuming any influence of Greek examples upon the Indian drama at any stage of its progress. Finally, it had found its way into its decline before the dramatic literature of modern Europe had sprung into being.

The earliest themes with the native mythology of Vishnû agrees with that ascribing the origin of a particular kind of dramatic performance—the sâyajû— to Kâshì and the shepherdesses. The author's later poem, the Gâgovinda, has been conjectured to be suggestive of the early species of Hindu dramas. But while the epic poetry of the Hindus gradually approached the dramatic in the way of dialogue, their drama developed itself independently out of the union of the lyric and the epic forms. Their dramatic literary stage arose later than the epic, its chief works, the Mahâbhârata and the Raâyâyana, had again been long preceded by the hymnody of the Vedas—just as the Greek drama followed upon the Homeric poems, and these had been preceded by the early hymns. The beginnings of the Indian drama may accordingly belong to the 5th century B.C., or to a rather earlier date. But by the time it produced the first specimens with which we are acquainted, it had already reached its zenith; and it was therefore looked upon as having sprung into being as a perfect art. We know it only in its glory, in its decline, and in its decay.

The history of Indian dramatic literature may be roughly divided into the following periods:—

I. From the 1st century B.C. to the 10th century A.D.—First period (classical). This period belongs to the pre-Mahometan age of Indian history, but to that second division of it in which Buddhism had already become a powerful factor in the social, as well as in the moral and intellectual, life of the land. It is the classical period of the Hindu drama, and includes the works of its two indisputably greatest masters. Of these Kâlîdâsa was by far the earlier, who lived at the
court of King Vikramaditya of Avanti (died 56 B.C.), being accounted the brightest of its "nine gems" of genius. He is the author of Sākuntala,—the work Sir William Jones's translation of which first revealed to the Western world of letters the existence of an Indian drama. It is a dramatic love-dyll of surpassing beauty, and, in the opinion of the highest authorities, one of the master-pieces of the poetic literature of the world. Kālidāsa's other dramas, Vikrama and Uṇāshi (The Hero and the Nymph), though unequal as a whole to Sākuntala, contains one act of incomparable loveliness, and its enduring effect upon Indian dramatic literature is shown by the imitations of it in later plays. To Kālidāsa has likewise been attributed a third play—the Mālāvākiyānimitra; but it is doubtful whether this comedy, though held to be of ancient date, was not composed by a different poet of the same name.

Another work of high merit, the pathetic Mrdhchakañcika (The Toy-Cart), a domestic drama with a public underplot, may possibly belong to the close of the 2nd century A.D., and seems certainly of an earlier date than the 10th. It is attributed (as is not uncommon with Indian plays) to a royal author named Śūlakaka.

The palm of pre-eminence is disputed by Kālidāsa by the great dramatic poet Babhavātī (called Cṛkitāṭha, or he in whose throat is fortune), who flourished in the earlier part of the 8th century. While he is considered more artificial in language than his rival, and in general more bound by rules, he can hardly be deemed his inferior in dramatic genius. Of his three extant plays, Mahāvīra-Charitra and Uttara-Rāma-Charitra are heroic dramas concerned with the adventures of Rāma (the seventh incarnation of Viṣṇu); the third, the powerful Mālaṅ and Mādeva, has love for its theme, and has been called (with more aptitude than such comparisons usually possess) the Romeo and Juliet of the Hindus. It is considered by their critical authorities the best example of the prakrāta, or drama of domestic life.

Among the remaining chief works of Indian dramatic literature, the Vedā-Sūtrakīta is thought probably to date from about the 8th or 9th century. Its author's name seems doubtful; the play is described as one in which both pathos and horror are exaggerated, and which in the violence of its action recalls the manner of Shakespeare's predecessors. The next series of plays forms a transition between the first period of Indian dramatic literature and II. The period of decline, which may be reckoned from about the 11th to about the 14th century of our era, and of which the playing of the plays passed with the monkish times, was one of continuous series of Mahometan invasions of India. Hanumān-Nālaka, or "the great Nālaka" (for this play, the work of several hands, surpasses all other Indian dramas in length, extending over not less than fourteen acts), dates from the 10th or 11th century. Its story is taken from the Rāmacycle, and a prominent character in it is the mythical monkey-chief Hanumān, to whom, indeed, tradition ascribed the original authorship of the play. Krīṣhṇa-māmā's "theosophic mystery," as it has been called, of Prabhodha-Chandragotra (The Rise of the Moon of Knowledge, i.e., the victory of true doctrine over error), is ascribed by one author to the middle of the 11th century, by another to about the end of the 12th. The dates of the famous Rāmatāla (The Necklace), a court-comedy of love and intrigue, with a half-Terentian plot, and of the interesting Bareh-Prakāsa (The Necklace, or Nāthādīya, which begins as an erotic play but passes into a most impressive exemplification of the supreme virtue of self-sacrifice, depend on the disputed question of their respective authorship. One of them belongs to the first quarter of the 12th century, the other to an earlier time. Finally, Vaiśhṇavātta's interesting drama of political intrigue, Mādura-Rakhasa (The Sogey of the Minister), in which prince Chandragupta, presumably identifiable with Sandrocottus, makes his appearance, was probably composed later than the end of the 12th century.

This is only Indian play known to us with an essentially historical fable—a noteworthy circumstance, if (as is most likely) it was produced at a time when the Mahometan invasions had already begun.

The remaining plays of which it has been possible to conjecture the dates range in the time of their composition from the end of the 11th to the 14th century, and belong to the period of decline. Of this period, as compared with the first, the general characteristics seem to be an undue preponderance of narrative and description, and an affected and over-elaborated style. As a striking instance of this class is mentioned a play on the adventures of Rāma, the Anargha-Rāghava, which, in spite, or by reason, of the commonplace character of its sentiments, the extravagance of its diction, and the obscurity of its mythology, is stated to have enjoyed a reputation with the pandits of the present age than the master-pieces of Kālidāsa and Babhavātī. To the end of this period, the 14th century, has likewise (but without any pretension to certainty) been ascribed the only Tamil drama of which we possess an English version, Arivandira (The Martyr of Truth) exemplifies—with a strange likeness in the contrivance of its plot to the Book of Job and Psalms—in the trials of a heroically enduring king the maxim "Better die than live."

III. Isolated plays remain from centuries later than the Tamil 14th, but these, which chiefly turn on the legends of Krīṣhṇa (the last incarnation of Viṣṇu), may be regarded as a mere aftergrowth, and exhibit the Indian drama in its decay. Indeed, the latest of them, Catura-Yajna, which was composed about the beginning of the present century, and still serves as a model for Bengali dramatic performances, is imperfect in its dialogue, which (after the fashion of Italian improvised comedy) is left to the actors to supplement. Besides these there are farces or farcical entertainments, more or less indecided, of uncertain dates.

The number of the plays which have descended to us from so vast an expens of time is both relatively and absolutely small. Wilson doubts whether all the plays to be found, and three may be reckoned, by Hindu writers on the dramatic system, amount to more than 60, and it has been seen that not more than three are ascribed to either of the two great masters. To these should be, however, added the plays in Tamil, stated to be about 100 in number, and to have been composed by a few actors who enjoyed the patronage of the Pandian kings of Madura. On the other hand, there is among the Hindus no death of dramatic theory. The Critical Sage Bhārata, the reputed inventor of dramatic entertainments, was likewise revered as the father of dramatic criticism—a combination of functions to which the latter days of the English theatre might perhaps furnish an occasional parallel. The commentators (possibly under the influence of inspiration rather than as a strict matter of memory) constantly cite his sūtras, or aphorisms. (From sūtra, thread, was named the sūtra-dhāra, thread-holder, carpenter, a term applied to the architect and general manager of sacrificial solemnities, then to the director of theatrical performances). By the 11th century, when the drama was already approaching its decline, dramatic criticism had reached an advanced point; and the Pannā-Rāpaka (of which the text belongs to that age) distinctly defines the ten several kinds of dramatic composition. Other critical works followed at later dates, exhibiting a rage for sublimation unsurpassed by the efforts of Western theorists, ancient or modern; but should not be examples remaining (if they ever existed) to illustrate all the branches of so elaborate a dramatic system.
"What," inquires the manager of an actor in the induction to one of the most famous of Indian plays, "are those qualities which the viruous, the wise, the learned, and the Brahmans require in a drama?" "Profound exposition of the various passions," is the reply, "pleasing interchanges of mutual affection, loftiness of character, delicate expression of desire, a surpassing story, and elegant language." "Then," says the manager (for the Indian dramatics, though we may term them, like Ben Jonson, and "to rail" the public "into approbation," are unaffected by maquerre honte) "I recollect one." And he proceeds to state that "Babharoti has given us a drama composed by him, replete with all qualities, to which indeed this sentence is applicable, "How little do they who speak of us with censure! This entertainment is not for them. Possibly some one exists, or will exist, of similar tastes with myself; for time is boundless, and the world is wide." This self-possessed disregard of popularity, springing from an imperturbable consciousness of lofty aims, accounts for much that is characteristic of the higher class of Indian plays. It explains both their paucity and occasions, chiefly of length, renders Brahmans, with religious worship, they were only performed on solemn occasions, chiefly of a public nature, and more especially at seasons sacred to some divinity. Thus, though they might in some instances be reproduced, they were always written with a view to one particular solemn representation. Again, the greater part of every one of the plays of Northern India is written in Sanskrit, which ceased to be a popular language by 300 a.c., but continued the classical, and at the same time the sacred, form of speech of the Brahmans. Sanskrit is spoken by the heroes and principal personages of the plays, while the female and inferior characters use varieties, more or less refined, of the Prakrit languages (as a rule not more than three, that which is employed in the songs of the women being the poetical dialect of the most common Prakrit language, the Čaurasæni). Hence, part at least of each play cannot have been understood by the large majority of the audience, except in so far as their general acquaintance with the legends or stories treated enabled them to follow the course of the action. Every audience thus contained an inner audience, which could alone feel the full effect of the drama. It is, then, easy to see why the Hindu critics should make demands upon the art, in which they are more highly-trained and refined intellects were capable of entering, or called upon to enter. The general public could not be expected to appreciate the sentiments expressed in a drama, and thus (according to the process prescribed by Hindu theory) to receive instruction by means of amusement. These sentiments are termed rasa (tastes or flavours), and said to spring from the bádhas (conditions of mind and body). A variety of subdivisions is added; but the saňcita rasa is logically enough excluded from dramatic composition, as much as it implies absolute quiescence.

The Hindu critics know of no distinction directly corresponding to that between tragedy and comedy, still less of any determined by the nature of the close of a play. For, in accordance with the child like element of their character, the Hindus dislike an unhappy ending to any story, and a positive rule accordingly prohibits a fatal conclusion in their dramas. The general term for all dramatic compositions is rásapakā (from rás, form), those of an inferior class being distinguished as uparáspakā. Of the various subdivisions of the rásapakā, in a more limited sense, the nálaka, or play proper, represents the most perfect kind. Its subject should always be celebrated and important—it is viruously either heroism or love, and most frequently the latter—and the hero should be a demigod or divinity (such as Ráma in Babharoti's hero play) or a king (such as the hero of Śakuntala). But although the later poets took their plots from the sacred writings or Puránas, they held themselves at liberty to vary the incidents,—a licence from which the later poets abstained. Thus, in accordance, perhaps, with the respective developments in the religious life of the two peoples, the Hindu drama in this respect reversed the early drama. The prakarasas agree in all essentials with the nálaka except that they are less elevated; their stories are more fictitious, taken from actual life in a respectable class of society. Among the species of the uparáspakā may be mentioned the talañaka, in which the personages are partly human, partly divine, and of which a famous example remains. Of the báhasa, a monologue in one act, one literary example is extant—a curious picture of manners in which the speaker describes the different persons he meets as a spring festival in the streets of Kolahalar. The nature of the farcical prakarasas is usually directed against the hypocrisy of ascetics and Brahmans, and the sensuality of the wealthy and powerful. These trifles represent the lower extremes of the dramatic scale, to which, of course, the principles that follow only partially apply. Unity enjoined by the Hindu theory. The "nauté".

With the solemn character of the higher kind of Pro-dramatic performances accord the rules and prohibitions priorum, defining what may be called the proprieties of the Indian drama. Not only should death never be inflicted on a popular, but the various operations of luting, scratching, kissing, eating, sleeping, the bath, and the marriage ceremony should never take place on the stage. Yet such rules are made to be occasionally broken. It is true that the mild humour of the siddhásaka is restricted to his "gastenlating eating", instead of perpetrating the obnoxious act. The charming love-scene in the Śakuntala (at least in the earlier recension of the play) breaks off just as the hero is about to act the part of the bee to the honey of the heroine's lips. But later writers are less squeamish, or less refined. In two dramas the heroine is dragged from the stage by her braid of hair; and this outrage, a worse one than that imputed to Danstan, is in both instances the motive of the action. In a third, sleeping and the marriage ceremony occur in the course of the representation.

The dramatic construction of the Indian plays presents Construs no very striking peculiarities. They open with a benediction.

---

1. e.g., Mṛchakaṭṭi; Mālāṭi and Mālaṭara.
2. Vācura and Gāruḍa; Cūcum, Panjića.
3. Śakuntala, Ulula-Ráma-Khariśvarī.
5. Nágānanda, act i.
7. Veda-Sambhara; Prachanda-Fanhdva.
8. Vidhū-Shākunīshya.

Indian.]  

Drama (nāḍā), followed by "some account" of the author, and by an introductory scene between the manager and one of the actors, which is more or less skilfully connected with the opening of the play itself. This is divided into acts (ākōla) and scenes; of the former a nāḍak should have not fewer than 5, or more than 10; 7 appears a common number; "the great nāḍako" reaches 14. Thus has the length of the higher class of Indian plays is considerable—about that of an Eschylean trilogy, but not more than a single play was ever performed on the same occasion. Comic plays are restricted to two acts (here called sandhā). In theory the scheme of an Indian drama corresponds very closely to the general outline of dramatic construction given above, it is a characteristic merit that the business is rarely concluded before the last act. The piece closes, as it began, with a benediction or prayer. Within this framework is found for situations as ingeniously devised and highly wrought as those in any modern Western play. What could be more pitiful than the scene in Sākuntalā, where the true wife appears before her husband, whose remembrance of her is fatally overclouded by a charm; what more terrible than that in Malātī and Madhu Bobby, where the lover resigned has beheld from the horrors of the charnel field? Recognition—especially between parents and children—frequently gives rise to scenes of a pathos which Euripides has not surpassed. The ingenious device of a "play within the play" (so familiar to the English drama) is employed with the utmost success by Babhavūti. On the other hand, miraculous metamorphosis and, in a later play, vulgar magic lend their aid to the progress of action. With scenes of strong effectiveness contrast others of the more delicate poetic grace—such as the inexpressibly lovely episode of the two dancers of the god of love and his queen on the meadows of the Nandī hill. In many of the scenes of the two damsels of the god of love and his queen on the meadows of the Nandī hill. Inact II, the lovers are separated, and the chief interest of the play passes off to scenes of a kind rarely kept free from affectation in the modern drama. For the diminution in the narrower sense of the term the Indian dramatist largely resort to the expedient of the deus ex machīna, often in a sufficiently literal sense.

Characters. Every species of drama having its appropriate kind of hero or heroine, theory here again amuses itself with an infinitude of subdivisions. Among the heroes are to be noticed the courtesans, whose social position to some extent resembles that of the Greek hero, and association with whom does not seem in practice, however, it may be in theory, to be regarded as dishonorable even to Brahman society. In India, the Indian drama indicates relations between the sexes subject to peculiar restraints of usage, but freer than those which Mahometan example seems to have introduced into higher Indian society. The male characters are frequently drawn with skill, and sometimes with genuine force. Prince Sāmabhavikā in the purple worthy to rank besides figures of the modern drama, of which this has at times naturally been a favourite class of character; elsewhere the intrigues of ministers are not more fully exposed than their characters and principles of action are judiciously discriminated. Among the lesser personages common in the Indian drama, two are worth noticing, as corresponding though by no means precisely to familiar types of other dramatic literatures. These are the wid, the accomplished but dependent companion (both of men and women), and the jāthābhās, the humble associate (not servant) of the prince, and the butt of the action. Strangely enough, he is always a Brahman, or the pupil of a Brahman. His humour is to be ever intent on the pleasures of a quiet life, and on that of eating in particular, his jokes are always devoid of both harm and point.

Thus, clothing itself in a diction always ornate and Oriental tropical, in which (as Buckett has happily expressed) the proles is the warp and the verse the woof, in which (as Goethe says) words become allusions, allusions similes, and amilies metaphors, the Indian drama essentially depended upon its literary qualities, and upon the familiar sanctity of its favourite theses, for such effect as it was able to produce. Of scenic apparatus it knew but little; the simple devices of scenery by which exits and entrances were facilitated it is unnecessary to describe, and on the contrivances it resorted to for such "properties" as were required (above all, the cars of the gods and of their emusories) it is useless to speculate. Propriety of costume, on the other hand, seems always to have been observed, agreeably both to the peculiarities of the Indian drama and to the habits of the Indian people. The munsters of an art practised under such conditions actors could not but be regarded with respect, and spared the contempt or worse, which, except among one or other great civilized people, the Greeks, has everywhere at one time or another been the actor's lot. Companies of actors seem to have been common in India at an early date, and the inductions show the players to have been regarded as respectable members of society. In late if not in earlier times individual actors enjoyed a widespread reputation,—"all the world" is acquainted with the talents of Kalaha-Kandala. The directors, as already stated, were usually Brahmanas. Female parts were in general, though not invariably, represented by females. One would like to know whether such was the case in a piece where—after the fashion of more than one Western play—a crafty minister passes off his daughter as a boy, on which assumption she is all but married to a person of her own sex.

The Indian drama would, if only for purposes of comparison, be invaluable to the student of this branch of literature, but from the point of view of purely literary excellence it holds its own against all except the very foremost dramas of the world. It is, indeed, a mere periphrasis of Kalaha-Dasa the Indian Shakespeare—a title which, moreover, if intended as anything more than a synonym for poetic pre-emmience, might fairly be disputed in favour of Babhavūti, while it would be absolutely misleading to place a dramatic literature of the Hindūs beside the Greek or Latin. The larger and more quintessence of the culture of a caste, the Indian has been the actor's lot. But as a whole, the Indian drama is a sort of scholastic system of religious philosophy, self-conscious of its completeness. To the power of Fate is occasionally ascribed a supremacy, to which gods as well as mortals must bow; but it may be asserted of the whole of its beauty and moral effort at the same time points to the summit of possibilities, and self-sacrifice is the supreme condition both of individual perfection and of the progress of the world. Such conceptions as these seem at once to...
enfold and to overshadow the moral life of the Indian drama. The affections and passions forming part of self it delineates with a fidelity to nature which no art can neglect; but the freedom of the picture is restricted by conditions which to us are unfamiliar and at times seem intolerable, but which it was impossible for the Indian poet's imagination to neglect. The sheer self-absorption of ambition or love appears inconceivable by the minds of any of these poets; and their social philosophy is always based on the system of caste. On the other hand, they are masters of many of the truer forms of pathos, above all of that which blends with resignation in humour of a delicate kind they are by no means deficient; to its lower forms they are generally strangers, even in productions of a professionally comic intention. Of wit, Indian dramatic literature—though a play on words as the breath of its nostrils—furnishes hardly any examples intelligible to Western notions.

The distinctive excellence of the Indian drama is to be sought in the poetic robe which envelops it as flowers overspread the bosom of the earth in the season of spring. In its nobler productions, at least, it is never untrue to its half religious, half rural origin; it weaves the wreaths of idyllic fancies in an unbroken chain, adding to its favourite and familiar blossoms ever fresh beauties from an inexhaustible store. To its admirers it is unequal to depicting the finer aspects of nature in her mighty forests and on the shores of the ocean. A profound familiarity with its native literature can here alone follow its lineament, its outline, its character, with an accuracy we cannot profess to control, into four phases, the noble garden. Nor is it unequal to depicting the mango tree. But the poetic beauty of the Indian drama has continued to be left aside by any lover of the earlier pieces treating of the fortunes of an hero to the imperial throne, who was preserved in a mysterious box like another Cypselus or Moses. Voltairse seized the theme of the earlier play for a rhetorical tragedy, in which he coolly professes it was his intention to paint the manners of the Chinese and the Tartars. The last play, which is something less elevated in the rank of its characters, and very decidedly less refined in treatment, was afterwards translated by Stanislaus Julien; and to the labours of this scholar, of Sir J. F. Davis, and of Basin the elder, we owe a series of translated Chinese dramas, among which there can be no hesitation in designating the master-piece. The justly famous Pi-Pa-Ki (The Story of the Lute) belongs to a period rather later than that of the Yuen plays, having been composed towards the close of the 14th century by Kao-Tong-Kiu, and reproduced in 1404, under the Ming dynasty, with the alterations of Mao-Taeu, a commentator of learning and taste. Pi-Pa-Ki, which as a domestic drama of sentiment possesses very high merit, long enjoyed a quite exceptional popularity in China; it was repeatedly republished with laudatory prefaces, and so late as the 18th century was regarded as a monument of morality, and as the master-piece of the Chinese theatre. It would seem to have remained without any worthy competitors, for although it had been originally designed to produce a reaction against the immorality of the drama then in vogue, especially of Wang-Chi-Fou's celebrated Si-Siang-Ki (The Story of the Western Pavilion), yet...
CHINESE DRAMA

Drama as reflected in the drama seems one in which creed eludes creed, and superstitions are welcome whatever their origin. Of all religious traditions and doctrines, however, those of Buddhism (which had reached China long before the known beginnings of its drama) are the most perceptible; thus, the theme of absolute self-sacrifice is treated in one play, that of entire absorption in the religious life in another. The historical drama is not unknown to the Chinese; and although a law prohibits the bringing on the stage of “emperor, empresses, and the famous princes, ministers, and generals of former ages,” no such restriction is observed in practice. In Hun-Kong-Tsou (The Sorrows of Han), for instance, which treats a national historic legend strangely recalling in parts the story of Esther and the myth of the daughter of Ezechceus, the Emperor Yuen-Ti (the representative, to be sure, of a fallen dynasty) plays a part, and a sufficiently sorry one. By far the greater number, however, of the Chinese plays accessible in translations belong to the domestic species, and to that sub-species which may be called the criminal drama: Their favourite virtue is purity, of a formal kind, to parents or parents-in-law; their favourite interest lies in the discovery of long-hidden guilt, and in the vindication of persecuted innocence. In the choice and elaboration of such subjects they leave little to be desired by the most ardent devotees of the literature of agony. Besides this description of plays, we have at least one love-comedy pure and simple—a piece of a nature not “tolerably mild,” but ineffably harmless.

Range of characters

Free in its choice of themes, the Chinese drama is likewise remarkably unrestricted in its range of characters. Chinese society, it is well known, is not based, like Indian, upon the principle of caste; rank is in China determined by office, and this again depends on the results of examination. These familiar facts are constantly brought home to the reader of Chinese plays. The T'oo-hong-Yuen, or senior classman on the list of licentiates, is the flower of Chinese society, and the hero of many a drama; and it is a proud boast that for years “one's ancestors have held high posts, which they owed to their literary successes.” On the other hand, a person who has failed in his military examination, becomes, as if by a natural transposition, a murdering monster. But of more class the Chinese drama as a no respecter, painting with noteworthy freedom the virtues and the vices of nearly every phase of society. The same liberty is taken with regard to the female sex: it is clear that in earlier times there were few vexatious restrictions in Chinese life upon the social intercourse between men and women. The variety of female characters in the Chinese drama is great, ranging from the heroine who sacrifices herself for the sake of an empire to the well brought-up young lady who averts that “woman came into the world to be obdurate, to unravel skeins of silk, and to work with her needle.” From the chambermaid who contrives the most genteel sentiment of renderance, to the reckless courtesan who, like another Millwood, upbraids the partner of her guilt on his suing for mercy, and holds the hero in hopes of a re-union after death. In marriage the first or legitimate wife is distinguished from the second, who is at times a cx-devant, and towards whom the feelings of the former vary between bitter jealousy and suavely kindness.

The conduct of the plays exhibits much ingenuity, and construct an aversion from restrictions of time and place, in fact, and conduct of the plot.

The conduct of the plays exhibits much ingenuity, and construct an aversion from restrictions of time and place, in fact, and conduct of the plot.
The JAPANESE DRAMA, as all evidence seems to agree in showing, still remains what in substance it has always been—an amusement passionately loved by the lower orders, but dignified by no literature deserving the name. Apart from its native elements of music, dance, and song, and legendary or historical narrative and parody, it is clearly to be regarded as a Chinese importation; nor has it in its more advanced forms apparently ever attempted to emancipate itself from the reproduction of the conventional Chinese types. As early as the close of the 6th century Hada Kawanu, a man of Chinese extraction, but born in Japan, is said to have been ordered to arrange entertainments for the benefit of the country, and to have written as many as thirty-three plays. The Japanese, however, ascribe the origin of their drama to the introduction of the dance called Surandae as a charm against a volcanic depression of the earth which occurred in 809; and this dance appears still to be used as a prelude to theatrical exhibitions. In 1108 lived a woman called Ie no Zenji, who is looked upon as "the mother of the Japanese drama." But her performances seem to have been confined to dancing or posturing in male attire (oko-man); and the introduction of the drama proper is universally ascribed to Saruwaka Kanzaburo, who in 1654 opened the first theatre (naba) at Yedo. Not long afterwards (1651) the play-houses were removed to their present site in the capital; and both here and in the provincial towns, especially in the north, the drama has continued to flourish. Persons of rank are never seen at these theatres; but actors are occasionally engaged to play in private at the houses of the nobles, who appear formerly themselves to have taken part in performances of a species of opera affected by them, always treating patriotic legends and called nob. The Mikado only has a court theatre.

The subjects of the popular plays are to a large extent historical, though the names of the characters are changed. An example is to be found in the Kotoni, or musical romance, in which the universally popular tale of Chushingura (The Loyal Vengeurs) has been amplified and adapted for theatrical representation. This famous narrative of the feudal fidelity of the forty-seven ronin, who about the year 1699 revenged their chieftain judicial suicide upon the arrogant official to whom it was due, is strolling rather than touching in its incidents, and contains much bloodshed, together with a tea-house scene which suffices as a specimen of the Japanese comedy of manners. One of the books of this dramatic romance consists of a metrical description, mainly in dialogue, of a journey which (after the fashion of Indian plays) has to be performed on the stage. Other popular plays are mentioned dealing with similar themes, besides which there are domestic dramas of a very realistic kind, and often highly improper, though all intrigues against married women are excluded. Fairy—

On the other hand, the merits of this dramatic literature are by no means restricted to ingenuity of construction and variety of character-merits, in themselves important, which no candid criticism will deny to it. Its master-piece is not only truly pathetic in the conception and the main situations of its action, but includes scenes of singular grandeur and felicity of treatment—such as that where the re-married husband of the deserted heroine in vain essays in the presence of his second wife to sing to his new lute, now that he has cast aside the old. In the last act of a tragedy appealing at once to patriotism and to pity, there is true imaginative power in the picture of the emperor, whose very life is not spared by the terror of the death of his beloved, sitting in solitude broken only by the ominous shriek of the wild fowl. Nor is the Chinese drama devoid of humour. The lively abiga who has to persuade her mistress into confessing herself in love by arguing (almost like Beatrice) that "humanity bids us love men;" the corrupt judge (a standing type of the Chinese plays) who falls on his knees before the prosecuting parties to a suit as before the father and mother who give him sustenance, may serve as examples; and in Pe-Pa-Ki there is a scene of admirable burlesque on the still more characteristic theme of the humours of a competitive examination. If such illustrations could not easily be multiplied, they are at least worth citing in order to deprecate a perfunctory criticism on the qualities of a dramatic literature as to which our materials for judgment are still scanty.

While the north of China houses are temporarily set apart for dramatic performances, in the south these are usually confined to theatres erected in the streets (Hi-Thai). Thus scenic decorations of any importance must always have been out of question in the Chinese theatre. The costumes, on the other hand, are described as magnificent; they are traditionally those worn before the 17th century, in accordance with the historical colouring of most of the plays. The actor's profession is not a respectable one in China, the managers being in the habit of buying children of slaves and bringing them up as slaves of their own. Women may not appear on the stage, since the emperor Khien-Long admitted an actress among his concubines; female parts are therefore played by lads, occasionally by eunuchs.

Drama

The civilization and religious ideas of the Egyptians so vitally influenced the people of whose drama we are about to speak that a reference to them cannot be altogether omitted. The influence of Egyptian upon Greek civilization has probably been over-estimated by Herodotus, but while it will never be clearly known how much the Greeks owed to the Egyptians in divers branches of knowledge, it is certain that the former confessed themselves the school of Egypt in the cardinal doctrine of its natural theology. The doctrine of the immortality of the soul there found its most solemn expression in mysterious recitations connected with the rites of sepulture, and treating of the migration of the soul from its earthly to its eternal abode.

Traces of a drama exist in any of the other civilized peoples of Asia—for that in Siam may probably be regarded as a branch of the Indian. Among the Hebrews and other Semitic peoples, as well as in at least one originally Aryan people of Asia which has cultivated letters with assiduity and success—the Persians—the dramatic art is either wanting, or only appears as an occasional and exotic growth. It is unnecessary to dwell on the dramatic element apparent in two of the books of the Hebrew Scripture—the Book of Ruth and the Book of Job. Of the dramatic element in the religious rites of the Egyptians a word will be said immediately, meanwhile it may be convenient at once to state that traces of dramatic entertainments have been found in various parts of the New World, which it cannot be part of the present sketch to pursue. Among these are the performances, accompanied by dancing and intermingled with recitation and singing, of the South Sea Islanders, first described by Captain Cook, and lately introduced to the notice of students of comparative mythology by Mr. W. Wyatt Gil. Of the so-called Inca drama of the Peruvians, the unique relic, Apu Olantay, said to have been written down in the Quichua tongue from native dictation by Spanish priests shortly after the conquest of Peru, has been partly translated by Mr. Clements Markham, and recently twice rendered into German verse. It appears to be an historic play of the heroic type, combining stirring incidents with a pathos finding expression in at least one lyric of some sweetness—the lament for the lost Collyar. With it may be contrasted the ferocious Aztec dramatic ballet, Xalotl-Achs (translated by the Abbé de Bourbourg), of which the text seems rather a succession of warlike harangues than an attempt at dramatic treatment of character. But these are mere isolated curiosities.

Greek drama, as it received its later growth, is at once so active and so fluid as flexible in its anthropomorphic formations, that no other religious system has ever so victoriously assimilated to itself foreign elements, or so vivaciously and variously developed its own. The worship of Dionysus, introduced into Greece by the Phoenicians as that of the tauroimana sun-god whom his worshippers adored with loud cries (whence Bacchus or Bacchus), and the god of generation (whence his phallic emblem) and production, was brought into connection with the Doric religion of the sun-god Apollo. Apollo and his sister, again, corresponded to the Pelasgian and Achaean divinities of sun and moon, whom the Phoenician Dionysus and Demeter superseded, or with whose worship theirs was blended. Dionysus, whose rites were specifically conducted with reference to his attributes as the wine-god, was attended by defied representations of his original worshippers, who wore the skin of the goat sacrificed to him. These were the satyrs. Out of the connected worship of Dionysus, Bacchus, Apollo, and Demeter sprang the beginnings of the Greek drama.

"Both tragedy and comedy," says Aristotle, "originated in a rude and unpremeditated manner,—the first from the leaders of the dithyramb, and the second from those who added the satyric elements to it. The diversity of origin, and the distinction jealously maintained down to the latest times between the two branches of the dramatic art, even where they might seem to come into actual contact with one another, necessitate a separate statement as to the origin and history of each separately.

The custom of offering thanks to the gods by hymns andOrigin of and songs of the dances in the places of public resort was first practised by the Greeks in the Doric states, whose whole system of life was organized on a military basis. Hence the dances of the Dorians originally taught or sustained the movements of soldiers, and their hymns were warlike chants. Such were the beginnings of the chorus, and of its songs (called peana, from an epithet of Apollo), accompanied first by the phorminx and then by the flute. A step in advance was taken when the poet with his trained singers and dancers, like the Indian śāra-chātra, performed these religious functions as the representative of the population. From the Doric peana a very early period several styles of choral dancing formed themselves, to which the three styles of dance in scenic productions—the tragic, the comic, and the satyric—are stated afterwards to have corresponded. But none of these could have led to a literary growth. This was due to the introduction among the Dorians of the dithyramb,—originally a song of revelers, probably led by the flute-player and accompanied by the music of other Eastern instruments, in which it was customary in Crete to celebrate the birth of Bacchus (the doubly-born) and possibly also his later adventures. The leader of the band
Lyric tragedy.

(coryphæus) may be supposed to have at times assumed the character of the wine-god, whose worshippers bore aloft the vase-clad thyrsus. To this thyrsus was reëliged to a definite form by the Lesbian Arion (fl. 610), who composed regular poems, turned the moving band of worshippers into a standing or cyclic chorus, invented a style of music adapted to the character of the chorus—the ἀργικός or goat style—and called these songs goat-songs, or tragoediae. Hence the invention of lyrical tragedy—a transition stage between the dithyramb and the regular drama. His invention, or the chorus with which it dealt, was established according to fixed rules by his contemporary Stevechius. About the same time that Arion introduced these improvements into the Dorian city of Corinth, the (likewise Dorian) Families at Scydon honoured the hero-king Adрастus by tragic choruses. Hence the invention of tragedy was ascribed by the Sicyoniens to their poet Epigenes; but this step, significant for the future history of the Greek drama, of employing the Bacchic choruses for the celebration of other than Bacchic themes, was soon annulled by the tyrant Clasthenes.

The element which transformed lyrical tragedy into the tragic drama was added by the Iouans. The custom of the recitation of poetry by wandering minstrels called rhapsodes, sailors, or from καταβας, to pause together) first sprang up in the Ionian beyond the sea; to such minstrels was due the spread of the Homeric poems and of subsequent epic cycles. These recitations, with or without musical accompaniment, soon included gnostic or didactic, as well as epic, verse; if Homer was a rhapsode, so was the Sententious or "moral" Hesiod. The popular effect of these recitations was enormously increased by the metrical inventions of Archilochus (from 708), who invented the trochee and the σαμβος, the latter the arrowy metre which is the native form of natural invective—the species of comic composition in which Archilochus excelled—though it was soon used for other purposes also. The recitation of these iambics may already have nearly approached to theatrical declamation. The rhapsodes were welcome guests at popular festivals, where they exercised their art in mutual emulation, or ultimately recited parts, perhaps the whole, of longer poems. The recitation of a long epic may thus have resembled theatrical dialogue; what of alternating iambic poems, the form being frequently an address in the second person, even more so. The rhapsode was in some sense an actor; and when these recitations reached Attica, they thus brought with them the germ of theatrical dialogue.

The rhapsodes were actually introduced into Attica at a very early period; the θίανδ, we know, was chanted at the Brauronia, a rural festival of Bacchus, whose worship had early entered Attica, and was cherished among its rustic population. Meanwhile the cyclic chorus of the Dorians had found its way into Attica and Athens, even since the Athenians had recognized the authority of the great centre of the Apolline religion at Delphi. It therefore only remained for the rhapsoid and the cyclic—in other words, for the epic and the choral—elements to coalesce; and this must have been brought about by a union of the two accompaniments of religious worship in the festive rites of Bacchus, and by the domestication of these rites in the ruling city. This occurred in the time of Pausistratus, perhaps after his restoration in 534. To Thespis (535), said to have been a contemporary of the tyrant and a native of a Dacician deme (Icaria), the invention of tragedy is accordingly ascribed. Whether his name be that of an actual person or not, his claim to be regarded as the inventor of tragedy is founded on the statement that he introduced an actor for the sake of relieving the Dionysian chorus. Thus, the representative of the rhapsoids, and doubtless, at first, generally the poet himself, instead of merely alternating his recitations with the songs of the chorus, addressed his speech to its leader—the coryphæus—with whom he thus carried on a species of dialogue. The chorus stood round its leader upon the steps of the Bacchic altar (thyrsus), the actor was placed upon a table. The table is the predecessor of the stage, for the wagon of Thespis is a fiction, probably due to a confusion between his table and the wagon of Susarion. It is a significant minor invention ascribed to Thespis, that he disguised the actor's face first by means of a pigment, afterwards by a mask. In the dialogue was treated a myth relating to Bacchus or some other deity or hero. Whether the god Thespis actually wrote tragedies (and there seems no reason to doubt it), and although both the cyclic chorus and rhapsodic recitation continued in separate use, tragedy was now in existence. The essential additions afterwards made to its simple framework were remarkably few. Aeschylus added a second actor, and by reducing the functions of the chorus further established the dialogue as the principal part of the action. Sophocles added a third actor, by which change the preponderance of the dialogue was made complete.

If the origin of Greek comedy is simpler in its nature than that of Greek tragedy, the beginnings of its progress are involved in more obscurity. It is said to have been invented by Susarion, a native of Megara, whose inhabitants were famed for their coarse humour, which they communicated to their colonies in Sicily. In this island, to this day the home of spontaneous merriment, comedy was to have arisen. In the rural Bacchic vintage-festivals of bands of jolly companions (σάλπιγγες) properly a revel continued after supper) went about in carts or afoot, carrying the phallic emblem, and indulging in the ribald licence of wanton mirth. From the song sung in these processions or at the Bacchic feasts, which combined the praise of the god with gross personal ridicule, and was called comus in a secondary sense, the Bacchic reveler taking part in it was called a comus-singer or comoxus. These phallic processions, which were afterwards held at Athens as in all Greek cities, imparted their character to Old Attic comedy, whose essence was personal exhibition. The recitation of the recitations is thus independent of one another in their origin, Greek tragedy and comedy never actually coalesced. The satyr-drama, though in some sense it partook of the nature of both, was in its origin as in its history connected with tragedy alone. Phrynias, a contemporary of Aeschylus in his earlier days, is said to have restored the tragic chorus to the satyrs, i.e., he first produced dramas the same in form and theme as the tragedies, but in which the dances were different and entirely carried on by satyrs. The tragic poets, while never writing comedies, henceforth also composed satyr-dramas; but neither tragedies nor satyr-dramas were ever written by the comic poets, and it was in conjunction with tragedies only that the satyr-dramas were performed. The theory of the Platonic Socrates, that the same man ought to be the best tragic and the best comic poet, was never exemplified in practice. The so-called Tragikos-tragedy or tragic-comedy of later writers, though in comedy, some of its features to have been anticipated by Euripides, in form nowise differed from tragedy; it merely contained a comic element in its characters, and invariably had a happy ending. The serious and sentimental element in the comedy of Menander and his contemporaries did far more to destroy the essential difference between the two great branches of the Greek dramatic art.

The history of Greek—which virtually always remained the drama of the tragedian—tragedy divides itself into three periods.

A L E X A N D R E A .
The uncontestable pre-eminence of the three great tragic poets acknowledged at Athens by the usage allowing them no tragedies but those to be more than once performed, and by the law of Lycurgus (c. 330) which obliged the actors to use, in the case of the great masters, authentic rev. copies preserved in the public archives. It is thus not impossible that the value of later Attic tragedy, of which the fertility continued considerable, has been overrated. In all the names of 1400 tragedies and satyr-dramas are preserved, and tragic poets are mentioned of whose plays no names are known. Among the more celebrated Attic tragedians contemporary with the great writers, Ion of Chios (d. before 412) seems to have followed earlier traditions of style than Euripides, Agathon, who survived the latter, on the other hand, introduced certain innovations of a transmortal kind into the art of tragic composition.

III. Of the third period of Greek tragedy the concluding limit cannot be precisely fixed. Down to the days of Alexander the Great, Athens remained the chief home of tragedy. Though tragedies must have begun to be acted at the Syracusan and Macedonian courts, since Eschylus, Homer of the Euripides, and Agathon had sojourned there,—though the practice of producing plays at the Dionysia before the allies of Athens must have led to their holding similar exhibitions at home,—yet before the death of Alexander we meet with no instance of a tragic poet writing or a tragedy written outside Athens. An exception should indeed be made in favour of the tyrant Dionysus of Syracuse, who (like Critias in his earlier days at Athens) was "addicted to" tragic composition. Not all the tragedians of this period, however, were Athenians born, though the names of Euphorion, the son of Eschylus, Sophocles, of whom the son of the same name, and Sophocles, Euripides and Sophocles, the nephew and the grandson respectively of their great namesakes, illustrate the descent of the tragic art as an hereditary family possession.

Soon after the death of Alexander theatres are found spread over the whole Hellenic world of Europe and Asia—a result to which the practice of the conqueror and his father of celebrating victories by scene performances had doubtless contributed. Alexandria having now The Alex becomes a literary centre with which even Athens was in India some respects unable to compete, while the latter still retained the home of comedy, the tragic poets flocked to the capital of the Ptolemies, and here, in the house of Ptolemy Philadelphus (283–247) flourished the seven tragic poets famed as the "Plebes," who still wrote in the style and followed the rules observed by the Attic masters. Tragedy and the dramatic art continued to be favoured by the later Ptolemies, and about 100 B.C. we meet with the curious phenomenon of a Jewish poet, Ezechiel, composing Greek tragedies, of one of which (the Eudos from Egypt) fragments have come down to us. Tragedy, with the satyr-drama and comedy, survived in Alexandria beyond the days of Cleopatra and Varro, nor was their doom finally sealed till the Emperor Caracalla abolished the-theatrical performances in the Egyptian capital in 217 A.D. During the whole of its productive age Greek tragedy seems to have adhered to the lines laid down by its great masters; nor were these in most respects departed from by the Roman imitators of these poets and their successors. Tragedy was defined by Plato as an imitation of the noblest life. Its proper themes—the deeds and sufferings of heroes—were familiar to audiences interested in the mythology of the national religion. So much Greek tragedy almost wholly confined itself; and in later days there were numerous books which discussed these
myths of the tragedians. They only very exceptionally treated historic themes, though one great national calamity, and a yet greater national hero, and in later times a few other historical subjects, were brought upon the stage. Such veiled historical allusions as critical ingenuity has sought not only in passages but in the entire themes of other Attic tragedies cannot, of course, even if accepted
as such, stamp the plays in which they occur as historic dramas. No doubt Attic tragedy, though after a different and more decorous fashion, shared the tendency of hpr
comic sister to introduce allusions to contemporary events and persons; and the indulgence of this tendency was facilitated by the revision (rearrangement) to which the works of the great poets were subjected by them, or by those who produced their works after them. So far as we know, the subjects of the tragedies before Aeschylus were derived from the poets; and it was a famous saying of this poet that his dramas were but dry scraps from the great banquet of Homer—an expression which may be understood as including the poems which belong to the so-called Homeric cycles. Sophocles, Euripides, and their successors likewise resorted to the Trojan, and also to the Heraclean and the Theban myths, and to Attic legend in general. To Theban, to Troy, to Medea, to the law of Lycurgus applied to the Cyclops, to the themes of Greek tragedy, the Trojan myths always retained so prominent a place that Lucian could jest on the universality of their dominion. Purely invented subjects were occasionally treated by the later tragedians; of this innovation Agathon was the originator.

Theophrastus is said to have introduced the use of a prologue and a rhēs (speech)—the former being probably the opening speech recited by this solitary actor, the latter the dialogue between actor and chorus. It was a natural result of the introduction of the second actor that a second rhēs should likewise be added; and this tripartite division would be the earliest form of the trilogy—three sections of the same myth forming the beginning, middle, and end of a single drama, marked off from one another by the choral songs. From this Aeschylus proceeded to the treatment of these several portions of a myth in three separate plays, conducted together by their subject and by being performed in sequence on a single occasion. This is the Aeschylean trilogy, of which we have only one extant example, the Orestes,—as to which critics may differ whether Aeschylus adhered in it to his principle that the strength should lie in the middle—in other words, that the interest should center in the second play. In any case, the symmetry of the trilogy was destroyed by the practice of performing after it a satyr-drama, probably, as a rule, if not always, connected in subject with the trilogy, which thus became a tetralogy, though this term, unlike the other, seems to be a purely technical expression invented by the learned.

Sophocles, a more conscious and probably a more self-
critical artist than Aeschylus, may be assumed from the fact to have elaborated his plots with greater care; and to this, as well as to his innovation of the third actor, which materially added to the fulness of the action, we may attribute his introduction of the custom of contending for the prize with single plays. It does not follow that he never produced connected trilogies, though we have no example of such by him or any later author; on the other hand, there is no proof that either he or any of his successors ever departed from the Aeschylean rule of producing three tragedies, followed by a satyr-drama, on the same day. This remained the third and last stage in the history of the construction of Attic tragedy. The tendency of its Complexity of action towards complication was a natural progress, and was approved by Aristotle. This complication, in which Euripides excelled, led to his use of prologues, in which one of the characters opens the play by an exposition of the circumstances under which its action begins. This practice, though railed at by Aristophanes, was too convenient not to be adopted by the successors of Euripides, and Menander transferred it to comedy. As the dialogue increased in importance, so the dramatic significance of the chorus diminished. While in Aeschylus it mostly, and in Sophocles occasionally, takes part in the action, its songs could not be more approach the character of lyrical interludes; and this they openly assumed when Agathon began the practice of inserting choral songs (embolisms) which had nothing to do with the action of the play. In the general contrivance of their actions it was only natural that, as compared with Aeschylus, Sophocles and Euripides should exhibit a greater latitude and ingenuity; but the palm due to a treatment at one point adhering to the substance of the ancient legends and original in an effective dramatic treatment of them must be given to Sophocles. Euripides was, moreover, less skilful in uniting complicated actions than in weaving them; hence his frequent resort to the deva ex machina, which Sophocles employs only in his latest play.

The other distinctions to be drawn between the dramatic characters of the three great tragic masters must be mainly based upon a critical estimate of the individual genius of each. In the characters of their tragedies, Aeschylus and Sophocles avoided those lapses of dignity with which from one point of view Euripides has been charged by Aristophanes and other critics, but which from another connect themselves with his humanity. If his men and women are less heroic and statuesque, they are more like men and women. Aristotle objected to the later tragedians that, compared with the great masters, they were deficient in the drawing of character—by which he meant the lofty drawing of lofty character. In diction, the transition is even more perceptible from the "helmed phrases" of Aeschylus, who had Milton's love of long words and sonorous proper names, to the play of Euripides' "smooth and dextrous tongue;" but to a sustained style even he remained essentially true, and it was reserved for his successors to introduce into tragedy the "low speech"—i.e., the conversational language—of comedy. Upon the whole, however, the Euripidean diction seems to have remained the standard of later tragedy, the flowery style of speech introduced by Agathon finding no permanent favour.

Finally, Aeschylus is said to have made certain reforms Improvements in tragic costume of which the object is self-evident,—to have improved the mask, and to have invented the corders or buxuin, upon which the actor was raised to

1 Phrynichus, Capture of Miletus.

5 Trilogy; Sophocles, Antigone; Oedipus Colonus; Eumolpos, Medea.

6 Phithiasos; Scopas. 7 Quide from this revision was the passage against which the fool of Lycurgus was directed, of "cobbling and letting" the drama of the great masters by alterations of a kind familiar enough to the students of Shakespeare as improved by Colley Cibber. The later tragedians also appear to have occasionally transposed long speeches from one tragedy to another—a device introduced by the Roman dramatists, and called collationem by Latin writers.
8 One satyr-drama only is preserved to us, the Oedipus of Euripides, a dramatic version of the Homeric tale of the visit of Odysseus to Polypheemas. Lymphroth, one of the poets of the Pleas, by using the satyr-scene as a vehicle of personal ridicule, applied it to a purpose like that of Old Attic comedy.

9 Ton; Sophocles; Iphigeneia in Tauris; Electra; Helen; Hypolytus; Andromache.
10 Philoctetes.
lofter stature. Euripides was not afraid of rage and tatters; but the sarcasms of Aristophanes on this head seem feeble to those who are aware that they would apply to King Lear as well as to Telephus.

The history of Greek comedy is likewise that of an essentially Attic growth, although Sicilian comedy was earlier in date than its Attic sister or descendant. The former is represented by Epicharmus (fl. 500), and by the names of one or two other poets. It probably had a chorus, and, dealing as it did in a mixture of philosophical discourse, anti-ethical rhetoric, and wild buffoonery, necessarily varied in style. Though in some respects it seems to have resembled the Middle rather than the Old Attic comedy, its subjects sometimes, like those of the latter, coincided with the myths of tragedy, of which they were doubtless parodies. The so-called mimes of Sophron (fl. 430) were dramatic scenes from Sicilian life, intended, not for the stage, but for recitation.

Attic comedy is usually divided into three periods or species, viz. —

I. OLD COMEDY, which dates from the complete establishment of democracy by Pericles, though a comedy directed against Themistocles is mentioned. The Megarian farcical entertainments had long spread in the rural districts of Attica, and were now introduced into the city, where Cratinus and Crates (fl. 450) first moulded them into the forms of Attic art. The final victory of Pentes and the democratic party may be reckoned from the ostracism of Thucydides (444), and so eagerly was the season of freedom employed by the comic poets that already four years afterwards a law — which was, however, only a short time in force — limited their licence. Cratinus, an exceedingly bold and broad satirist, apparently of conservative tendencies, was followed by Eupolis (416—after 415), every one of whose plays appears to have attacked some individual, by Phrynickus, and others; but the representative of old comedy in its fullest development is Aristophanes (c. 444—c. 380), a comic poet of unique and unsurpassed genius. Dignified by the acquisition of a chorus (though of a less costly kind than the tragic), of masked actors, and of scenery and machinery, and by a corresponding literary elaboration and elegance of style, Old Attic comedy nevertheless remained true both to the spirit and to the purposes of its introduction into the free imperial city. It borrowed much from tragedy, but it retained the phallic abandonment of the old rural festivals, the licence of word and gesture, and the audacious directness of personal invective. These characteristics are not features peculiar to Aristophanes. He was twitted by some of the older comic poets with having degenerated from the full freedom of the art by a tendency to refinement, and he took credit to himself for having superseded the time-honoured canons and the stale practical joking of his predecessors by a nobler kind of mirth. But in boldness, as he likewise boasted, he had no peer; and the shafts of his wit, though dipped in woeless and at times feathered from very obscene bow, flew at high game. He has been accused of seeking to degrade what he ought to have recognized as good; and it has been shown with complete success that he is not to be taken as an impartial or accurate authority on Athenian history. But partisan as he was, he was also a genuine patriot; and his very political sympathies — which were conservative — were such as have often stimulated the most effective political sarcasm, because they imply an antipathy to every species of excess. Of the conservative quality of reverence he was, however, altogether devoid; and his

love for Athens was that of the most free-spoken of Sons. Flexible even in his religious notions, he was in this as in other respects ready to be educated by his times, and, like a true comic poet, he could be witty at the expense even of his friends, and, it might almost be said, of himself. In wealth of fancy, and in beauty of lyric melody, he ranks high among the great poets of all times.

The distinctive feature of Old, as compared with Middle Comedy, is the parabasis, the speech in which the chorus, moving towards and facing the audience, addressed it in the name of the poet, often abandoning all reference to the action of the play. The loss of the parabasis was involved in the loss of the chorus, of which comedy was deprived in consequence of the general reduction of expenditure upon the comic drama, culminating in the law of Cinesias (396). But with the downfall of the independence of Athenian public life, the ground had been cut from under the feet of its most characteristic representative. The catastrophe of the city (405) had been preceded by the temporary overthrow of the democracy (411), and was followed by the establishment of an oligarchical "tyranny" under Spartan protection; and when liberty was restored (406), the citizens for a time addressed themselves to their new life in a soberer spirit and continued (or passed) the law prohibiting the introduction by name of any individual as one of the personages of a play. The change to which comedy had to accommodate itself was one which cannot be defined by precise dates, yet it was not the less inevitable in its progress and results. Comedy, in her struggle for existence, now chiefly devoted herself to literary and social themes — such as the criticism of tragic poets, and the literary praise of women's rights — and the transition to Middle Comedy accomplished itself. Of the later plays of Aristophanes, three are without a parabasis, and in the last of those preserved to us the chorus is quite insignificant.

II. MIDDLE COMEDY, whose period extends over the Middle, remaining years of Athenian freedom, thus differed in substance as well as in form from its predecessor. It is represented by the names of thirty-seven writers (more than double the number of poets attributed to Old Comedy) among whom Eubulus, Aristophanes, and Alexis are stated to have been pre-eminent in fertility and success. Middle comedy of manners as well as of character, although its ridicule of particular classes of men tended to the creation of standing types, such as parasites, courtiers, revellers, and — a favourite figure already drawn by Aristophanes — the self-conceited cook. In style it necessarily became more easy and conversational; while in that branch which was devoted to the parodying of tragic myths, its purpose may have been to ridicule, but its effect must have been to degrade. This species of the comic art had found favour at Athens already before the close of the great civil war; its inventor was the Thasian Hegemon, at whose Gigantomachia the Athenians were laughing on the day when the news arrived of the Sicilian disaster.

III. NEW COMEDY, which is dated from the establishment of Macedon. If its favourite types were more numerous, including the captain (of mercenaries) — the original of a long line of comic favourites — the cunning slave, etc., they were probably more conventional. New Comedy appears to have first constituted love intrigues the main subject of dramatic action. The most famous of the 64 writers said to have belonged to this period of comedy were Philonion (fl. from 330), Menander (342-291), Philionion and Menander.

6 6 6

5 Pericles.

8 Philemon and Menander.
and his contemporary Diphilus. Of these, authors we know something from fragments, but more from their Latin adapters Plautus and Terence. As courtesans of character, they were limited by a range of types which left little room for originality of treatment; in the construction of their plots they were skilful rather than varied. In style, as well as to some extent in construction, Menander took Euripides as his model, infusing into his comedy an element of moral and sentimental reflection, which refined if it did not enliven it. Yet it may be doubted whether either a high moral or a high artistic purpose animated this school of writers, and whether Epicurus in Landor's dialogue does injustice to Menander in suspecting him of "enjoying the follies of men in our rotten state as flies enjoy fruit in its decay." Fate or chance were the directing powers of his dramatic actions.

New Comedy, and with it Greek comedy proper, is regarded as having come to an end with Posidippus (fl. c 280). Other comic writers of a later date are, however, mentioned, among them Rhodon of Tarentum (fl. c 260), whose mixed compositions have been called by various names, among them by that of phlyacography (from phlyax, useless chatter). But Greek comedy ceased to be productive after it had been transplanted from Athens to Alexandria; and though even in its original form it long continued to be acted in imperial Rome, the pieces of its history which may here be passed by.

The religious origin of the Attic drama impresses itself upon all its most peculiar features. Theatrical performances were held at Athens only at fixed seasons in the early part of the year—at the Bacchic festivals of the country Dionysia (vintage), the Lenaia (wine-press), probably at the Anthesteria, and above all, at the Great Dionysia, or the Dionysia par excellence, at the end of March and beginning of April, when in her most glorious age Athens was crowded with visitors from the islands and cities of her empire. As a part of the religious worship, the performances took place in a sacred locality—the Lenon or on the south-eastern declivity of the Acropolis, where the first wine-press (lenos) was said to have been set up, and where now an altar of Bacchus (thymi) formed the centre of the theatre. For the same reason, the elevation required the attendance of the spectators, and was therefore provided on a grand scale—according to the Platonic Socrates, for "more than 30,000" spectators. The performances lasted all day, or at least, in accordance with their festive character, extended to as great a length as possible. To their religious origin is likewise to be attributed the fact that they were treated as a matter of state concern. The expenses of the chorus, which in theory represented the people at large, were defrayed on behalf of the state by the liturgites (public services) of wealthy citizens, chosen in turn by the tribes to be choragi (leaders, i.e., providers of the chorus), the duty of training being, of course, deputed to the professional persons (chorodides). Publicly appointed and sworn judges decided between the merits of the dramas produced in competition with one another; the successful poet, performers, and choruses were crowned with ivy, and the last-named was allowed at his own expense to consecrate a tripod in memory of his victory, in the neighbourhood of the sacred Bacchic enclosure. Such a monument—one of the most graceful relics of ancient Athens—still stands in the place where it was erected, and recalls to posterity the victory of Lysicrates, achieved in the same year as that of Alexander on the Granicus. The dramatic exhibitions held at the number of religion and state, the dramaticus (theorikon) which had been introduced to prevent overcrowding, was from the time of Pericles provided out of the public treasury. The whole population had a right to its Bacchic holiday; neither women, nor boys, nor slaves were excluded from theatrical spectacles at Athens.

The religious character of the dramatic performances at Corinth; and the circumstances under which they accorded, and scenically took place, likewise determined their externals of costume and scenery. The actor's dress was originally the festive Dionysian attire, of which it always retained the gay and variegated hues. The use of the mask was due to the actor's appearing in the open air and at a distance from most of the spectators; its several species were elaborated with great care, and adapted to the different types of theatrical character. The cothurnus, or thick-soled boot, which further raised the height of the tragic actor (while the comedian wore a thin-soled boot), was likewise a relic of Bacchic costume. The scenery was, in the simplicity of its original conception, suited to open-air performances; but in course of time the art of scene-painting came to be highly cultivated, and movable scenes were contrived, together with machinery of the ambitious kind required by the Attic drama, whether for heightening gods down from heaven, or for raising mortals aloft.

On a stage and among surroundings thus conventional, Actors, it might seem as if little scope could have been left for the actor's art. But though the demands made upon the Attic actor differed in kind even from those made upon his Roman successor, and still more from those which the historic art has to meet in modern times, they were not the less rigorous. Mask and buskin might increase his stature, and the former might at once lend the appropriate expression to his appearance and the necessary resonance to his voice. But in declamation, dialogue, and lyrical passages, in gesticulation and movement, he had to avoid the least violation of the general harmony of the performance. At the same time, the refinements of by-play must, from the nature of the case, have been impossible on the Attic stage; the gesticulation must have been broad and massive; the actor must slow and the grouping hard in tragedy; and the recitation must have surpassed in its weighty sameness that half-chant of which the echoes have never wholly died out from the stage. Not more than three actors, as has been seen, appeared in any Attic tragedy. The actors were provided by the poet; perhaps the performer of the first parts (protagonists) was paid by the state. It was again a result of the religious origin of Attic dramatic performances, and of the public importance attached to them, that the actor's profession was held in high esteem. These artists were as a matter of course free Athenian citizens, often the dramatists themselves, and at times were employed in other branches of the public service. In later days, when tragedy had migrated to Alexandria, and when theatrical entertainments had spread over all the Hellenic world, the art of acting seemed to have reached an unprecedented height, and to have taken an extraordinary hold of the public mind. Synods or companies of Dionysian artists abounded, who were in possession of various privileges, and in one instance at least (at Pergamus) of rich endowments. The most important of these was the Ionian company, established first in Teos, and afterwards in Lebedos, near Colophon, which is said to have lasted longer than many a famous state. We likewise hear of strolling companies performing in partibus. Thus it came to pass that the vitality of some of the master-pieces of the Greek drama is without a parallel in theatrical history; while Greek actors were undoubtedly among the principal and most effective agents of the spread of literary culture through a great part of the known world.
touched the subject incidentally, Aristotle has in his *Poetics* (after 334) included an exposition of it, which, mutilated as it is, has formed the basis of all later systematic enquiries. The specialities of Greek tragic dramaticy refer above all to the chorus; its general laws are those of the regular drama of all times. The theories of Aristotle and other earlier writers were elaborated by the Alexandrians, many of whom doubtless combined examples with precept; they also devoted themselves to commentaries on the old masters, such as those in which Diodorus (c. 30 B.C.) abundantly excelled, and collected a vast amount of learning on dramatic composition in general, which was doomed to perish, with so many other treasures, in the flames kindled by religious fanaticism.

"The history of the Greek stage," says Sir Walter Scott, "is that of the dramatic art in general," and herein no doubt lies the broad distinction to be drawn between the drama of the Greeks and the isolated growths previously treated in this sketch. Yet though such is the case,—though in the Roman drama the native elements sink into insignificance when compared with those borrowed from the Greeks, and though the literary element in the modern drama of the West is directly or indirectly derived from the same source,—the Greek drama, both tragic and comic, had features of its own which it has been the principal aim of the foregoing brief account of it to mark. Tragedy never lost the traces of its religious origin, and the festive purposes of comedy are most signally apparent in precisely that period of its productivity whose works are least congenial to modern feeling and taste. But such is the wonderful power of the highest kind of art, that the tragedy of the three great masters, though its themes are so peculiar to itself that they have never been treated with the same effect by the numberless writers of other peoples who have essayed them, "hath ever been held the gravest, moralist, and most profitable of all other poems," and such is the commanding claim of genius, that Aristophanes, who cultivated a species of comedy of an altogether eccentric kind, occupies an eminence in his branch of the drama hardly more contestable than that of the great tragic trud in theirs. What is Homeric to us that we should weep for her,—or Antigones that our sympathy should accompany her on her holy errand, forbidden by human laws, but enjoined upon her by the behest of Zeus and of Justice dwelling with the gods below,—or Agamemnon that we should shrill with horror when his cries announce the wreaking of his doom? Why can we laugh at the ribald repartees of hide-seller and sausage-seller, careless of the merits of the former of these advanced politicians, and catch something of the dew of the rue-bringing maidens as it falls upon their beloved land, where the Etruscan joy greets the advent of spring? Because in all these instances, and in every other, the art of the Greek drama, while wrenched by the individual power of genius, is at the same time true to its purposes as an art, and in harmony with Nature, who will not teach her laws or surrender her secrets of a sudden or to all.

In its most productive age, as well as in the times of its decline and decay, the Roman drama exhibits the continued coexistence of native forms by the side of those imported from Greece—either kind being necessarily often subject to the influences of the other. Italy has ever been the native land of acting and of scenic representation; and though Roman dramatic literature is in the main but a faint reflex of Greek examples, yet there is perhaps no branch of Roman literary art more congenial than this to the soil wherein it sprang.

The beginnings of dramatic performances in Italy are to be sought in the rural festivities which doubtless from a very early period developed in lively intermixture the elements of the dance, of jocular and abusive improvisations in the native forms of song, speech, and dialogue, and of an assumption of character such as may be witnessed in any ordinary conversation among southern Italians at the present day. The occasions of these festivities were religious celebrations, public or private,—among the latter more especially weddings, which have in all ages been provocative of mirthful demonstrations. The so-called Festuccia verses (from festuccia, or from Festuccia in southern Etruria), which were afterwards confined to weddings, and ultimately gave rise to an elaborate species of artistic poetry, never married into actual dramatic performances. In the *satyrion*, on the Saturnalia, another—name originally due to the goatkins of the shepherds, but from primitive times connected with the *festival* of both performers and performance—there seems from the first to have been a dramatic element; they were probably comic songs or stories recited with gesticulation and flute accompaniment. Introduced into the city, these entertainments received a new impulse from the performances of the Etruscan players (tuscanes), who had been brought into Rome when scenic games (ludi reperi) were, in 364 B.C., for purposes of religious propitiation, first held there. These *tuscanes*, as they were called at Rome (*tusi istiones*), had been their native name, who have had the honour of transmitting their appellative to the entire *hispanica* art and its professors, were at first only dancers and pantomimists in a city where their speech was unintelligible. But their performances encouraged and developed those of other players and mountebanks, so that after the establishment of the regular drama at Rome on the model, the *saturion* came to be performed as farcical after-pieces (*exodos*), until they gave way to other species. Of these the *mimus* were at Rome probably coeval in their beginnings with the stage itself, where those who performed them were afterwards known under the same name, possibly in the place of an older appellation (*plantypides*, bare-footed). These loose farces, after being probably at first performed independently, were then played as after-pieces, tall in the imperial period, when they reasserted their predominance, they were again produced by themselves. At the close of the republican period the *mimus* had found its way into literature (through D. Laberius and others), and had been assimilated in both form and subjects to other varieties of the comic drama—preserving, however, as its distinctive mark, a preponderance of the name or gestual element. Together with the *pantomimus* (*v. infra*), the *mimus* continued to prevail in the days of the empire, having transferred its innate grossness (for it was originally a representation of *lesser life*) to its treatment of mythological subjects, with which it dealt in accordance with the demands of a "librerie and adulterae age." As a matter of course, the *mimus* freely borrowed from other species, among which, so far as they were of native Italian origin, the *Atellana* (from *Atella in Campania*) call for special mention. Usually supposed to be of Oriental birth, they originally consisted in delineations of the life of small towns, in which dramatic and other satire has never ceased to find a favourite butt. The principal personages in these living sketches gradually assumed a fixed and conventional character, which they retained even when, after the final overthrow of Campanian independence (210), the *Atellanae* had been transplanted to Rome. Here the heavy father or husband (*poppeus*), the ass-eared glutton (*macucus*), the full-cheeked, voracious chestnut-box (*nucocus*), and the wily sharper (*doresmus*) became accepted comic types, and with others of a similar kind were handed down, to reappear in the modern Italian drama. In these characters lay the essence of the *Atellanae*, their plots were extremely simple; the dialogue (perhaps interspersed with songs in Vili. — 52

Greek) origin; and its early history, at all
families,
tragedies belong to the Trojan cycle; and EuripIdes,
his favourite source and model. M. Pacuvius (b.
like Ennius subject from his youth up to the
influences of Greek civilization, and the first
Roman dramatist who devoted himself exclusively to the tragic
drama, was the least fertile of the chief Roman tragedians,
but was regarded by the ancients as indisputably superior to
Ennius. He again was generally (though not uniformly)
held to have been surpassed by L. Accius (b. 170),
a learned scholar and prolific dramatist, of whose plays 50
titles and a very large number of fragments have been
preserved. The plays of the three last-named poets maintained
themselves on the stage till the close of the republic;
and Accius was quoted by the emperor Tiberius.4 Of the other
tragic writers of the republic several were dilettanti—such
as the great orator and eminent politician C. Julius Strabo;
the cultivated officer Q. Tullius Cicero, who made an
attempt, disapproved by his illustrious brother, to introduce
the satyr-drama into the Roman theatre; L. Cornelius
Balbus, a Cassian partisan; and finally C. Julius Cesar himself.
Tragedy continued to be cultivated under the
earlier emperors; and of one author, the famous and ill-
feted L. Annesus Seneca
has come down to us. In accordance with the character
of their author's prose-work, they exhibit a strong
predominance of the rhetorical element, and a pomposity
of style far removed from that of the poets Sophocles and
Euripides, from whom Seneca derived his themes. The
metrification of his plays is very strict, and they were doubt-
less intended for recitation, whether or not also designed for
the stage. A few tragic poets are mentioned after Seneca,
but the reign of Domitian (81-96) the list becomes
finite. The close of Roman tragic literature is obscurer
than its beginning; and, while there are traces of tragic
performances at Rome as late as even the 6th century, we
are ignorant how long the works of the old masters
of Roman tragedy maintained themselves on the stage.
It would obviously be an error to draw from the plays of

Roman drama 411

In Roman comedy two different kinds—respectively called palliata and togata from the names of dress—were distinguished, the former treating Greek subjects and imitating Greek originals, the latter professing a native character. The palliata sought its originals especially in New Attic comedy, and its authors, as they advanced in refinement of style, became more and more dependent upon their models, and unwilling to gratify the coarser tastes of the public by local allusions or gross seasonings. But that kind of comedy which shrinks from the rude breath of popular applause usually has in the end to give way to its squeamish rivals, and thus, after the species had been cultivated for about a century (c. 250–150 B.C.), palliata ceased to be composed except for the amusement of small circles, though the works of the most successful authors, Plautus and Terence, kept the stage even after the establishment of the empire. Among the earlier writers of palliata were the tragic poets Andronicus, Naevius, and Ennius, but they were alike surpassed by T. Maccius Plautus (254–184), nearly all of whose comedies esteemed genuine by Varro—not less than 50 in number—have been preserved. He was exclusively a comic poet, and though he borrowed his plots from the Greeks—from Diphilus and Philemon apparently in preference to the more refined Menander—there was in him a genuinely national as well as a genuinely popular element. Of the extent of his originality it is impossible to judge; probably it lies in his elaboration of character and the concise details of his dialogue rather than in his plots. Modern comedy is indebted to him in all these points; and in consequence of this fact, as well as of the attention his text has for linguistic reasons received from scholarship both ancient and modern, his merits have met with their full share of recognition. Status Caecilius (an Insubrian brought to Rome as a captive c. 200) stands midway between Plautus and Terence, but no plays of his remain. P. Terentius Afor (c. 185–159) was, as his cognomen implies, a native of Carthage, of whose conqueror he enjoyed the patronage. His six extant comedies seem to be tolerably close renderings of their Greek originals, nearly all of which were plays of Menander. It was the good fortune of the works of Terence to be preserved in an exceptionally large number of MSS. in the monastic libraries of the Middle Ages, and thus (as will be seen) to become a main link between the ancient and the Christian drama. As a dramatist he is distinguished by correctness of style rather than by variety in his plots or vivacity in his characters; his chief merits—and at the same time the quality which has rendered him so suitable for modern imitation—is to be sought in the polite ease of his dialogue. In general, the characteristics of the palliata, which were divided into five acts, are those of the New Comedy of Athens, like which they had no chorus for purposes of explanation from author to audience the prologue sufficed; the Roman versions were probably terser than their originals, which they often altered by the process called contamination.

The togata, in the wider sense of the term, included all togata Roman plays of native origin—among the rest the protaseis in contradistinction to which and to the transient species of the trabeata (from the dress of the knights) the comedies dealing with the life of the lower classes were afterwards called tebaneris (from tebaneris, a shop), a name suited by some of their extant titles, while others point to the treatment of provincial scenes. The togata, which was necessarily more realistic than the palliata, and doubtless fresher as well as coarser in tone, flourished in Roman literature between 170 B.C. and 100 B.C. all whose plays bear Latin titles and were tebaneris, was succeeded by the more refined L. Afranius, who, though still choosing national subjects, seems to have treated them in the spirit of Menander. His plays continued to be performed under the emperors, though with an admixture of elements derived from that lower species, the pantomime, which they also were in the end to succumb. The Romans likewise adopted the burlesque kind of comedy called from its inventor Eukratoma, and by other names (cf. ante).

The end of Roman dramatic literature was dulcitantum Tha and critica, the end of the Roman drama was spectacle and show, buffoonery and sensual enjoyment. It was for this that the theatre had passed through all its early troubles, when the political partisanship of the old school had upheld the martial games of the circus against the enervating influence of the stage. In those days the guardians of Roman virtue had sought to diminish the attractions of the theatre by insisting upon its remaining as uncomfortable as possible, but as was usual at Rome, the privileges of the upper orders were at last extended to the population at large, though a separation of classes continued to be characteristic of a Roman audience. The next permanent theatre was erected at Rome by C. Pompeius (55 B.C.), which contained nearly 18,000 seats; but even of this the portion allotted to the performers (scena) was of wood, nor was it till the reign of Tiberius (22 A.D.) that, after being burnt down, the edifice was rebuilt in stone. See THEATRE.

Thought a species of amateur literary censorship, introduced by Pompeius, became customary in the Augustan age, in general the drama's laws at Rome were given by the dramatists' patrons—in other words, the production of plays was the occupation of private speculators who were contracted for with the officials charged with the superintendence of public amusements (curatores ludorum), the actors were slaves trained for the art, mostly natives of the South of Italy or Greece. Many of them rose to reputation and wealth, purchased their freedom, and themselves became directors of companies, though Sulla might make a knight of Roscius, and Cæsar and his friends defy ancient prejudice, the stigma of civil disability (infamia) continued to adhere to the profession. The actor's art was carried on at Rome under conditions differing in other respects from those of the Greek theatre. The Romans loved a full stage, and from the later period of the republic liked to see it crowded with supernumeraries. This accorded with their military instincts, and with the general gaiety of their tastes, which led them in the theatre as well as in the circus to delight in spectacle and tumult, and to applaud Pompeius when he furnished forth the return of Agamemnon in the Citraemnestra with a grand total of 600 heavily-laden mules. On the other hand, the actors were nearer to the spectators in the Roman theatre...
Roman ancient classical drama has been already foreshadowed. Pantomime—the art of gesticulation and movement only. In what respects tragedy and comedy, were now altogether conquered by oratory, and that art, by the influence of oratory, had become the nursing mother of the new birth of an art. Both these great actors are said to have been constant hearers of the great orator Clodius Gallus (d. c. 62 A.D.), who, like the great Roscius, excelled equally in tragedy and comedy, and his younger contemporary Clodius Aespous, a Greek by birth, likewise eminent in both branches of his art, though in tragedian more particularly. Both these great actors are said to have been constant hearers of the great orator Hortensius; and Roscius wrote a treatise on the relations between oratory and acting. In the influence of oratory upon the drama are perhaps to be sought the chief among the noble features of Roman tragedy to which a native origin may be fairly ascribed.

The ignoble end of the Roman—end with it of the ancient classical—drama has been already foreshadowed. The elements of dance and song, never individually united with the dialogue in Roman tragedy, were now altogether separated from it. While it became customary simply to recite tragedies to the small audiences who continued (or, as a matter of courtesy, affected) to appreciate them, the pantomimus commended itself to the heterogeneous multitude of the Roman theatre by confining the performance of the actor to gesticulation and dancing, a chorus singing the accompanying text. The species of drama, involved all its manifestations in a consistent condemnation; and when the faith of that church was acknowledged as the religion of the Roman empire, the doom of the theatre was sealed. This doom was not undeserved; for the remnants of the literary drama had long been overshadowed by entertainments such as both earlier and later Roman emperors—Domitian and Trajan as well as Galerius and Constantine—had found themselves obliged to prohibit. The drama towards the stage was in general as unavoidable as its particular expressions were at times heeded by fanaticism or distorted by ignorance. Had she not visited with her anathema a wilderness of decay, she could not herself have become—what she little dreamed of becoming—the nursing mother of the new birth of an art which seemed incapable of regeneration.

Though already in the 4th century actors and mountebanks had been excluded from the benefit of Christian sacraments, and excommunication had been extended to those who visited theatres instead of churches on Sundays and holidays, and though similar enactments had followed at later dates, yet the entertainments of the condemned profession had never been entirely suppressed, and had even occasionally received imperial patronage. Gradually, however, the mountebanks became a wandering fraternity, who doubtless appeared at festivals when they were wanted and vanished again into the deepest obscurity which has ever covered that mysterious existence—a stroller's life. It was thus that these strange intermediaries of civilization carried down such traditions as survived of the acting drama of pagan antiquity into the succeeding ages.

While the scattered and persecuted strollers thus kept alive something of the popularity, if not of the loftier traditions, of their art, neither, on the other hand, was there an utter absence of written compositions to bridge the gap between ancient and modern dramatic literature. In the midst of the condemnation with which the Christian church visited the stage, its professors, and votaries, we find individual ecclesiastics resorting in their writings to both the tragic and the comic form of the ancient drama. These isolated productions, which include (in the latter part of the 4th century) the Passion of Christ, usually attributed to St. Gregory Nazianzen, were doubtless mostly written for educational purposes, whether Eusebides and Lycophon, or Menander, Plautus, and Terence served as the outward models. The same was probably the design of the famous comedies of Hrosvitha, the Benedictine nun of Hrosvitha Ganderheim, in Eastphalian Saxony, which associate themselves in the history of Christian literature with the spiritual revival of the 10th century in the days of Otto the Great.

While awesomely imitated in form from the comedies of Terence, these religious exercises derive their themes—martyrdoms, and miraculous or otherwise startling conversions—

1 Callimachus, Part i.; Sepheria.
from the legends of Christian saints. Thus from perhaps the 9th to the 12th centuries Germany and France, and through the latter, by means of the Norman Conquest, England, became acquainted with what may be called the literary monastic drama. It was no doubt occasionally performed by the children under the care of monks or nuns, or by the religious themselves; an exhibition of the former kind was that of the Play of St. Katharine, acted at Dunstable about the year 1110 in “copes” by the scholars of the Norman Geoffrey, afterwards abbot of St Albans. Nothing is known of it except the fact of its performance, which was certainly not regarded as a novelty.

These forms of minstrelsy and mimesis, more and more popular, came to blend themselves with more popular forms of the early Christian drama. To what extent the minimes, or joculators (as in the early Middle Ages they came to be more generally called), kept alive the usage of entertainments more essentially dramatic than the monastic varieties of their performances, we cannot say; but we know that in Northern France they at a very early date appropriated the beginnings of the religious drama to secular uses. Doubtless in both Celtic and Teutonic populations there survived the remnants of religious rites containing dramatic elements, and the heathen festivals, of Roman or other origin, communicated something of their character to the Christian, at which the joculators were apt to appear. In different countries these entertainers united themselves to different tastes, and with the rise of native literatures to different literary tendencies. The literature of the troubadours of Provence, which communicated itself to Spain and Italy, came only into isolated contact with the beginnings of the religious dramas; in Northern France the jongleurs, as the joculators were now called, were confounded with the troubadours, who sang the chamou de gaste commemorative of deeds of war. As appointed servants of particular householders they were here and there, and afterwards in England, called minstrels or minstrels (from minstrelsy and mimesis). Such a histrion or mensa (as he is called) was Tulliefer, who rode first into the fight at Hastings, singing his songs of Roland and Charlemagne, and tossing his sword in the air and catching it again. In England such accomplished minstrels so far became the less versatile glee-men of pre-Norman times; while here as elsewhere the humbler members of the craft strolled from castle to convent, to other places, and even to the plays acted in the plays acted after the plays acted after the plays acted after the plays acted after the plays acted after the plays acted after the plays acted after the of the craftsmen of the acting profession. In France, where they had always preserved a secular side, they were introduced into courts and, with little initial resistance, found their way into the churches. In the 13th and 14th centuries, they were performed in several ways. The religious dramas of the Troubadours, which were popular throughout Europe, were adapted to the liturgical calendar and performed in churches. The Passion tales were performed in the streets during the Passion Week, and the Easter Passion plays were performed in the open air. The Christmas Passion plays were performed in the churches, and the Shrove-Tuesday plays were performed in the streets.

1 Such a piece was the Sinfonia e Serpente (1486), by Lorenzo de' Medici, who afterwards sought to reform the Italian stage by pursuing it.
the individual plays in these collections were doubtless founded on French originals; others are taken direct from Scripture, from the apocryphal gospels, or from the legends of the saints. Their characteristic feature is the combination of a whole series of plays into one collective whole, exhibiting the entire course of Bible history from the creation to the day of judgment. For this combination it is unnecessary to suppose that they were generally indebted to foreign examples, though there are several remarkable coincidences between the Chester plays and the French M&étre du Veil Testament.

The manner of these plays,” we read in a description of those at Chester, dating from the reign of Henry VII. Every company had its pageant, which pageants were a high scaffold with two rooms, a higher and a lower, upon four wheels. In the lower they appalred themselves, and in the higher room they played, being all open at the top, that all beholders might hear and see them. The places where they played was in every street. They began first at the alleys gate, and when the first pageant was played, it was wheeled to the high cross before the mayor, and so to the market, that corresponded to the pageant playing before them at one time until all the pageants appointed for the day were played, and when one pageant was near ended, word was brought from street to street, that the next might come in place thereof, exceedingly orderly, and all the streets have their pageants afore them all at one time playing together, to see which plays was great respect, and also a flattery and stage made in the streets in those places where they determined to play their pageants, etc.

Each play, then, was performed by the representative of a particular trade or company, after whom it is called the fishers' golvers', etc., pageant, while a general prologue was spoken by a herald. As a rule the movable stage sufficed for the action, though we find horsemanship riding up to the scaffold, and Herod instructed to “rage in the pagond and in the street also.” There is no probability that the stage was, as in France, divided into three platforms with a dark cavern at the side of the lowest, appropriated respectively to the Heavenly Father and His angels, to saints and glorified men, to mere men, and to souls in hell. But the last-named locality was frequently displayed in the English miracles, with or without fire in its mouth. The costumes were in part conventional,—divine and saintly personages being distinguished by gilt hair and beards, Herod being clad as a Saracen, the demons wearing hideous heads, the souls black and white coats according to their kind, and the angels gold skins and wings.

Doubleless these performances abounded in what seem to us ludicrous features, and though their main purpose was serious, they were not in England altogether devoid of fun. But many of these features are in truth only homely and woful, and the simplicity of feeling they exhibit are times not without its pathos. The occasional excessive grossness is due to an absence of refinement of taste rather than to an obliquity of moral sentiment. In this, as in other respects, the Coventry Plays, which were possibly written by clerical hands, show an advance upon the others. In the same plays is already to be observed an element of abstract figures, which connect them with a different species of the medieval drama.

Morality plays corresponded to the love for moral morality which manifests itself in so many periods of our literature, and which, while dominating the whole field of medieval literature, was nowhere more assiduously and effectively cultivated than in England. It is necessary to bear this in mind in order to understand what it means to us seems so strange, the popularity of the moral-plays, which indeed never equaled that of the miracles, but sufficed to maintain the former species till it received a fresh impulse from the connection established between it and the “new learning,” through the new political and religious ideas and questions, of the Reformaion age. Moreover, a specially popular element was supplied to these plays, which

in manner of representation differed in no essential point from the Devil from the muses, in a character borrowed from the latter, and, in the moralities, usually provided with a companion whose task it was to lighten the weight of such abstractions as Sapience and Justice. These were the Devil and his attendant the Vice, of whom the latter seems to have been of native origin, as he was usually dressed in a fool’s habit, was probably suggested by the familiar custom of keeping an attendant fool at court or in great houses. The Vice had many names (Stiffy, Ambadaster, Sin, Fraud, Ignorant), etc., but his usual duty was to torment and tease the Devil his master for the elucidation and diversion of the audience. He was gradually blended with the domestic fool, who survived in the regular drama.

The earlier English moralities1—from the reign of Henry Groups or VI. to that of Henry VII—usually allegorize the contrasts between good and evil in the mind and life of man, without any side-intention of theological controversy, such as is still essentially the purpose of the morality we possess by Henry VIII’s poet, the witty Skelton,2 even of another, perhaps the most perfect example of its class, which in date is already later than the Reformation. But if such a theory as Every-Man teaches the orthodox doctrine of Rome, its successor, R. WEVER'S Lusty*Jovwntus, breathes the spirit of the dogmatic reformation of the reign of Edward VI.

Theological controversy largely occupies the moralities of the earlier part of Elizabeth’s reign, and connects itself with political feeling in a famous morality,3 Sir DAVID Lyndsey’s Nature of the Three Estates, written on the other side of the border, where such efforts as the religious drama proper had made had been extinguished by the Reformation. Only a single English political morality proper remains to us, which belongs to the beginning of the reign of Elizabeth.4 Yet another series connects itself with the ideas of the Renaissance rather than the Reformation, treating of intellectual progress rather than of moral conduct,5 this extends from the reign of Henry VIII. to that of his younger daughter.

The transition from the morality to the regular drama in England was effected on the one hand by the intermixture of historical personages with abstractions—as in Bishop TALON’S Knyg Johan (1558), which was based upon the regular Chronicle History,—on the other by the introduction of types of real life by the side of abstract figures. This latter tendency, of which instances occur in earlier plays, is observable in several of the 16th century moralities,6 but the most influential of all, a further instance which had been taken by a man of genius, John Heywood (d. 1555), whose sinneres were short farces in the French manner, dealing entirely with real—very real—men and women. Orthodox and conservative, he had at the same time a keen eye for the vices as well as the foibles of his age, and not the least for those of the clerical profession. Other writers, such as T. Ingeland,7 took the same direction, and the allegory of abstractions was thus undermined on the stage, very much as in didactic literature the ground had been cut out from under its feet by the Ship of Fools. Thus the sinneres—a name which had been used for the moralities themselves from an early date—facilitated the advent of comedy, without having superseded the earlier form. Both moralities and miracle-plays survived into the Elizabethan age, after the regular drama had already begun its course.

Drama

The Renaissance and the national drama.

The priority in this as in most of the other aspects of the Renaissance belongs to Italy. In ultimate achievement, the Italian drama fell short of the fulness of the results obtained elsewhere—a surprising fact when it is considered, not only that the Italian language had the vantage-ground of closest relationship to the Latin, but that the genius of the Italian people has at all times inspired it with a predilection for the drama. The cause is doubtless to be sought in the absence from Italian national life during a long period, and more especially during that contemporarily with the rise and earlier promise of Italian dramatic literature, of those loftiest and most potent impulses of popular feeling to which a national drama owes so much of its strength. This absence was due partly to the peculiarities of the Italian character, partly to the political and ecclesiastical experiences Italy was fated to undergo. The Italians were strangers to the enthusiasm of patriotism, which was as the breath in the nostrils of our Elizabethan age, as well as to the single-mindedness of Spain with which the Catholic Revival a civilization like those of Italy has ever experienced, did the rest, and for many generations rendered impotent the higher efforts of the dramatic art. No basis was permanently found for a really national tragedy; while the light comedy, after turning from the direct imitation of Latin models to a more popular form, lost tragedy in an abandoned immorality of tone and in reckless insolence of invective against particular classes of society. Though its productivity long continued, the poetic drama more and more concentrated its efforts upon subordinate or subsidiary species, artificial in origin and decorative in purpose, and surrendered its substance to the overpowering aids of music, dancing, and spectacle. Only a single form of the Italian drama, the improvised comedy, remained truly national; and this was of its nature dissociated from higher literary effort. The revival of Italian tragedy in later times is due partly to the imitation of French models, partly to the endeavour of a brilliant genius to infuse into his art the historical and political spirit. Comedy likewise attained to new growths of considerable significance, when it was sought to accommodate its popular forms to the representation of real life in a wider range, and again to render it more poetical in accordance with the tendencies of modern romanticism.

The regular Italian drama, in both its tragic and its comic branches, began with a reproduction, in the Latin language of classical models; but tragedy in its beginnings showed a tendency which it was before long to treat themes of national historical interest. Two examples, which we hear, written by the Paduan historian Miasato about 1300, were both copies of Seneca, but while the one (Achilles) treated a classical theme, the other dealt with the history of a famous tyrant of the author's native city (Eccenas). In the next century events of recent or contemporary history were similarly dealt with; but the majority of its Latin dramas were doubtless written to suit the tastes of the friends and patrons of the Italian Renaissance, who, like Lorenzo the Magnificent, wished to domesticate the heathen gods and goddesses on a stage hitherto occupied by the revered figures of Christian belief. Such were the Latin imitations and translations of Greek and Latin tragedies and comedies by Bishop Martirano, the friend of Lorenzo's son Leo X., on the adventure of Danae, and other subjects; the famous Progne of G. Corrado (c. 1644), the nephew of an earlier Pope; and the efforts of Pomponius Lestus, who, with the aid of Cardinal Riauro, sought to revive the ancient theatre, especially that of Plistus and Terence, at Rome. Many Latin comedies are mentioned from the 15th century, during which, as during its predecessor, Latin continued the dominant language of the stage in Italy. Nor was the representation even of Greek plays altogether unknown; it was by her performance of the Electra of Sophocles that Alexandra Scala caused Politian to envy Orestes.

Early in the 16th century, tragedy began to be written in Italian in the native tongue; but it retained from the first, and never wholly lost, the impress of its origin. Whatever the source of its subjects—which, though mostly of classical origin, were occasionally derived from native romance, or even due to invention—they were all treated with a pre-dilection for the horrible, inspired by the example of Seneca, though no doubt encouraged by a perennial national taste. The chorus, stationary on the stage as in old Roman Latins, De Capitale Deuca Jacob (Jacopo Principane, d. 1664) Fragmata, Vernaculo, Ferdinandez et alia (Aragon) Servitaes, Historia Batica (cession of the Moors from Granada).

tragedy, was not reduced to a merely occasional appearance between the acts till the beginning of the 17th century, or ousted altogether from the tragic drama till the earlier half of the 18th. Thus the changes undergone by Italian tragedy were for a long series of generations chiefly confined to the form of versification and the choice of themes, nor was it, at all events till the last century of the course it has hitherto run, more than the after-growth of an after-growth. The honour of having been the earliest tragedy in Italian seems to belong to Galeotto's Soffonabia (1502), a piece in 15 or 20 acts, regardless of unity of scene. A da Pistoia's Pamfìlia (1508) followed, of which the subject was taken from Boccaccio, though the names of the characters were Greek. The play usually associated with the beginning of Italian tragedy—that with which "th' Italian scene first learned to glow"—was another Soffonabia, acted before Leo X. in 1515, and written in blank verse (verso sciolto) instead of the ottava and terza rima of the earlier tragedians (retaining, however, the lyric measures of the chorus), by Traverso, who was employed as nunco by that Pope. Other tragedies of the former half of the 16th century were the Rosmunda of Racchioli, a nephew of Lorenzo the Magnificent (1516); Alamanno's Antigone (1532); the Canace of Sperone Sperone, the famous Muspo of Tusso, who, like Tasso's elaborate style for his model, the Orfeo, the earliest dramatic treatment of this famous subject, of the notorious Aretino (1549); and the nine tragedies of G. Cintio, among which L'Orbene (1541) is accounted the best and the bloodiest. Guittone, the author of those Heautontimoruma to which Shakespeare was indebted for so many of his subjects, was (supposing him to have invented these) the first Italian who was the author of the fables of his own dramas; he introduced some novelties into dramatic construction, separating the prologue and probably also the epilogue from the action, and has by some been regarded as the inventor of the pastoral drama. In the latter half of the 16th century may be mentioned the Dolone and the Manniana of L. Dolce, the translator of Seneca (1563); the Hydriama (acted before 1561 or 1568) of L. Grotto, which treats the story of Romeo and Juliet, Tasso's Torrimento (1587), the Tancredi of Asnara (1598); and the Meropo of Torelli (1593), the last who employed the stationary chorus (coro fisso) on the Italian stage. Leonico's Soldato (1550) is noticeable as supposed to have given rise to the modern coda"coda", or domestic tragedy, of which there are few examples in the Italian drama, and De Velo's Tamar (1556), as written in prose. Subjects of modern historical interest were in this period treated only in isolated instances 1.

The tragedians of the 17th century continued to pursue the beaten track, at times in vain, seeking by the introduction of musical airs to compromise with the danger with which their art was threatened of being (in Voltaire's phrase) extinguished by the beautiful monster, the opera, now rapidly gaining ground in the country of its origin. (See Opera.) To Count P. Bonarelli (1593-1599), the author of Soldano, is on the other hand ascribed the first uses of the chorus in Italian tragedy. The innovation of the use of rhythm attempted in the learned Pallavicino's Erminigildi (1533), and defended by him in a discourse prefixed to the play, was in Italy no more than in England able to achieve a permanent success; its chief representative was afterwards Martelli (d. 1577), whose rhymed Alexandrine verse (Martellano), though on one occasion used in comedy by Goldoni, failed to command itself to the popular taste. By the end of the 17th century Italian tragedy seemed destined to expire, and the great tragic actor Cotta had withdrawn in disgust at the apathy of the public towards the higher forms of the drama. The 18th century was, however, to witness a change, the beginning of which are attributed to the institution of the Academy of the Arcadui at Rome (1630). The principal efforts of the new school of writers and critics were directed to the abolition of the chorus, and to a general increase of freedom in treatment. Before long the Marquis S. Maffeis Mistri, with his Meropi (first printed 1713) achieved one of the most brilliant successes recorded in the history of dramatic literature. This play, which is devoid of any love-story, long continued to be considered the master-piece of Italian tragedy, Voltaire, who declared it "worthy of the most glorious days of Athens," adapted it for the French stage, and it inspired a celebrated production of the English drama. 2 It was followed by a tragedy full of horrors, noticeable as having given rise to the first Italian dramatic parody, and by the highly esteemed productions of Graselli (d. 1769) and his contemporary Bettinelli. The influence of Voltaire had now come to predominate over the Italian drama, and, in accordance with the spirit of the times, greater freedom prevailed in the choice of tragic themes. Thus the greatest of Italian tragic poets, Count V. Alfieri (1749-1803), founded his path prepared by him. Alfieri's grand and impassioned treatment of his subjects caused his faults of form, which he never altogether overcome, to be forgotten. The spirit of a love of freedom which his creations 3 breathed was the herald of the national ideas of the future. Spurning the usages of French tragedy, his plays, which abound in soliloquies, owe part of their effect to an impassioned force of declamation, part to the "poésie" by which Italian acting seems pre-eminent capable of thrilling an audience. He has much besides the subjects of two of his dramas 4—in common with Schiller, but his amanzo-muse (as Schlegel called her) was not schooled into serenity, like the muse of the German poet. Among his numerous plays (21), Meropi and Saul, and perhaps Mirra, are accounted his master-pieces. The political colouring given by Alfieri to Italian tragedy reappears in the plays of U. Posolo (c. 1750-1827) and A. Manzoni (1784-1873), both of whom are under the influence of the romantic school of modern literature; and to these names must be added those of S. Pellico (1789-1854) and G. B. Niccolini (1785-1861), whose most esteemed dramas 5 treat national themes familiar to all students of modern history and literature. While Italian tragedy has upon the whole adhered to its love of strong situations and passionate declamation, its later growths have shown a capability of development precluding the supposition that its history is closed. The art of tragic acting at the present day probably stands higher in Italy than in any other European country, if the tragic muse were to be depicted with the features of a living artist, it is those of Adelaide Ristori which she would assume. In comedy, the efforts of the scholars of the Italian Renaissance for a time went wide of the mark, by the progress of popular entertainments noticed above. While the contrasts of the close of the 15th and of the 16th century were disputations between pairs of abstract or allegorical figures, in the frotteola human types take the place of abstractions, and more than two characters appear. To the farce (a name used of a wide variety of entertainments) a new literary and as well as social significance was given by the Neapolitan court-poet Sanmarano (c. 1492), about the same time as a capitanio valoroso," Venturino of Pesaro, first brought on the modern stage the capitanio glorioso o spavento, the

military braggart who owed his origin both to Plautus and to the Spanish officers who abounded in the Italian cities of those days. The popular character-comedy, a relic of the ancient Attic drama, likewise took a new lease of life—and this in a double form. The improvised comedy (commedia a soggetto) was now as a rule performed by professional actors, members of a craft, and was thence called the commedia dell’arte, which is said to have been invented by Francesco (called Terenzo) Chera, the favorite player of Leo X. Its scenes, still unwritten except in skeleton (scenario), were connected together by the ligatures or links (lazzu) of the arteluchino, the descendant of the ancient Roman annio (whence our skizzz). Harlequin’s summit of glory was probably reached early in the 17th century, when he was ennobled in the person of Cecchino by the Emperor Matthias, of Cecchino’s successors Zaccagnino and Truffaldino, we read that “they shut the door in Italy to good harlequin.” Distinct from this growth is that of the masked comedy, the action of which was chiefly carried on by certain typical figures in masks, speaking in local dialects, but which was not improvised, and indeed from this time on to the time when that had been done. The inventor was A. Beolco of Padua, who called himself Ruzzante (joker), and who published six comedies in various dialects, including the Greek of the day (1530).

This was the masked comedy to which the Italians so tenaciously clung, and in which, as all their own and imitative by no other nation, they took such a great pride that even Goldoni was unable to overthrow it.

Meanwhile the Latin imitations of Roman, varied by occasional translations of Greek, comedies early led to the production of Italian translations, several of which were performed at Ferrara in the 15th century, and before its close to the composition of what is regarded as the first original Italian comedy—in other words, as the first of the modern drama. But the claim to this honour of Boiardo’s Timone (before 1494) is doubtful—not in time, but because that play is only in part original, being founded upon, and in a great measure taken from, a dialogue of Lucian’s; since moreover its personages are abstractions, it represents at most the translation from the moralities. The first Italian comedy in verse, Ricci’s I Tre Tiranni (before 1530), is likewise a morality, and Trissino’s comedy, which followed, a mere adaptation of the Menachmi of Plautus. About this time, however, the commedia erudita, or scholarly comedy, began to be cultivated by a succession of eminent writers, among whom the titles of the father of modern comedy, if it belongs to any man, belongs to Ariosto (1474–1533). His comedies (though the first two were originally written in prose) are in blank verse, to which he gave a singular mobility by the dactylic ending of the line (avverso). Ariosto’s models were the masterpieces of the calidora, and his morals those of his age, which equalled those of the worst days of ancient Rome or Byzantium in looseness, and surpassed them in effrontery. He chose his subjects accordingly; but his dramatic genius displayed itself in the effective drawing of character, and especially in the skilful management of complicated intrigues. Such, with an additional brilliancy of wit and lasciviousness of tone, are likewise the characteristics of Machiavello’s (1469–1527) famous prose comedy, the Mandragola (The Magic Draught), and, in their chimeras, of the plays of A. Araldo (1492–1557), especially the prose Mandragola, whose name, it has been said, ought to be written in asterisks. Other comedians of the 16th century were R. Accolti, whose Virginia (prob. before 1513) treats the story from Boccaccio which reappears in Alt’s Well that Ends Well; G. B. Araldo and J. Nardi, noteworthy as decent and moral in tone and tendency; G. Cocchi, F. D’Ambra, A. F. Grazzini, N. Secco or Scoci, and L. Dolce—all writers of romantic comedy of intrigue in verse or prose.

During the same century the pastoral drama flourished in Italy. The origin of this peculiar species—which was pastoral drama.

In Italy. The origin of this peculiar species—which was already known in the bucolic idyll in a dramatic form, and which freely lends itself to the pastoral idyll in a double form. The pastoral drama is the present of the opera—this beautiful work tells its story simply. N. da Correggio’s (1450–1508) Cefalo, or Aurora, and others followed, before in 1554 A. Becchi produced, as totally new of its kind, his Arcadian pastoral drama Il Soggetto, in which the comic element predominates. But an epoch in the history of the species is marked by the Aminta of Tasso (1573), in whose Arcadia is allegorically mirrored the Ferrara court. Adorned by choral lyrics of great beauty, it presents an allegorical treatment of a social and moral problem; and since the conception of the characters, all of whom think and speak of nothing but love, is artificial, the charm of the poem lies not in the interest of its action, but in the passion and sweetness of its sentiment. This work was the model of many others, and the pastoral drama reached its height of popularity in the famous Pastor Fido (written before 1590) of B. Guarini, which, while founded on a tragic love-story, introduces into its complicated plot a comic element, partly with a satirical intention. Thus, both in Italian and in other literatures, the pastoral drama became a distinct species, characterised like the great body of modern pastoral poetry in general by a tendency either towards the artificial or towards the burlesque. Its artificiality affected the entire growth of Italian comedy, including the commedia dell’arte, and impressed itself in an intensified form upon the opera. (See Opera.) The foremost Italian masters of the last-named species, so far as it can claim to be included in the poetic drama, were A. Zeno (1668–1750) and F. Metastasio (1699–1782).

The comic dramatists of the 17th century are grouped Comedy in as followers of the classical and of the romantic school, the 17th (called a commedia cinese in verse, the other two, free century, and 18th adaptations from Plautus and Terence, are in prose.}

1 Pyrgopolonies in the Miles Gloriosus.
2 The masked characters, each of which spoke the dialect of the place he represented, were (according to Barchi) Pandolfo, a Venetian merchant; Dottore, a Florentine physician; Spampento, a Neapolitan braggadocio; Pirolammetta, a wag of Apulia; Gianniparolo and Cornello, clowns of Calabria; Golfofaro, a Roman bear; Braccellata, a Ferrarese piper; Aretino, a blundering servant of Bergamo. Besides these and a few other such personages (of whom four at least appeared in each play), there were the Amoroso or Amoresoratus, men or women, and latter not before 1546, up to which time actresses (unknown in Italy) with serious parts, and Smalaldina, Colombina, Spinetta, and other servis or waiting-maidens. All these spoke Latin, and were no masks.
3 Boiardo died in 1494, in or after which year Nardini’s Amica was written; while Dorico’s (afterwards Cardinal of Bologna) is dateless but not comic, comedy, which precedes that not taken from Plautus, is thought to have been composed not long before its representation in 1508.
tion of Spanish examples. Italian comedy had fallen into decay, when its reform was undertaken by the wonderful theatrical genius of C. Goldoni (1707-1793). One of the most fertile and rapid of playwrights (of his 150 comedies 16 were written and acted in a single year), he at the same time pursued definite aims as a dramatist. Disgusted with the conventional buffoonery, and ashamed of the rampant immorality, of the Italian comic stage, he drew his characters from real life, whether of his native city (Venice) or of society at large, and sought to enforce virtuous and pathetic sentiments without neglecting the essential objects of his art. Happy and various in his choice of themes, he produced, besides comedies of general human character, plays on subjects drawn from literary biography or from fiction. Goldoni, whose style was considered defective by the purists whom Italy has at no time lacked, met with a severe critic and a temporarily successful rival in Count C. Gozzi (1722-1806), who sought to rescue the comic drama from its association with the real life of the middle classes, and to infuse a new spirit into the figures of the old masked comedy by the invention of a new species. His themes were taken from Neapolitan and Oriental* fairy tales, to which he accommodated some of the standing figures upon which Goldoni had made war. The attempt at mingling fancy and humour—occasionally of a directly satirical turn—was in harmony with the tendencies of the modern romantic school, and Gozzi’s efforts, which though successful found hardly any imitators in Italy, have a family resemblance to those of Tieck.

During the latter part of the 18th and the early years of the present century comedy continued to follow the course marked out by its acknowledged master-dramatist, under the influence of the sentimental drama of France and other countries. Villi, Nelli, the Marquis Albergati Capaccili, Sografi, Federici, and Signorelli (the historian of the drama) are mentioned among the writers of the school; to the present century belong Count Girardi, Marchiato (who took his subjects especially from commercial life), and Nata, a fertile writer, among whose plays are three treating the lives of poets. Of still more recent date are Bon and Brofferio. Though no recent Italian comedies have acquired so wide a celebrity as that which has been obtained by the successful productions of the recent French stage, there seems no reason to predict a barren future for Italian comedy any more than for Italian tragedy. Both the one and the other have survived periods of a seemingly hopeless decline, tragedy has been rescued from the pedantry of a timid classicism, comedy from the vileness of its most popular but least progressive form; and neither the opera nor the drama has succeeded in ousting from the national stage the legitimate forms of the national drama.

To the above summary of the history of the modern Italian drama it would not have been inappropriate to append a brief account of that of the modern Greek drama. The dramatic literature of the later Hellenes is a creation of the literary movement which preceded their glorious struggle for independence, or which may be said to form part of that struggle. After beginning with dramatic dialogues of a patriotic tendency, it took a step in advance with the tragedies of J. R. Nerulos (1778-1850), whose name belongs to the political as well as to the literary history of his country. His comedies—especially one directed against the excesses of journalism—largely contributed to open a literary life for the modern Greek tongue. Among the earlier patriotic Greek dramatists of the present century are T. Alkane, J. Zampelos (whose tragic style was influenced by that of Alfieri),6 S. K. Karydas, and A. Vaiocritas. A. Zoros10 is noteworthy as having introduced the use of prose into Greek tragedy, while preserving to it that association with sentiments and aspirations which will probably long continue to pervade the chief productions of modern Greek literature. The love of the theatre is ineradicable from Attic as it is from Italian soil, and the tendencies of the young dramatic literature of Hellas seem to justify the hope that a worthy future awaits it.

Italy produced many brilliant growths, from which the Spanish dramatic literature of other nations largely borrows.

Spain is the only country of modern Europe which shares with England the honour of having achieved, at a relatively early date, the creation of a genuinely national form of the regular drama. So proper to Spain was the form of the drama which she produced and perfected, that to it the term romantic has been specifically applied, though so restricted a use of the epithet is clearly unjustifiable. The influences which from the Romance peoples—in whom Christian and Germanic elements mingled with the legacy of Iberian law, learning, and culture—spread to the Germanic nations were represented with the most signal force and fullness in the institutions of chivalry—to which, in the words of Scott, “it was peculiar to blend military valour with the strongest passions which actuate the human mind, the feelings of devotion and those of love.” These feelings, in their combined operation upon the national character, and in their reflection in the national literature, were not peculiar to Spain; but nowhere did they so long or so late continue to animate the moral life of a nation. Outward causes contributed to this result. For centuries after the crusades had become a mere memory, Spain was a battle-ground between the cross and the crescent. And it was precisely at the time when the Renaissance was establishing new starting-points for the literary progress of Europe, that Christian Spain rose to the height of Catholic as well as national self-consciousness, and the conquest of the New World. From their rulers or rivals of so many centuries the Spaniards had derived that rich glow of colour which became permanently distinctive of their national life, and more especially of its literary and artistic expressions; they had also perhaps derived from the same source an equally characteristic refinement in their treatment of the passion of love. The ideas of Spanish chivalry—more especially religious devotion and a pungent sense of personal honour—asserted themselves (according to a process often observable in the history of civilization) with peculiar distinctness in literature and art, after the great achievements to which they had contributed in other fields had already been wrought. The repeated glories of the Spanish drama belong to an age of national decay—mindful, it is true, of the ideas of a greater past. The chivalrous enthusiasm, perhaps so many of the master-pieces of its literature is indeed a characteristic of

the Spanish nation in all, even in the least hopeful, periods of its later history; and the religious ardour breathed by the
Spanish people in the glorious days of Ferdinand and Isabella;
and it is not in the beginnings but in the great age of
Spanish dramatic literature that there is often most difficulty
in distinguishing between what is to be termed a religious and
what a secular play. After Spain had thus, the first after
England among modern European countries, fully unfolded
that incomparably richest expression of national life and sentiment
in an artistic form—a truly national dramatic literature,—the terrible decay of her greatness and prosperity gradually impaired the strength of a brilliant but, of
its nature, dependent growth. In the absence of high
original genius the Spanish dramatists began to turn to
foreign models, though little supported in such attempts by
popular sympathy; and it is only in more recent times that
the Spanish drama has sought to reproduce the ancient
forms from whose master-pieces the nation had never become estranged, while accommodating them to tastes and
tendencies shared by later Spanish literature with that of
Europe at large.

The earlier dramatic efforts of Spanish literature may
without inconvenience be briefly dismissed. The reputed
author of the Couplets of Mingo Bevulgo (Il Cota the
eldest) likewise composed the first act of a story of intrigue
and character, purely dramatic but not intended for representa­tion. This tragic comedy of Calcado and Molina,
which was completed (in 21 acts) by 1499, afterwards
became famous under the name of Celestina; it was frequently imitated and translated, and was adapted for the
Spanish stage by R. de Zepeda in 1582. But the father of the
Spanish drama was...

fertility, which was such that he wrote about 1500 plays, besides 300 dramatic works classed as *autos sacramentales* and *entremeses*, and a vast series of other literary compositions, has indisputably prejudiced his reputation with those to whom he is but a name and a number. Yet as a dramatist Lope more fully exemplifies the capabilities of the Spanish theatre than any of his successors, though as a poet Calderón may deserve the palm. Nor would it be possible to imagine a truer representative of the Spain of his age than a poet who, after suffering the hardships of poverty and exile, and the pangs of passion, sailed against the foes of the faith in the Invincible Armada, subsequently became a member of the Holy Inquisition and of the Order of St Francis, and after having been decorated by the Pope with the cross of Malta and a theological doctorate, honored by the nobility, and idolized by the nation, ended with the names of Jesus and Mary on his lips. From the plays of such a writer we may best learn the manners and the sentiments, the ideas of religion and honour, of the Spain of the Philippine age, the age when she was most prominent in the eyes of Europe and most glorious in her own. For, with all its inventiveness and vigor, the genius of Lope primarily set itself the task of pleasing its public,—the very spirit of whose inner as well as outer life is accordingly mirrored in his dramatic works. In them, we have, in the words of Lope's French translator Baret, "the movement, the elegance, the conflict of unforeseen intrigues suitable to unreckoning spectators, perpetual forteresses addressed to an unextinguishable national pride; the painting of passions dear to a people never tired of admiring itself; the absolute sway of the point of honor, the dedication of revenge; the adoration of symbols, buffoonery and burlesque, everywhere beloved of the multitude, but here never defied by obstinacy, for this people has a sense of delicacy, and the foundation of its character is nobility; lastly, the flow of proverbs which at times escape from the grácioso (the comic servant domesticated in the Spanish drama by Lope)—'the commonplace literature of those who possess no other.'"

The plays of Lope, and those of the national Spanish drama in general, are divided into classes which it is naturally not always easy, and which there is no reason to suppose him always to have intended, to keep distinct from one another. After his early youth composing elogies, pastoral plays, and allegorical moralities in the old style, he began his theatrical activity at Madrid about 1550, and the plays which he thenceforth produced have been distributed under the following heads. The Lopean *autos de capa y espada*—not comedies proper, but dramas, the principal personages in which are taken from the classes of society which wears cloak and sword. Gallantry is their main theme, an interesting and complicated, but well-constructed and perspicuous intrigue their chief feature; and this is usually accompanied by an underplot in which the grácioso plays his part. Their titles are frequently taken from the old proverbs or proverbial phrases of the people, upon the themes suggested by which the plays often (as Mr Lewes admirably expresses it) constitute a kind of gloss (plus) in acting. This is the favourite species of the national Spanish theatre; and to the plots of the plays belonging to it the drama of other nations owes a debt almost incalculable in extent. (2) The c. herbóci are distinguished by some of their personages being of royal or very high rank, and by their themes being often historical and large,

of strictly classical tastes protested in essays in prose and verse against the ascendency of the popular drama; the prohibition of Philip II. had been recalled two years after his death and was never renewed; and the activity of the theatre spread through the towns and villages of the land, everywhere under the controlling influence of the school of writers who had established so complete a harmony between the drama and the tastes and tendencies of the people.

The literary and theatrical career of Calderon was most notable in the 17th century. His writings were rather of a national than of an international character, and, if compared with those of his contemporaries, seem to have lacked some of the immediate and direct influence that attaches to the works of genius. In the latter part of the century more closely in the footsteps of the masters without effecting any noticeable changes in the form of the Spanish drama; even the senyeta (till-it), which owes its name to Benavente (1645), was only a kind of entremas. The Spanish drama in all its forms retained its command over the nation, because they were alike popular in origin and character; nor is there any other example of so complete an adaptation of a national art to the national taste and sentiment in its ethics and aesthetics, in the nature of the plots of the plays (whatever their origin), in the motives of their actions, in the conduct and tone and in the very costume of their characters.

National as it was, and because of this very quality, the Decay of Spanish drama was faster to share the lot of the people. At the end of the 17th century, when the Spanish throne at last became the declared apple of discord among the Governments of Europe, the Spanish people lay, in the words of a historian of its later days, "like a corpse, incapable of feeling its own impotence." That national art to which it had so faithfully clung had fallen into decline and decay with the spirit of Spain itself. By the time of the close of the great war, the theatre had sunk into a more amusement of the populace, which during the greater part of the 18th century, while allowing the old masters the measure of favour which accords to traditional art, continued to uphold the representatives of the old drama in its degeneracy—authors on the level of their audiences. But the Spanish court was now The French, and France in the drama, even more than in any other form of art, was the arbiter of taste in Europe. With the restoration of peace accordingly began isolated attempts to impose the French canon of dramatic theory and practice on their theatre; to follow the example of French dramatic practice; and in the middle of the century these endeavours assumed more definite form. Montiano's bloodless tragedy of Virginia (1750), which was never acted, was accompanied by a discourse endeavouring to reconcile the doctrines of the author with the practice of the old Spanish dramatists; the play itself was in blank verse (a metre never used by Calderon, though occasionally by Lope), instead of the old national ballad-measures (the romance-measure, and the rhymed redonda quattrain) preferred by the old masters among the variety of metres employed by them. The earliest Spanish comedy in the French form (a translation only, though written in the national metre) (1751), and the first original Spanish comedy on the same model, Moratin's Petimeta (Petite-Maitresse), printed in 1726 with a critical dissertation, likewise remained unacted. In 1770, however, the same author, Horrinda, wrote his historic drama on a national theme and in the national metre, but adhering to the French rules, appeared on the stage; and similar attempts followed in tragedy by the same writer and others (including Ayala, who ventured in 1775 to compete with Cervantes on the theme of Numancia), and in comedy by Yriarte and Jovellanos (afterwards minister under Godoy), who produced a sentimental comedy in Diderot's manner. But these endeavours failed to effect any change in the popular theatre, which was with more later success raised from its deepest degradation by R. de la Cruz (b. 1731), a fertile author of light pieces of genuine humour, especially senyetas, depicting the manners of the middle and lower classes. In literary circles La Huerta's voluminous collection of the old plays (1785) gave a new impulse to dramatic productivity, and the conflict continued between representatives of the old school, such as Comella (fl. 1786) and of the new, such as the younger Moratin (1780-1829), whose comedies—of which the last

and most successful was in prose—raised him to the foremost position among the dramatists of his age. In tragedy N. de Cienfuegos (d. 1609) likewise showed some originality. After, however, the troubles of the French domination and the war had come to an end, the precepts and examples of the new school failed to reassert themselves. The Spanish dramatists of the present century, after passing, as in the instances of F. Martinez de la Rosa and Breton de los Herrerías, from the system of French comedy to the manner of the national drama, appear either to have stood under the influence of the French romantic school, or to have returned once more to the old national models. Among the former class A. Gil y Zarate, among the latter J. Zorilla, are mentioned as specially prominent. Meanwhile the old popular religious performances are not wholly extinct in Spain, and their relic may long continue to survive there. Whatever may be the future history of one of the most remarkable of dramatic literatures, it may confidently be predicted that so long as Spain is Spain, her theatre will not be permanently denationalized, and that the revolutions it may be destined to undergo are unlikely to extinguish it, whatever degree they may repress, its conservative elements.

The beginnings of the regular drama in France, which here, without absolutely determining, potently swayed its entire course, sprang directly from the literary movement of the Renaissance. De Bellay sounded the note of attack which converted that movement in France into an endeavour to transform the national literature; and in Ronsard the classical school of poetry put forward its conquering hero and sovereign lawgiver. Among the disciples who gathered round Ronsard, and with him formed the "Pieds de l'Académie," as Jodelle, the reformer of the French theatre, Stephen Poitevain (1532-1572), the first to attempt a regular comedy by classical models; but the distance was less between the national faces and Terence, than between the mysteries and moralities, and Seneca and the Greeks. L'Eugène differs little in style from the more elaborate of the old faces; and while it satirizes the foibles of the clergy without any appreciable abatement of the old licence, its theme is the favourite burlesque of the French comic theatre of all times—the courtier. The examples, however, which directly facilitated the productivity of the French comic dramatists of this period, among whom Jean de la Taille was the first to attempt a regular comedy in prose, were those of the Italian stage, which in 1576 established a permanent colony in France, destined to survive there till the close of the 17th century, by which time it had adopted the French language, and was ready to coalesce with French actors, without, however, relinquishing all remembrance of its origin. R. Belcaro (1528-1577), a member of the "Pieds," produced a comedy in which the type (already approached by Jodelle) of the swaggering captain appears, J. Greviscopied the Italian intrigue, characters, and mannera; O. de Torquemada (d. 1581) borrowed the title of one Italian play and perhaps parts of the plots of others; the Florentine F. d'Amboise (d. 1558) produced versions of two Italian comedies; and the foremost French comic poet of the century, P. de Larivey (1550-1612), like an Italian boy on the stage of Pietro Guasto, openly professed to imitate the poets of his native country. His plays are more or less literal translations of L. Dolce, Scicli, and other Italian dramatists; and this lively and witty author, to whom Molière owes much, thus connects two of the most important and successful growths of the modern comic drama.

Before, however, either tragedy or comedy in France entered into the period of their history when genius was to tragedy illuminate both with creations of undying merit, they had, together with the general literature of the country, passed through a new phase of the national life. The troubles and terrors of the great civil and religious wars of the 16th century had in certain spheres of society produced a reaction towards culture and refinement; and the soul had been set upon the results of the Renaissance by Malherbe, the

1 El Se de los Tribos (The Young Scotsman's Companions).
2 Ñe de Soto.
3 Sophocles, Antigone; Electra; Euripides, Iphigenia in Tauris; d'Indy, Armand, Platon (by Ronsard, 1540).

The history of French tragedy begins with the Cléopâtre Captive, in the representation of which the author, together with other members of the "Pieds d'Indy," took the lead in the manner of Seneca, devoid of action and provided with a ghost and a chorus. Though mainly written in the five-foot Iambic couplet, it already contains passages in the Alexandrine metre, which soon afterwards La Ferva by his Médié (pr. 1556) established in French tragedy, and which Jodelle employed in his Didon. Numerous tragedies followed in the same style by various authors, among whom Bonnaux produced the first French regular tragedy on a subject neither Greek nor Roman, and the brothers De la Taille, and J. Grevis, distinguished themselves by their style. Though in the reign of Charles IX. a vain attempt was made by Filicid to introduce the pastoral style of the Italians into French tragedy (while the Broderhood of the Passion was intermingling with pastoral plays its still continued productions of the old entertainments, and the religious drama making its expiring efforts), the classical school, in spite of all difficulties, prevailed. Monchrestien exhibited unusual vigour of rhetoric, and in R. Garner (1545-1601) French tragedy reached the greatest height in nobility and dignity of style, as well as in the exhibition of dramatic passion, to which it attained before Corneille. In his tragedies' choruses are still interlaced among the long Alexandrine stanzas of the dialogue.

During this period, comedy had likewise been influenced by classical models; but the distance was less between the

Jodelle.
father of French style. The people continued to solace or
distract its weariness with its sufferings with the help of the
numerous of that half-cynical gaiety which has always
lighted up the darkest hours of French popular life.
In the troublous days preceding Richelieu's definitive accession
to power (1624) the Tabbardades—a kind of street dialogue
recalling the earliest days of the popular dramas—had made
the Fout-NiCh, the favourite theatre of the Parisian
populars. Meanwhile the influence of Spain, which Henry
IV. had overcome in politics, had throughout his reign and
afterwards been predominant in other spheres, and not the
least in that of literature. The etoile culte, of which Gongora
was the native Spanish, Marmo the Italian, and
Lyly the English representative, asserted its dominion over
the favourite authors of French society; the pastoral
romance of Honord de Urfé—the text-book of pseudo-pastoral
gallantry—was the parent of the romances of the Scudéry
and De la Calprenède; the Hôtel de Rambouillet was in its
glory; the true (not the false)
tragedies of its defects. A mixture of the forms of classical comedy
and the drama. Everybody knew by heart Gongora's version
of the French drama, the appearance of Corneille's
Tristan S (1601-1655)
and De la
CarrIer. The mould of French tragedy was cast
in the days of the popular
stages, on the model of the classical tragedy of
Scudéry—Le Mentor, the parent of a numerous dramatic progeny)—
was itself derived from a Spanish original, which it did
not (as was the ease with the Cid) transform into something
new. French tragi-comedy Corneille can hardly be said
to have invented; and of the mongrel growth of sentimental
comedy, domestic drama or drame, he rather suggested than
exemplified the conditions.

The tragic art of Racine (1639-1699) supplements Racine's,
rather than surpassed that of his older contemporary. His
works reflect the serene and settled formality of an age in
which the sun of monarchy shone with an effulgence no
clouds seemed capable of obscuring, and in which the life
of a nation seemed reducible to the surroundings of a court.
The tone of the poetic literature of such an age is not
necessarily unreal, because the range of its ideas is limited,
and because its forms seem to exist by an immutable
authority. Madame de Sévigné said of Racine, whose plays
so well suited themselves to the successive phases in the
life of Louis XIV., that in his later years he loved God as
he had formerly loved his mistresses; and this sally at all
events indicates the range of passions which inspired his
tragic muse. His heroes are all of one type—that of
deprived itself to the art of which it claimed to furnish
theatre and for the national
romance of Honore
and others; and among these
and it is not (as
throughout its history)
its heights do not lose themselves
to the exhibition of conflicts political rather than broadly
ethical in their significances. The defects of his style are
of less moment; but in this, as in other respects, he was,
with all his strength and brilliance, not one of those rarest
of artists who are at once the example and the despair of
their successors.

In comedy also Corneille begins the first great original His
epoch of French dramatic literature; for it was to him that
comedia
and
tragedia
were

he made those of the higher forms of French comedy. But
Le Menteur (the parent of a numerous dramatic progeny)—
was itself derived from a Spanish original, which it did
not (as was the case with the Cid) transform into something
new. French tragi-comedy Corneille can hardly be said
to have invented; and of the mongrel growth of sentimental
comedy, domestic drama or drame, he rather suggested than
exemplified the conditions.

The tragic art of Racine (1639-1699) supplements Racine's,
rather than surpassed that of his older contemporary. His
works reflect the serene and settled formality of an age in
which the sun of monarchy shone with an effulgence no
clouds seemed capable of obscuring, and in which the life
of a nation seemed reducible to the surroundings of a court.
The tone of the poetic literature of such an age is not
necessarily unreal, because the range of its ideas is limited,
and because its forms seem to exist by an immutable
authority. Madame de Sévigné said of Racine, whose plays
so well suited themselves to the successive phases in the
life of Louis XIV., that in his later years he loved God as
he had formerly loved his mistresses; and this sally at all
events indicates the range of passions which inspired his
tragic muse. His heroes are all of one type—that of
deprived itself to the art of which it claimed to furnish
the theatre and for the national
romance of Honore
and others; and among these
and it is not (as

speech are cadenced by a modern measure. In construction, the simplicity and regularity of the ancient models are stereotyped into a rigid etiquette by the exigencies of the court-theatre, which is an apartment of the palace. The unity of time and place, with the Greeks mere rules of convenience, French tragedy imposes upon itself as a permanent yoke. The European prologue is judiciously exchanged for the exposition of the first act, and the lyrical element essential to Greek tragedy is easily suppressed in its would-be copy; lyrical passages still occur in some of Corneille's early masterpieces, but the chorus is consistently banished, to reappear only in Racine's latest works as a scholastic experiment appropriate to a conventional atmosphere. Its uses for explanation and comment are served by the expeditor, which in its turn becomes conventional, of the conversations with confidantes and confidantes, which more than sufficiently supply the fail of general sentiments. The epical element is allowed full play in narrative passages, more especially in those which relate parts of the catastrophe, and, while preserving the stage intact from realisms, assimilates itself to the generally rhetorical character of this species of the tragic drama. This character imposes itself more and more upon the tragic art of a rhetorical nation in an age when the loftiest themes are elsewhere (in the pulpit) receiving the most artistic oratorical treatment, and develops in the style of French tragedy the qualities which cause it to become something between prose and poetry—or to appear (in the phrase of a French critic) like prose in full dress. The force of this description is borne out by the fact that the distinction between the verisimilitude of French tragedy and that of French comedy is at times an imperceptible one.

The universal genius of Voltaire (1694–1778) found it necessary to shine in all branches of literature, and in tragedy to surpass predecessors whom his own authority declared to have surpassed the efforts of the Attic muse. He succeeded in impressing the world with the belief that his innovations had imparted a fresh vitality to French tragedy, in truth, however, they represent no essential admeasure in art, but rather augmented the rhetorical tendency which paralyzes true dramatic life. Such life as his plays possess lies in their political and social sentiments, their invective against tyranny, and their exposure of fanaticism. In other respects his versatility was barren of enduring results. He might take his themes from French history, or from Chinese, or Egyptian, or Syrian, from the days of the Epigon or from those of the Crusades; he might appreciate Shakespeare, with a more or less partial comprehension of his strength, and consequently borrow from and improve the barbarian. But he added nothing to French tragedy where it was weakest—in character; and where it was strongest—in diction—he never equalled Corneille in fire or Racine in refinement. While the criticism to which French tragedy in this age at last began to be subjected has left unimpaired the real titles to immortality of its great masters, the French theatre itself has all but buried in respectful oblivion the dramatic works bearing the name of Voltaire—a name second to none in the history of modern progress and of modern civilization.

As it is of relatively little interest to note the ramifications of an art in its decline, the contrasts need not be pursued among the contemporaries of Voltaire, between his

imitator Saurin (1706–1781), Saurin's royalist rival Le Belloy (1727–1775), Racine's imitator Lagrange-Chancel (1676–1758), and Voltaire's own would-be rival, the "terrible" Crebillon the elder (1674–1742), who professed to vindicate to French tragedy, already mistress of the heavens through Corneille, and of the earth through Racine, Pluto's supplementary realm, but who, though thus essaying to carry tragedy lower, failed to carry it further. In the latter part of the 18th century French classical tragedy as a literary growth was dying a slow death; however numerous might be the leaves which sprouted from the decaying tree its form had been permanently fixed; and even Shakespeare, as manipulated by Ducis (1735–1816)—an author whose tastes were better than his times—failed to bring about a change. "It is a Moor, not a Frenchman, who has written this play," cried a spectator of Ducis's Othello (1791), but though Talma might astonish the theatre, Shakespeare's influence over the French drama was only gradually preparing itself, by means more especially of Letourneur's translation (1775–1782), which attracted the sympathy of Dodert and the excitements of the aged Voltaire The command which classical French tragedy continued to assert over the stage was due in part, no doubt, to the love of Roman drapery which in more than one sense characterized the Revolution, and which was by the Revolution handed down to the Empire. It was likewise, and more signally, due to the great stage actors who freed the tragic stage from much of its artificiality and animated it by their genius. No great artist has ever more generously estimated the labours of a predecessor than Talma (1763–1826) judged those of Le Rain (1728–1778); but it was Talma himself whose genius was pre-eminently fitted to reproduce the great figures of antiquity in his muse, which, like the world outside, both required and possessed its Caesar. He, like Rachel (1821–1858) after him, reconciled French classical tragedy with nature, and it is upon the art of great original actors such as these that the theatrical future of this form of the drama in France depends. Mere whims of fashion—even when inspired by political feeling—will not wait back to it a real popularity; nor will occasional literary aftergrowths, however inerterious, such as the effective Lucrèce of F. Poussard, and the attempts of even more recent writers, suffice to re-establish a living union between it and the progress of the national literature.

The rival influences under which classical tragedy has Comedy, become a thing of the past in French literature connect themselves with the history of French comedy, which under the co-operation of other influences produced a wide variety of growths. The germ of most of these—though not of all—are to be found in the works of the most versatile, and, in some respects, the most consummate comic dramatist the world has known,—Molière (1622–1673). Molière. What Molière found in existence was a comedy of intrigue, derived from Spanish or Italian examples, and the elements of a comedy of character, in French and more especially in Italian farce and ballet-pantomime. Corneille's Menteur had pointed the way to a fuller combination of character with intrigue, and in this direction Molière's genius exercised the height of its creative powers. After beginning with farces, he produced in the earliest of his plays (from 1652), of which more than fragments remain, comedies of intrigue which are at the same time marvelously lively pictures of manners, and then proceeded with the École des Maris (1661) to begin a long series of masterpieces of comedy of character. Yet even these, the chief of which are altogether unrivalled in dramatic literature, do not exhaust the variety of his productions. To define the

1. La Cid; Polyeucte.
2. Figaro, Athéna.
3. Corneille, Roderique; Racine, Phèdre.
4. Brutus, La Mort de Clovis, Shamiram.
5. Éphys. La Faussettaine (Molière).
6. Adèle de Château, La Guerre des Trois Chiffres.
8. Olympe. 11. Tamarise. 12. La Mort de Clovis; Zaire, (Othello);
range of his art is as difficult as to express in words the essence of his genius. For though he has been copied over since his time, neither his spirit nor his manner has descended in full to any of his copyists, whole schools of whom have missed elements of both. A Molière can only be judged in his relations to the history of comedy at large. He was indeed the inheritor of many forms and styles—remaining a stranger to those of Old Attic comedy only, rooted as it was in the political life of a free imperial city; though even the rich extravagance of Aristophanes’s burlesque was not left wholly unreproduced by him. Molière is both a satirist and a humourist; he displays at times the sentiments of a loyal courtier, at others that gay spirit of opposition which is all but indispensable to a popular French wit. His comedies offer elaborate and subtle—e'en tender—pictures of human character in its eternal types, lively sketches of social follies and literary extravagances, and broad appeals to the ordinary sources of vulgar meritment. Light and perspicuous in construction, he is master of the delicate play of irony, the penetrating force of wit, and the expansive gaiety of frolicsome fun. Faithful to the canons of artistic taste, and under the safe guidance of true natural humour, his style suits itself to every species attempted by him. His morality is the reverse of rigid, but its aberrations are not those of prudence. In its laws those of pretence; and wholly free as he was from the didactic aim which is foreign to all true dramatic representation, the services he rendered to his art are not the less services rendered to society, concerning which the laughter of true comedy tells the truth. He raised the comedy of character out of the lower sphere of caricature, and in his greatest comedies subordinated to the highest ends of all dramatic composition the plots he so skilfully built, and the pictures of the manners he so faithfully reproduced.

Even among the French comic dramatists of this age there must have been many who, if Molière was its greatest poet, for though he had made the true path luminous to them, their efforts were still often of a tentative kind, and one was reviving Pardon while another was translating the Andries. A more unique attempt was made in one of the very few really modern versions of an Aristophanes’s comedy, which deserves to be called an original copy—Les Pléiades de Racine. The tragic poet Quinault and Camisparton likewise wrote comedies, one or more of which furnished materials to contemporary English dramatists, as did one of the felicitous plays in which Boursault (1658–1701) introduced Mercury and Eos into the theatrical envoi. But if the mantle of Molière can be said to have fallen upon any of his contemporaries or successors, this honour must be ascribed to J. F. Regnard (1655–1700), who imitated the great master in both themes and characters, while the skillfulness of his plots, and his gaiety of the treatment even of subjects tempting into the by-path of sentimental comedy, entitled him to be regarded as a comic poet of original genius. In the next generation (that of Voltaire) this by-path threatened to become the chosen walk of comedy, though Grescat (1709–1777) still attempted comedy of character, and the witty Firon (1689–1779) produced something like a new type in the hero of his epigrammatic, but hardly dramatic, Ménagère. Marivaux (1658–1763), "the French spectator," whose minute analysis of the tender passion enriched the scorn of Voltaire, forms the connecting link between comedy and the mixed species of the sentimental or "tearful" domestic drama, which still retained the name, but no longer pursued the ends, of the comic art. The sentimentally effective and professedly didactic dramatic moralists of this school were Destouches (1650–1754) and Nivelle de la Chaussée (1692–1754), in whose hands French comedy became a champion of the sanctity of marriage and reproduced the sentiments—in one instance even the characters—of Richardson.

Melpomene, humbly shod with the stock, and Thalia, dissolved in tears, had now entered into partnership. The species which varied as comédie burlesque or as comédie bourgeoisie, and which ruled or was to rule supreme in so many dramatic literatures of Europe, more and more firmly established its hold on that of France. In the hands of Diderot (1713–1784) it sought to proclaim itself as an agent of social reform, and as an apostle of the gospel of philanthropy; but the execution of these works fell short of their aims; it was, in Mme. de Staël’s words, "the affection of nature," not nature itself which they exhibited. Their author announced them as examples of a third dramatic form—the genre sérieux—which he declared to be the consummation of the comic art. Making war upon the frigid artificiality of classical tragedy, he began it verse from the new species. The effect of these plays was intended to spring from their truth to nature—a truth such as no spectator could mistake, and which should bring home its moral teachings to the business as well as the bosoms of all. The theatre was to become a real and realistic school of the principles of society and of the conduct of life; it was, in other words, to usurp functions with which it has no concern, and to essay the reformation of mankind. The idea was neither new nor just, but its speciousness will probably continue to commend it to many benevolent minds, in whatever shape it is revived.

From this point the history of the French drama becomes that of a conflict between an enfeebled artistic comedy of the Revolution and the name of a school at all. Beaumarchais (1732–1799), the first for his early sentimental plays, in which he imitated Empson’s Empyre. Diderot, invented the apellation drame—en convening the vagueness that it became the accepted name of the hybrid species to which they belonged—in two works of a very different kind, the famous Barbier de Séville and the still more famous Mariage de Figaro, boldly carried comedy back into its old Spanish atmosphere of intrigue; but while surpassing all his predecessors in the skill with which he constructed his frivolous plots, he drew his characters with a lightness and sureness of touch peculiar to himself, animated his dialogue with an unparalleled brilliancy of wit, and seasoned action as well as dialogue with a political and social meaning, which caused his epigrams to become proverb and which marks his Figaro as a herald of the Revolution. Such plays as these were ill suited to the rule of the despot whose vigilance could not overlook their significance. The comedy of the empire is, in the hands of Collin d’Harleville, Picard, A. Duval, Étiene, and others, mainly a harmless comedy of manners; nor was the attempted innovation of N. Lemercier (1771–1840)—who was fain to invent a new species, that of historical comedy—more than a flattering self-delusion. The theatre had its share in all the movements and changes which ensued in

France; but the impulse which gave rise to the revolution the drama itself was to undergo was not one of native origin. Those branches of the drama which belong specifically to the history of the opera, or which associate themselves with it, are here passed over. (See OPERA.)

The stage of the dramatic school of French drama, however, was the neoclassical (from Val de Vire to Calvados), which began as an interpenetration of pantomime with the airs of popular songs, and which, after the Italian masks had been removed from it, was cultivated by Ponsard (1690–1765) and Marmontel (1723–1799). The latter, as well as Rousseau,5 likewise composed opérettes, a smaller kind of opera, at first of the pastoral sort, and these flexible species easily entered into combination. The melodrama proper, of which the invention is also attributed to Rousseau,6 in its latter development became merely a drama acousticated by music, though usually in little need of any accentuation.

The chief home of the regular drama, however, demanded efforts of another kind. At the Théâtre Français, or Comédie Française, whose history as that of a single company of actors had begun in 1660, the party-strife of the time made itself audible; and the most prominent tragic poet of the Revolution, M. J. de Chénier (1764–1811), a disciple of Voltairé in dramatic poetry as well as in political philosophy, wrote for the national stage the historical drama—with a political moral—in which in the memorable year 1789 Talma achieved his first complete triumph. But the victorious Revolution proclaimed among other liberties that of the theatres in Paris, of which soon not less than 50 were open. In 1807 the empire restricted the number to 9, and reinstated the Théâtre Français in sole possession (or nearly such) of the right of performing the classic drama. No writer of note was, however, tempted or inspired by the rewards and other encouragements offered by Napoleon to produce such a classic tragedy as the emperor would have willingly stamped out of the earth.

The tragedies of C. Delavigne (1794–1844) represent the transition from the expiring efforts of the classical to the ambitious beginnings of the romantic school of the French drama. Of this it must suffice to say that it derives some of its characteristics from the general movement of romanticism which in various ways and at various points of time transformed nearly every modern European literature, coming from the rhetorical tendency which is a French national feature. Victor Hugo was its conquering founder; A. Dumas the elder (1803–1870) its middleman. The marvellous energy and poetic genius of the former, always in extremes, was nowhere more signally so than in the drama; the latter was a Briareus, working with many hands besides his own. The name of A. de Vigny (1799–1863), "George Sand" (1804–1876), A. de Musset (1810–1857), whose dramatic "proverbs" and other pieces of a similar kind have a delicate flavour all their own, and perhaps that of P. Mérimeé (1803–1870), who invented not only Spanish dramas but a Spanish dramatist,5 may be all with more or less precision classed in the romantic school, which in its turn has come to an end as a productive body of writers. It was not, however, the brief classical revival begun by P. Ponsard and continued, in closer relation to modern ideas, both by him and by E. Augier, which overthrew the Romanticists. While the theatrical ability of E. Scribe (1791–1858) supplied a long series of productions attesting the rapid advance of the playwright's mastery over the secrets of his craft, and while the name of his competitors, with the aid of some of whom he held his own against the rest, is legion, the latest developments of the French drama possess a social and often a moral interest of greater depth, while they are not inferior in technical skill to anything that has preceded them. After a fashion which would have startled even Diderot, the younger A. Dumas has undertaken to reform society by means of the stage; O. Feuillet and others have, with perhaps fewer prefaces, applied themselves to the solution of the same "problems;" and whatever style will best succeed with the public is the style of V. Sardou.

That the theatre will lose the hold it possesses over the intellectual and moral sympathies of nearly the whole of the educated, and of a great part of the uneducated population of France, seems hardly within the range of probability. But this is not tantamount to a prophecy that the creative activity of French dramatic literature is certain to endure. The art of acting is not dependent upon a contemporary literary productivity; Talma and Midle Mars (1779–1847) flourished in one of the most barren ages of the French literary drama; the authors and actors of the sottises, like those of the Palais Royal farces of our own day, could strike their roots in the lightest of soils. The constantly accumulating experience and the apparently inexhaustible fertility of the art of acting in France may ensure to it a future not less brilliant than its past; and the judicious policy of not leaving the leading theatres at the mercy of shifting fashion will at all events supply the possibility of maintaining a high artistic standard. So long as the French nation continues to maintain its ascendancy over other nations in much that adorns and brightens social life, the predominant influence of the French theatre over the theatres of other nations is likewise assured. But in the end its own future must be ruled by that progress or decay of French dramatic literature. The history of that literature shows periods of marvellously rapid advance, of hardly less swift decline, and of frequent though fitful recovery. Its future may be equally varied, but it will not be less dependent on the conditions which in every people, ancient or modern, are indispensable to national vigour and vitality. Should the calamity—for it would be nothing less—befall modern civilization of a hopeless degeneration of the French drama, the fault will lie in the severance of self-consciousness from self-control; and, under other circumstances, but with even deeper regret, the story of the Roman theatre of the later Empire may have to be told again.

Among the nations of Germanic descent, but one—our English own—succeeded under the influence of the Renaissance movement in transforming the last growths of the mediaeval drama into the beginnings of a great and enduring national dramatic literature. This transformation connects itself with one of the greatest epochs of the national history, more properly speaking, forms part of it; the Elizabethan drama and the Elizabethan age are, it is no exaggeration to assert, equally inconceivable one without the other.

It has been seen how already in the reign of Edward Beguining V., the breath of a new age with its "new learning" had quickened the relatively inanimate species of the morality drama, first into the chronicle history (still intermingled with remnants of the earlier species); and how at an earlier date John Heywood's interludes had bridged the distance separating from only partially relieved abstractions the concrete directness of comedy proper. Soon afterwards, the study and imitation of the ancient classical drama were introduced into the English world of letters; and under their influence tragedy and comedy, which might otherwise have from the first coalesced, were in their early growths by our literature kept sunder, though not absolutely so. Already, in Queen Mary's reign, translation was found the readiest form of expression offering itself to literary scholar-
Earliest tragedies.

Some ship, and Italian examples helped to commend Seneca, the most modern of the ancient tragedians, as a favourite author for such exercises. With the year of Elizabeth's accession began a series of translations of his plays by Jasper Heywood (John Heywood's son) and others; and to the direct influence of one of Seneca's tragedies is to be ascribed the composition of the first tragedy proper in the English tongue, the "Gorboduc" (afterwards renamed "Pericles and Perseus") of T. Sackville, Lord Buckhurst, with whom T. Norton was joint author (1563). Though, unlike "Gorboduc," classical in theme, and in some respects approaching nearer to the true conception of tragedy in their treatment of dramatic passion, the nearly contemporary "Ajax" and "Virginia" (c. 1563) and Preston's "Cambridge King of Peraea," it was Shakespeare's jars of Euripides (1566), and of R. Edward's "Damon and Phaethon," 1571), which calls itself a comedy, and is in fact a mixture of both species. Simultaneously with the influence, directly or indirectly exercised, of classical literature, that of Italian, both dramatic and narrative, asserted itself; early works from this source were the first "Romeo and Juliet" (not preserved, but apparently anterior in date even to "Gorboduc"), Tancred and Gumatia (1563), and "Whetstone's Promos and Cassandra" (printed 1578), from which Shakespeare took the story of "Measure for Measure." From the double danger which threatened our tragic drama in the days of its infancy—that it would congeal on the cold heights of classical themes, or dissolve its vigour in the glowing heat of a passion fiercer than that of the Italians ("Inglesi Italianato è un dio volo inincerto")—it was preserved, more than by any other cause, by its happy association with the traditions of the national history. The crudes growth of the chronicle history proved strong enough to assert itself by the side of tragedy based on classical and Italian models; and in a series of works of more or less uncertain dates, a vein was worked from which Shakespeare was to draw the richest ore. Among these rude compositions, which intermixed the blank verse introduced art in harmony with the tastes and tendencies of the time, the earliest extant English comedy, N. Udall's "Ralph Roister Doister," which cannot be dated later than 1551, may be described as a genuinely English adaptation of Plautus, while its successor, "Gammer Gurton's Needle," printed 1575, and probably written by (Bishop) Still, has an original, and in consequence a slighter, though by no means unmasterly, plot. In the main, however, our early English comedy, while occasionally introducing characters of genuinely native origin, and appealing to the traditional humour of Will Summer, the court-fool of Henry VIII, or Grin, the collie of Croydon, was content to borrow its themes from Italian or classical sources; Aristotle's "Supposi" found a translator in Gascoigne (1566), and the Menagius of Plautus translators or imitators in writers of rather later dates. While on the one hand the mixture of tragic with comic motives was already leading in the direction of tragic-comedy, the precedent of the Italian pastoral drama encouraged the introduction of figures and stories from classical mythology; and the rapid and versatile influence of Italian comedy seemed likely to continue to control the progress of the lighter branch of the English drama. One of such promises as these the glories of our drama Conditions were ripened by the warmth and light of the great of the Elizabethan age—of which the beginnings may fairly be reckoned from the third decennium of the reign to which it owes its name. The queen's steady love of dramatic entertainments could not of itself have led, though it undoubtedly contributed, to such a result. Against the attacks which a nascent puritanism was already directing against the stage by the hands of Northbrooks, the repentant playwright Gosson, Stubbes, and others, were to be set not only the barren favour of royalty, and the more direct patronage of great nobles, but the fact that literary authorities were already weighing the claims of both tragedy and comedy were upheld by those who shrunk from the desipience of idle pastimes. As the popularity of the stage increased, the functions of playwright and actor, whether combined or not, began to fall within a reasonable promise of personal gain. Nor, above all, was that higher impulse, which leads men of talent and genius to attempt forms of art in harmony with the tastes and tendencies of their times, wanting to the group of writers who can be remembered by no nobler name than that of Shakespeare's predecessors.

The lives of all of these are, of course, in part contemptible. The propaganda with the life of Shakespeare himself; nor was there any substantial difference in the circumstances under which of Shake-peare's career was to take place, and the first of them, and he, led their lives as dramatic authors. A distinction was manifestly kept up between poets and playwrights. Of the contempt entertained for the actor's profession some fell to the share of the dramatist; "even and bold," says Dr Ingleby, "who had indeed never trod the stage, but had written several plays, and had no reason to be ashamed of his antecedents, speaks of the vocation of the play-maker as sharing the odium attaching to the actor." Among the dramatists themselves good fellowship and literary partnership only at times asserted themselves as stronger than the tendency to mutual jealousy and abuse; of all chapters of dramatic history, the annals of the early Elizabethan stage perhaps least resemble those of Arcadia.

Moreover, the theatre had hardly found its strength. History of as a powerful element in the national life, when it was involved in a bitter controversy, with which it had to hearken to no connections of the court or the courtly; and with sympathy with it can only have been of a very limited

1 Thetis.

kind. The Marpellite controversy in 1589 led to a stoppage of stage plays which proved only temporary; but the general result of the attempt to make the stage a vehicle of political abuse and invective was beyond a doubt to censor and degrade both plays and players. The true remedy was at last applied, when from about the year 1594 the chief London actors became divided into two great rival companies—the Lord Chamberlain’s and the Lord Admiral’s—whence alone received licences. Instead of half-a-dozen or more companies whose jealousies communicated themselves to the playwrights belonging to them, there were now, besides the Children of the Chapel, two established bodies of actors, directed by steady and, in the full sense of the word, respectable men. To the Lord Chamberlain’s Company, which, after being settled at the “Theater,” moved to the Globe on the Bankside in 1599, Shakespeare and Richard Burbage, the greatest of the Elizabethan actors, belonged; the Lord Admiral’s was managed by Philip Henslowe, the author of the Diary, and Edward Alleyn, the founder of Dulwich College, and was ultimately, in 1600, settled at the Fortune. In these and other houses were performed the plays of our Elizabethan dramatists, with few adventitious aids, the performance being crowded into a brief afternoon, when it is obvious that only the idler sections of the population could attend. No woman might appear at a playhouse unless masked; on the stage, down to the Restoration, women’s parts continued to be acted by boys.

It is futile to take no account of such outward circumstances as these and many which cannot here be noted in surveying the progress of the literature of the Elizabethan drama. No dramatic literature which has any claim to rank beside it—not that of Athens nor those of modern Italy and Spain, nor those of France and Germany in their classic periods—had to contend against such odds, a mighty inherent strength alone ensuring to it the vitality which it so triumphantly asserted, and which enabled it to run so unequalled a course.

Among Shakespeare’s predecessors John Lyly (1554–1600), whose plays were all written for the Children of the Chapel and the Children of St Paul’s, holds a position apart in our dramatic literature. The euphues, to which his famous romance gave its name, likewise distinguishes his mythological, quasi-historical, allegorical, and satirical comedies. But his real service to the progress of our drama is to be sought neither in his choice of subjects nor in his imagery—though both fondness for fairy lore and for the whole phantasmagoria of legend, classical as well as romantic, his contemporaries, and Shakespeare in particular, were indebted for a stimulative precedent. It lies in his adoption of Gassentaigne’s innovation of writing plays in prose; and in his heaving, though under the fetters of an affected and vicious style, given the first example of brisk and vivacious dialogue—an example to which even such successors as Shakespeare and Jonson were indebted. Thomas Kyd (c. 1584), the author of the Spanish Tragedy, possesses some of the characteristics, but none of the genius, of the greatest tragic dramatist who preceded Shakespeare. No higher tribute than this is assuredly the due of Christopher Marlowe (1564–1593), whose violent and prematurely closed a poetic career of dazzling brilliancy. His earliest play, Tamburlaine the Great, in which the use of blank verse was introduced, and full of the “high astounding terms” of an extravagant and often bombastic diction, is already marked by the passion which was this poet’s most characteristic feature, and which was to find expression so luxuriant in his Doctor Faustus and so surpassingly violent in his Jew of Malat this master-piece, Edward II., is a tragedy of singular pathos and of a dramatic power unapproached by any of his contemporaries.

George Peele (1558–1596?) was a far more versatile writer even as a dramatist, but though his plays contain passages of exquisite beauty, not one of them is worthy to be ranked by the side of Marlowe’s Edward II., compared with which, if indeed not absolutely, Peele’s Chronicle of Edward I. still stands on the level of the species to which its title and character alike assign it. His finest play is undoubtedly David and Bethsabe, which resembles Edward I. in construction, but far surpasses it in beauty of language and versification, besides treating its subject with greatly superior dignity. If the difference between Peele and Shakespeare is still in many respects besides that of genius an immemorial one, we seem to come into something like a Shakespearean atmosphere in more than one passage of the plays of the unfortunate Robert Greene (1591–1592), whose unfortunate perhaps in nothing more enduringly than in his notorious enmity to Shakespeare himself. His genius, which shone most brightly in plays treating English life and scenes, was in the main free from the pedantry which occasionally besets the flight of Peele’s and even of Marlowe’s muse; and his most delightful work at all events seems to breathe something of that indescribable freshness which we recognise, if not as a peculiarly Shakespearean characteristic, at least as one belonging to none but a truly national art. Thomas Lodge (c. 1558–1635), Thomas Nash the redoubtable pamphleteer (c. 1565–c. 1603), Henry Chettle (1594–c. 1617), who worked the chords of both pitty and terror with equal vigour, and Anthony Munday (1553–1633), better remembered for his city pamphlets than for his plays, are among the other more generally known writers of the early Elizabethan drama, though not all of them can strongly speaking be called predecessors of Shakespeare.

The common characteristics of nearly all these dramatists were in accordance with those of the great age to which they belonged. Stirring times called for stirring themes, such as those of “Malonnet, Sippo, and Tamurkane,” and these again for a corresponding vigour of treatment. Neatness and symmetry of construction were neglected for fulness and variety of matter. Novelty and grandeur of subject seemed well matched by a swelling amplitude and often reckless extravagance of diction. As if from an inner necessity, the balance of rhymed couplets gave way to the impetuous march of blank verse; “strong lines” were as in-evitably called for as strong situations and strong characters. Distinct as the chief of these poets are from one another by the marks impressed upon both form and matter by individual genius, yet the stamp of the age is upon them all. Writing for the stage only, of which some of them possessed a personal experience, they acquired an instinctive insight into the laws of dramatic cause and effect, and infused a warm vitality into the dramatic literature which they produced, so as to produce, immediate consumption. On the other hand, the same cause made rapidity of workmanship indispensable to a successful playwright. How a play was produced, how many hands had been at work upon it, what loans and what spoliation had been made in the process, were considerations of less moment than the question whether it was produced, and whether it succeeded. His harness—frequently double or triple—was inseparable from the lusty Pegasus of the early English drama, and its genius toiled, to borrow the phrase of the Attic comedian, "like an Arcadian mercenary."
This period of our drama, though it is far from being one of crude effort, could not therefore yet be one of full consummation. In tragedy the advance which had been made in the choice of great themes, in knitting closer the connection between the theatre and the national history, in vindicating to passion its right to adequate expression, was already enormous. In comedy the advance had been less decisive and less independent; much had been gained in reaching greater freedom of form and something in enlarging the range of subjects; but artificiality had proved a snare in the one direction, while the licence of the comic stage, upheld by favourite "clowns," such as Kemp or Tarleton, had not succumbed before more exacting demands. The way of escaping the dilemma had, however, been already recognized to lie in the construction of suitable plots, for which a full storehouse was open in the popular traditions preserved in national ballads, and in the growing literature of translated foreign fiction, or of native imitations of it. Meanwhile, the aberration of the comic stage to political and religious controversy, which it could never hope to treat with real freedom in a country provided with a strong monarchy and a dogmatic religion, seemed likely to extinguish the promise of the beginnings of English romantic comedy.

These were the circumstances under which the greatest of dramatists began to devote his genius to the theatre. Shakespeare's career as a writer of plays can have suffered little in its beginnings from those of his contemporaries and rivals. Before or while he was proceeding from the re-touching and re-writing of the plays of others to original dramatic composition, the most gifted of those we have termed his predecessors had passed away. He had been destined as an actor before he was known as an author; and after living through days of darkness for the theatre, if not for himself, attained, before the close of the century, to the beginnings of his prosperity and the beginnings of his fame. But if we call him fortunate, it is not because of such enfranchisement.

With equal power and variety the working of those passions in the mastery of which over man lies his doom? Here, above all, Shakespeare as compared with his predecessors, as well as with his successors, "is that nature which they paint and draw." He threw open to modern tragedy a range of hitherto unknown breadth and depth and height, and emancipated the national drama in its noblest forms from limits to which it could never again restrict itself without a consciousness of having renounced its enfranchisement. Happily for the variety of his creative genius on the English stage, no divorce had been proclaimed between the serious and the comic, and no division of species had been established such as he himself ridicules as pedantic when it professes to be exhaustive. The comedies of Shakespeare accordingly refuse to be tabulated in deference to any method of classification deserving to be called precise; and several of them are comedies only according to a purely technical use of the term. In those in which the comic interest asserts itself to the instinct of reader or spectator as supreme, it is still of its nature incidental to the progress of the action; and if it seems a just criticism (and one agreeing with what we can conclude as to Shakespeare's process of construction) that all of his comedies but one is in both design and effect a comedy of character proper. Thus in this direction, while the unparalleled wealth of his invention renewed or created a whole gallery of types, he left much to be done by his successors, while the true secrets of his comic art, which interweaves fancy with observation, draws wisdom from the lips of fools, and imbues with character what all other hands would have left shadowy, monstrous, or trivial, are among the things inimitable belonging to the individuality of his poetic genius.

The influences of Shakespeare's diction and versification upon those of the English drama in general can hardly be over-rated, though it would be next to impossible to state them definitely. In these points, Shakespeare's manner as a writer was progressive; and this progress has been deemed sufficiently well traceable in his plays to be used as an aid in seeking to determine their chronological sequence. The masque.
(1634) composed one of the loftiest and loveliest of English poems. Comus has been judged and condemned as a drama—unduly, for the dramatic qualities of a mask are not essential to the species. Nor need its history in England have here been referred to, were it not so inseparably connected with that of the Elizabethan drama. In later times the mask merged into the opera, or continued a humble life of its own apart from literary effort. It is strange that our later poets should have done so little to restore to its nobler uses, and to invest with a new significance, a form of so proved a flexibility as the poetic mask.

The annals of our drama proper in the period reaching from the closing years of Elizabeth to the outbreak of the great Revolution include, together with numerous names relatively insignificant, many illustrious in the history of our poetic literature. Among Shakespeare's contemporaries and successors there is, however, but one who by the energy of his genius, not less than by the circumstances of his literary career, stands in a position of undisputed primacy among his fellows. Ben Jonson (1572-1635), to whom in his latter days a whole generation of younger writers did homage as to their veteran chief, was alone in full truth the founder of a school or family of dramatists. Yet his pre-eminence did not (whatever he or his followers may have thought) extend to both branches of the regular drama. In tragedy he fell short of the highest success; the weight of his learning lay too heavily upon his efforts to draw from deeper sources than those which had sufficed for Shakespeare. Such as they are, his tragic works stand almost, though not quite, alone in this period as examples of sustained effort in historic tragedy proper. G. Chapman (1557 or 1559-1634) treated stirring themes, more especially from modern French history, always with vigour, and at times with genuine effectiveness; but though rich in beauties of detail, he failed in this branch of the drama to follow Shakespeare even at a distance in the supreme art of fully developing a character by means of the action. Mention has already been made of Ford's isolated effort in the direction of historic tragedy and of those excursions into the still popular domain of the chronicle history by T. Heywood, Dekker, and others, which are to be regarded as nothing more than attempts to compete with him in the wide variety of sources, and consequent apparent variety of themes, the number of motives employed—at least as a rule—in the tragic drama of this period was comparatively small and limited. Hence it is that, notwithstanding the diversity of subjects among the tragic dramas of such writers as Marston, Webster, Fletcher, Ford, and Shirley, an impression of sameness is left upon us by a connected perusal of these works. Politic ambition, conjugal jealousy, absolute female devotion, unbridled masculine passion, such are the motives which constantly recur in the Decameron of our later Elizabethan drama. And this impression is heightened by the want of moderation, by the excess of passion, which these dramatists so habitually exhibit in the treatment of their favourite themes. All the tragic poets of this period are not equally amenable to this charge; in J. Webster* (c. 1650), master as he is of the effects of the horrid, and in J. Ford* (1586-1649), surpassingly seductive in his sweetness, the monotony of exaggerated passion is broken by those marvellously sudden and subtle touches through which their tragic genius creates its most thrilling effects. Nor will the tendency to excess of passion which F. Beaumont (1586-1616) and J. Fletcher (1576-1625) undoubtedly exhibit be confounded with their distinctive power of sustaining tenderly pathetic characters and situations in a degree unequalled by any of their contemporaries—a power seconded by a beauty of diction and softness of versification which for a time raised them to the highest pinnacle of popularity, and which entitles them in their conjunction, and Fletcher as an independent worker, to an enduring pre-eminence among their fellows. In their morals Beaumont and Fletcher are not above the level of their age. The manliness of sentiment which ennobles the rhetorical genius of F. Massinger (1584-1640), and the gift of poetic illustration which entitles J. Shirley (1593-1666) to be remembered as something besides the latest and the most fertile of this group of dramatists, have less direct bearing upon the general character of the tragic art of the period. The common features of the romantic tragedy of this age are sufficiently marked, but not capable of obscuring the distinctive features in its individual writers which it is the highest function of criticism to discover and establish.

In comedy, on the other hand, the genius and the insight of Jonson pointed the way to a steady and legitimate advance. His theory of "humours" (which found the most palpable expression in two of his earliest plays*), if translated into the ordinary language of dramatic art, signifies the paramount importance in the comic drama of the creation of distinctive human types. In the actual creation of these it was impossible that Jonson should excel Shakespeare; but in the consciousness with which he recognized and indicated the highest sphere of a comic dramatist's labours, he rendered to the drama a direct service which Shakespeare had left unperformed. By the rest of his contemporaries and his successors, some of whom (such as Brome) were content avowedly to follow in his footsteps, Jonson was only occasionally rivalled in individual

---

Comedy.

Ben Jonson.
instances of comic creations; in the entirety of its achievements its genius as a comic dramatist remained unapproached. The favourite types of Jonsonian comedy, to which Dekker, J. Marston (1575/6-1624), Chapman had, though to no large extent, added others of their own, were elaborated with incessant zeal and remarkable effect by their contemporaries and successors. It was after a very different fashion from that in which the Roman comedians reiterated the ordinary types of the New Attic comedy, that the inexhaustible source of T. Middleton (1574-1624), the buoyant productivity of Fletcher, the observant humour of N. Field (c. 1590-c. 1640), and the artistic versatility of Shirley—not to mention many later and lesser names—mirrored in innumerable pictures of contemporary life the undying fancies and follies of mankind. As comedians of manners more than one of these surpassed the old master, not indeed in distinctness and correctness, the fruits of the most painstaking genius that ever fitted a learned sock to the living realities of life,—but in a lightness which did not impair their essential merit, while in the construction of plots the access of abundant new materials, and the greater elasticity in treatment which is the result of accumulated experience, enabled them to maintain a steady progress. Thus our comic dramatic literature from Jonson to Shirley is unsurpassed as a comedy of manners, while as a comedy of character at least it does compare with any other national literary growth preceding or contemporaneous with it. Though the younger generation, of which W. Cartwright (1611 or 1615-1643) may be taken as an example, was unequal in originality or force to its predecessors, yet so little exhausted was the vitality of the species, that its traditions survived the interregnum of the Revolution, and connected themselves in some measure with later growths of English comedy.

The rivals against which in its closing period the old English drama had to contend have already noticed. From the masks and triumphs at court and at the houses of the nobility, with their Olympusses and Parnassuses built by Inigo Jones, and filled with goddesses and nymphs clad in the gorgeous costumes designed by his inventive hand, to the city pageants and shows by land and water,—from the tilts and tournaments at Whitehall to the more philosophical devices at the Inns of Court and the academical plays at the universities,—down even to the brief but thrilling theatrical exentiments of Bartholomew Fair and the "Ninevithical motions" of the puppets,—in all these ways the sections of the theatrical public were tempted aside. Foreign performers—French and Spanish actors, and even French actresses—paid visits to London. But the national drama held its ground. The art of acting maintained itself at least on the level to which it had been brought by Shakespeare's associates and contemporaries, Burbage and Heminge, Alleyne, Lewin, Taylor, and others "of the older sort." The profession of actor came to be more generally than of old separated from that of playwright, though they were still (as in the case of Field) occasionally combined. But this rather led to an increased respect in actors who valued the dignity of their own profession and whose co-operation the authors learnt to esteem as of independent significance. The stage was purged from the barbarism of the old school of clowns. Women's parts were still acted by boys, many of whom attained to considerable celebrity; and a practice was thus continued which placed the English theatre at a considerable disadvantage as compared with the Spanish (where it never obtained), and which probably to some extent reacted upon the licence of expression assumed by our dramatists. The arrangement of the stage, which followed a rapid succession of scenes without any necessity for them being organically connected with one another, remained essentially the same as in Shakespeare's days, though the primitive expedients for indicating locality had begun to be occasionally exchanged for scenery more or less appropriate to the place of action. Costume was apparently cultivated with much greater care, and there is no reason to suppose that the English stage of this period had not gone so far as was expedient in a direction in which in feebler times so vast an amount of effort has come to be spent. The drama still depended in the main upon its literary essentials and upon the actor's art; but the system of prologues and epilogues, and of dedications to published plays, was more uniformly employed than it had been by Shakespeare as the conventional method of recommending authors and actors to the favour of individual patrons, and to that of their chief patron, the public.

Up to the outbreak of the Civil War the drama in all its forms continued to enjoy the favour or good-will of the court, although a close supervision was exercised over all attempts to make the stage the vehicle of political references or allusions. The regular official agent of this supervision was the Master of the Revels, but under James I, a special ordinance, in harmony with the king's ideas concerning the dignity of the throne, was passed "against representing any modern Christian king in plays on the stage." The theatre could hardly expect to be allowed a liberty of speech in reference to matters of state confined to the public at large; and occasional attempts to indulge in the freedom of criticism dear to the spirit of comedy met with more or less decisive repression and punishment. But the sympathies of the dramatists were so entirely on the side of the court, that the real difficulties against which the theatre had to contend came from a directly opposite quarter. With the growth of Puritanism the feeling of hostility to the stage increased in a large part of the population, well represented by the civic authorities of the capital. This hostility found many ways of expressing itself. The attempts to suppress the Blackfriars theatre (1619, 1631, 1633) proved abortive; but the representation of stage plays continued to be prohibited on Sundays, and during the prevalence of the plague in London in 1637 was temporarily suspended altogether. The desire of the Puritans for the more pronounced type openly aimed at a permanent closing of the theatres. The war between them and the dramatists was accordingly of a life-and-death kind. On the one hand, the drama hesitated its uttermost and often coarsely attacks upon whatever aspect of the Puritan spirit—gibes, taunts, caricatures in ridicule and aspersion of Puritans and Puritanism made up a great part of the comic literature of the later Elizabethan drama and of its aftergrowth in the reigns of the first two Stuarts. This feeling of hostility, to which Shakespeare was no stranger, though he could not be connected with the authorship of one of its earliest and coarsest expressions, rose into a spirit of open defiance in some of the masterpieces of Ben Jonson; the comedies of his contemporaries and successors abound in caricatured reproductions of the more common or more extravagant types of Puritan life. On the other hand, the moral defects, the looseness of tone, the mockery of ties and consanguinity, the denial of the dignity of the throne, was passed "against representing any modern Christian king in plays on the stage." The theatre could hardly expect to be allowed a liberty of speech in reference to matters of state confined to the public at large; and occasional attempts to indulge in the freedom of criticism dear to the spirit of comedy met with more or less decisive repression and punishment.

The drama and Puritanism.
the theatres. of the age, intensified the Puritan opposition to all and any stage plays. A patient endeavor to reform instead of supplanting the drama was not to be looked for from such adversaries, should they ever possess the means of carrying out their views; and so soon as Puritanism should victoriously assert itself in the state, the stage was doomed. Among the attacks directed against it in its earlier stages was the famous spillovers of drama's 'Dufty Mathe' (1652), while it involved its author in shamefully cruel persecution, did not remain wholly without effect upon the tone of the dramatic literature of the subsequent period, but the quarel between Puritanism and the theatre was too old and too deep to end in any but one way, so soon as the latter was deprived of its protectors. The Civil War began in August 1642; and early in the following month was published the Ordinance of the Lords and Commons, which, after a brief and solemn preamble, commanded "that while these sad causes and set-times of humiliation do continue, public stage plays shall cease and be forbidden." Many actors and playwrights followed the fortunes of the royal cause in the field; some may have gone into a more or less voluntary exile; upon those who lingered on in the familiar haunts the hand of power lay heavy; and though there seems reason to believe that dramatic entertainments of one kind or another continued to be occasionally presented, stringent ordinances gave summary powers to magistrates against any players found engaged in such proceedings (1647), and bade them treat all stage-players as rogues, and pull down all stage galleries, seats, and boxes (1648).

A few dramatic works were published in this period; while at fairs about the country were acted farces called "drolls," consisting of the most vulgar scenes to be found in popular plays. Thus, the life of the drama was not absolutely extinguished; and its darkest day proved briefer than perhaps either its predecessor or successor. It may here be noticed, that the fortunes of the Irish theatre in general followed those of the English, of course it was merely a branch. Of native dramatic compositions in earlier times not a trace remains in Ireland; and the drama was introduced into that country as an English exotica—apparently already in the reign of Henry VIII., and more largely in that of Elizabeth. The first theatre in Dublin was built in 1635; but in 1641 it was closed, and even after the Restoration the Irish stage continued in a precarious condition till near the end of the century.

Already "in Oliver's time" private performances took place from time to time at noblemen's houses and (though not undisturbed) in the old haunts of the drama, the Red Bull. In 1656 the ingenuity of Sir William Davenant (1606-1669), whose name, though not otherwise eminently in our dramatic literature, is memorable as connecting together two distinct periods in it, ventured on a bolder step in the production of a quasi-dramatic entertainment "of declamation and music;" and in the following year he brought out with scenery and music a piece which was afterwards in an enlarged form acted and printed as the first part of his opera, The Siege of Rhodes. This entertainment he afterwards removed from the private house where it had been produced to the Cockpit, where he soon ventured upon the performance of regular plays written by himself. Thus, under the cover of two sister arts, whose aid was in the sequel to prove by no means altogether beneficial to its progress, the English drama had boldly anticipated the Restoration, and was no longer hiding its head when that much desired event was actually brought about. Soon after Charles II.'s entry into London, two theatrical companies are known to have been acting in the capital. For these companies patents were soon granted, under the names of "the Duke (of York's)" and "the King's Servants," to Davenant and one of the brothers Killigrew respectively,—the former from 1662 acting at Lincoln's Inn Fields, then at Dorset Garden in Salisbury Court, the latter from 1663 at the Theatre Royal near Drury Lane. These companies were united from 1682, a royal licence being granted in 1685 to a rival company which performed in Lincoln's Inn Fields, which migrated to Covent Garden in 1733. Meanwhile Vanbrugh had in 1705 built the theatre in the Haymarket; and a theatre in Goodman's Fields—afterwards rendered famous by the first appearance of Garrick—led a fitful existence from 1729 to 1737. The Act of 1737 revived the Crown of the power of licensing any more theatres; so that the history of the English stage for a long period was confined to a limited area. The rule which prevailed after the Restoration, that neither of the rival companies should ever attempt a play produced by the other, operated beneficially both upon dramatic perfection and upon the progress of the art of acting, which was not exposed to the full effects of that deplorable spirit of personal rivalry which leads actors, in order to outshine their fellows, to attempt parts for which they often have no special qualification. There can be little doubt that the actor's art has rarely flourished more in England than in the days of T. Betterton (1635-1710) and his contemporaries, among whose names those of Hart, Mohun, Kynaiston, Nokes, Mrs Barry, Mrs Betterton, Mrs Dragegirdle, and Mrs Eleanor Gwynne have, together with many others, survived in various connections among the memories of the Restoration stage. No higher praise had ever been given to an actor than that which Addison bestowed upon Betterton, in describing his performance of Othello as a proof that Shakespeare could not have written the most striking passages of the character otherwise than he has done.

Owing in part to the influence of the French theatre, Tragedy, which by this time had taken the place of the Spanish as the ruling drama of Europe, the separation between tragedy and comedy is clearly marked in our post-Restoration plays. Comic scenes are still occasionally introduced into tragedies by some of our dramatists who adhered more closely to the Elizabethan models (such as Otway and Crowne), but the practice fell into disuse; while the endeavour to elevate comedy by pathetic scenes and motives is one of the characteristic marks of the beginning of another period in our dramatic literature. The successive phases through which English tragedy passed in the later Stuart times cannot be here discussed, as they are another subject of the dramatic plan, which is offered by the theories put forth by some of the dramatists in support of their practice is often delusive. Following the example of Corneille, Dryden and his contemporaries
and successors were fond of proclaiming their adherence to this or that principle of dramatic construction or form, and of upholding, with much show of dialectical acumen, maxims derived by them from French or other sources, or elaborated with modifications and variations of their own, but usually amounting to little more than what Scott calls "certain romantic whimsical imitations of the dramatic art." The student of the drama will find much both to entertain and to instruct him in these prefaces, apologies, dialogues, and treatises; he will acknowledge that Dryden's incomparable vigour does not desert him either in the exposing or in the upholding of fallacies; and that even Byrom, usually regarded as having touched the nadir of dramatic criticism, is not wholly without grains of salt. But Restoration tragedy itself must not be studied by the light of Restoration criticism. So long as any dramatic power remained in our tragic poets—and it is absent from none of the chief among them from Dryden to Rowe—the struggle between fashion (disguised as theory) and instinct (tending in the direction of the Elizabethan traditions) could never wholly determine itself in favour of the former.

Lord Orrery (1652-1679), in his "Essay on Tragedy," claims for English tragedy the "abstract art" of such it professed to be. This new species of tragedy, for such it professed to be, borrowed from France that garb of rhyme which the "romans de longue haleine" of the Scudéry and their contemporaries—and by French plays treating similar themes. It likewise borrowed from France that garb of rhyme which the English drama had so long abandoned, and which now reappeared in the heroic couplet. But the themes which to readers of novels might seem of their nature inexhaustible could not long suffice to satisfy the more capricious appetite of theatrical audiences; and, for the form, in the application it was sought to enforce for it, was doomed to remain an exotic. In conjunction with his brother-in-law Sir R. Howard (1626-1698), and afterwards more confidently, by himself, Dryden (1631-1699) threw the incomparable vigour and brilliancy of his genius into the scale, which soon rose to the full height of fashionable popularity. At first he claimed for English tragedy the right to combine her native inheritance of freedom with these valuable foreign acquisitions. Nor was he dismayed by the ridicule which the celebrated burlesque (by the duke of Buckingham and others) of "The Rehearsal" (1671) cast upon heroic plays, with such materials for ridicule as the contemporary dramas supplied to its facetious authors, but returned to the defence of a species which he himself was in the end to abandon. The desire for change proved stronger than the love of consistency—which in Dryden was never more than theoretical. After summoning tragedy to rival the freedom (without disdaining the machinery) of opera, he came to recognize in characterization the truest secret of the master-spirit of the Elizabethan drama, and, after audaciously but not altogether unhappily essaying to rival Shakespeare on his own ground, produced under the influence of the same views at least one work of striking merit. But he was already growing weary of the stage itself as well as of the rhymed heroic drama, and though he put an end to the species to which he had given temporary vitality, he failed effectively to point the way to a more legitimate development of English tragedy.
The English comic writers often succeeded in achieving a special brilliance without at the same time adding coarseness to their art. They were capable of portraying the most virulent and the most honest passion in a manner which seemed legitimate to be made upon their stage. Writers like John Dryden, whose comedies are among the most successful of his age, have done so. But while they excelled in the comic style, they never wholly abandoned its prerogative, were, it must be confessed, the best of the age in this respect. The English comedy of the Restoration, like the rest of its literature, was characterized by a great deal of this found in the stage. The English comic writers often succeeded in achieving a special brilliance without at the same time adding coarseness to their art. They were capable of portraying the most virulent and the most honest passion in a manner which seemed legitimate to be made upon their stage. Writers like John Dryden, whose comedies are among the most successful of his age, have done so. But while they excelled in the comic style, they never wholly abandoned its prerogative, were, it must be confessed, the best of the age in this respect. The English comedy of the Restoration, like the rest of its literature, was characterized by a great deal of this found in the stage.
wards to so large an extent became dissociated. But the
demands of the stage and those of its patrons and of
the public of the "Augustan" age, and of that which succeeded it,
were not, in general, fast bound by the trammels of a taste with
which a revival of the poetic drama remained irremediable during a long period of our literature. There is
reason to conclude that the art of acting progressed in the
same direction of artificiality, and stiffened into apparently
immovable forms in such actors as Macklin and Quin. The
genius of Garrick, whose theatrical career extended from
1741 to 1776, opened a new era in his art. His unequalled
success was due in the first instance to his incomparable
natural gifts; but these were indisputably enhanced by a
careful and continued literary training, and enabled by a
purpose which prompted him to carry the noblest, as
he was capable of performing the most various, range of
English theatrical characters. By devoting himself as actor
and manager with special zeal to the production of Shake-
speare, Garrick permanently popularized on the national
stage the greatest creations of our dramas, and indirectly
helped to seal the doom of the surviving tendency to main-
tain in most ambitious walks of our dramatic literature
the nerveless traditions of the pseudo-classical school.
A generation of celebrated actors and actresses, many of whom
live for us in the dramatic epigrams of Churchill's Roscoe
(1761), were his helpmates or his rivals, but their fame
has paled, while his is destined to endure as that of one of
the typical masters of his art.

Decline of tragedy.

The contrast between the tragedy of the 18th century and
these plays of Shakespeare and one or two other
Elizabetians which already before Garrick were known to the
English stage, was indeed weakened by the mutated
form in which these generally, if not always, made their appearance there. Even so, however, there are perhaps
few instances in theatrical history in which so strange
a competition was so long sustained. In the hands of the
tragic poets of the age of Pope, as well as of that
of Johnson, tragedy had hopelessly stiffened into the forms of
its accepted French models. Direct reproductions of these
continued, as in the case of Ambrose Philips's (c. 1671-
1749) and Charles Johnson's (1769-1748) translations from Racine, and Aaron Hill's (1685-1750) from Voltaire.
Among other tragic dramatists of the earlier part of the
century may be mentioned J. Hughes (1677-1720), who,
while assisting Addison in his Cato, produced at least one
praiseworthy tragedy of his own,1 E. Fenton
(1683-1730), a joint translator of "Popes Homer" and
the author of one extremely successful drama,2 and L. Theobald
(d. 1744), the first hero of the Dunciad, who,
besides translations of Greek dramas, produced a few more
or less original plays, one of which he was daring enough to
father upon Shakespeare.3 A more distinguished name is that of J. Thomson (1700-1748), whose unlucky
Sophonisba and subsequent tragedies are, however, barely
remembered by the side of his poems. The literary
genius of E. Young (1681-1765), on the other hand,
posessed vigour and variety enough to distinguish his
talents from the ordinary level of Augustan plays; in
one of them he seems to challenge comparison in the treat-
ment of his theme with a very different rival,4 but by his
main characteristics as a dramatist he belongs to the school of his contemporaries. The endeavours of G. Lillo
(1693-
1739) to bring the lessons of tragedy home to his fellow-citizens were destined to exercise a powerful influence upon
the early progress of the German dramas, and not to remain
without significance for the history of our own; but his pedestrian muse failed in the end to satisfy higher
artistic demands than those met in his most popular

Play,5 and broke down in the attempt to carry the
Theatres into the regions of domestic tragedy 6 "Classical" tragedy in the generation of Johnson pursuing
the even tenor of its way, the dictator himself treading
with solemn footfall in the accustomed path,7 and Mason
(1725-1757) making the futile attempt to produce a complete imitation of Greek models. The best-remembered tragedy
of the century, Homo's Douglas (1757), was the production of
an author whose famous kinsman, David Hume, had
advised him "to read Shakespeare, but to get Racine and
Voltaire by heart." The indisputable merits of the play
cannot blind us to the fact that Douglas is the child of
Merope.

While thus no high creative talent arose to revive the English
poetic genius of English tragedy, comedy, which had to
have a
content against the same rivals, naturally met the demands of the conflict with greater buoyancy. The history of the
most memorable of those rival forms no part of this
sketch (see Music), but the points of contact between its
progresses and the history of our dramatic literature cannot
be altogether left out of sight. If Purcell's (1658-1695)
endeavours to unite English music to the words of Greek
poets were now a thing of the past, the isolated efforts of
Addison8 and others to recover the operatic stage for the
national tongue had proved powerless. Italian texts, which
had first made their entrance piecemeal, in the end asserted
themselves in their entirety; and the German genius in
tragedy was due in the first instance to his high
artistic demands. But as the operatic stage was preserved
by Handel (c. 1735-c. 1797) making the
attempt to produce a close

afterwards to suggest to him the theme of the first of the novels which have made his name immortal, accordingly
written in two days (though we should call them those days) upon a larger admixture of political with
literary and other satire. A third attempt\(^2\) (which never reached the stage) furnished the offended
minister, Sir Robert Walpole, with the desired occasion for placing a curb upon the licence of the theatre, such as had already
been advocated by 4 representative of its old civic
adversaries. The famous Act of 1737 asserted no
new principle, but converted into legal power the customary
authority hitherto exercised by the Lord Chamberlain (to
whom it had descended from the Master of the Revels).
The regular censorship which this Act established has not
appreciably affected the literary progress of the English
drama, and the objections which have been raised against it
seem on candid consideration untenable. The liberty of
the stage is a question differing in its conditions from
that of the liberty of speech in general, or even from that of
the liberty of the press; and occasional lapses of official
judgment weigh lightly in the balance against the obvious
advantages of a system which in a free country needs only
the vigilance of public opinion to prevent its abuse. The
policy of the restraint which the Act of 1737 put upon
the number of playhouses is different, but has long
been obsolete, partly suggested by Goethe's
little comedy in the latter half of the
18th century.

The Licensing Act.

Comedy in

the demands of dramatic compositions; his
successes have habitually consulted.

The decline of dramatic composition of the higher class,
the history in the English theatre about the English
beginning of the 19th century, is attributed by Scott to the
weakening out of the French model that had been so long
wrought upon; while, as he points out, the new impulse
which was sought in the dramatic literature of Germany
was derived from some of its worst, instead of from its
noblest, productions—from Kotszabu rather than from
Lessing, Schiller, and Goethe. But the change which was
coming over English literature was in truth of a wider and
deeper nature than it was possible for even one of its chief
representatives to perceive. As that literature freed itself
from the fetters so long worn by it as indispensable
ornaments, and threw aside the veil which had so long
obscured both the full glory of its past and the lofty
capabilities of its future, it could not resort except tenta-
tively to a form which like the dramatic is bound by a
hundred bonds to the life of the age itself. Soon, the poems
with which Scott and Byron, and the unrivalled prose fictions with
which Scott both satisfied and stimulated the imaginative
demands of the public, diverted the attention of the
literary public from the more refined comedy, which was
unable to escape, with the light foot of verse or prose fiction, into
"the new, the romantic land." New themes, new ideas,
in the formation of a new generation of writers and
readers; nor did the drama readily lend itself as a
vehicle of new dramatic attempts betraying a more or less wilful ignorance of the
requirements of dramatic composition; his
beautiful Masque, partly suggested by Goethe's Faust, and his powerful
Comedy, have in fact the form of plays; his tragedies
on Italian historical subjects show some resemblance in their
political rhetoric to the contemporary works of
Allieri; his Werner is a hastily-dramatized sensation
novel. To Coleridge (1772–1834), who gave to English
literature a fine though inaccurate translation of Schiller's
Willestain, the same poet's Roberis (to which Wordsworth's
only dramatic attempt, the Borderers, is likewise
indebted) had probably suggested the subject of his tragedy of
Olario, afterwards acted under the title of Remorse. Far

superior to this is his later drama of Zophoim, a genuine homage to Shakespeare, out of the themes of two of whose plays it is gracefully woven. Scott, who in his earlier days had translated Goethe's \textit{Gute von Berlichingen}, gained no reputation by his own dramatic compositions. W. S. Landor (1775–1864), apart from those \textit{Imaginary Conversations} upon which he best loved to expend powers of observation and characterization such as have been given to few dramatists, cast in a formally dramatic mould studies of character of which the value is far from being confined to their wealth in beauties of detail. Of these the magnificent, but to construction altogether undramatic, \textit{Count Julian} is the most noteworthy. Shelley's (1792–1822) \textit{The Cenci}, on the other hand, is not only a poem of great beauty, but a drama of true power, abnormally revolting in its theme, but singularly pure and delicate in treatment. A humbler niche in the temple of our dramatic literature belongs to some of the plays of C. R. Maturin\footnote{Bentham.} (1782–1824), Sir T. N. Talfourd\footnote{Thom.} (1795–1854), and Dean Milman\footnote{Paxton.} (1791–1866). Divorced, except for moments, from the stage, English dramatic literature in its higher forms can in the present century no longer be regarded as a connected national growth, though it would be rash to deny that with the isolated efforts of individual poets future developments may connect themselves. Among living poets Sir H. Taylor has perhaps approached nearest to the objective spirit and the fullness of style of the Elizabethan drama; R. H. Horne survives as a worthy representative of the modern Romantic school; Matthew Arnold has the dignity of form of his classic models, \textit{Longfellow the graceful facility of a mellow literary culture}; while R. Browning's insight into the secrets of human character and A. C. Swinburne's gift of passionate poetic speech, are true dramatic qualities. By his \textit{Hansard J. Nichol} has likewise made a noteworthy contribution to the higher literature of our drama. The latest English dramatic poet is Tennyson, whose homage to the national form of the historic drama may be hopefully interpreted as a promise of the future possibly awaiting it. Far greater is the number of those English writers of the present century who, while seeking to preserve a connection between the demands of the stage and their dramatic productions, have addressed themselves to the theatrical rather than the literary public—since such a distinction must needs be drawn. The respect paid by her contemporaries to the modestly \textit{simple} and judiciously concentrated efforts of Mrs Joanna Baillie (1795–1854) entitles her to remembrance in the annals of literature as well as those of the stage; but it would be going too far to make a similar exception in favour of the plays of Sheridan Knowles (1784–1862) or of the late Lord Lytton (1806–1873). At the present day the theatre commands the services of many authors of talent, a few of whose most successful productions may be destined to survive the age which gave birth to them. But here, if anywhere, the task of selection must be left to time.

The history of the English stage in the present century has been one of gradual decline and decay, not (especially at the present day) without prospects of recovery, of which a praiseworthy hopefulness is ever willing to make the most. At the beginning of the century the greatest tragic actress of the English theatre, Mrs Siddons, had passed away; and before its second decade had closed, not only she (1812), but her brother John Kemble (1817), the representative of a grand style of acting upon which the present generation would hardly dare to look, had withdrawn from the boards. Mrs Siddons was soon followed into retirement by her successor Miss O'Neill (1819); while Kemble's brilliant later rival, Edmund Kean, as actor the intimations of whose genius seem to have supplied, so far as intuition ever can supply, the absence of a steady self-culture, remained on the stage till his death in 1833. Young, Macready, and others handed down some of the traditions of the older school of acting to the very few who remain to suggest its resemblance to the living generation. But even these—among whom a tribute of gratitude is especially due to Helen Faucit and S. Phelps—are now lost (or all but last) as active members to the theatre, and they have left no school behind them. The comic stage has been fortunate in anammer aftergrowth, from generation to generation, of the successors of the old actors who live for us in the reminiscences of Charles Lamb; nor are the links all snapped which bind the humours of the present to those of the past. It is least of all in any spirit of depreciation that the efforts of the actors of our day, in any branch of the art, should be discussed. But it is right to point out that these efforts are carried on under conditions of a partly novel character, to which the actors are forced to submit. No art stands in greater need of the help of training,—an advantage with which the modern English actor is virtually obliged to dispense. No art stands in greater need of the relief of change in the subjects of its exercise,—but the modern English actor is made to look forward, as to the height of success, to playing the same character for three hundred nights. No art stands in greater need of the guidance of criticism,—but the modern English actor is too often left to criticise himself. Finally, none stands in greater need of the protection of self-respect,—but there are few theatres in England which are not from time to time degraded in deference to tastes which in earlier days not Puritan censors only would have called by a simpler name.

The reaction against the theatre, which set in with the spread of the religious movement at the close of the last century, had the natural effect of lowering instead of raising its tone and manners, as well as those of the literature designed to supply its immediate demands. With the growth of that enlightenment which is inseparable from tolerance, this reaction seems to be passing, and an effort to counter-reaction; while on the other hand, a larger section of the educated classes have begun to take an interest in the progress of the national drama, and the world of fashion is descending to follow the impulse. Dramatic criticism, too—a branch of English literature to which from the days of Steele to those of Hazlitt so many writers of mark were ready to devote their efforts, but which had more recently often fallen into hands either unequal to the task or disdainful of it—seems here and there awakening to a sense of its higher duties. But all this will not permanently recover the stage for its higher tasks, or reunite to it a living dramatic literature, unless an object of serious moment for the future of the nation is pursued in a serious spirit, and unless it is thought worth while to devise means suited to this end. In a word, so long as there is no national theatre which, removed above the conditions of a commercial speculation, can cultivate the art to which it is dedicated for the sake of that art itself, the future of the English drama will be at the mercy of the likings of London, and of the adoption of those likings by the London which is not London, and by the "provinces," as in theatrical matters they are only too appropriately called. The time may come when it will be recognized that the progress and culture of a people depend on its diversions as well as upon its occupations, and that the interests of a national art are not unworthy the solicitude of thoughtful statesmen.
The enduring influence. Among the foreign actors of England who flitted through the innumerable courts of the Banter and novelty, and Duke Henry Julius of Brunswick-Luneburg. The history of the German drama differs widely from that of our own, though a close contact is observable between them at an early point, and again at relatively recent points, in their annals. The dramatic literature of Germany, though in its beginnings intimately connected with the great national movement of the Reformation, soon devoted its efforts to a sterile imitation of foreign models, while the popular stage, persistently sitting itself to a robust but gross taste, likewise largely due to the influence of foreign examples, seemed destined to a hopeless decay. The literary and the acted drama were thus estranged from one another during a period of extraordinary length; nor was it till the middle of the 18th century that, with the opening of a more hopeful era for the life and literature of the nation, the reunion of dramatic literature and the stage began to accomplish itself. Before the end of the same century the progress of the German drama in its turn began to influence that of other nations, and by the widely comprehensive character of its literature, as well as by the activity of its stage, to invite a steadily increasing interest.

Towards the close of the Middle Ages, as has been seen, dramatic performances had in Germany as in England largely fallen into the hands of the civic guilds, and the composition of plays was more especially cultivated by the master-singers of Nuremberg and other towns. Thus, while the scholars of the German Renaissance, who so largely became the agents of the Reformation, eagerly dramatized, both in the Latin and the native tongue, the narratives of the Bible, and sought to suit the scholastic drama to the demands of the times (P. Rehnn, a prolegomen of Luther, standing foremost among those religious dramatists), it was under the influence of the Reformation also, and of the impulse given by Luther and others to the use of High German as the popular literary tongue, that Hans Sachs, the immortal shoemaker of Nuremberg, seemed destined to become the father of the popular German drama. In his plays, "spiritual," "secular," and "Fastnachtspiele" alike, the interest indeed lies in the dialogue rather than in the action, nor do they display any attempt at development of character. In their subjects, whether derived from Scripture, or from popular legend and fiction, there is no novelty, and in their treatment no originality. But the healthy vigour and fresh humour of this marvellously fertile author, and his innate sympathy with the views and sentiments of the burgher class to which he belonged, were elements of genuine promise—a promise which the event was signal to disappoint. Though the manner of Hans Sachs found a few followers, and is recognizable in the German popular drama even of the beginning of the 17th century, the literature of the Reformation, of which his works may claim to form part, was soon absorbed in labours of a very different kind. The stage, after admitting novelties introduced from Italy or (under Jesuit supervision) from Spain, was subjected to another and enduring influence. As the foreign nations who flitted through the innumerable courts of the empire, or found a temporary home there, special prominence was acquired, towards the close of the 16th and in the early years of the 17th century, by the "English comedians," who appeared at Cassel, Wolfenbuttel, Berlin, Dresden, Cologne, etc. Through these players a number of early English dramas found their way into Germany, where they were performed in more or less imperfect versions, and called forth imitations by native authors. Duke Henry Julius of Brunswick-Luneburg and Jacob Ayres (a citizen of Nuremberg, where he died, 1808) represent the endeavours of the early German drama to suit its still uncouth forms to themes suggested by English examples; and in their works, and in those of contemporary playwrights, reappears no small part of what we may conclude to have been the "English comedians" characteristic. The converse influence of German themes brought home with them by the English actors, or set in motion by their strolling ubiquity, cannot have been equal in extent, though Shakespeare himself may have derived the idea of one of his plots from such a source. But though welcome to both princes and people, the exertions of these foreign comedians, and of the native imitators who soon arose in the earliest professional companies of actors known in Germany, instead of bringing about a union between the stage and literature, led to a directly opposite result. The popularity of these strollers was owing partly to the (very real) blood and other horrors with which their performances were deluged, partly to the buffoons which theyseasoned, and the various tricks and feats with which they diversified them. The representatives of the English clowns had learnt much on their way from their brethren in the Netherlands, where in the period the art of grotesque acting greatly flourished. Nor were the sides of other arts neglected,—to this day in Germany professors of the "equestrian drama" are known by the popular appellation of "English riders." From these true descendents of the mimes, then, the professional actors in Germany inherited a variety of tricks and traditions; and soon the favourite figures of the popular comic stage became conventional, and were stereotyped by the use of masks. Among these, an acknowledged supremacy was acquired by the native Hans Wurst (Jack Pudding)—of whose name Luther disapproved the invention, and who is known already to Hans Sachs—the privileged buffoon, and for a long series of generations the real lord and master of the German stage. If that stage, with its grossness and ribaldry, seemed likely to become permanently estranged from the tastes and sympathies of the educated classes, the fault was by no means entirely its own and that of its patron the populace. The times were evil times for a national effort of any kind; and poetical literature was in all its branches passing into the hands of scholars who were often pedants, and whose language was a jargon of learned affectations. Thus things continued, till the awful visitation of the Thirty Years' War cast a general blight upon the nation, and the traditions of the popular theatre were left to the guardianship of the marionettes ("Puppenspiele").

When, in the midst of that war, German poets once more began to essay the dramatic form, the national drama was left outside their range of vision. M. Opitz (1597-1639), who holds an honoured place in the history of the German language and literature, in this branch of his labours contented himself with translations of classical dramas and of Italian pastorales—among the latter is Daphne, with which the history of the opera in Germany begins. A. Gryphius (1616-1664), though as a comic dramatist lacking neither vigour nor variety, and acquainted with Shakespearean as well as Latin and Italian examples, chiefly devoted himself to the imitation of Latin, earlier French, and Dutch tragedy, the rhetorical dialogue of which he effectually reproduced in the Alexandreine metre. Neither the turgid dramas of D. C. von Lohenstein (1665-1684), for whose Cleopatra the honour of having been the first German tragedy has been attributed, nor the essays of H. E. von Breuning (1616-1684), in which the "Triumphant" of tragedy in Germany is seen, can be said to have so much as longed for a native dramatic art.
recently claimed, nor even the healthier comedies of Chr. Weise (1642–1708) were brought upon the stage; while the religious plays of J. Klay (1616–1656) are mere recitations connected with the Italian growth of the oratorio. The figural allegories commemorating of contemporary events, with which the learned from time to time supplied the theatre, and the pastoral dramas with which the didactic poets of Nuremberg—"the shepherds of the Pegnitz"—after the close of the war gratified the pious longings of their fellow-citizens, were alike mere scholastic efforts. These indeed continued in the universities and gymnasium to keep alive the love of both dramatic composition and dramatic representation, and to encourage the theatrical taste which led so many students into the professional companies. But neither these dramatic exercises nor the fable-Creates in which the Jesuits at Vienna revived the pomp and pageantry, and the mixture of classical and Christian symbolism, of the Italian Renaissance, had any influence upon the progress of the popular drama.

The history of the German stage remains to about the second half of the 16th century one of the most melancholy, as it is in way one of the most instructive, chapters of theatrical history. Ignored by the world of letters, the actors in return deliberately sought to emmanate their art from all dependence upon literary material. In composition reigned supreme, not only in farce, where Hans Wurst, with the aid of Italian examples, never ceased to charm his public, but in the serious drama likewise (in which, however, he also played his part) in those Haupt- und Staatsaktionen (high-matter-of-state-dramas), the plots of which were taken from the old stores of the English comedians, from the religious drama and its sources, and from the profane history of all times. The hero of this period is "Magister" J. Velthen, who at the head of a company of players for a time entered the service of the Saxon court, and by producing comedies of Mohlere and other writers sought to restrain the licence which he had himself carried beyond all earlier precedent, but who had to fall back into the old ways and the old life. His career exhibits the climax of the efforts of the art of acting to stand alone; after his death (c. 1693) chaos ensued. The strolling companies, which now included actresses, continued to foster the popular love of the stage, and even under its most degraded form to uphold its national character against the rivalry of the opera, and that of the Italian commedia dell'arte. From the latter was borrowed Harlequin, with whom the drama was blended, and who became a standing figure in every kind of popular play. He established his rule more especially at Vienna, where from about 1712 the first permanent German theatre was maintained. But for the actors in general there was little permanence, and amidst mazes of all sorts, and under the growing ban of clerical intolerance, the popular stage seemed destined to hopeless decay.

The first endeavours to reform what had thus apparently passed beyond all reach of recovery were neither wholly nor generally successful; but this does not diminish the honour due to two names which should never be mentioned without respect in connection with the history of the drama. Friederica Caroline Neuber's (1650–1760) biography is the story of a long-continued effort which, notwithstanding errors and weaknesses, and though, so far as her personal fortunes were concerned, it ended in failure, may almost be described as heroic. As director of a company of actors which from 1727 had its headquarters at Leipzig (hence the new school of acting is called the Leipzig school), she resolved to put an end to the formlessness of the existing stage, to separate tragedy from comedy, and to extinguish Harlequin. In this endeavour she was supported by the Leipzig professor J. Chr. Gottsched, who induced her to establish French tragedy and comedy as the sole models of the regular drama. Literature and the stage thus for the first time joined hands, and no temporary muschance or personal misunderstanding can obscure the enduring significance of the union. Not only were the abuses of a century swept away from a representative theatre, but a large number of literary works, designed for the stage, were produced on it. It is true that they were but versions or imitations from the French (or in the case of Gottsched's Dying Cato from the French and English), and that at the moment of the regeneration of the German drama new letters were thus imposed upon it, and upon the art of acting at the same time. But the impulse had been given, and the beginning made. On the one hand men of letters began to subject their dramatic compositions to the test of performance, the tragedies and comedies of J. E. Schlegel (1778–1749), the artificial and sentimental comedies of Chr. F. Gottsched (1715–1769) and others, together with the vigorous popular comedies of the Danish dramatist Holberg, were brought into competition with translations from the French.

On the other hand, the Leipzic school exercised a continuous effect upon the progress of the art of acting, and before long the Garrick of Germany, C. Eckhof (1729–

1778), began a career, outwardly far humbler than that of the great English actor, but which made his art a fit subject for the critical study of scholars, and his profession one for the equal esteem of honourable men.

Among the authors contributing to Mme. Neuber's Lessing, the Leipzig school had been a young student destined to complete, after a very different fashion and with very different aims, the work which she and Gottsched had begun. The critical genius of G. E. Lessing (1729–1781) is peerless in its comprehensiveness, as in its keenness and depth, but if there was any branch of literature and which by study and practice he made pre-eminently his own, it was that of the drama. As bearing upon the progress of the German theatre, his services to its literature, both critical and creative, can only be described as unmeasurable. The Hamburgische Dramaturgie, a series of criticisms of plays and (in its earlier numbers) of actors, was undertaken in furtherance of the attempt to establish at Hamburg the first national German theatre (1767–9). This alone would invest these papers with a high significance; for though the theatrical enterprise proved abortive, yet it established the principle upon which the future of the German theatre was to be based. For the drama the immediate theatrical public is no sufficient court of appeal. But the direct effect of the Dramaturgie was to complete the task Lessing had in previous writings begun, and to overthrow the dominion of the arbitrary French rules and the French models established by Gottsched. Lessing vindicated its real laws to the drama, made clear the difference between the Greeks and their would-be representatives, and established the claims of Shakespeare as the modern master of both tragedy and comedy. His own dramatic productivity was constant, tentative, progressive. His first step was, by his Miss Sara Sampson (1755), to oppose the realism of the English domestic drama to the artificiality of the accepted French models, in the forms of which Chr. F. Weissa (1726–1804) was seeking to treat the subjects of Shakespearean plays. Then, in his Mina von Barnheim (1767) he offered a national comedy drawn from real life, and appealing to patriotic sentiments as well as to broad human sympathies, written in prose (like Miss Sara Sampson), but in form holding a judicious mean between French and English examples.

The note sounded by the critics of Lessing met with a
The Sturm und Drang

but the permanent effect of Gots was to have crushed with an iron hand the last remnants of theatrical conventionality (those of costume and scenery included), and to have extinguished with them the lingering respect for rules and traditions of dramatic composition which even Lessing had treated with consideration. Its highest significance, however, lies in its having been the first great dramatic work of a great national post, and having definitely associated the national drama with the poetic glories of the national literature.

Thus in the classical period of that literature, of which Goethe and Schiller were the ruling stars, the drama had a full share of the loftiest of its achievements. Of these, the dramatic works of Goethe vary so widely in form and character, and connect themselves so intimately with the different phases of the development of his own self determined poetic genius, that it was impossible for any of them to become the starting-points of any general growths in the history of the German drama. His way of composition was, moreover, so peculiar to himself—conception often preceding execution by many years, part being added to part under the influence of new sentiments and ideas and views of art, flexibly followed by changes of form—that the history of his dramatic works, which furnished the text for so many of Lessing's criticisms, helps to mark an epoch in German literature. Under the influence of Shakespeare, or of their conceptions of his genius, arose a youthful group of writers who, while worshipping their idol as the representative of nature, displayed but slight anxiety to harmonize their imitations of form with the demands of art. The notorious Ungolini of H. W. von Gerstenberg (1737-1823) seemed a premonitory sign that the coming flood might make a circular motion back to the extravaganzas and horrors of the old popular stage; and it was with a sense of this danger in prospect that Lessing in his third important work, his comedy Brutus (1779), furnished the text for an instance of his poetic and personal biography. His Clavigo and Stella, which succeeded Gots, are domestic dramas in prose; but neither by these, nor by the series of charming pastoral operas which he composed for the Weimar court, could any influence be exercised upon the progress of the national drama. In the first conception of his Faust, he had indeed sought the suggestion of his theme partly in popular legend, partly in a domestic motive familiar to the authors of the Sturm und Drang (the story of Gotschen); the later additions to the First Part, and the Second Part generally, are the results of metaphysical and critical studies and meditations belonging to wholly different spheres of thought and experience. The dramatic unity of the whole is thus, at the most, external only; and the standard of judgment to be applied to this wondrous poem is not one of dramatic criticism. Egmont, originally designed as a companion to Gots, was not completed till many years later; there are few dramas more effective in part, but the idea of a historic play is lost in the elaboration of the most graceful of love episodes. In Iphigenias and Tasso, Goethe exhibited the perfection of form of which his classical period had enabled him to acquire the mastery; but the sphere of the action of the former (perfect though it is as a dramatic action), and the nature of that of the latter, are equally remote from the demands of the popular stage. Schiller's genius, unlike Goethe's, was naturally Schiller's, and consistently suited to the claims of the theatre. His juvenile works, The Robbers, Fiesco, Kabale und Liebe (Intrigue and Love), vibrating under the influence of an age of social revolution, mingled in their prose form the truthful expression of passion with no small element of extravaganzas. But with true insight into the demands of his art, and with unequaled single-mindedness and self-devotion to it, Schiller gradually emancipated himself from his earlier style; and with his earliest tragedy in verse, Don Carlos, the first period of his dramatic authorship ends, and the promise of the second announces itself. The works which belong to this—from the Wallenstein trilogy to Tell—are the acknowledged master-pieces of the German poetic drama, treating historic themes reconstructed by conscious dramatic workmanship, and clothing their dialogue in a noble vestment of rhetorical verse. In one of these, The Bride of Lambsin, Schiller attempted a new use of the chorus of Greek tragedy; but the endeavour was a splendid error, and destined to exercise no lasting effect.

Schiller's later dramas gradually conquered the stage,
The popular stage.

Over which his juvenile works had triumphantly passed,
but on which his Don Carlos had met with a cold welcome.
For a long time, however, its favourites were authors of
a very different order, who suited themselves to the demands
of a public little concerned with the literary progress of the
age. Poetic and other popular tastes had oscillated between
the imitators of Guts and those of Emstia Galotti, they
entered into a more settled phase as the establishment of
standing theatres at the courts and in the large towns
increased the demand for good "acting" plays. Famous
actors, such as Schröder and A. W. Linnel (1759-1814),
sought by translations or compositions of their own to
meet the popular hings, which largely took the direction of
drama. The national drama (especially in its mixed and
comic national drama, but its species) from the
and time ranged from the school and other literary
astonishing, and it seems announced as authentically
an introduction to the dramatic
Institut.-A. von Kotzebue (1761-1819). His productivity
ranged from the domestic drama and comedy of all kinds to
theatrical attempts to rival Schiller and Shakespeare in verse;
and though his popularity (which ultimately proved his doom)
became upon him the bitterest attacks of the Romantic
school and other literary authorities, his self-conceit is not
astonishing, and it seems to say that there is some
exaggeration in the contempt which has been lavished upon
him by posterity. Nor should it be forgotten that German
literature had hitherto failed to furnish the comic stage
with any successors to Minna von Barnhelm, for Goethe's
efforts to dramatize characteristic events or figures of the
Revolutionary age must be dismissed as failures, not from
a theatrical point of view only. The joint efforts of Goethe
and Schiller for the Weimar stage, important in many respects
for the history of the German drama, at the same
time reveal the want of a national dramatic literature
sufficient to supply the needs of a theatre endeavouring to
satisfy the demands of art.

Meanwhile the so-called Romantic school of German
literature was likewise beginning to extend its labours to
original dramatic composition. From the universality of
sympathies proclaimed by this school, to whose leaders
Germany owed its classical translation of Shakespeare,4
and an introduction to the dramatic literatures of so many ages
and nations,5 a variety of new dramatic impulses might be
expected; while much might be hoped for the future of
the national drama (especially in its mixed and comic
species) from the alliance between poetry and real life
which they preached, and which some of them sought
personally to exemplify. But in practice universality pre-
pared itself as peculiarity or even as eccentricity; and in
the end the divorce between poetry and real life was
announced as authoritatively as their union had been.
Outside this school, the youthful talent of Th. Klopfer
(1791-1813), whose early promise as a dramatist5 might
perhaps have ripened into a fulness enabling him not
unwarily to occupy the seat left vacant by his father's
friend Schiller, was extinguished by a patriotic death.
The efforts of M. von Collin (1776-1823) in the direction of the
historical drama remained isolated attempts. But of the
leaders of the Romantic school, A. W. (1767-1845) and
F. von Schlegel (1772-1829), contented themselves with
frigid classicallities; and L. Tieck (1772-1855), in the
strange alchemy of his Phaenix, melted legend and fairy-
tale, novel and drama,6 poetry and satire, into a compound,
easily indeed, but hardly in its entirety, or in many of its parts, to any but the literary mind.

F. de la Motte-

Fouquè (1777-1843) infused a spirit of poetry into the
chivalry drama. Clemens Brentano (1777-1842) was a later
fantastic dramatist unsuited to the stage. Here a feeble
dramatist outgrowth of the romanticists, the "destroy dramatists"
Z. Werner (1766-1823), A. Mullner (1774-1829), and C. E.
N. Hovinhus (1776-1845), achieved a temporary
success; and it was with an attempt in the same direction11 that
the Austrian dramatist F. Grillparzer (1791-1871) began his
long career. He is assured what he pronounced himself to be, the foremost of the later dramatic poets of Germany,
unless that tribute be paid to the genius of H. von Kleist
(1776-1811), who in his short life produced besides other
works a romantic drama12 and a rustic comedy13 of genuine
merit, and an historical tragedy of angular originality and
power.14 Grillparzer's long series of plays includes poetic
dramas on classical themes15 and historical subjects from
Austrian history.16 The Romantic school, which through
Tieck had satirized the drama of the bourgeois and its
offshoots, was in its turn satirized by A. Count von Platen-
Hallermeijer's (1796-1853) admirable imitations of Aristophanec
comedy. Among the objects of his banter were the
popular play-wright E. Raupach, and K. Immermann (1796-
1840), a true poet, who, however, less generally remembered
as a dramatist F. Hebbel18 (1813-1863) is justly
ranked high among the foremost later dramatic poets of his
country, few of whom equal him in intensity. Other names of
literary mark are those of Chr. D. Grabbe (1801-1836),
J. Mosen (1803-1867), O. Ludwig (1813-1865), and "F.
Halm" (1806-1871), and, among living writers, K. Gutzkow,
G. Freytag, and H. Laube. The last of these names recalls
The in one of its most noteworthy examples the long continued
German stage of the present day.

These efforts have not been confined to fostering the art of acting in a succession of eminent re-
presentatives, among whom the sons of L. Devrient
in various ways acquired a reputation worthy of their name,
and B. Dawison was accounted the equal of the most brilli-
ant of the brotherhood, or to maintaining as intimate a
relation as possible between the stage and literature.
Happily contrasting with other countries by the number
and variety of its centres of intellectual life—rivals in
artistie effort even where political or social rivalry is out of
the question—Germany has not only cherished its own
national drama, but with a catholicity of taste, aided by
the powers of a language admirably adapted for trans-
literation, has opened its theatres to the dramatic master-
pieces of other nations also, and more especially of our
own. The German theatre has its weak points, and has
not maintained itself wholly free from vicious influences;
but upon the whole its efforts are on a level with the
demands of the national culture, and in harmony with
the breadth and variety of the national intelligence. No
other stage furnishes the same opportunities for the
study of dramatic literature

With this summary of the history of the German drama
it is necessary to close this survey. To be even nominally
complete, it would have had to take into account the
fortunes of more than one other modern European drama.
Dutch Among these the Dutch is interesting both in its beginnings,

1 Der Deischen (Chivalrous); Der Bergemann.

which resemble those of the German—the influence of the so-called chambers of the redkyners (rhetoricians), from the early years of the 16th century onwards, reposing that of the master-sangers of contemporary Germany. The earliest of their efforts, which so effectively tempered the despotism of both church and state, seem to have been of a dramatic kind; and a manifold variety of allegories, moralities, and other entertainments (examenmata, dramas, and faticies or farces) enhanced the attractions of those popular pageants in which the Netherlands surpassed all other countries of the North. The art of acting flourished in the Low Countries even during the troubles of the great revolt; but the birth of the regular drama was delayed till the advent of quieter times. Dutch dramatic literature begins, under the influence of the classical studies cherished in the seats of learning founded before and after the close of the war, with the classical tragedies of S. Koster (c. 1585–1650). The romantic dramas and farces of Gerbrand Bredero and the tragedies of Hooff belong to the same period; but his foremost dramatic poet was J. van den Vondel (1587–1679), who from an imitation of classical models passed to more original forms of dramatic composition, including a patriotic play and a dramatic treatise of part of what was to form the theme of Paradise Lost. But Vondel had no successor of equal mark. The older form of Dutch tragedy—in which the chorus still appeared—was, especially under the influence of the critic A. Fels, exchanged for a close imitation of the French models, Cornelle and Racine; nor was the attempt to create a national comedy successful. Thus no national Dutch drama was permanently called into being. Still more decidedly the dramatic literature of the Scandinavian peoples springs from foreign growths; but Denmark, where the beginnings of the drama in the plays of the schoolmaster Chr. Hansen recall the mixture of religious and farcical elements in contemporary German efforts, at a later date produced a comic dramatist of thorough originality and of a wholly national cast. L. Holberg (1654–1754), one of the most noteworthy comic poets of modern literature, not only marks an epoch in the dramatic literature of his native land, but he contributed to overthrow the trivialities of the German stage in its worst period, which he satirized with merciless humour, and set an example, never surpassed, of a series of comedies deriving their types from popular life and ridiculing with  

Scandinavian drama.

Dramsburg, a town of Prussia, at the head of a circle in the government of Koaln, about fifty miles east of Stettin. It occupies both banks of the River Drage, a tributary of the Oder, and is inclosed by walls and defended by a fort, containing a hospital and various administrative offices, and carries on cotton and woollen weaving, tanning, brewing, and distilling. Population at the end of December 1875, 6525.

Drammen, a town in the amt of Buserud, in Norway, is situated at the northern end of the Drammen fjord, a western arm of Christiania fjord, at the mouth of the Dramslev. It consists of the three places Brangnas or Bragernas, Stromso, and the port Tangen, the first on the north, and the other two on the south side of the river. The greater part of the town has been rebuilt since the confinimations of 1668 and 1870. The principal industrial establishments are oil, cotton, and tobacco factories, breweries, arsenals, gun foundries, and an active trade in wood, pitch, and iron is carried on. The population at the end of December 1875 was 18,838.

Draughts, a game of unknown origin. Some consider it to be a very old game, but Strutt (Sports and Pastimes) calls it a "modern invention." It is not mentioned in the older editions of the Académie des Jeux, nor in the Complect Gamester, so, if an old game, it was not formerly an important one. As early as 1668 M. Mallet published a treatise on draughts, at Paris, and the game was played in Europe at least a century earlier. The Romans played a similar game called latrunculi, the men moving diagonally, capturing by leaping over, and obtaining superior power when they arrived at the furthest row of squares. The board, however, consisted of only sixteen squares. It is believed that sorki among the Greeks was a similar game with a central space "called the sacred barrier," and representations of a kind of draught game are frequently found on the monuments of the ancient Egyptians (Wilkinson).

Draughts is played by two persons. A board (see diagram) is required, and twenty-four men—twelve white
DRAUGHTS

and twelve black—which at starting are disposed on the board as in the diagram. Either the white or black squares may be played on (the latter being now more usual). If the black squares are used the board must be placed with a black square in the left hand corner; if the white squares are used, it is placed as in diagram.

The game is played by moving a man, one square at a time, along the diagonal to the right or left. Thus a man placed on square 13 in diagram can move to 15 or 14. Each player moves alternately, the first move being decided by lot.

As soon as a man is moved on the square adjacent to an opponent's man, and there is an unoccupied square beyond, the unprotected man may be captured and removed from the board. Thus, if there is a white man on square 18, and a black man on square 14, square 14 being vacant, and white having to move, he jumps over 14 and remains on square 9, and the man on 14 is taken up.

If two or more men are so placed that one square intervenes between them they may all be taken at one move. Thus if white having to move has a man on 26, and black man on 25, 18, and 10, the intermediate squares and square 6 being vacant, white could move from 26 to 6, and take the men on 25, 18, and 10. In making such a move with a man, all the steps must be forward, that is, in the direction away from the player, just as in making simple moves and captures.

It is compulsory to take if able. If a player has a man en prise, and makes a move that does not capture, his adversary may allow the move to stand, without penalty, or he may have the move retracted and compel the player to take, or he may allow the move to stand and remove the man that neglected to capture from the board (called huffing). "Huff and move" go together, i.e., the player who huffs then makes his move. The huff must be made before the move. If the adversary of the player who fails to capture allows the move to stand, without huffing, and the player who can capture moves again without taking, the adversary again has the options he had before. If a player can take one man in one place and more than one in another, he may take in which place he pleases, not being obliged to capture the larger number of men. But if he elects to take the larger number, he must take all of that lot that are en prise, or he may be huffed from where he stands when he has taken a portion of the men, or he may be compelled to take the remainder, or the incomplete move may be allowed to stand.

As soon as a man reaches one of the squares furthest from his side of the board, e.g., when a white man (see diagram) reaches square 1, 2, 3, or 4, or a black man square 29, 30, 31, or 32, he is crowned by placing one of the captured men of his own colour on him, and becomes a king. A king has the additional power of moving and taking backwards, i.e., toward his own side of the table, as well as forwards. But on becoming a king the move ends, notwithstanding that there may be an adverse man en prise. Thus if there are black men on squares 7 and 6, a white one on 9, and squares 2 and 11 are unoccupied, white having to move takes the man on square 6 and becomes a king; but he cannot take the man on square 9 at the same move. A king can be huffed for not taking, the same as a man, with the exception just pointed out.

The game proceeds until one of the players has all his men and kings taken, or has all those left on the board blocked, so that he has no more left. If it should so happen that neither of the players has sufficient advantage in force or position to enable him to win, the game is drawn. The player having the stronger force may be required to win in forty moves (e., forty or exchange), computed from the move on which notice was given; if he fail, the game is drawn.

The game of draughts has been exhausted, i.e., the reply to every possible move is known by all proficient, and as there is no advantage in moving first, every game ought to end in a draw. Under these circumstances rules for playing are of but little use, the only way to become a player is to study the analyses laid down in works on the subject, and to know them by heart. For beginners, however, it may be stated that men should as a rule be played to the middle of the board rather than to the sides, as in the middle the man attacks two squares, at the side only one. It is good play to push for a king early in the game. Also, as soon as a player has any advantage in force, he should exchange whenever he can. When the forces are equal the position of having the move should be striving for.

To have the move means to occupy such a position as to be able to secure the last move. For example, place kings of opposite colours at 19 and 12. If the king at 12 is next to move, the king at 19 has the move and must win; but if the king at 12 is next to move, the other king has the move and the game must be drawn. Having the move does not always win. Thus at the beginning of a game the second player has the move, but at this stage it is of no use to him. When a player is in a cramped position it is often disadvantageous to have the move.

In order to ascertain who has the move, divide the squares into two systems of four columns each, the columns of one system being those which commence with the numbers 29, 30, 31, and 32 (see diagram), and end with the numbers 5, 6, 7, and 8, the remainder being the columns of the other system. Add together all the men and kings which stand in either system, and if their sum is odd the next player has the move, if even the last player has the move. For example, white has men or kings at squares 26 and 32, black at 23 and 19. There are three pieces on the white system and one on the black, and since the odd, white is the next player he has the move. An exchange generally, but not always, changes the move; so, when about to exchange, the player should prefer an exchange that will keep the move, or, not having it, an exchange that will gain it. To discover whether an exchange will change the move add together all the capturing pieces in both systems, and if they are odd and the captured pieces are also odd, the move is not changed by an exchange; the same rule applies if they are both even; but if one is even and the other odd, an exchange changes the move.

The laws of draughts used in match play are Anderson's, but so few matches at draughts are played that there is scarcely any demand for them, and they are out of print. Omitting those which relate only to match play, the following is an abridgment of Anderson's laws.

1. In a series of games the players take the white and black men alternately. Black has the first move, whether the previous game was won or drawn.

2. A player whose turn it is to play touching a man must move it, except he gives notice of adjusting the man, if it cannot be moved, he loses the game.

3. If a man is moved over an angle of the square on which it is stationed, the move must be completed in that direction.

4. The game is abandoned when the move is not made, or the move is made without a piece, or a piece is moved without a piece, or a piece is moved in the wrong direction, or a piece is not moved which could have been moved.
5. If a player who has the option of huffing touches the man he is entitled to remove, he must huff. 6. A false move loses the game.

7. If a player captures one of his own men by error, the adversary may replace or not. 8. When more than one man can be taken at one move, the player must not remove his hand from the capturing man until he has taken all he can; if he does so the move is completed, and he is liable to be huffed. 9. When a player pushes a man to king, his adversary is bound to crown it. 10. Each player must move within a specified time (the time is generally three, five, or ten minutes by previous agreement, unless there is only one way of taking or pass move on the board, when only two minutes are as a rule allowed). 11. The player having the stronger force may have notice given him to win in forty moves; when two kings remain against one, in twenty moves. When the odds of the draw are given, and he still continues to take, he must do so until he wins in twenty moves.

Polish Draughts was formerly played on a board of a hundred squares with forty men; but it is now more frequently played with an ordinary draughts-board and men, the men being placed at starting as at draughts. The man move and take at draughts, except that in capturing they move either forwards or backwards like a draught king. A man arriving at a crowning square becomes a queen, and has the move of a bishop at chess. In her capture she takes any unguarded man or queen in any unoccupied space she chooses of the same diagonal, beyond the piece taken. But if there is another unguarded man she is bound to choose the diagonal on which it can be taken. For example, place a queen on square 19, and advance a man at squares 22, 16, 24, 14. The queen is bound to move from 29 to 11, 20, 27, and having made the captures to remain at 9 or 5, whichever she prefers.

The capturing queen or man must take all the adverse pieces that are en prise, or that become so by the uncovering of any square that the capturing piece has been removed during the capture, e.g., white queen at square 7, black at squares 10, 18, 19, 22, and 27, the queen captures at 10, 23, 27, and 19, and the piece at 22 being now removed, she must go to 15, take the man at 18, and stay at 22, 25, or 29. In consequence of the intracity of some of these moves, it is the rule to remove every captured piece as it is taken.

If a man arrives at a crowning square when taking, and he can still continue to take, he must do so, and not stay on the crowning square as at draughts. Passing a crowning square in taking does not entitle him to be made a queen.

In capturing, the player must choose the direction by which he can take the greatest number of men or queens, or he may be huffed. Numerical power is the criterion, e.g., three men must be taken in preference to two queens, if the numbers are equal and one force comprises more queens than the other, the player may take whichever lot he chooses.

A single queen against three queens can draw. If one player has a queen and man, and the other three queens, the best play is to sacrifice the man, as the draw is more certain with the queen alone.

When two men of one colour are played on a diagonal with one vacant square between them (e.g., at squares 16 and 23), the position is called a lunette. If the adversary enters the lunette he must capture one of the pieces which compose it. Before entering a lunette it is advisable to calculate what the position will be after a capture, as the position sometimes intentionally or accidentally removes the one man.

**DRAWING.** Although the verb to draw has various derivations, the substantive drawing is confined by usage to that of design, and is treated as if it were a synonym of design. The word comes from the Latin *traire,* or from a hundred Gothic word, so that traction and drawing are nearly related, and preserve still the same meaning when applied to the work of animals or machines, as we say that a traction engine draws so many tons. Another form of the same word is draw, the strong low vehicle used by brewers and carriers. It may be worth while to inquire what is the connection between the idea of a draw horse and that of a drawing master.

The primitive idea, which is the common origin of both, is that of moving something in that very direction, of which the term "draught" is the first. A horse draws the plough; but a carpenter does not draw his plane, he pushes it; and we should say that a locomotive draws a train when the train is in front, and not when it was behind. The idea of design is preserved in the fine arts. We do not usually say, or think, that a sculptor is drawing when he is using his chisel, although he may be expressing or defining forms, nor that an engraver is drawing when he is pushing the point of the needle through the metal; although the result may be the rendering of a design. But we do say that an artist is drawing when he uses the lead pencil, and here we have a motion bearing some resemblance to that of the horse or engine. The fingers of the artist draw the pencil on the paper, and the same idea is preserved in the fine arts. We do not usually say, or think, that a sculptor is drawing when he is using his chisel, although he may be expressing or defining forms, nor that an engraver is drawing when he is pushing the point of the needle through the metal; although the result may be the rendering of a design. But we do say that an artist is drawing when he uses the lead pencil, and here we have a motion bearing some resemblance to that of the horse or engine. The fingers of the artist draw the pencil on the paper, and here we have a very close analogy with artistic drawing.

The poles are drawn on the ground as a pencil is on paper, and the same analogy may be observed between two of the French words in which the French verb *tirer* is frequently employed. The verb is not derived from *traire,* but may be ultimately traced, like our own verb to tear, to the Ionic stem "tirare." It was formerly used by good writers in the two senses of our verb to draw. Thus Lafontaine says, "Six forts chevaux tirent un coche," and Casiloba wrote, "Il n'y a pas longtemps que je me suis fait tirer par Rigaud," meaning that Rigaud had drawn or painted his portrait.

At the present day the verb *tirer* has fallen into disuse amongst cultivated Englishmen with regard to the drawing and painting, but it is still universally used for all kinds of design and even for photography by the common people. The cultivated use it still for printing, as for example "cette gravure sera tirée à cent exemplaires," but here rather in the sense of pulling than of drawing.

A verb much more nearly related to the English verb to *draw* is *traire,* which has *traire* for its past participle. It is used to draw, and is so little altered as to be scarcely even a corruption of the original Latin form. *Traire* is now used exclusively for milking cows and other animals, and the analogy between this and artistic drawing is not obvious at first, nevertheless there is a certain analogy of motion, the hand passing down the teat draws the milk downwards. The word *trait* is much more familiar in connection with art as "les traits du visage," the natural markings of the face, and it is very often used in a figurative sense, as we say "traits of character." It is quite familiar in portrait, derived from *protraiter.*

The ancient Romans used words which expressed more definitively precisely the meaning which drawing was done in line (delineare) or in shade (adumbarere), though there are reasons for believing that the words were often indiscriminately applied. Although the modern Italians have
DRAWING

both tracés and tracres, they are delineare stil in the sense of
artistic drawing, and also adnemare.

The Greek γραφή is familiar to the English reader in "graphic" and in many compounds, such as photograph, etc. It is worth observing that the Greeks seem to have considered drawing and writing as essentially the same process, since they used the word for both.

This points to the early identity of the two arts when drawing was a kind of writing, and when such writing as men had learned to practise was essentially what we should call drawing, though of a rude and simple kind. "The origin of the hieroglyphs of Egypt," says Dr Wilson (Pre-Historic Man, chap. xviii.), "is clearly traceable to the simplest form of picture-writing, the literal figuring of the objects designed to be expressed. Through a natural series of progressive stages this infantile art developed itself into a phonetic alphabet, the arbitrary symbols of sounds of the human voice." Even in the present day picture writing is not unfrequently resorted to by travellers as a means of making themselves intelligible. There is also a kind of art which is writing in the modern sense and drawing at the same time, such as the work of the medieval illuminators in their manuscripts.

The mental processes by which man has gradually become able to draw, in our modern sense of the word, may be followed, like the development of a chicken in the egg, by examining specimens at various stages of formation. His first efforts are remarkable for their highly abstract character, because the undeveloped intellect has few and simple ideas, and takes what it perceives in nature without being embarrassed by the rest. It seizez upon facts rather than appearances, and the primitive artist is satisfied when the fact has been clearly stated or conveyed by him. The study of appearances, and the effort to render them, come much later; and the complete knowledge of appearances is the sign of a very high state of civilization, implying most advanced artistic culture both in the artist and in the public to whom he addresses himself. The work of the primitive artist is an affirmation of the realities that he knew without mystery or confusion. In all early Egyptian work you see at once what the artist intended to draw, whereas the finest modern drawing is often so mysterious as to be most obscure to those who have not made a special study of the fine arts. The primitive artist knew that his work was really that of a writer, and as the sign-painter of the present day takes care to make his letters plain in order that they may be read, so the early Egyptian draftsman had no thought of any more delicate truth of appearance that that which sufficed to let people clearly understand what his figures and symbols intended for. There was no conception of what artists call "effect," which enters into the greater part of modern drawing, until a very much later period.

We may mention briefly two survivals of primitive art in our own day, which have for their purpose a high degree of legibility. These are coats-of-arms and trade-marks. Heraldic drawing, when properly done, is executed on primitive principles, and is a survival of the earliest uses of graphic art, being really a kind of writing intended to be recognizable by the illustrator when they saw it on shield or banner. Modern trade-marks, of which the use has greatly extended of late years, are of the same class, and are often designed with a simplicity of intention like that of primitive art.

Archæic forms of drawing are thus not all extinct even in our own day, and certain arts are practised among us which compel the modern mind to recover by effort and study something of that simplicity and decision which were inherent in earlier ages. Pottery-making, illuminating, and designing for pottery are often rightly practised in these days in an archaic spirit. In some of the best modern caricatures there are peculiarities which belong to early symbolic drawing, in which, as Dr Wilson says, "the figures are for the most part grotesque and monstrous from the very necessity of giving predominance to the special feature in which the symbol is embodied."

The first idea of drawing is always delineation, the delimiting marking out of the subject by lines, the notion of drawing from without lines being of later development. In primitive work the outline is hard and firm, but interior markings are given also. When the outline was complete, the primitive artist would proceed at once in many cases to fill up the space inclosed by it with flat colour, but he did not understand light and shade and gradation. The historical development of drawing may always be seen in the practice of children when left to draw for their amusement. They begin, as the human race began, with firm outlines, representing men and animals, usually in profile. The next thing they do, if left to their own instincts, is to fill up the spaces so marked out with colour, the brightest they can get. This is genuine primitive art.

By referring to the earliest kind of drawing we perceive how drawing may exist without certain elements which in modern times are usually associated with it. We generally conceive of drawing in close association with perspective, and at least with some degree of light and shade, but it may exist independently of both. Thus may perhaps help us to a definition of drawing. Such a definition would need to be exceedingly comprehensive, or else it would certainly exclude some of the many arts into which drawing more or less visibly enters. A modern critic would be very likely to say that a figure was deficient in drawing if it was deficient in perspective, and yet the two are easily separable, as for example in the work of the mechanical draftsman; or drawing may be associated with a kind of perspective which is usually false, as isometric perspective. We might say that drawing was the imitation of form, but a moment's reflection would enable us to perceive that it may create forms without imitating, as it does in many fanciful conceptions of ornamental designers. It might be suggested that drawing was the representation on a flat surface of forms which are not flat, but the most variously curved surfaces, as in the case of the fine arts. The primitive artist knew that his work was really that of a writer, and as the sign-painter of the present day takes care to make his letters plain in order that they may be read, so the early Egyptian draftsman had no thought of any more delicate truth of appearance that that which sufficed to let people clearly understand what his figures and symbols intended for. There was no conception of what artists call "effect," which enters into the greater part of modern drawing, until a very much later period.

We may mention briefly two survivals of primitive art in our own day, which have for their purpose a high degree of legibility. These are coats-of-arms and trade-marks. Heraldic drawing, when properly done, is executed on primitive principles, and is a survival of the earliest uses of graphic art, being really a kind of writing intended to be recognizable by the illustrator when they saw it on shield or banner. Modern trade-marks, of which the use has greatly extended of late years, are of the same class, and are often designed with a simplicity of intention like that of primitive art.

Archæic forms of drawing are thus not all extinct even in our own day, and certain arts are practised among us which compel the modern mind to recover by effort and study something of that simplicity and decision which were inherent in earlier ages. Pottery-making, illuminating, and designing for pottery are often rightly practised in
expression of certain customary ways of seeing things which were not intended traditionally by art, so that the artists in their turn became the means of imposing the authority of public sentiment upon their successors. The liberty of individual artists, even to draw what may seem such a simple thing as the outline of a human figure, is dependent upon the degree in which the civilization under which they live is not traditional.

To understand the effect of customary ways of seeing things on the use of pure line in drawing, the reader is recommended to study some specimens of early design as it was practiced in China, in Japan, in Egypt, in Assyria, and in Greece. It is easy, in these days, to procure photographic reproductions of ancient design when the student does not live near a museum. He will perceive at once in the five countries four entirely different ways of seeing and designing the curvature of lines, although the Chinese and Japanese ways are nearer to each other than they are to the Egyptian or the Greek; whilst on the other hand, different as the two latter may be, they are nearer to each other than to the art of China or Japan.

A certain kind of curvature is dominant in Chinese art, along with the preference for certain easily recognizable forms. In Japanese drawings the curves are wilder, bolder, more unexpected, more audacious; and when the Japanese designer chose to make use of angles he was, from the same tendency to vivacity and exaggeration, disposed to prefer acute angles. In both Chinese and Japanese work, when at its best, there is often the most exquisite beauty and delicacy of line, especially in the contours of female faces; and there is frequently a masterly power in the interpretation of natural truth, or certain portions of natural truth, by means of this utmost simplicity.

In ancient Egypt the line was quieter and less "tormented" than in China or Japan, the curvature more restrained, and the artistic expression generally rather that of calm dignity than of vigorous action. Egyptian art was kept within the strictest limits by the most powerful conventionalism that ever existed, but the student of drawing will find much in it that is well worth his attention. The Egyptian draftsmen attained to a most noble use of line, combining a serious and disciplined reserve with much delicacy of modulation. The true grandeur of Egyptian work has only been apprehended of late years, because it was formerly supposed that its conventionalism was due to simple ignorance of nature and want of skill in art. It is of various degrees of excellence, and there were inferior artists in the early Egyptian schools, as in others; but we are often startled by magnificent power in conventionalizing natural material, and by a peculiar sense of beauty. There is in Egyptian design a singular combination of tranquil strength with refinement.

Assyrian design is very familiar to us through the ancient wall-sculptures, where the line is often rather engraved than curved, so that we can see quite plainly what were the qualities of drawing which the Assyrian artists valued. They, too, conventionalized nature, but sought for those curves and accents of line which express mainly beauty rather than feminine. They drew, in their own way, admirably well, with great firmness and self-command, knowing always exactly what equivalents or representatives to give for the lines and markings of nature, in accordance with the spirit of their artistic system. Their art is much more strongly accented than the Egyptian, and we might even say that it is more picturesque while it is less tranquil. Assyrian design has more of the spirit of painting than Egyptian, and less of the spirit of sculpture. The Assyrian line tends to the expression of energy in action, the Egyptian to strength and beauty in repose.

Notwithstanding the high degree of power and skill attained in linear design by nations which existed before the artistic development of Greece, it must ever remain an inexorable marvel that the Greek designers should have attained, apparently without effort and simply by the gift of nature, to a degree of perfection in the use of line which had never been approached before and has never been equalled since. The manly beauty of an Assyrian king at a lion hunt, with his curly beard and his muscular legs, and his arm mighty to bend the bow, is grand indeed, but with a purely barbaric grandeur; the half-feminine beauty of an Egyptian deity lives chiefly in the serene face—the body is often frankly architectural, and has always rather the qualities of a column than those of the living flesh. But in Greece the curves of the line were for the first time made to express the fulness and grace of life, with an ideal perfection coming from the exquisite innate taste and refinement of the artists, and never to be found in any single mode. How much knowledge and taste may be expressed by a simple line may be seen in any Greek vase of the best time, especially if there are both draped and naked figures, of both sexes, in the composition.

The leading principle of Greek design on vases was the Greek expression of form by pure, firm, and accurate line. Spaces were distinguished by flat tints of red, black, and white, but there was no shading to indicate modelling. When local colour could be easily hinted at by markings of black thicker than a simple outline, it was frequently done, as it was continually in Japanese art, but care was taken that these broader black markings should never be important enough to alter the true character of the design, as essentially a work in simple line. Thus, a woman's hair might be drawn with broad touches to make us see that it was darker than her flesh, and the dark band round the edges of her dress would be given in pure black of its own width. Nor was this the only device by which a certain degree of local colour was suggested to the eye, though it was not really imitated. The red did for ordinary flesh colour, and white for flesh-colour intended to be of more than ordinary fairness. Great spaces of black were reserved for the background, by which a striking relief was given to the figures. This is the regular principle of Greek vase decoration, though the artists did not strictly confine themselves to it, but would also work in simple black and white, as in the Portland vase, or introduce brighter colour sparingly, like the turquoise of the mantle of the Venus of Camirus. This use of colour, however, did not in the least interfere with the unfinishing system of Greek drawing, which was, in the strictest sense of the word, delineation. In this it differs absolutely from many modern kinds of drawing which avoid the line as much as the Greeks delighted in it. This is not intended as an expression either of praise or blame; it is simply a statement of fact. The truth is that Greek line-drawing is simply the most searching and most perfect condition of a very early form of art. It is the child's idea of drawing, carried out with the knowledge and taste of men who lived in the early youth of the human race and were not disturbed and distracted by the discoveries and experiments of modern Europeans. Amongst its other peculiarities may be mentioned its beautiful independence of anatomy. No anatomical markings are ever given simply as such. The figures are living men and women with their skins on, not doré «kés in a dissecting room. There is less of the anatomical tendency in Greek art than in Assyrian. When the Assyrian artist wishes to make you feel that a man's leg is very strong, he shows every muscle and tendon as far as his knowledge will allow, but the Greek contented himself with showing the vigour and ease of the strong man's action. It is, however, in
the representation of the female form that the grace of the Greek line-drawing is most conspicuous and most unprecedented. There had been some little feminine grace of motion even in Egyptian art, but it is stiffness and awkwardness themselves in comparison with it Greek.

The right progress of art-education in modern times could not be better assured than by following in the case of each individual student that course of development which humanity itself has followed. True and careful lines, in combination with the colouring of spaces in a few flat tints, are the natural beginning. What a child does with infantile unsassured for its amusement the beginner in serious art should be taught to do carefully and well for his instruction. The accurate use of line is the first thing to be learned with the pencil point, and the equal laying of a flat tint is the first thing to be learned with the brush.

Even at so early a stage in art as the use of the simple line, we find ourselves face to face with one of the most severe peculiarities of the fine as distinguished from the mechanical arts. It does not require much critical acumen to discover that accuracy is one thing in a line and beauty another. The student ought to work at first for accuracy, but from beautiful works of art which are not in themselves accurate copies of nature but copies idealized at least in some degree by the taste and feeling of the artist. All works of art that are worth studying are ideal in one way or another. We have spoken of the Greek line, which is one of the most highly idealized of all artistic expressions. The Greek artist when they outlined an object always greatly simplified the outline by omitting many minor accidents of angle and curvature which a modern picturesque artist would seek for because of their variety. But simplification does not explain all that the Greek mind did to alter nature in its sense of beauty and elegance, and corrected what was awkward. All this could be done, and was done, with the simple line alone without any help from chiaroscuro, and it is one of the most remarkable proofs of the expressional power of the line that it even suggests modelling in the blank spaces which are included by it.

Notwithstanding the excellence of Greek linear design it would be well that the student's attention should not be confined to it too exclusively. For, in the first place, we may remember that the vase-paintings which remain to us were not executed by the most eminent panters living at that time, but were only done by clever workmen in the artistic spirit which the eminent panters had rendered prevalent and fashionable; whereas in modern art we can study the \textit{inassance} line of truly great men, both in their drawings and in many cases more accessible still in their etchings. Again, the Greek designers had certain excellencies, but not all excellences, the remarkably harmonious character of their work being, in fact, quite as much due to its absolute neglect of certain qualities of line as to its possession of other qualities. It is a narrow and limited kind of art, the singular perfection of it being due in great measure to that narrowness. Modern art, on the contrary, is infinitely vast and varied, full of imperfection, abounding in all conceivable kinds of error and failure, but also rich beyond all that a Greek could possibly have imagined in knowledge and sentiment of many kinds.

The Greek spirit passed through its first decadence in Roman art, and was at last degraded past recognition by Byzantium. A new spirit of linear design arose in the northern countries during the Middle Ages, gradually forming what we call the Gothic schools of architecture and ornament. The medieval artists began exactly like the Medieval Greeks by the natural primitive process of line and that drawing, colouring of spaces, of which we have abundant examples in their illuminated manuscripts, and examples less abundant in the mural paintings which remain to us. Students who intend to qualify themselves for decorative work, or for carving, will do well to give earnest attention to medieval designs of ornament which abound in the richest and most fanciful invention; but students of the figure have little to learn from the Middle Ages, for in those centuries the figure was very imperfectly understood. Sometimes we meet with a startling exception, with some instance of individual observation which strikes us because it looks like science; but the plain truth is that the medieval artists of all classes were as inferior to the Greek in the knowledge of the human frame as they were superior to them in the capacity for inventing new and fanciful schemes of decoration. If the student wishes to learn the figure he may therefore pass at once from the period of decline in Greek art to the Renaissance, without concerning himself about the more or less successful attempts of the intervening ages, in which, indeed, may be found examples of quaintly rendered human character, but hardly any of well-studied human form. The best way is to go from antiquity to Hans Holbein the younger at once. He had remarkable power and skill in the use of line, many of his best portraits being hardly anything more than a delicately true outline, with just enough shading to make us understand the modelling, but nothing of what is commonly understood by chiaroscuro. As Holbein was much more of a realist than the Greeks were, his lines have a variety of curvature than theirs, and the forms included by them are more individual. All that is best in the peculiar spirit of northern drawing at that time is to be found in Holbein's art, which is full of close observation, of calm sobriety, and unfailing truthfulness. In the south of Europe the Renaissance led to that artistic development of which the modern schools of figure design have inherited the ideas and principles. A certain period in the life of Raphael marks the transition from the old spirit to the new, and his great success in the application of the new principles led to their authoritative establishment in the schools of Europe. The Renaissance made drawing at the same time more scientific and more ideal. The artists studied anatomy more than it had ever been studied before, and they gave a degree of attention to the whole of the human body which a medieval draftsman would have concentrated almost exclusively on the face. But they did not rest satisfied with copying the facts of nature and investigating the laws of construction and of action,—they took that further step which the Greeks had taken before them, and drew the figure not merely as it appeared to their bodily eyes, but with that more perfect beauty which was suggested to the eye in the artist's mind. Raphael openly affirmed this principle by declaring that he drew men and women, not as they were, but as they ought to be, and the process of idealization may be actually seen in what he did by comparing his studies with his completed works.

We have hitherto spoken simply of the use of line, that being essentially drawing in the strict sense of delineation; but when the European mind had reached the period of the Renaissance a new study took its rise—chiaroscuro— which became so unsexringly mingled with that of drawing that it is impossible to speak adequately of the one without giving some account of the other. The increased knowledge of the muscular structure of the body led the artists to pay more attention to modelling than had ever been paid to it before, so that good modelling got to be considered an essential part of drawing. It may be necessary, for the unstruck in artistic matters to explain in this place...
Modelling that modelling in design is the art of shading in such a manner as to give everything its due degree of projection or relief, and the execution of it lies in the necessity for making the degree of projection in any object or part of an object exactly what it ought to be relatively to other projecting masses or details in the same drawing. The simple line-work of the early stages of art was therefore abandoned by the greatest artists of the Renaissance as a general means of study. Even when using the most rapid means of expression for themselves alone, they were accustomed to treat the outlines with little respect, and always to indicate shading in some way, often by the very rudest means, as for example by a few hasty diagonal strokes of the pen. Leonardo da Vinci retained to the last a good deal of that care about the outline which characterizes the earlier stage of art, but even in his case it was accompanied by an equal degree of care in modelling. In the sketches and studies of Michelangelo the care and time given to the outline are always in exact proportion to the pains taken with the modelling, and this employment of the time at the artist's disposal is a clear proof that he considered modelling as much a part of drawing as the outline itself. When he had time to do the modelling thoroughly, as in his finished studies, he made the outlines very carefully also, but when the time at his disposal was limited he did not economize it by four or four hours of labour.

The work in each instance is economized, not by rejection of one portion of his art, but by summarizing the whole, more or less, with the strictest reference to the time at his disposal. The studies of Raphael are done on the same principle. The spirit of the Renaissance was caught from the study of antiquity, but it gave more latitude to original genius by principle. Expression, and were to it what emphasis is to outline. Itself. When he had time to do the modelling, he pains taken with the modelling, and this employment of the means to the outline are always in

Michelangelo.

Exaggeration. Leonardo da Vinci, being of a calmer temper, put little pains into the outline which characterizes the greatest artists of the Renaissance and in all their strongest successors. The most perfect development of the picturesque spirit in drawing before our own century took place in Holland, the Dutch school working almost entirely in that spirit. The severe spirit has maintained itself chiefly as a sort of academic protest against the picturesque, which is never authoritatively taught in any academy of art. The academies direct students continually to Raphael, but never to Rembrandt. On the other hand, the kind of drawing usually taught to artists is, especially through the medium of water-colour. The strongest reaction against the picturesque has been that of the French "néo-Greeks," who in study went back to the pure Greek line and flat space, the most earnest of them declaring that nothing more was needed to the perfection of art. The most perfect and studied pictures of the fifteenth and sixteenth centuries are the studies of etchers and fumistes (artists who draw in charcoal). The picturesque is always easily recognizable by its love of accident and variety of line and character, and by its strong effects of light and shade. When in excess it violently exaggerates these accidents, varieties, and effects.

The kind of drawing which is best for landscape differs in some important respects from that which is best for the figure. To perceive the full truth of this, the reader has only to draw a landscape with the simplicity of the line in a Greek figure, when he will see that the more complicated character of landscape material requires a more varied interpretation. Good landscape draftsmen are seldom very accurate as to form, and it is not necessary that they should be; but they are always careful to preserve truth of character, and have great difficulties of their own to contend against, which are generally much underestimated. The accuracy of landscape design comes from the necessity for composition. When the figure painter composes, he can move his models about, and place them in different attitudes, and draw them faithfully after all; but when a landscape painter does the same thing, by an effort of imagination, with his mountains, trees, or towers, he unavoidably produces topography. The habit of measurement soon forms itself, for this reason, in all landscape draftsmen who compose; and all artists by profession are compelled to compose in order to make their works attractive in appearance.
The study of drawing is now becoming much more general in Great Britain than it has ever been before. The preliminary difficulties of the art can scarcely be overcome without the assistance of a master, and in his absence the student may obtain useful help from books.

The student should thoroughly master and remember Burnet's Essay on the Education of the Eye, which is most concise, and contains nothing doubtful or disputable. Mr. Harding's works, and Mr. Ruskin's Elements of Drawing, are also useful books for amateurs, especially if taken together. There are also various little treatises on elementary technical practice, usually written by artists, and published by the colour-makers, from which good practical hints may be obtained as to the use of instruments and materials. It is not generally known in England that there is a sufficient national collection of water-colours, with the exception of forty copies of the most important landscapes by great masters, which have been published by the British Museum, to which access may easily be obtained on compliance with a simple formality. The student is earnestly recommended to avail himself of these treasures, which are generally strangely neglected.

A handbook to the Department of Prints and Drawings, with an introductory notice of the various schools (Italian, German, Dutch, Flemish and English) has been lately compiled by Mr. Fagan, of the Museum, and published by Messrs. Bell & Sons. A collection of drawings by the Italian masters in the British Museum has been lately published in autotype by Messrs. Chatto & Windus, with notes by Mr. Comyns Carr, which, it is to be hoped, will be followed by similar publications from other schools. It is much to be regretted that some portion, at least, of these national treasures should not be made readily accessible to the general public by framing and putting them under glass in a gallery, according to the plan adopted in the Louvre. Their very existence is not so much as suspected by the great majority even of cultivated Englishmen.

DRA-YTON, Michael (1563-1631), English poet, was born at Hartshill, near Atherstone, in Warwickshire, in 1563. Even in childhood it was his great ambition to excel in writing verse. At the age of ten he was sent as a page into some great family, and a little later he is supposed to have studied for some time at Oxford. Sir Henry Goodere became his patron, and introduced him to the court of King James I, where he received the title of Grecian. He died in London, in 1603 under the title of The Barons' War. In 1598, he produced his first book, The Harmony of the Church, a volume of spiritual poems, dedicated to Lady Daventry. The best known work in this vogue of the Song of Solomon, executed with considerable richness of expression. A singular and now incomprehensible fate befell the book; with the exception of forty copies seized by the archbishop of Canterbury, the whole edition was destroyed by public order. It is preserved in a few copies and is now coming up to town laden with poetic wrappings, for he published a vast amount within the next few years. In 1593 appeared Idea: The Shepherd's Garland, a collection of pastoral, in which he celebrated his own love-sorrows under the poetic name of Rowland. The circumstances of this passion appear more distinctly in the cycle of 64 sonnets, published in 1594, under the title of Idea's Mirror, by which we learn that the lady lived by the river Anker, in Warwickshire. It appears that he failed to win her "Idea," and lived and died a bachelor. The same year, 1594, saw the publication of Matilda, an epic poem in rhyme royal, the first of his studies from English history. It was about this time, too, that he brought out Endymion and Phaethon, a volume which he never republished, but which contains some interesting autobiographical matter and acknowledgments of literary help from Lodge, if not from Spenser and Daniel also. In his Fig for Formosus, Lodge has reciprocated these friendly courtesies. In 1596 Dryton published his long and important poem of Mortimer's Cause, which deals with the Wars of the Roses, and is a very serious production in octavo Roma. He afterwards enlarged and modified this poem, and republished it in 1603 under the title of The Barons' War. In 1596,
also, appeared another historical poem, The Legend of Robert, Duke of Normandy, and a similar piece on Pierre Gassendi. In 1597 appeared England's Heroical Epistles, a series of historical studies, in imitation of those of Ovid. These last poems, written in the heroical couplet, contain some of the finest passages in Drayton's writings. With the year 1597 the first half of the poet's literary life closes. He had become famous by his rapid production of volumes, and he rested on his ears. It would seem that he was much favoured at the court of Elizabeth, and he hoped that it would be the same with her successor. But when, in 1603, he addressed a poem of compliment to James L on his accession, it was ridiculed, and his services rudely rejected. His bitterness of spirit found expression in a satire, The Owl, which he printed in 1604, although he had no talent in this kind of composition. Not much more entertaining was his scurrilous narrative of Moses in a Map of his Miracles, a sort of epic in heroics printed the same year. In 1605 Drayton republished his most important works, that is to say, his historical poems and the Idea, in a single volume, which ran through eight editions during his lifetime. He also collected his smaller pieces, hitherto unedited, in a volume undated, but probably published in 1606, under the title of Poems Lyric and Pastorall; these consisted of odes, elegies, and a fantastic satire, called The Muse in the Moon. Some of the odes are extremely stippled. He then adopted the extraordinary resolution of celebrating all the points of topographical or antiquarian interest in the island of Great Britain, and on this laborious work he was engaged for many years. At last, in 1613, the first part of this vast work was published under the title of Poly-Olbion, mid eight books being produced, to which the learned Selden supplied notes. The success of this great work, which has since become so famous, was very small at first, and not until 1622 did Drayton succeed in finding a publisher willing to undertake the risk of bringing out twelve more books in a second part. This completed the survey of England, and the poet, who had hoped to "crown Scotland with flowers," and arrive at last at the Arcades, never crossed the Tweed. In 1627 he published another of his uncollapsible volumes, and this contains some of his most characteristic and exquisite writing. It consists of the following pieces:—The Battle of Agincourt, an historical poem in octavo rima, and The Miseries of Queen Mary, written in the same verse and manner; Nymphidia, the Court of Faery, a most joyous and graceful little epic of fairyland; The Quest of Cynthia and The Shepherd's Sirena, two lyrical pastorals; and Finally The Moon Calf, a sort of satire. Of these Nymphidia is perhaps the best thing Drayton ever wrote, except his famous ballad on the Battle of Agincourt; it is quite unique of its kind, and full of rare fantastic fancy. The last of Drayton's voluminous publications was The Muse's Elucidum in 1630. He died in London on the 23d of December 1631, was buried in Westminster Abbey, and had a monument placed over him by the countess of Dorset, with memorial lines attributed to Ben Jonson. Of the particulars of Drayton's life we know almost nothing but what he himself tells us; he enjoyed the friendship of some of the best men of the age. He corresponded familiarly with Drummond; Jonson, Browne, Withers, and others were among his friends. In one of his poems, an "elegy" or epitaph to Sir Henry Reynolds, he has left some valuable criticisms on poets whom he had known. He was even engaged in the labour of the dramatists; at least he had a share, with Munday, Chettle, and Wilson, in writing Sir John Oldcastle, which was printed in 1600. That he was a restless and discontented, as well as a worthy master, is gathered from his last published work. The works of Drayton are bulky, and, in spite of the high place that he holds in critical esteem, it cannot be pretended that he is much read. For this his ponderous style is much to blame. The Poly-Olbion, the most famous but far from the most successful of his writings, is tedious and barren in the extreme. The metre in which it is composed, a couplet of Alexandrines, like the French classical measure, is wholly unsuited to our language, and becomes excessively wearisome to the reader, who forgets the learning and ingenuity of its author in labouring through its harsh and overgrown lines. His historical poems, which he was constantly rewriting and improving, are much more interesting, and often rise to a true poetical eloquence. His pastorals are brilliant, but overlaid with colour and sweet to insipidity. It is, with one or two magnificent exceptions, an indifferent sonneteer. The poet with whom it is most natural to compare him is Daniel; he is more rough and vigorous, more varied and more daring than the latter, but Daniel surpasses him in grace, delicacy, and judgment. In their elegies and epistles, however, the two writers frequently resemble each other. Drayton, however, approaches the very first poets of the Elizabethan era in his charming Nymphidia, a poem which inspired Herrick with his sweet fairy fancies, and which stands alone of its kind in our literature; while some of his odes and lyrics are inspired by noble feeling and high imagination.

In 1748 a folio edition of Drayton's complete works was published, under the editorial supervision of Oldys, and again in 1753 there appeared an issue in four volumes. But these were very unattentively and carelessly prepared. An attempt is now being made to republish Drayton in a more critical spirit. The works are printed in four volumes, and a new edition of The Muses' Elucidium, with notes. The success of his work, which has already been mentioned, was quite unique of its kind in our literature; while some of his odes and lyrics are inspired by noble feeling and high imagination.

DREAM. Dreams are a variety of a large class of mental phenomena which may be roughly defined as states of mind which, though not the result of the action of external objects, resume the form of objective perceptions. To this class belong the fleeting images which occasionally present themselves during waking hours, and especially before sleep, the "visions" which occur in certain excited emotional conditions, as in religious ecstasy, the hallucinations of the insane, the mental phenomena observable in certain artificially produced states (hypnotism), &c. These and other mental conditions resemble one another in many important respects, to be spoken of by and by. At the same time they are roughly marked by certain special circumstances. Thus, dreaming may be distinguished from the other species of the class as depending on the most complete withdrawal of the mind from the external world. All products of the imagination which take the aspect of objective perceptions must, it is clear, involve a partial abstraction of the intellectual processes. Yet in all cases except that of dreaming—including even somnambulism—the mind preserves certain limited relations to external objects. In dreams, on the contrary, the exclusion of the external world from consciousness is for the most part complete. Sleep has under normal circumstances the effect both of closing the avenues (sensory nerves) by which external impressions are conveyed to consciousness, and of cutting off from the mind that mechanism (the voluntary, motor nerves and muscles) through which they maintain and regulate its varying relations to the outer world. Dreams cover a great variety of mental states, from fleeting momentary fancies to extended series of imaginations. Again, dreams have certain constant or approximately constant features, while in other respects they manifest wide diversity. Among the most general characteristics is to be named the apparent objectivity of dream-experience. The presence of this objective element in dreams is clearly indicated in their familiar ad vocum appearance. This points to the well-recognized fact that a large part of our dream-imagination simulates the form of visual perception.
The next general characteristic of dreams is that, though resembling waking experience in many respects, they seem never exactly to reproduce the order of this experience. Most of our dreams differ very widely from any events ever known to us in waking life, and even those which most closely resemble certain portions of this life introduce numerous changes in detail. These deviations involve one or two distinct elements. First of all, there is a great confusion of the order in time, space, &c., which holds among real objects and events. Widely remote places and events are brought together, persons set in new relations to one another, and so on. Secondly, the objects and scenes are apt to assume a greatly exaggerated intensity. They take a firmer hold of us, so to speak, than our waking experience. We may when awake think of dreams as unsubstantial and unreal, but to the dreamer at the moment his unimagined surroundings are more real, more impressive, than the actual ones which he perceives when awake. Dream-fancy exaggerates the various aspects of objects, makes what is large still larger, what is striking still more striking, what is beautiful still more beautiful, and so on.

Having touched on these approximately universal characteristics of dreams, we will now specify a few of the more variable features. For example, in a large number of our dreams we appear to be passive spectators of events which we are incapable, or rather do not think of controlling in any way. In other dreams, again, we seem to be lively actors in the scene,—talking, moving, &c., as we are wont to do in waking life. In a class of dreams lying midway between these two extremes we appear to be impelled to act, to be struggling to seize some offered good or to avert some threatening evil, yet to be unable to execute our wishes. Once more, dreams differ very much as to their degree of reasonableness. It is certain that in many cases the dreamer is easily imposed upon, sees no contradictions, does not seek to understand the events which unfold themselves before his fancy, and so on. In some instances, indeed, the mind of the dreamer loses even the sense of identity in objects, and metamorphoses persons in the most capricious manner; and this confusion of identity may perhaps be the dreamer himself, so that he imagines himself to be somebody else, or projects a part of himself, so to speak, into another personality, which thus becomes an alter ego and an object for the contemplation of the remaining self. Yet though it is true that many, probably a large proportion, of our dreams are thus unintelligible to waking thought, there is a number of well-authenticated dreams in which persons have proved themselves to be possessed not only of their ordinary, but even of an extraordinary, power of reflection. We refer to the well-known stories of the intellectual achievements of Condillac, Condorcet, Coleridge, &c., when dreaming. Once more, great differences are observable in dreams with respect to the feelings excited by the visionary experiences. Sometimes the circumstances in which we find ourselves affect us much as in waking life,—anger terrifies us, beauty delights us, and so on. At other times, however, we are not thus affected:—what would puzzle, confuse, or shock our minds in waking experience fails to do so in dream-life. Finally, there are certain exceptional features of dream-life, as a vague consciousness of dreaming, which assumes the form of a dream within a dream, and the repetition of the images of previous dreams with a recognition of the familiarity of the dream scenes. It need hardly be added that dreaming varies with quantity and in quality, according to individual temperament, habits of thought, &c.

Theories of Dreaming.—From the slight sketch of the character of the dreaming process just given, it might be conjectured that the human mind at all times would be profoundly impressed with the fact of dreaming, and seek to arrive at some explanation of what on the surface is undoubtedly so mysterious and so wonderful a phenomenon. And as a matter of history we find that men have in all the known stages of their intellectual development endeavoured to account for the visions of the night. The various theories thus put forward fall into two main classes—the super-ordinary, power of reflection. We refer to the well-known portionalism, which holds among real objects and events. Widely remote places and events are brought together, persons set in new relations to one another, and so on. Secondly, the objects and scenes are apt to assume a greatly exaggerated intensity. They take a firmer hold of us, so to speak, than our waking experience. We may when awake think of dreams as unsubstantial and unreal, but to the dreamer at the moment his unimagined surroundings are more real, more impressive, than the actual ones which he perceives when awake. Dream-fancy exaggerates the various aspects of objects, makes what is large still larger, what is striking still more striking, what is beautiful still more beautiful, and so on.

Having touched on these approximately universal characteristics of dreams, we will now specify a few of the more variable features. For example, in a large number of our dreams we appear to be passive spectators of events which we are incapable, or rather do not think of controlling in any way. In other dreams, again, we seem to be lively actors in the scene,—talking, moving, &c., as we are wont to do in waking life. In a class of dreams lying midway between these two extremes we appear to be impelled to act, to be struggling to seize some offered good or to avert some threatening evil, yet to be unable to execute our wishes. Once more, dreams differ very much as to their degree of reasonableness. It is certain that in many cases the dreamer is easily imposed upon, sees no contradictions, does not seek to understand the events which unfold themselves before his fancy, and so on. In some instances, indeed, the mind of the dreamer loses even the sense of identity in objects, and metamorphoses persons in the most capricious manner; and this confusion of identity may perhaps be the dreamer himself, so that he imagines himself to be somebody else, or projects a part of himself, so to speak, into another personality, which thus becomes an alter ego and an object for the contemplation of the remaining self. Yet though it is true that many, probably a large proportion, of our dreams are thus unintelligible to waking thought, there is a number of well-authenticated dreams in which persons have proved themselves to be possessed not only of their ordinary, but even of an extraordinary, power of reflection. We refer to the well-known stories of the intellectual achievements of Condillac, Condorcet, Coleridge, &c., when dreaming. Once more, great differences are observable in dreams with respect to the feelings excited by the visionary experiences. Sometimes the circumstances in which we find ourselves affect us much as in waking life,—anger terrifies us, beauty delights us, and so on. At other times, however, we are not thus affected:—what would puzzle, confuse, or shock our minds in waking experience fails to do so in dream-life. Finally, there are certain exceptional features of dream-life, as a vague consciousness of dreaming, which assumes the form of a dream within a dream, and the repetition of the images of previous dreams with a recognition of the familiarity of the dream scenes. It need hardly be added that dreaming varies with quantity and in quality, according to individual temperament, habits of thought, &c.

Theories of Dreaming.—From the slight sketch of the character of the dreaming process just given, it might be conjectured that the human mind at all times would be profoundly impressed with the fact of dreaming, and seek to arrive at some explanation of what on the surface is undoubtedly so mysterious and so wonderful a phenomenon. And as a matter of history we find that men have in all the known stages of their intellectual development endeavoured to account for the visions of the night. The various theories thus put forward fall into two main classes—the supermundane, and the natural and the natural. By the former we mean all explanations which assume the action of forces unknown to our waking experience; by the latter those which make no such assumption, but seek to interpret dream-phenomena as products of forces familiar to waking perception. The supernatural hypothesis, again, falls into two divisions, according as the dream is regarded as the immediate effect of some reality corresponding to the actual world of our waking experience, or as it is conceived as a mediate result depending on the volition and command of some absent being. We thus have three main methods of explaining dreams:—(a) The naive objective explanation, (b) the religious explanation, (c) the scientific explanation.

(a) The Dream as an Immediate Objective Experience.—According to recent researches the savage mind regards dreams as no less real an objective experience than waking experience and the objects and scenes which first appear in the dreaming fancy of the primitive man are real maternal existences, the sounds he seems to hear are real external sounds, the dream figures which stand before his imagination and converse with him are real persons. How then does he conceive the relation of this dream-world to the world of waking experience? This question has lately been answered by Mr. E. B. Tylor and Mr. Herbert Spencer. The belief in the objective reality of dreams requires the savage to conceive a double nature both for objects (animate and inanimate) external to himself and for himself. The vision of dead ancestors, of material objects long since lost or destroyed, easily suggests the idea of a duplicate of the original person of thing, a second self or soul. On the other hand, when the savage dreams that he goes forth to accustomed scenes, to hunt, to fight, and so on, he accounts for the dream by the supposition that his own second self or soul leaves the body and passes forth to the particular locality. Thus the dream-life shames itself to our primitive philosopher as an intercourse of souls or duplicate selves, co-ordinate in kind and of equal reality with the experience of waking life. It appears to follow from the unfamiliarity of dream scenes, personages, &c., that the region visited during sleep will be projected by the savage mind quite outside the world of waking observation. Mr. Spencer connects with this fact the earliest theories of another world or a spiritual state. (For a fuller account of the part played by dreams in primitive ideas consult E. B. Tylor, Primitive Culture, vol. i. chap. xi.; H. Spencer, Principles of Sociology, i. ch. x. et seq.)

(b) The Dream as a Communication from a Supernatural Being.—It is plain that even in the savage's conception of dreaming there is room for the thought of a divine announcement. When once the idea of superior beings, deities, demons, &c., is reached, it becomes natural to regard the visit of some departed soul as the despatch of a messenger to the dreamer. In this way the first mode of explanation passes insensibly into the second. In higher stages of religious thought the view of a dream as a divine revelation takes a less crude form. The immediate object present to the dreamer is no longer conceived as possessing the same degree of materiality. Something is still present, no doubt, and so the dream is in a sense objective; but the reality is less like a tangible material object, and is transformed more or less completely into something unsubstantial, spiritual, and intangible. On the other hand, the dream is objective in the sense of being a message or revelation from some actual divine personage. The essence of the
function of dreams has been fully recognized in all the nations. At times, too, the divinely created vision is distinctly disguised and only partially divulged by symbol, in which case there arises the necessity of an art of interpretation. Thus at times the oral utterance may assume the form of a dim oracular declaration which calls for careful attention and a certain skill in the application of verbal figures. This is, however, in the last form of dream-revelation that we find the greatest demands made on the interpreter’s art. It follows from what has been said respecting the novelty of dream-combinations that many of the visual images which make up so large a bulk of our dreams cannot be fitted to any actual order of events. Hence, if such dreams are to be interpreted as having a bearing on actual events, they must be regarded as figurative or symbolic. Accordingly we find that the symbolic function of dreams has been fully recognized in all the theories of dreaming now dealt with. It seems to have been assumed that the normal mode of divine communication to man during sleep was that of such a figurative dream. And agreeably with this supposition the task of deciphering dream-symbols gradually grew into a skilled art, which became the prerogative of a certain class of experts,—as prophets, divinators, or magicians.

A very brief historical review of this religious theory of dreams must here suffice. Among the Oriental peoples this view of dreams was the prevailing one. We find, however, great differences in the mode of interpretation adopted. Among the ancient Hebrews, for example, we find all the three forms of dream-communication mentioned above. As to interpretation there seem to have been no definite rules, and the procedure followed resolves itself into an attempt to discover the most natural or least forced application of the persons, objects, and relations of the dream to some existing person, social circumstances, and events. This mode of interpretation clearly left wide scope for individual skill. In the Persian scheme of interpretation, on the other hand, so far as we can judge of it from the compilations of a later age, the art of dream-interpretation, oneirocritics, or oneiroscopy, was defined and fixed in a number of rules. Thus in the work known under the name of the Ṣafat-Šiūrah, minute and elaborate prescriptions are given for interpreting various classes of dreams according to the particular day of the month on which they occur. A similar systematization of the rules of dream-interpretation is to be met with among the Arabs (see L’Ouvrerie Musulman, par Gabdorrahachaman, traduction de Pierre Vattier). In such cases, it is plain, the interpretation of dreams involved less of individual genius or inspiration, and became a more mechanical process, involving only careful knowledge of formulae, and one which could be easily communicated. Such a state of things points to the transition of dreamlore from the stage of an exoteric mystery to that of a communicable science. Among the Greeks and Romans the religious view of dreams is to be found in popular literature as well as in philosophic writings. In Homer, dreams are distinctly said to be sent by the gods and goddesses, as in the expression θείον ὅρων, and it is implied that they may be intended to deceive the subject of them (e.g., Agamemnon’s dream, Iliad, book ii.). Similarly the dramatists frequently speak of foreknowledge divinely communicated by dreams (e.g., Clytemnestra’s prescience as to the fall of Troy in the Agamemnon of Eschylus is ascribed to a dream). The popular view was countenanced to a certain extent by philosophers. Thus Plato found in dreams a view of the world in his mystic scheme of life. On the other hand, the communication may be disguised and only partially divulged by symbol, and it is obvious that we find the greatest demands made on the interpreter’s art. It follows from what has been said respecting the novelty of dream-combinations that many of the visual images which make up so large a bulk of our dreams cannot be fitted to any actual order of events. Hence, if such dreams are to be interpreted as having a bearing on actual events, they must be regarded as figurative or symbolic. Accordingly we find that the symbolic function of dreams has been fully recognized in all the theories of dreaming now dealt with. It seems to have been assumed that the normal mode of divine communication to man during sleep was that of such a figurative dream. And agreeably with this supposition the task of deciphering dream-symbols gradually grew into a skilled art, which became the prerogative of a certain class of experts,—as prophets, divinators, or magicians.

A very brief historical review of this religious theory of dreams must here suffice. Among the Oriental peoples this view of dreams was the prevailing one. We find, however, great differences in the mode of interpretation adopted. Among the ancient Hebrews, for example, we find all the three forms of dream-communication mentioned above. As to interpretation there seem to have been no definite rules, and the procedure followed resolves itself into an attempt to discover the most natural or least forced application of the persons, objects, and relations of the dream to some existing person, social circumstances, and events. This mode of interpretation clearly left wide scope for individual skill. In the Persian scheme of interpretation, on the other hand, so far as we can judge of it from the compilations of a later age, the art of dream-interpretation, oneirocritics, or oneiroscopy, was defined and fixed in a number of rules. Thus in the work known under the name of the Ṣafat-Šiūrah, minute and elaborate prescriptions are given for interpreting various classes of dreams according to the particular day of the month on which they occur. A similar systematization of the rules of dream-interpretation is to be met with among the Arabs (see L’Ouvrerie Musulman, par Gabdorrahachaman, traduction de Pierre Vattier). In such cases, it is plain, the interpretation of dreams involved less of individual genius or inspiration, and became a more mechanical process, involving only careful knowledge of formulae, and one which could be easily communicated. Such a state of things points to the transition of dreamlore from the stage of an exoteric mystery to that of a communicable science. Among the Greeks and Romans the religious view of dreams is to be found in popular literature as well as in philosophic writings. In Homer, dreams are distinctly said to be sent by the gods and goddesses, as in the expression θείον ὅρων, and it is implied that they may be intended to deceive the subject of them (e.g., Agamemnon’s dream, Iliad, book ii.). Similarly the dramatists frequently speak of foreknowledge divinely communicated by dreams (e.g., Clytemnestra’s prescience as to the fall of Troy in the Agamemnon of Eschylus is ascribed to a dream). The popular view was countenanced to a certain extent by philosophers. Thus Plato found in dreams a view of the world in his mystic scheme of life. On the other hand, the communication may be disguised and only partially divulged by symbol, and it is obvious that we find the greatest demands made on the interpreter’s art. It follows from what has been said respecting the novelty of dream-combinations that many of the visual images which make up so large a bulk of our dreams cannot be fitted to any actual order of events. Hence, if such dreams are to be interpreted as having a bearing on actual events, they must be regarded as figurative or symbolic. Accordingly we find that the symbolic function of dreams has been fully recognized in all the theories of dreaming now dealt with. It seems to have been assumed that the normal mode of divine communication to man during sleep was that of such a figurative dream. And agreeably with this supposition the task of deciphering dream-symbols gradually grew into a skilled art, which became the prerogative of a certain class of experts,—as prophets, divinators, or magicians.
is the power of accompanying the soul in its flight to the celestial regions, and of sharing in the contemplation of Divine truths. Socrates extols the rank of dreaming among the arts of divination, setting it far above other modes of prophecy as being more simple and sure, open to all, unencumbered with expensive and laborious preparations, and so on. He affirms that he has repeatedly found dreams of service in arranging his ideas, and in improving his style of composition. Medieval and modern Christian theologians have continued to attribute dreams, or, more accurately, certain orders of dream, to the intermediate agency of the divine Being. The popular theory of dreams to be met with among the later European peoples bears the impress of that folklore which developed itself in the Middle Ages under influences partly Christian, partly pagans. Dreams were referred to a variety of supernatural agencies, including not only God and the devil, but also subordinate beings, as fairy, fiend (incubus), &c. Further, the art of interpreting dreams according to definite rules (omniscience) was developed to a very high point. (See Brand, Popular Antiquities, vol. ii. Dictionary of Dreams). In our own times certain restricted classes of dreams are customarily associated with the action of benevolent or malignant beings. On the other hand, people are now wont to interpret dreams as omens or signs without distinctly attributing them to any supernatural agent. This view of dreams forms the transition point between the religious and the scientific theories.

(c) The Dream as a Subjective Phenomenon Dependent on Natural Causes. - While the theory of the divine or supernatural origin of dreams has thus held its ground so long, there has been gradually growing up from an early period of human history a more scientific conception of the phenomenon as dependent on natural laws (of mind and body). Psychologists and physiological alike have approached the subject from their respective points of view, and sought to explain the phenomena of dreaming as natural events. The first germ of a scientific theory of dreams are to be found in antiquity. Thus Democritus, from whom the Epicureans derived their theory, held that dreams are the product of the summation or phantasms of corporeal objects which are constantly floating in the atmosphere, and which attack the soul during repose. Again, Plato speaks in the Republic of dreaming as illustrating the dominant mental impulses and habits of the individual (unchecked appetite, and temperance with its inverse), and the phantasms which may accompany waking operations of feeling and thought. Aristotle in his short treatise on dreams (προν ορωσιν) refers dreaming to the action of objects of outward sense which leave behind impressions on the soul and body. Dreaming is said to be the function of the sensitive part of the mind, but of this so far as phantasia; and a dream is defined as "the phantasm arising from the sense of sensible perceptions when it presents itself to him who is asleep." Aristotle further has some correct observations on the immediate bodily conditions of dreaming, such as the exaggeration of sensation in this condition of mind. Thus, he says, we fancy it thunders and lightens when a small sound is produced in our ears; we imagine that we are eating honey in consequence of a defluxion of the least quantity of palsem. In the De Divinatis of Cicero we have an unique instance among classic writings of a complete rejection of the doctrine of the supernatural origin of dreams, and of a full and consistent adoption of the natural method of explaining the phenomena. Cicero's position stands in marked contrast to that of partial sceptics, as, for example, Pliny, who seems content to exclude from the supernatural method of explanation certain of the more obviously natural dreams, such as those occurring immediately after food and wine, when one has just fallen asleep after waking (Nat. Hist.).

While philosophers were thus learning to regard dreams as natural processes, physicians, on the other side, had their attention called to dreaming in its relation to pathological bodily conditions. It seems probable, indeed, that men occupied in studying bodily diseases were among the first to suspect the true nature and origin of dreaming. Thus Hippocrates, while inclined to admit that some dreams may be divine, distinctly says that others arise from the action of the mind and the body. Hippocrates, too, appears to have been the first to supply a scientific basis for the premonitory character of certain kinds of dreams. There are dreams, he says, which announce beforehand the afortoions of the body. This idea has, as we shall see presently, been confirmed by modern pathological observations. It is easy to understand that this prophetic side of dreams was in the early stages of knowledge greatly exaggerated. Thus appears to be true of the speculations of Galen, who held that to dream one's thigh was turned into stone signified the approaching loss of this member. This belief in the premonitory character of dreams was only one side of a general doctrine of dreams according to which they arise from bodily disturbances, and so may serve as symptoms which the physician has to include in the complete diagnosis of a case. This idea, which is recognized by modern physiologists as true within certain limits, led in the first crude stages of scientific investigation to exaggerated and fanciful conclusions. Thus a new system of dream-interpretation came into vogue according to which to dream of a certain thing always means a disturbance in one particular organ. On the doctrine of Oriental physiologists (the Hindu and Chinese) dreams are thus referred to pathological states of the five organs—heart, lungs, kidneys, spleen, and liver. Thus to dream of war and fighting signifies a bad state of the lungs; of fire, smoke, &c., a bad state of the heart, and so on.

Modern Theory of Dreams. — Under this head we shall give an account of the principal results of modern investigations, psychological and physiological, on the nature and conditions of dreams. Respecting many points there is still considerable diversity of view. Certain questions are in fact yet remain unanswered, the reason of this being the inaccessibility of dream-phenomena to accurate and adequate observation. Further, owing to the divided condition of psychological principles, the explanation of dreaming assumes very different forms with different writers. On the one hand there are those who conceive the mind as an independent spiritual substance, which employs the body as its instrument, but is not dependent on this. With these, dreams will naturally wear the aspect of products of some spiritual faculty or faculties which are not involved in the sleep of the body and the senses. At the other extreme are those who regard mental phenomena as an outcome of bodily changes, as a refined result of physical processes. By these, dreams will be regarded as given off, so to speak, by the various organs of the body during sleep. Midway between the spiritualist and materialist hypotheses is the scientific view in its narrower sense, namely, the doctrine that the mental and the bodily are perfectly dissimilar regions of phenomena, which are yet connected in such a way that bodily events appear as the conditions of mental events. In the following account of modern dream theory we shall confine ourselves for the most part to the last stand-point, though indicating here and there how the other theories of the relation of mind to body lead to divergent conclusions.

On the very threshold of our inquiry we are met by a much disputed question—What is the relation of dreaming...
Dreaming an indication of imperfect sleep which must cease as soon as the higher nervous centres reach a complete repose? Is it, on the other hand, something wholly spiritual and independent of sleep as a bodily condition? Here we have two different views arising from different theories of the relation of mind and body. These distinct views of the subject have commonly appeared as answers to the question of fact—are we when asleep always dreaming? This question was first raised by philosophers in connection with certain conceptions of the soul and its activity. Descartes, who regarded thought as of the essence of personal existence, was naturally led to maintain that the mind is always thinking. "I am," he says, "I exist, that is certain; but for how long? as long as I think; for perhaps even it might happen that if I ceased wholly to think I should cease at the same time wholly to exist" (Meditation ii). Among the Cartesians the proposition, the mind is always thinking, became a leading tenet. Locke argues against this supposition. He contends that in sleep men do not always think, or they would be conscious answers. And the next moment distinct views of the subject have commonly appeared in the mind. It is asserted that in sleep the soul thinks apart from the body. If it is asserted that they think but they forget it, he replies it is "hard to be conceived" that "the soul in a sleeping man should be this moment busy a-thinking, and the next moment in a waking man not remember not be able to recollect one jot of all those thoughts." To suppose that in sleep the soul thinks apart from the body involves the absurdity of a double mind, and is further contradicted by the irrationality of dreams (Essay, book ii. ch. 1). Locke was answered by Leibnitz in the Nouveaux Essais, who upheld the Cartesian affirmation, and maintained that during sleep the mind has always some "little perceptions" or "confused sentiments," though, according to his doctrine of unconscious perceptions, these need not become objects of conscious attention. That we never sleep without dreaming is further maintained by Kant in his Anthropology, by Jouffroy and others. In his Lectures on Metaphysics, Sir W. Hamilton argues fully for the same idea. He says that during sleep the mind "is never either inactive or wholly unconscious." He seeks to refute the argument of Locke, that we ought to remember our dreams, by calling attention to the fact that the somnambulist has no recollection of his dream, and that persons who betray in their expression and utterance the characteristics of sleep, by calling attention to the fact that the somnambulist has no recollection of his dream, and that persons who betray in their expression and utterance the characteristics of sleep, have been said to be "confused in their reasoning," by the absence or suspension of the will. The importance of the cessation of the will's action has been emphasized by Duval and Stewart (Elements of the Phil. of the Human Mind, vol. i. chap. v. sect. 5). Stewart does not mean that the will is wholly dormant in sleep, but that it loses its hold on the faculties. By this supposition he seeks to account not only for the incoherence but also for the apparent reality of dream-images. That the absence of the normal processes of volition, especially as involved in attention, constitutes one important factor in the explanation of dreaming seems to be admitted by all writers,—for example, Sir Darwin (Zoonomia), Sir Benj. Brodie, Dr Carpenter, and M. A. Maury (Le Sommeil et les Rêves). It is doubtful, however, whether this simple hypothesis explains all that Stewart refers to. Maury objects to Stewart's theory that the will does not wholly lose its command of the bodily organs, etc., in dreams.

While great stress has thus been laid by some writers on this negative condition, the suspension of will, others have sought to construct a simple theory of dreaming by supposing that the unimpeded action of some mental faculty. Thus Cadworth (Treatise concerning Eternal and Immutable Morality) reasons, from the orderly coherence of dream-imagination and the novelty of their combinations, that this state of mind arises from the action of "the phantastical power of the soul," and not from "any fortuitous dancings of the spirits." A very curious theory of dreaming as depending on a particular circum-
scribed faculty the soul is to be found in Scherner's Das Leben des Traumens. Dreaming is a decentralization of the movement of life. In waking consciousness the central forces, the ego spontaneity, is supreme,—in dreaming the activity of the ego becomes purely receptive. The central ego is now merely the point about which the peripheral life plays in perfect freedom. Thus the will (the spontaneous force of the ego) is suspended, and thought loses its categories. On the other hand, the imagination now freed from the ego reaches its perfect unrestrained function. And this function is seen in the symbolic representation both of the bodily parts and of the mental stimuli which influence the conscious perception of the creative fancy in dreaming is adopted by Dr Johannes Volkelt (Die Traumphantasie).
In addition to these simple metaphysical and psychological theories of dreaming, there are to be found no less simple physiological hypotheses. Among these we may take the opinion of Hobbes (Leuethen), that the imaginations of dreams all proceed from "the agitations of the inward parts of a man’s body," the disturbance of which parts, owing to their connections with the brain, serves to keep the latter in motion. Another simple physiological hypothesis for explaining dreams is offered by Schopenhauer. According to this writer, the exciting causes of dreams are impressions received from the internal regions of the organism through the sympathetic nervous system. These impressions are afterwards worked up by the mind into quasi-realities by means of its "forms" of space, time, &c.

This simple and "geometric" method of explaining dreams, though it may be valuable up to a certain point, must necessarily fail to account for all the phenomena concerned. As we have shown in our preliminary discussion of the sources of dream-imagination, or the stimulations which are the immediate causes of these. The second question has to do with the order or form of dream-combinations, and seeks to determine the conditions of the peculiar arrangements, simultaneous and successive, which are observable in dreams. The last problem is that of accounting for the objective reality and generally for the intensity and impressiveness of dream-fancies.

In briefly opening up each of these lines of inquiry we shall seek to keep in mind the variable as well as the constant features of dreaming; also we shall proceed, as far as possible, according to that double method of study, the psychological and the physiological (subjective and objective), which offers itself to those who accept the idea of a perfect parallelism between mental and bodily events.

(A) The Sources of Dream Materials. — The numerous images which make up the ever-renewed current of a dream appear sometimes to come from the internal depths of the mind itself. In other cases, as even the ancients recognized, they depend on a stimulation of the brain arising from varying conditions of the bodily organs. According to the view that all mental events have their physical accompaniments, the first class of imaginations must also be referred to certain conditions of the brain and nervous system. These various sources of dream-activity are roughly classified by Hartley in his Observations on Man. Dream-images, he tells us, are deducible from three causes: — (1) impressions and dreams their creations; (2) present state of the body (especially the stomach and the brain); (3) association. The large part played by bodily states in our dream-life is recognized not only by physiologists, as Maury, but also by those who ascribe dreams in part to occult spiritual faculties, as Scherner. By help of the results of recent researches we are able to improve a little on Hartley’s classification. The exciting causes of dream-images fall into two main classes: — (I) peripheral, and (II) central stimulations. The latter arise in the outlying parts of the nervous system, namely, the organs of sense, the muscular apæatus, the internal bodily organs, together with the external portions of the nerves connected with these.

Central stimulations are such as arise mainly, if not entirely, within the encephalic region. These again are either (a) direct, or (b) indirect. The first depend on the condition of the nerve-elements acted upon, and the unknown influences (possibly connected with the circulation) brought to bear on these at the moment. The indirect stimulations arise as a result of some preceding excitation in a connected region of the brain. They form the apparently spontaneous imaginations of dreaming, as well as those which are the echo of a recent waking experience. The latter are the physical counterpart of images or ideas called up by association with preceding images or thoughts.

(1) Among peripheral stimulations are to be noticed (a) those which arise from the action of external objects on the organs of sensation. Recent researches show that these may play an important part in dreams. Dr Beattie speaks of a man who could be made to dream about a subject by whispering into his ear. Experiments were made by M. Giron de Bazemargues (Journal de Physiol tom viii) as to the effects of external impressions on dreaming. Thus, by leaving his knee uncovered during sleep, he dreamt he was travelling in a diligence (where knees are apt to get cold). The most elaborate experiments bearing on this point have been carried on by Afl. Maury, with the help of an assistant. A large plaster was applied to his face and then torn off. Sensations of hearing, smell, and taste were also followed by appropriate though greatly exaggerated images. Wundt (Physiologische Psychologie) thinks that cutaneous sensations, arising from the varying pressure and temperature of the bodily surface, are frequent excitants of dream-images. (2) Along with such objective sensations must be reckoned subjective sensations which arise in the absence of external stimuli, and which have as their physical basis the phenomena of the central regions of the brain. Of such are the visual images (Schimmenbilder) seen by J. Muller, Goethe, Parkins, and others, when the body is disposed to sleep. These are called the dream-chaos by Gruithuesen, since they are supposed to form the raw material of dreams. Maury gives a full account of these phenomena, which he terms "hypnagogic hallucinations," and which appear to include not only visual images but also subjective sensations of sound, touch, &c. He attaches great importance to the action of these subjective sensations in dreams. The predominance of visual imagery in dreaming appears to be connected with the great activity of the organ of sight and its consequent excitability. It is to be added that one can only roughly distinguish these subjective sensations, which involve the peripheral regions of the nervous system, from images supposed to be confined to the central regions. (3) The condition of our muscles during sleep, which somehow convey impressions to the brain, affect consciousness, and so influence dreaming. To this source we must refer the active phenomena of dreams, as running, flying, resuscitating, struggling, &c. It is probable, as Wundt remarks, that the movements of the body during sleep, such as the breathing and the extensions and contractions of the limbs, give rise to dream-fancies, and painful conditions of the muscles due to an awkward position of the limbs may also serve to excite images. (5) Among the most frequent hallucinations of dreams are those connected with the varying states of the internal bodily organs. The prominence given to this source of dreaming
in ancient and modern systems of medicine has already been referred to. States of the stomach, lungs, heart, secretory organs, teeth and mouth, and general, as we all know, powerful provocatives of dreams. Owing to the close connection of dreams with these organic conditions they may serve as important elements in the diagnosis of bodily disease. Thus M. Macaro (Du Sommeil, des Rêves, et du Somnambulisme) recognizes among the morbid class of dreams those which are "prodomic," or premonitory (e.g., a dream of sanguinary conflicts before hemorrhage), as well as those which are symptomatic of existing bodily and mental disorders.

(II) We pass to internal or cerebral excitations. Under (a), the direct excitations, are to be included all dream-ideas which do not arise from bodily stimuli, or through association, with preceding feelings and ideas. It seems fairly certain that many of our dream-images are thus occasioned by a kind of "automatic excitement" of the cerebral regions. The dreams which clearly arise from an after-effect in the brain of recent perceptions, especially those of the previous day, appear to illustrate this process. Also, many of the images which correspond to persons and scenes supposed to be long since forgotten may be due to some such local automatic cerebral "sub-excitation." Maury distinctly recognizes this factor in dream-estimation. It appears from many cases recorded by him that by means of these automatic central excitations images may sometimes be called up of objects which have never been distinctly perceived, and which yet have left a trace of their action on the cerebral substance. (b) The indirect central stimulations include, no doubt, a large number of our dream-fancies. When once a starting-point is reached, whether through a peripheral or a central automatic (direct) excitation, the nervous connections which answer to mental associations provide a vast range of new material. It is to be added that these general excitations may largely be accounted for by a kind of association acting on all the coherent, heterogeneous and disconnected elements supplied by the periphery and central (direct) stimulation at the time, there being no volitional control (dominating attention) to interfere with the process. Summarizing that these two primary sources are continually sending forth new and disconnected images to the dream-consciousness, and that owing to the extreme excitability of the brain during sleep numerous paths of association open themselves up in connection with every such image, we may see how it is that objects group themselves, and even unite themselves, without any such chaotic manner. It is not correct to say that we here dispense with the "forms" of space and time; objects are viewed in space, and events "intuited" in time, it is only that the particular positions of things in space and time are overlooked. On the other hand, it is true that there is in these loosely-threaded dreams, if not in all dreams, a suspension of the reasoning process by which objects are intuited in a causal relation. In these dreams, then, the mind is passive, and consciousness is made up of a flur of images and feelings which is not analyzed and rationalized as it is in the normal processes of waking perceptions.

(5) Let us now consider the more coherent class of dreams. These, as we have seen, have by some been accounted for as the products of some occult power of the soul, as the "phantastical power" of Cudworth and the symbolic plastic phantasy of Scherner. There is no doubt that in many of the more elaborate and pictorial of our dreams a result is reached very similar to the products of the waking imagination. Can this operation be analyzed into simple processes? First of all, the images, however disconnected their corresponding objects may be, group themselves in a certain arrangement. This process would be described by psychologists of the Kantian school as the superposition on the dream-materials of certain mental forms. On the other hand, it may perhaps be explained as a result of association. When two orders of impression—for example, the sight of the human form and the sound of a human voice—have been habitually associated, there arises what may be called a general associative disposition to connect some variety of other order of impression with any particular variety of the order which happens to present itself to the mind; and so, when dreaming, the mind is disposed to add to images of colour certain relations of space, position, magnitude, &c., to images of human beings some form of the appropriate human actions, relations, &c. By this means the intuitive clearness and completeness of our dream-imaginations may largely be accounted for. It is to be added that these general associative tendencies do not determine what particular relations or actions are to be added to the images. These latter depend on the particular circumstances of the moment, as, for example, the locality of the optic fibres involved, the varying excitability of the central regions, &c.

In this factor of our dream-constructions the mind seems to be wholly passive. We have now to turn to a second influence, which involves to some extent the active side of the mind, namely, the play of attention under the influence, not of the will, but of certain vague emotional impulses. The chief of these are the feeling for unity, and the instinct of emotional harmony. First of all, there seems to be a tendency in the more orderly dreams to bring new images into some intelligible connection or relation of unity with the pre-existing ones. This vague impulse, acting through the processes of expectation and attention, becomes selective, leading to a retention of those members of the ever-renewed flux of images which are fitted to enter into the dream-scene as consistent factors. In certain cases, indeed, this process seems to rise to something like a conscious voluntary exertion. We occasionally remember that we strove in our dream to discover a consistency in the variegated and confused scene presented to consciousness. Secondly, the unity of dream-structure is largely determined by the need and desire of the mind, a large part, if not all, of our dream-fancies are attended with a feeling of pleasure or of pain. Now, when a certain state of emotion has been excited in the mind, there is a tendency to reject all ideas to reject all ideas
which conflict with this feeling, and to accept any which harmonize with it. The emotion controls the movements of anticipation and of intellectual attention, so that suitable ideas are at once recognized and detained. The unity of our most complex dreams appears to arise very largely from this source. In dreams described by Scherner, Volkm., and Wundt the successions of imaginary events are clearly strung together by a thread of emotion, as joy, terror, and so on. The commonest example of such a dominating emotional tone in dreaming occurs when there is a current of pleasurable or painful feeling contributed by the condition of some of the internal organs of the body. These bodily sensations become the basis of complex groups of images, each new scene being connected with some analogous shade of feeling, "bodily" or "mental."

(C) The Objective Reality and Intensity of Dream-Imaginations—These are explained by Hartley by two circumstances,—first, the absence of any other reality to oppose to the ideas which offer themselves, and secondly, the greater vividness of the visual images which occur in dreams as measured by the corresponding waking ideas. This last fact may, he thinks, be partly accounted for by an increased heat of the brain. As already remarked, Dugald Stewart explains the reality of dreams through the suspension of the ordinary action of volition. In waking life, he says, we distinguish objective impressions from ideas by finding that the former are independent of volition, while the latter are dependent on the same. Hence, in dreaming, when the will no longer controls ideas, these are mistaken for realities. The chief influences here concerned appear to be included in Hartley's theory, though the circumstances emphasized by Stewart may be a secondary element in the case. That the reality of dream-images depends in large part on the absence of external impressions has been recognized by most recent writers. Among others M. Taine (De l'Intelligence) dwells on the function of external sensation as a corrective to internal imaginations, keeping these below the illusory stage. External impressions are distinguished from ideas in the waking state, in part at least, by their greater intensity. When this relation is no longer recognized by reason either of the ideas acquiring preternatural vividness or of the sensations being withdrawn, illusion follows. Waking hallucinations depend on the first circumstance, dream-illusions on the second, perhaps also on the first as well. This leads us to the reflection that during sleep the ideas arising in consciousness undergo an increase of absolute as well as of relative vividness. That is to say, they are in themselves more intense states of consciousness than waking ideas. This seems to point, as Maury observes, to an increased excitability of the nervous substance in sleep. This same circumstance, too, helps to account for the preternatural impressiveness and the exaggeration which meet us in dreams. If the brain is during sleep particularly excitable it will follow that all sensational stimuli, external and internal alike, will produce an exaggerated result. Thus the intensity of sensations will be augmented, and their volume, and so the apparent magnitude of dream-images be increased. Again, if in dreaming the stream of fancies be a rapid one, if images simultaneously and successively crowd in on consciousness, we may understand how space and time may appear to swell to unusual proportions. Once more, the peculiar excitability of the brain will manifest itself in an exaggeration of all feeling. Slight bodily discomforts, for example, will be transformed, as in Maury's experiments, into huge sufferings, and so locally circumscribed bodily sensations of pleasure may expand into preternatural forms of emotional delight.

We are now perhaps in a position to explain the symbolic function of dreams so much emphasized by Scherner. He considers that our dream-phantasy habitually represents the seat of bodily sensations under the symbol of a house and its parts, and the silent processes of thought as the audible conversation of living persons. The latter remark is probably correct, and its truth follows from a consideration of the close association between thought and audible speech. The former observation is surely an exaggerated statement, as has been shown by his friendly critic Volkel. Yet though bodily sensations do not as a rule reveal themselves under the symbol of a building or mass of buildings, they undoubtedly do appear in consciousness disguised and transformed, and the reasons of this are plain. Even in the waking condition we have but a vague consciousness of the seat of the bodily sensations, and in sleep this can hardly be present at all. In addition to this, the exaggerating influences just referred to must tend to disguise the real nature of bodily sensations, and so to remove all consciousness of their locality. Hence bodily sensations do as a rule clothe themselves in a disguise appearing under the form of emotional experiences.

And the particular pleasurable or painful images selected, which will vary with the individual's emotional nature and experience, will be apt to recur as a "symbolic expression" of this variety of bodily feeling. It will follow, too, from the predominance of visual ideas in dreams, that these emotional fancies will commonly take the shape of alluring or alarming visual perceptions.

Dreaming is a subject of great interest by reason of its points of contact with other mental conditions. Thus the common suspension of many of the higher processes of emotion, thought, and volition suggests an analogy between the dreaming state and the insensate stage of mental growth as observable in children, primitive men, and the lower animals. This aspect of dreams has been treated by Maury.

Again, dreaming has many curious resemblances to the mental states of the insane. The differences which mark off dreaming from these states have already been given. The resemblances between them are no less important. In the illusory intensity of its internal images, in the rapidity of its flux of ideas, and in the wildness and incoherence of its combinations, the dream stands very close to the whole class of hallucinations and delusions of waking life. In truth, a systematic psychological treatment of dreams must connect them with other forms of illusion. This is done, for example, by Wundt, who refers all these groups of phenomena to an increased excitability of the sensory regions of the brain. Maury seems disposed to regard dreaming as the incipient stage of a pathological mental condition, of which somnambulism, insanity, &c., are more fully developed forms. Among other writers who have discussed dreams in relation to these other abnormal states of mind are Macaro (op. cit.), Duret de Bounmont (Les Hallucinations), J. Moreau (Du Hasard et d'Alimentation Mentale), also Sir H. Holland, and Dr Carpenter (Mental Physiology).

A good deal of random and undigested information respecting dreams and dream-theories is to be found in Dr Erskine Nicholls's Literature and Curiosities of Dreams. A curious account of the ancients' views of dreams is to be met with in a work entitled Histoire du Somnambulisme, par A. Gauthier. For the best statement of the modern theory of dreams, the student is referred to the works of Maury, Wundt, Carpenter, and Volkel, already named. Dreams have been roughly classified according to the source of their ideas and the relative activity of association and imagination involved, by Scherner, Volkel, and others. The view of the processes involved in the imaginative construction of dreams here adopted has been more fully developed by the present writer in an article in the Cornhill Magazine of November 1876. (J. S.)

DREDGE, THE NATURALIST, is an implement constructed on the general plan of the common water-wheel, and used by naturalists for obtaining specimens of the
DREDGE

animals living on the bottom of the sea at greater or less depths, for the purpose of determining their structure and zoological relations, and ascertaining their geographical distribution. The instrument usually employed in this and other northern countries for dredging oysters and clams is a light frame of iron about 5 feet long by a foot or so in width, with a scraper like a narrow hoe on one side, and a suspening apparatus of thin iron bars which meet in an iron ring for the attachment of the dredge-rope on the other. From the frame is suspended a bag about 2 feet in depth of iron chain netting, or of wide-meshed hemp-cord netting, or of a mixture of both. Naturalist dredgers at first used the oyster dredge, but it is scarcely suitable for scientific purposes. Having a scraper on one side only, it is liable in a current, in deep water, or in unskilled hands, to fall on its back and consequently to come up empty, the scraper not having come into play. Oyster dredgers are not allowed to take oysters below a certain size, and the dredge is made large enough as to allow all small bodies to fall through, and, as many of these are of the highest interest to the naturalist, his object is thus in a great measure defeated.

The remedy for these defects is to have a scraper on each side, with the arms attached in such a way that one or other of the scrapers must reach the ground in whatever position the dredge may fall; and to have the dredge-bag deeper in proportion to the size of the frame, and of a material which is only sufficiently open to allow the water to pass freely through, with the openings so distributed as to leave a part of the bag close enough to bring up the finest mud.

The late Dr Robert Ball of Dublin devised the modification which has since been used almost universally by naturalists in this country and abroad under the name of "Ball's Dredge" (Fig. 1). The dredges on this pattern, used in Britain for ten years after their first introduction, about the year 1838, were usually small and rather heavy—not more than 12 to 15 inches in length, by 4 or 4½ inches in width at the mouth. Two scrapers, the length of the dredge-frame, and 1½ to 2 inches wide, were set at an angle of about 110° to the plane of the dredge's mouth, so that when the dredge was gently hauled along it took hold of the ground and secured anything loose on its surface.

Latterly Ball's dredges of considerably larger size have been used. Perhaps the most convenient form for dredging from a row-boat or yawl, probably the best kind of line is bolt-rope of the best Russian hemp, not less than ½ inches in circumference, containing eighteen to twenty yards in three strands. Each strand should bear nearly a hundred weight, so that the breaking strain of such a rope ought to be about a ton. Of course it is never voluntarily exposed to such a strain, but in shallow water the dredge is often caught among rocks or coral, and the rope should be strong enough in such a case to bring up the boat, even if there were some little way on. It is always well, when dredging, to ascertain the approximate depth with the lead before casting the dredge; and the lead ought always to be accompanied by a registering thermometer, for the subsequent haul of the dredge will gain greatly in value as an observation in geographical distribution, if it be accompanied by an accurate note of the depth.

Depths under 100 fathoms the amount of rope paid out should be at least double the depth; under 30 fathoms, where one usually works more rapidly, it should be more nearly three times; this gives a good deal of slack before the dredge if the boat be moving very slowly, and keeps the lip of the dredge well down. When there is anything of a current, from whatever cause, it is usually convenient to attach a weight, varying from 14 lb to half a hundred weight, to the rope 3 or 4 fathoms in front of the dredge. This prevents in some degree the lifting of the mouth of the dredge; if the weight be attached nearer the dredge it is apt to injure delicate objects passing in.

In dredging in sand or mud, the dredge-rope may simply be passed through the double eye formed by the ends of the two arms of the dredge-frame; but in rocky or unknown ground it is better to fasten the rope to the eye of one of the arms only, and to tie the two eyes together with three or four turns of rope-yarn. This stops breaks much more readily than the dredge-rope alone; so that if the dredge get caught it is the first thing to give way under the strain, and in doing so it often alters the position of the dredge so as to allow of its extrication.

The dredge is slipped gently over the side, either from the bow or from the stern—in a small boat more usually the latter—while there is a little way on, and the direction which the rope takes indicates roughly whether the dredge is going down properly. When it reaches the ground and begins to scrape, an experienced hand upon the rope can usually detect at once a tremor given to the dredge by the scraper passing over the irregularities of the bottom. The amount of rope is then paid out, and the dredge is tied to a bench or roller-pin. The boat should move very slowly, probably not faster than a mile an hour. In still
the dredge, but a pair of brass or bone forceps into the jars of seawater, where their movement and their natural colours may be observed, or placed at once in bottles of strong or weak spirit of wine or dried, according to the object for which they have been collected.

The scientific value of a dredging depends mainly upon two things—the care with which the objects procured are preserved and labelled for future identification and reference, and the accuracy with which all the circumstances of the dredging—the peacock, the depth, the nature of the ground, the date, the bottom-temperature, etc.—are recorded. Every specimen, whether dry or in spirit, should be labelled at once with the number under which that particular dredging is entered in the dredger's note book.

Up to the middle of last century the little that was known of the inhabitants of the sea beyond low-water mark seems to have been gathered almost entirely from the objects found thrown on the beach after storms, and from chance captures on lead-lines, or by fishermen on their long lines, and in trawls and oyster and clam dredges. The naturalist's dredge does not appear to have been used for investigating systematically the fauna of the bottom of the sea until it was employed by Otho Frederick Muller in the researches which afforded material for the publication, in 1779, of his admirable Descriptions and History of the rarer and less known Animals of Denmark and Norway. In the preface to the first volume Muller gives a quaint description and figure of a dredge (fig. 3) not very unlike that used by Bail and Forbes, only the mouth of the dredge was square, a form which, unless used with great caution, gives fatal facilities for "washing out" in the process of hauling in.

At the Birmingham meeting of the British Association in 1839 an important committee was appointed "for researches with the dredge with a view to the investigation of the marine zoology of Great Britain, the illustration of the geographical distribution of marine animals, and the more accurate determination of the fossils of the Fig. 3—Otho Frederick Muller's Dredge (1770)."

This committee was under the general influence of his contagious enthusiasm great progress was made during the next decade in the knowledge of the fauna of the British seas, and many wonderful pleasant days were spent by the original committee and by many others who from year to year were "added to their number." Every annual report of the British Association contains communications from the English, the Scottab, or the Irish branches of the committee, and in 1850 Edward Forbes submitted his first general report on British marine zoology. This report, as might have been anticipated from the eminent qualifications of the reporter, was of the highest value, and taken along with his remarkable memoirs previously published, "On the Distribution of the Mollusca and Radiata of Ægean Sea," and "On the Zoological Relations of the existing Fauna and Flora of the British Isles," may be said to mark an era in the progress of human thought.

The dredging operations of the British Association committee were carried on generally under the idea that at the 100-fathom line, by which amateur work in small boats was practically limited, the zero of animal life was approached—a notion which was destined to be gradually undermined, and finally overthrown. From time to time, however, there were not wanting men of great skill and ex-
perience to maintain, with Sir James Clerk Ross, that "from however great a depth we may be enabled to bring up mud and stones of the bed of the ocean we shall find them teeming with animal life." Samples of the sea-bottom, procured with great difficulty and in small quantity from the first deep soundings in the Atlantic, chiefly by the use of Brooke's sounding machine, an instrument which by a neat contrivance disengaged its weights when it reached the bottom, and thus allowed a tube, so arranged as to get filled with a sample of the bottom, to be recovered by the sounding line, were eagerly examined by microscopists; and the singular fact was established that these samples yielded over a large part of the bed of the Atlantic of the entire or broken shells of certain Foraminifera. Dr Wallich, the naturalist to the "Bulldog" sounding expedition under Sir Leopold McClintock, reported that star-fishes, with their stomachs full of the deep-sea Foraminifera, had come up from a depth of 1200 fathoms on a sounding line; and doubts began to be entertained whether the bottom of the sea was in truth a desert, or whether it might not present a new zoological region open to investigation and discovery, and peopled by a peculiar fauna suited to its special conditions.

In the year 1868, while the question was still undecided, two testing investigations were undertaken independently. In America Count L. F. Pourtales, one of the officers employed in the United States Coast Survey under Professor Piersol, commenced a series of deep dredgings across the Gulf Stream off the coast of Florida, which were continued in the following year, and were productive of most valuable results; and in Great Britain the Admiralty, on the representation of the Royal Society, placed the "Lightning," a small gun vessel, at the disposal of a small committee to sound and dredge in the North Atlantic between Scotland and the Faroe Islands.

In the "Lightning" were the dredging parties placed with the help of a "donkey-engine" for winding in; dredging was carried on with comparative ease at a depth of 600 fathoms, and at that depth animal life was found to be still abundant. The results of the "Lightning's" dredgings were regarded of so great importance to science that the Royal Society pressed upon the Admiralty the advantage of continuing the researches, and accordingly, during the years 1869 and 1870, the gun-boat "Porcupine" was put under the orders of a committee consisting of Dr Carpenter, F.R.S., Dr Gwyn Jeffreys, F.R.S., and Professor Wyrville Thomson, F.R.S., one or other of whom superintended the scientific work. A series of dredging trips in the North Atlantic to the north and west of the British Islands, which occupied two summers.

In the "Porcupine," in the summer of 1869, dredging was carried down successfully to a depth of 2435 fathoms, upwards of two miles and a half, in the Bay of Biscay, and the dredge brought up well-developed representatives of all the classes of marine invertebrates. During the cruises of the "Porcupine" the fauna of the deep water off the western coasts of Great Britain and of Spain and Portugal was tolerably well ascertained, and it was found to differ greatly from the fauna of shallow water in the same region, to possess very special characters, and to show a very marked relation to the fauna of the earlier Tertiary and the later Cretaceous periods.

In the winter of 1872, as a sequel to the preliminary cruises of the "Lightning" and "Porcupine," by far the most considerable expedition in which systematic dredging had ever been made a special object left Great Britain. H.M.S. "Challenger," a corvette of 2306 tons, with auxiliary steam working to 1234 horse-power, was despatched to investigate the physical and biological conditions of the great ocean basins.

The "Challenger" was provided with a most complete and liberal organization for the purpose; she had powerful deck engines for hauling in the dredge, workrooms, laboratories, and libraries for investigating the results on the spot, and a staff of competent naturalists to undertake such investigations and to superintend the packing and preservation of the specimens reserved for future study.

In these deep-sea dredgings it was frequently found that, while few objects of interest were brought up within the dredge, many echinoderms, corals, and sponges came to the surface sticking to the outside of the dredge, and even to the first few fathoms of the dredge-line. This suggested many expedients, and finally a long transverse iron bar was attached to the bottom of the dredge-bag, and large bunches of teased-out hemp were fastened to the free ends of the bar (fig 4). The "kempen-tangles" are now regarded as an essential part of the dredge, nearly as important as the dredge-bag, and often much more conspicuous in its results. This addition to Ball's dredge is not, however, generally available in dredging from a boat or in shallow water; the tangles are apt to catch on rocks or coral, and a turn of the drum of the donkey-engine is required to free them.

Ball's dredge was still employed, with some slight modifications, as the result of further experience. Fig. 4 represents the form of dredge which was found most suitable for great depths. The dredge-frame of hammered iron is 4 feet 6 inches long and 1 foot 3 inches in breadth; the scrapers are 3 inches wide, and are connected at the ends by bars 1½ inches round iron. The arms are of inch round iron, and slightly curved; they are bolted together to a stout iron bar which ends above in a swivel and ring.

Two bars of square iron of some strength are attached by eyes to the round cross-bars at the ends of the dredge-frame, and have the other ends lashed to the iron bar which bears the tangles. These rods keep the dredge-bag at its full length, and prevent it or the tangles from folding over the mouth of the dredge. The dredge-bag is 4 feet 6 inches in length; the lower half is of twine netting so close as to retain everything except the finest mud, which indeed only partially washes through, and the upper half is of twine netting with the meshes an inch to the side. The bag is guarded by three loops of bolt-ropes attached to the frame of the dredge, to the bottom of the bag, and finally to the tangle-bar. The canvas pads represented in the figure on the dredge-frame are only to protect the seizures of the loops. The dredge is suspended by an iron chain, which forms the first few fathoms of the dredge-line. The chain is not, however, directly fastened to the ring at the end of the arms, but is made fast to one of the end bars of the dredge-frame, and it is stopped to the ring by a single strand of bolt-ropes. If the dredge get caught the stop carries away, the direction of the strain on the dredge is altered, and it probably relieves itself and comes up end upwards. In deep water a 28 lb deep-sea lead is usually hung from the centre of the tangle-bar with four tangles on each side.

Dredging was carried on in the "Challenger" from the main yard-arm. A strong pendant was attached by a hook to the cap of the main-mast, and by a tackle to the yard-arm a compound arrangement of 55 to 70 of Hodge's patent accumulators was hung to the pendant, and beneath
it a block through which the dredge-rope passed. The donkey-engines for hauling in the dredging and sounding gear were placed at the foot of the main-mast on the port side. They consisted of a pair of direct-acting, high-pressure, horizontal engines, in combination of 18 horse-power nominal. Instead of a connecting rod to each, a guide was fixed to the end of the piston-rod with a brass block working up and down the slot of the guide. The crank-axles ran through the centre of the blocks, and the movable block, obtaining a backward and forward motion from the piston-rod, acted on the crank as a connecting-rod would do. This style of engine is commonly used for pumping, the pump-rods being attached to the guide on the opposite side from the piston-rod. At one end of the crank a small toothed wheel was attached, which drove one thrice the multiple on a horizontal shaft extending nearly across the deck, and about 3 feet 6 inches above it. At each end of this shaft a large and a small drum were fixed, the larger having three sheaves cast upon it of different sizes, the lesser being a common barrel only. To these drums the line was led, two or three turns being taken round the drum selected. In hauling in, the dredge-rope was taken to a gin-block secured to a spar on the forecastle, then aft to the drum of the donkey-engines on the port side, then to a leading-block on the port side of the quarter-deck, and across the deck to a leading-block on the starboard side corresponding in diameter with the drum used on the port side, and from this it was finally taken by the hands and coiled. The strain is of course greatest at the yard arm and the first leading-block, and by this arrangement it is gradually diminished as the line passes round the series of blocks and sheaves.

A change made latterly in the handling of the dredge had certain advantages. Instead of attaching the weights directly to the dredge-rope, and sending them down with the dredge, a "toggler," a small spindle-shaped piece of hard wood, was attached transversely to the rope at the required distance, 200 to 300 fathoms in advance of the dredge. A "messenger," consisting of a figure of eight of rope, with two large thimbles in the loops, had one of the thimbles slipped over the chain before the dredge was hung, and the other thimble made fast to a hizard. When the dredge was well down and had taken its direction from the dust of the ship, the weights, usually six 28½ deep-sea leads in three canvas covers, were attached to the other thimble of the traveller, which was then cut adrift from the hizard and allowed to spin down the line until it was brought up by the toggle. By this plan the dredge took a somewhat longer time to go down, but after it was adopted not a single case occurred of the fouling of the dredge in the dredge-rope, a misadventure which had occurred more than once before, and which was attributed to the weights getting ahead of the dredge in going down, and pulling it down upon them entangled in the double part of the line.

The great risk in dredging in very deep water is that of the dredge running down nearly vertically and sinking at once into the soft mud, and remaining imbedded until hauling in commences. During the earlier part of the voyage of the "Challenger" this accident seemed too often to defeat, at all events partially, the object of the operation; and, after various suggestions for modifying the dredge, it was proposed to try some form of the trawl in order to insure, so far as possible, the capture of any of the larger marine animals which might be present, and thus to gain a better general idea of the nature of the fauna. A 15-feet beam-trawl was sent down off Cape St Vincent to a depth of 600 fathoms; the experiment was tried at several different depths, but the trawl seemed to answer so well that it was tried again a little farther south in 1090 fathoms, and again it was perfectly successful, and during the remainder of the voyage it was employed almost as frequently, and in nearly as deep water, as Ball's dredge. The deepest successful haul of the trawl was in the Pacific in 3123 fathoms, and the deepest haul of Ball's dredge was in the Atlantic at 3150 fathoms.

During the voyage of the "Challenger" a course of about 70,000 nautical miles was traversed in three years and a half, and 362 observing stations were established at intervals as nearly uniform as circumstances would permit; and at the greater number of these dredging or some modication of the process was successfully performed—52 times at depths greater than 2000 fathoms, and three at depths beyond 3500 fathoms. So fully convinced were the "Challenger" officers that they could dredge at any depths, that it was only want of time and daylight which prevented their doing so at their deepest sounding, 4575 fathoms. The Atlantic was crossed five times, and an errate route through the Pacific gave a good idea of the conditions of the abysses of that ocean, while in the South Indian Ocean dredging and trawling were carried down close to the Antarctic ice-barrier.

The expedition was successful, and the results were of the most interesting nature. Animal life was found to exist at all depths, although probably in diminishing abundance as the depth becomes extreme; and in all parts of the world at depths beyond 400 or 500 fathoms the fauna had much the same general character. The species usually differed in widely separated areas, but the great majority of forms, if not identical, were so nearly allied that they might be regarded as representative and genetically related. Although all marine invertebrate classes were represented, echinoderms in their different orders, sponges, and Crustacea were comparatively scarce. In the first two groups named many forms occurred allied to families which had been previously regarded as extinct or nearly so; thus among the echinoderms, stalked crinoids were by no means rare, and many species of regular Echinidea related to the Chalk genus Echinocardium, and many irregular species allied to Anomalines and Dysaster occurred. The sponges were mainly represented by the Hexactinellida, the beautiful order to which the glass-robe sponges of Japan and the marvellous "Vena's Flower Basket" of the Philippines belong, the order to which the Turritasites of the Chalk must also be referred.

Dredging at these great depths is a difficult and critical operation, and, although by its means some idea of the nature and distribution of the abyssal fauna of the ocean has already been attained, it will be long before the blanks are filled up, for of the area of 140,000,000 square miles forming the "abyssal province" the actual amount hitherto traversed by the naturalist's dredge may still be readily reckoned by the square yard. (C. W. T.)

DREDGING. Dredging is the same given to the severer processes to the process of excavating materials under water, raising them to the surface, and depositing them in barges. It is a process which has been useful from very early times in works of marine and hydraulic engineering, and it has of late years, by improved appliances, been brought to high perfection.

Bag and Spoon Dredge.—The first employment of machinery to effect this object is, like the discoverer of the canal lock, claimed alike for Holland and for the United States, both of which countries dredging is believed to have been practised before it was introduced in this country. It was found practised in the Dutch at a very early period used about 155 lbs per hour "bag and spoon" dredge for clean.
simply a ring of iron, about 2 feet in diameter, flattened and steadied for about one-third of its circumference, having a band of strong leather attached to it by leather thongs. The ring and bag were fixed to a pole, which, on being used, was lowered to the bottom from the side of a barge moored in the canal or river. A rope made fast to the iron ring was then wound up by a windlass placed at the other end of the barge, and the spoon was thus dragged along the bottom, and was guided in its progress by a man who held the pole. When the spoon reached the end of the barge where the windlass was placed, the winding was still continued, and the suspending rope being nearly perpendicular, the bag was raised to the surface, bringing with it the stuff excavated while it was being drawn along the bottom. The windlass being still wound, the whole was raised to the gunwale of the barge, and the bag, being emptied, was again hauled back to the opposite end of the barge, and lowered for another supply. This system is slow, and only adapted to a limited depth of water and soft bottom. But it has been generally employed in canals, and is much used in the Thames. The writer had occasion to use it at the Fossdyke Canal, in Lincolnshire, where 135,000 tons were raised in the manner described.

Dredging by Bucket between two Lighters.—Another plan, practised at an early period in rivers of considerable breadth, was to moor two large barges, one on each side; between them was slung an iron dredging bucket, which was attached to both barges by chains wound round the barrels of a crab winch worked by six men in one barge, and round a simple windlass, worked by two men in the other. The bucket, being lowered at the side of the barge carrying the windlass, was drawn across the bottom of the river by the crab winch on the other barge; and, having been raised and emptied, it was hauled across by the opposite windlass for a repetition of the process. This plan was in use in the Tyne till 1833.

Steam Dredges.—In all large operations these and other primitive appliances have now, as is well known, been superseded by the steam dredges, which was first employed, it is believed, in deepening the Wear at Sunderland about the year 1796. The Sunderland machine was made for Mr Grimshaw by Boulton and Watt. Receiving improvements from Mr Hughes, Mr Rennie, Mr Jessop, and others, the steam dredge, as now generally constructed, is a most powerful machine in skilful hands, excavating and raising materials from depths of 15 to upwards of 30 feet of water according to the size of the machinery, at a cost not very different from, and in some cases even less than, that at which the same work could be performed on dry land. As to the kind of work that may be accomplished by dredging, it may be stated that almost all materials, excepting solid rock or very large boulders, may now be dredged with ease. Loose gravel is probably the most favourable material to work in; but a powerful dredge will readily break up and raise indurated beds of gravel, clay, and boulders, and even find its way through the surf and soft bottom, though it will not penetrate very far into it. In such cases it is usual to alternate on the bucket-frame a bucket for raising the stuff, with a rake or pronged instrument for disturbing the bottom. The writer in his own experience has raised boulders weighing upwards of a ton with a powerful dredge of the ordinary construction, and removed the disintegrated or rotten rock at least to a limited depth, and he believes that in many cases the surfaces of submerged most of a may, by means of such appliances, be to some extent had seen cut up and removed, so as to obtain in certain Situations the H.M.S. "Vestigia." Considerable increase of depth, without recourse to steam working, which involves the investigation of large riversteam dredges is now an ocean basins. The main feature of the machine is the bucket-ladder, which is lowered through an arks formed in the vessel till it reaches the bottom. Along this ladder a series of buckets traverse which cut into the bottom at the lower extremity of the ladder and return loaded with the excavated material, which is discharged at the top of the bucket-ladder into a lighter or barge prepared for its reception. The machines are sometimes made with single and sometimes with double ladders, sometimes discharging at the stern of the vessel and sometimes at both sides, but it is obviously impossible to give illustrative drawings of the different forms of dredgers in sufficient detail to be practically useful. It may be stated that a first-class dredging machine to work in 30 feet water, and discharge over either side, of 60 horse-power complete, costs at present prices about £16,000 to £18,000. The steam hoppers employed to receive and remove the dredgings carry about 500 tons of excavations; they are 70 horse-power, and steam at about 9 miles per hour. The hopper, of course, can only be operated during the day, and may be opened when the place of deposit is reached, and the dredgings easily and quickly discharged. These steam barges cost about £8000. Large dredges, such as those constructed by Messrs Wingsate, for Glasgow for the Tyne and other places, will excavate at the rate of 450 tons per hour when working on a favourable ground.

Hopper Dredge.—Some improvements that have been suggested on the dredging plant hitherto used deserve notice. Among these may be mentioned that of Messrs Simons & Company, Renfrew, who have patented and constructed what they have called a hopper-dredge, combining in itself the advantages of a dredge for raising the material and a screw hopper vessel for conveying it to the place of discharge, both which services are performed by the same engines and the same crew. Messrs Simons have constructed seven hopper dredges on this plan, varying from 200 to 1000 tons of "hopper capacity."

Bulldredge.—Another of the recently suggested improvements is that by Mr C. Randolph, who, in 1870, proposed that, instead of the ordinary dredging buckets, pipes should be lowered until they come into contact with the sand or mud at the bottom. The tops of these pipes were to be in communication with powerful centrifugal pumps, so that the velocity of the in-drawing water through the pipes could be made so great as to carry with it a large percentage of the sand or mud from the bottom; and when the solid matter, and the water in which it is suspended, were raised to the desired height, they would flow freely to any required place for deposit of the suspended material. It is not known that this plan has been carried into practical operation.

Dredging at Amsterdam and Suez Canals.—Another arrangement is that of raising the material by buckets in the ordinary way, and, thereafter receiving it in a vessel and floating it off by pipes to the place of deposit. This, of course, can only be done where the place of deposit is close to the spot whence the material is dredged. Two plans have been proposed for effecting this. One of these has been used in the Amsterdam Canal, where the stuff is discharged from the buckets into a vertical cylinder, and is there mingled with water by a revolving Woodford-pump and sent off under pressure to the place of deposit in a semi-fluid state. At the Amsterdam Canal this was done by pipes made of timber, and hooped with iron rings. These wooden cylinders were made in lengths of about 15 feet, connected with leather joints, and floated on the surface of the water, conveying the stuff to the requisite distance, like the hose of a fire engine. It is, however, believed, of 4 or 5 feet, and depositing it over the banks of the canal. A somewhat similar process was employed.
on the Suez Canal.—not, however, by using pumps, but simply by running the stuff to the banks on steeply inclined shoots, which were supplied with water when the material raised did not contain sufficient water to cause it to run freely. It is obvious, however, that these arrangements can only be applied in situations where the material to be excavated is of a very soft nature, and where the place of deposit is close at hand. In keeping clear the Suez Canal such appliances may be very useful, as the soft deposit of the canal has only to be raised and projected over the banks on either side.

**American Dredges.**—Dredging in Canada and the United States is done by what are called *Dipper* and *Clam-shell* dredges, the bucket dredge being seldom used.

The *dipper dredge* consists of a barge, with a Derrick-crane reaching over the stern, suspending a large wrought-iron bucket which brings up the dredged material. To the bucket is attached a pole 6 inches by 4 inches in cross section, by which means it is guided while being drawn along the bottom; it is then raised, and its bottom being made to drop open, the contents fall into the barge moored alongside of the dredge. The bottom of the barge is kept closed by a catch, which, by means of a rope, can be withdrawn at the proper moment. The *clam-shell* is a box made of two similar pieces of wrought iron hinged together at one end; by a simple arrangement of the gearing the clamp, mouth open, drops down and is closed at the bottom, and the first effect of heaving up is to close it, thus imprisoning a quantity of material which is raised and deposited as in the case of the dipper. Both kinds of dredges are worked by a steam-engine, and rough as they appear to be, they are extensively employed in deepening and widening river channels, making or deepening canals, and other such works.

This is not the place to discuss the merits of different apparatus, which perhaps can only be settled by the actual performance of different arrangements when fully tested by practice. Having thus briefly noticed them, a few practical observations on dredging, as more immediately applicable to British rivers, have still to be mentioned.

**Longitudinal and Cross Dredging.**—In river dredging, two systems are pursued. One plan consists in excavating a series of longitudinal furrows parallel to the axis of the stream, the other in dredging cross furrows from side to side of the river. It is found that inequalities are left between the longitudinal furrows when that system is practiced, which do not occur, to the same extent, in side or cross *dredging*, and the writer invariably finds cross dredging to leave the most uniform bottom. To explain the difference between the two systems of dredging it may be stated that in either case the dredge is moved from the head and stern by chains about 250 fathoms in length. These chains in improved dredges are wound round windlasses worked by the engine, so that the vessel can be moved ahead or astern by simply throwing them into or out of gear. In longitudinal dredging the vessel is worked forward by the head chain, while the buckets are at the same time performing the excavation, so that a longitudinal trench is made in the bottom of the river. When the dredge has proceeded a certain length, it is stopped and permitted to drop down and commence a new longitudinal furrow parallel to the first one. In cross-dredging, on the other hand, the vessel is supplied with two additional moorings, one on each side, and these chains are, like the head and stern chains, wound round barrels wrought by the engine. In commencing to work by cross dredging, it may suppose itself to be at one side of the channel to be excavated. The bucket frame is set in motion, but, instead of the dredge being drawn forward by the head chain, she is drawn to the opposite side of the river by the side chain, and, having reached the extent of her work in that direction, she is then drawn a few feet forward by the head chain, and, the bucket frame being still in motion, the vessel is hauled across by the opposite chains to the side where she started. By means of this transverse motion of the dredge a series of cross furrows is made; she takes out the whole excavation from side to side as she goes on, and leaves no protuberances such as are found to exist between the furrows of longitudinal dredging, even where it is executed with great care. The two systems will be best explained by reference to fig 1, where A and B are the head and stern moorings, and C and D the side moorings, the arc of represents the course of the vessel in cross dredging, while in longitudinal dredging, as already explained, she is drawn forward towards A, and again dropped down to commence a new longitudinal furrow.

**Blasting combined with Dredging.**—In some cases, however, the bottom is found to be too hard to be dredged until it has been to some extent loosened and broken up. Thus at Newry, Mr. Bennie, after blasting the bottom in a depth of from 6 to 8 feet at low water, removed the material by dredging at an expense of from 4s. to 5s. per cubic yard. The same process was adopted by Messrs. Stevenson at the bar of the Erne at Ballyshannon, where, in a situation exposed to a heavy sea, large quantities of boulder stones were blasted, and afterwards raised by a dredger worked by hand at a cost of 10s. 6d. per cubic yard.

Sir William Cubitt also largely employed blasting in connection with dredging on the Severn, of which an instructive account is given in the Minutes of Proceedings of the Institution of Civil Engineers, from which the following particulars are taken—

1. Clay weighs about 105 lb. and sandstone about 155 lb. per cubic foot.

![Diagram](image-url)
coast at any time be done in one tide. The surface over which the blasting was done measured 800 yards in length by 200 yards in breadth, a small part of the surface being uncovered at low water. The depth obtained in mid-channel was 14 feet at low-water, the average depth of rock blasted being about 4 feet 6 inches. The holes, which were bored with the diamond drill, varied in depth from 7 to 9 feet, the distance between them being 18 feet. Dynes were filled in tin canisters fired by patent fuse was used as the explosive, the charges being 2 lb. and under. The rock is Oolite shale of variable hardness, and the average time occupied in drilling 5-feet holes was twelve minutes. The dredger raised the blasted rock,—the cost for blasting, lifting, and discharging at sea being about 4s. per cubic yard, including interest on dredging and other plant employed. The dredger sometimes worked a face of blasted material of from 7 to 8 feet. The quantity blasted was 110,000 cubic yards, and the contract for blasting so as to be lifted by the dredger was 3s. 1d. per cubic yard.

Dredging in Exposed Situations.—In some cases dredging has to be conducted in exposed situations such as the deepening of the "flats" at Londonderry and the bar at Carlisle. Messrs Stevenson found that dredging at the Foyle could not be conducted when the height of the waves exceeded 2½ feet; and Mr Barton at Dundalk so far confirms this, as he estimates a swell of 2 feet as the highest to work in.

Dredging on the River Clyde.—An important point connected with this subject is the cost at which dredging may be done when conducted on a large scale. This, of course, must depend on the character of the stuff to be raised and other circumstances; but the following information, kindly communicated by Mr James Deas, the engineer to the Trustees of the Clyde Navigation, cannot fail to be both interesting and useful.

Mr Deas says truly that the Clyde Trustees employ probably the largest dredging fleets of any trust in the kingdom, in maintaining and still deepening and widening the river to meet the ever-increasing demands of the shipping trade.

In the year 1871, for example, 904,104 cubic yards, or about 1,130,000 tons, were dredged from the river, of which 689,560 cubic yards were carried to sea by steam hopper barges, and 214,544 cubic yards was deposited on land by means of punts. Of this 904,104 cubic yards, 343,299 cubic yards were deposit from the higher reaches of the river and its tributaries, and from the city sewers, and 558,865 cubic yards new material. The total cost for dredging and depositing was £33,448, or about 9½ pence per cubic yard.

Owing to the difference in power of the dredging machines employed, and the character of the material lifted, the cost of dredging varies much. In 1871 the most powerful machine, working 24 hours, lifted 430,240 cubic yards of silt and sand at a cost of 2½ pence per yard; and this was deposited in Loch Long, 27 miles from Glasgow, by steam hopper barges, at 5½ pence per yard. On the other hand, another dredger, working 2605 hours, lifted only 26,720 cubic yards of hard gravel and boulder clay, at the cost of 20½ pence per cubic yard, which was deposited on the alveus of the river at the cost of 17½ pence per cubic yard; another, working 1831½ hours, lifted 122,664 cubic yards of silt, sand, and sewage deposit, at the cost of 5½ pence per cubic yard, which was deposited on land at the cost of 18½ pence per cubic yard; and another, working 2335 hours, lifted 65,160 cubic yards of till, gravel, and sand, at the cost of 5½ pence per cubic yard, which was deposited on the alveus of the river at the cost of 9½ pence per cubic yard.

The total quantity dredged from the river during the twenty-seven years prior to 1872 amounts to 13,617,000...
cubic yards, or upwards of 17,000,000 tons. The dredging plant of the Clyde Trust comprises—

- 6 steam dredges,
- 14 steam hopper barges,
- 1 steam-tug,
- 3 diving-bells,
- 270 pinte, and numerous small boats.

The expenditure for wages of crews, coal, and stores amounted in the year 1871 to fully £14,000, and for repairs £10,775. The value of the dredging plant employed is about £140,000.

Mr. Deas has also kindly furnished the following tables, from which the reader will see the gradual increase that has been made on the size of the dredging machines to meet the increased depth of water and growing necessity of increased accommodation for the larger class of vessels which now frequent the river.

The following are the details as regards the dredgers and barges employed on the Clyde:

**No. 8 Dredger.**

- Length, 141 ft.
- Breadth, 29 ft.
- Depth, 10 ft.
- One bucket ladder, 90 ft. 9 in. between centres.
- Size of buckets, 3 ft. 3 in. x 3 ft. 2 in. x 1 ft. 11 in.
- When working in sand, can lift 190 cubic yards per hour.
- Greatest depth can dredge in, 28 ft.
- Working distance, 6 to 7 miles.
- Wages per day on 10 hours as under:
  - Master
  - Mate
  - Lionhearty
  - Fireman
  - Assistant do. and cook
  - Bow craneman
  - Stern craneman
  - Deck hands (2), each
  - Watchman
  - Coals
  - Tailors
  - Oil (lead)
  - Waste

**Steam Hopper Barge**

- Length, 145 ft.
- Breadth, 25 ft.
- Depth, 11 ft. 9 in.
- Engines, 40 horse power.
- Draught light (average), 5 ft. 4 in.
- Draught loaded, 11 ft.
- Speed, 8 to 9 miles per hour.
- Capacity of hopper, 250 cubic yards, or say 400 tons.
- Average distance run, loaded, 20 miles.
- Wages per day as under:
  - Master
  - Engineer
  - Fireman
  - Deck hands (2), each
  - Tailor
  - Oil (lead)
  - Waste

Quantity and cost of dredging done by No. 8 Dredger during year ending 30th June 1871:

- Wages £672 6 0
- Coal £37 10 0
- Repairs £175 1 0
- Interest and depreciation—£13,551.3 2 10 per cent

- Total £11,079 6 2

- Number of days worked during year, 256
- Engine hours 4,220
- Horse power 258
- Total cubic yards 2,964,806

Quantity and cost of conveying and discharging the total dredgers by Nos. 6 and 8 Dredgers during the year ending 30th June 1871:

- Wages, coal, and stores £697 8 0
- Repairs £25 2 9
- Interest and depreciation—£10,172 8 2
- Total £15,125 4 2

No. 6 and 8 are punt-loading machines.

DRELCOURT, CHARLES (1560–1669), an eminent minister of the French Calvinistic church, was born at Sedan on the 10th July 1565. He studied first at the university of his native town, and afterwards at Saumur under the celebrated Professor Mark Duncan. In June 1618 he undertook the charge of the French Protestant church at Langres, where his ministrations were highly appreciated. The church, however, failed to receive the necessary royal sanction, and early in 1620 Drelincourt

DRELCOURT, CHARLES (1560–1669), an eminent

* Contractor's price for discharging at Blythwood Park, including ship docks, and voyaging a distance of about 1 mile.
removed to Paris, where he was ordained minister of the church at Charenton. He was an popular and eloquent preacher, distinguished especially by his power of practically applying the words of Scripture. He was the author of a large number of works in devotional and polemical theology, several of which had great influence, and attained a very extensive circulation. His Catechism and his Consolations against the Fear of Death (Consolations contre les frayeurs de la mort) became well known in England by means of translations, which were very frequently reprinted. It has been said that Defoe wrote his fiction of Mrs Veal, who came from the other world to recommend the perusal of Drelincourt on death, for the express purpose of promoting the sale of an English translation of the work. His controversial works were very numerous. Directed entirely against Roman Catholicism, they did much to strengthen and consolidate the Protestant party in France. Drelincourt died on the 5th November 1669. In 1628 he had married the only daughter of a wealthy merchant, by whom he had a family of sixteen. Several of his sons were distinguished as theologians or physicians. The third, Charles, was dean of Armagh. ordained a physician to the prince of Orange; professor of physic in the university of Leyden, and became dean of Armagh.

DRESDEN, the capital of the kingdom of Saxony, is situated in a beautiful and richly cultivated valley on both sides of the Elbe, at an altitude of 402 feet above the level of the Baltic, 72 miles E.S.E. of Leipzig, and 116 miles S.E. of Berlin, in 51° 3' N. lat. and 13° 44' E. long. It is approached on almost every side through avenues of trees, and the distance is bounded by gentle eminences covered with plantations and vineyards. On the left bank of the Elbe are the Altstadt, with three suburbs, and Friedrichstadt (separated from the Altstadt by the Weisselitz, a small affluent of the Elbe); on the right the Neustadt and Antonstadt. Two fine bridges connect the Altstadt and Neustadt—one of them, the old bridge, erected 1727–31, being 1420 feet long, and having 16 arches. The other, built 1846–52, unites the railways on the right and left banks. The streets of the Altstadt are narrow and somewhat gloomy; those of the Neustadt wider and more regular. In 1875 there were 196,378 inhabitants, of whom 138,306 were on the left bank, 58,072 on the right. The vast majority of the population belong to the Lutheran Church.

On account of its delightful situation, and the many objects of interest it contains, Dresden is often called "the German Florence," a name first applied to it by Herder. The most imposing of the churches is the church of Our Lady, built 1726–45, with a cupola 311 feet high. The Roman Catholic church, built 1737–56, contains a magnificent organ by Silbermann, a number of statues by Mattielli, and pictures by Raphael Mengs, Sylvestre, and other artists. The church of St Sophia, begun in the 14th century, completed in the 16th, and restored in 1864–69, the Cross Church, the Russian church, and the synagogue are also noteworthy buildings. The Royal Palace, rebuilt 1734 by Duke George, surmounted by a tower 397 feet high, the highest in Dresden, is externally unattractive, but the interior is splendidly decorated. In the palace chapel are pictures by Rembrandt, Nicolas Poussin, Guido Reni, and Annibale Canacci. The Prince's Palace, built in 1715, has a fine chapel, in which are various works of Torelli; it has also a library of 20,000 volumes. The Zwinger, begun in 1711, and built in the Bococo style, forms an inclosure within which is a statue of King Frederick Augustus I. It was intended to be the vestibule to a palace, but now contains a number of collections of great value. Until 1846 it was open at the north side; but this space has since been occupied by the Museum, a beautiful building in the Renaissance style, the exterior of which is adorned by statues of Michelangelo, Raphael, Giotto, Dante, Goethe, and other artists and poets, by Rietschel and Hahnel. The Bruhl Palace was built in 1737 by Count Bruhl, the minister of Augustus II. Near it is the Bruhl Terrace, approached by a grand flight of steps, on which are groups, by Schilling, representing Morning, Evening, Day, and Night. The terrace commands a charming view of the Elbe and the surrounding country, and is a favourite promenade. The Japanese Palace, in the Neustadt, built in 1715 as a summer residence for Augustus II., receives its name from certain Oriental figures with which it is decorated; it is also sometimes called the Augusteum. Connected with it is a public garden, from which, as from the Bruhl Terrace, fine views are obtained. Among the remaining buildings of note may be named the guard-house, the arsenal, and the court theatre, an edifice in the Renaissance style, built since 1871 to replace the theatre burnt in 1869. In the Neustadt there is an equestrian statue of Augustus the Strong, erected in 1737. The public monuments of Dresden also include the Maurice Monument, a relief dedicated by the elector Augustus to the memory of his brother; a statue of Weber, the musical composer, by Rietschel; statues of King Frederick Augustus II. and Theodore Korner, by Hahnel; and the Rietschel monument, on the Bruhl Terrace, by Schilling.

The chief pleasure-ground of Dresden is the Grosser Garten, in which there are a summer theatre, the Rietschel Museum, and a château containing the Museum of Antiquities. The latter is composed chiefly of objects removed from the churches in consequence of the Reformation. Near the château is the zoological garden, formed in 1860, and excellently arranged. A little to the south of Dresden, on the left bank of the Elbe, is the village Racknitz, in which is Moreau's monument, erected on the spot where he was fatally wounded in 1813. The remains of Saxon Switzerland are seen from this neighbourhood.

On the right bank, the slopes of which are covered
with villas, there are several popular places of public resort.

Dresden owes a large part of its fame to its extensive artistic, literary, and scientific collections. Of these the most valuable is its splendid picture gallery, founded by Augustus II and increased by his successors at great cost. It is in the Museum, and contains about 3500 pictures, being especially rich in specimens of the Italian, Dutch, and Flemish schools. Among the Italian masters represented are Raphael, Titian, Coreggi, Leonardo da Vinci, Paolo Veronese, Andrea del Sarto, Guilio Romano, Annibale Carracci, Guido Reni, and Carlo Dolci. Of the Flemish and Dutch schools there are paintings by Rubens, Van Dyck, Rembrandt, and Ruysdael, Wouvermann, Dow, Teniers, Ostade, Potter, &c. The French school is represented, among others, by Poussin and Claude. The gem of the collection is Raphael's Madonna di San Sisto, for which a room is set apart. There is also a special room for the Madonnas of the younger Holbein. Other paintings with which the name of the gallery is generally associated are Coreggi's La Notte and Magdalen, Titian's Tribute Money and Venna; The Adoration and The Marriage in Cana, by Paolo Veronese; Andrea del Sarto's Abraham's Sacrifice, Rembrandt's Portrait of Himself with his Wife sitting on his Knee, The Judgment of Paris and The Boar Hunt, by Rubens; Van Dyck's Charles I, his Queen, and their Children. In separate compartments there are a number of crayon portraits, most of them by Rembrandt Carriera, and views of Dresden by Canaletto and other artists. Besides the picture gallery the Museum includes a magnificent collection of engravings and drawings. There are upwards of 350,000 specimens, arranged in twelve classes, so as to mark the great epochs in the history of art. A collection of casts, likewise in the Museum, is designed to display the progress of plastic art from the time of the Egyptians and Assyrians to modern ages. This collection was begun by Raphael Mengs, who secured casts of the most valuable antiquities in Italy, some of which no longer exist.

The Japanese Palace contains a public library of more than 300,000 volumes, with about 3000 MSS. and 20,000 maps. This library is especially rich in the ancient classics, and in works bearing on literary history and the history of Germany, Poland, and France. In the Japanese Palace there are also a valuable cabinet of coins and a collection of ancient works of art. A collection of porcelain, formerly in the Japanese Palace, but since 1876 in the "Museum Johanneum" (which once contained the picture gallery), is made up of specimens of Chinese, Japanese, East Indian, Sèvres, and Meissen manufacture, carefully arranged in chronological order. There is in the same building an excellent Historical Museum, in which there are many interesting relics of past times, besides objects which cast light on the history of races and of manners. In the Green Vault of the Royal Palace, so called from the character of its original decorations, there is an unequaled collection of precious stones, pearls, and works of art in gold, silver, amber, and ivory. The objects, which are about 3000 in number, are arranged in eight suites. They include the regalia of Augustus II as king of Poland; the electoral sword of Saxony; a group by Dunginger, in gold and enamel, representing the court of the Grand Mogul Aurungzebe, and consisting of 132 figures upon a plate of silver 4 feet 4 inches square; the largest onyx known, 63 inches by 23 inches; a pearl representing the dwarf of Charles II. of Spain; and a green brilliancy weighing 40 carats. Besides the Green Vault the Royal Palace has a gallery of arms, consisting of more than 2000 weapons of artistic or historic value. In the Zwinger are the Zoological and Mineralogical Museums, and a collection of instruments used in mathematical and physical science.

The two chief art institutions in Dresden are the Royal Academy of Arts, founded in 1764, and the Royal Choir. The Art Union, founded in 1828, which has a permanent exhibition in the Brühl Terrace, is a private body; and there are a good many other private art societies more or less distinguished. Dresden is also the seat of a number of well-known scientific institutions. The educational institutions of the town are both numerous and of a high order, including a technical college with a staff (in 1876) of 39 professors and teachers, three gymnasia, two real schools of the first class, and many schools of different ranks for popular education. The Catholics and Jews have schools of their own; and there are two seminaries for the education of teachers. Dresden has several important hospitals, asylums, and other charitable institutions.

Among the chief branches of industry are manufactures in gold and silver, turnery, straw plait, scientific and musical instruments, paper-hangings, artificial flowers, and painters' canvas. There are several large breweries; a considerable corn trade is carried on, and there is an extensive traffic in books and objects of art. A number of steam-ship companies provide for the navigation of the Elbe.

Dresden, which is known to have existed in 926, was of Slavonic origin. It became the capital of Henry the Illustrious, margrave of Meissen, in 1270, but belonged for some time after his death, first to Wenceslas of Bohemia, and next to the margrave of Brandenburg. Early in the fourteenth century it was restored to the margrave of Meissen. On the division of the territory in 1455, it fell to the Albertine line, which has since held it. Having been burned almost to the ground in 1491, it was rebuilt, and in the sixteenth century the fortifications were begun and gradually extended. John George I, in the seventeenth century, formed the Grosser Garten, and otherwise greatly improved the town, but it was in the first half of the 18th century, under Augustus I and Augustus II, who reigned as Poland, as well as electors of Saxony, that Dresden assumed something like its present appearance. The Neustadt, which had been burned down in the 17th century, was then rebuilt by Augustus I., and he also founded Friedrichstadt. The town suffered severely during the Seven Years' War, being bombarded in 1760. Some damage was also inflicted on it in 1813, when Napoleon made it the centre of his operations, one of the batteries and two arches of the old bridge were then blown up. The dismantling of the fortifications had been begun by the French in 1810, and was gradually completed after 1817, the space occupied by them being appropriated to gardens and promenades. Many buildings were completed or founded by King Anton, from whom Antonsdorf derives its name. Dresden again suffered severely during the revolution of 1848, but all traces of the disturbances which then took place were soon effaced. In 1866 it was occupied by the Prussians, who did not finally evacuate it until the spring of the following year. Since that time numerous improvements have been carried out, and between 1871 and 1875 the population increased at the rate of rather more than 11 per cent.

DREUX (Dureusca, Droic), a town of France in the department of Eure-et-Loir, on the Blaise, 21 miles north of Chartres. Noteworthy structures are the Gothic church of St Fere; the town-house, partly in the Gothic and partly in the Renaissance style, built in the 16th century, and the remains of a castle of the 12th century, situated on the hill overlooking the town, within the enclosure of which is a chapel commenced in 1516 by the dowager duchess of Orleans, and completed and adorned at great cost by Louis Philippe. The chief industries of Dreux are dyeing and silk-weaving, and the manufacture of jewellery, serge, hose, canoes, hats, and leather. In 1872 the population of the commune was 7418, of the town 6666.

Dreux was governed by counts in the Middle Ages. In 188 it was taken and burned by the English; and in 1562 Coligny and the Prince of Condé were defeated in its vicins. Montmorency was captured in 1563 Henry IV, captured the town after a fortnight's siege. Dreux was occupied by the Germans on October 9th, 1870, was subsequently evacuated, and was again taken, on November 17th, by General Von Treuschow.

DREW, SAMUEL (1765-1833), theologian, was born in the parish of St Austell, in Cornwall, March 3, 1765. Has
father was a poor farm-labourer, and could not afford to send him to school long enough even to learn to read and write. At the age of seven he lost his mother, a woman of superior mind and religious character; and he was then sent to work with the tanners. At ten he was apprenticed to a shoemaker, and at twenty he settled in the town of St. Austell, first as manager for a shoemaker; and about three years later he began business on his own account. He had already gained a reputation in his narrow circle as a keen debater and a jovial companion. He was first aroused to serious thought by the preaching of Adam Clarke; and the impression thus produced was deepened by the death of his elder brother. He now joined the Methodists, was soon employed as a class leader and local preacher, and continued to preach till a few months before his death. His opportunities of gaining knowledge were very scanty, but he strenuously set himself to make the most of them. It is stated that an accidental introduction to Locke's great essay determined the ultimate direction of his studies. In 1788 the first part of Bown's Age of Reason was put into his hands; and in the following year he made his first appearance as an author by publishing his Remarks on that work. The book was favourably received, and was republished in 1820. Drew had begun to meditate a greater attempt before he wrote his Remarks on Poins; and the fruits of his laborious investigation were given to the world in the Essay on the Immutability and Immortality of the Soul, in 1802. This work made him widely known, and his reputation in his narrow circle was already gained. His superior mind and religious character; and he was a debater and a powerful and successful orator. He was the first to put a complete needle-gun. A gunnery was opened by him about 1804, and in 1809 he was appointed editor of the Magazine, then newly established, and in 1821 to London, the business being then transferred to the capital. Here he filled the post of editor till his death, and had also the supervision of all works issued from the Caxton press. He was an unsuccessful competitor for a prize offered in 1811 for an essay on the existence and attributes of God. His success in that year, and which in his own judgment was his best, was published in 1820, under the title of An Attempt to demonstrate from Reason and Revelation the Necessary Existence, Essential Perfections, and Superintending Providence of an Eternal Being, who is the Creator, the Supporter, and the Governor of all Things (2 vols. 8vo.). This procured him the degree of M.A. from the university of Aberdeen. Among Drew's lesser writings are Life of Dr. Thomas Coke (1817), A History of Cornwall (1824), and a work on the divinity of Christ (1821). He died at Helston, in Cornwall, March 29, 1833. A memoir of his life by his eldest son appeared in 1834. 

DREYSE, JOHANN NICHOLAS VON (1787-1867), inventor of the needle-gun, was the son of a locksmith, and was born at Sommerda the 20th November 1787. He served his apprenticeship in the shop of his father, and from 1806 to 1809 followed his calling at Altenburg and Dresden. From 1809 to 1814 he was in Paris, where he succeeded in finding employment in the gun-factory of the Swiss officer Pauli, patronized by Napoleon I. Afterwards he returned to Sommerda, where, in partnership with Kronebich, he established a factory for the making of steel in place of iron by machine tools. In 1824 he patented a new percussion action for the gun, and continued thereafter to busy himself with experiments to improve in every way possible the process of shooting. In 1827 he invented the needle-gun, but without the advantage of breech-loading; and in 1836, having been encouraged in his undertakings by the Prussian Government, he invented his first complete needle-gun. A gunnery was opened by him in 1841, which ultimately supplied weapons for the troops of all the German states, and before his death employed about 1500 persons. In 1864 he and his family had the rank of nobility conferred on them. He died 9th December 1867.

DRIFIELD (or GREAT DRIFIELD, to distinguish it from the neighbouring hamlet of Little Driffield), a market-town of England, in the east riding of Yorkshire, 28 miles to the east of York, and 196 miles from London. The town—constituent of one parliamentary borough of the former county of the West Riding of Yorkshire—itself is now a smaller division of the larger of the two, and has received greater attention in modern times. The ancient fortifications, still extant in the beginning of the century, have almost completely disappeared; but of the four gateways, one named after St. Lawrence remains comparatively perfect, and there are considerable ruins of another. Great improvements have been effected in the town since 1847, under the invention and patent of Benjamin Whittworth, M.P., who built a town-hall at his own expense in 1855, and furnished half the funds necessary for the construction of the water-works which now supply 800,000 gals. daily. Among the public buildings are a mansion-house or mansion-house and towns-hall, the old linen-hall, a fine chapel, the old infirmary, a workhouse, and a hospital; five Protestant churches, five Roman Catholic chapels, three friaries, and four nunneries. St Peter’s Church formerly served as the cathedral of the Roman Catholic archbishopric of Armagh; and in the abbey of the Dominican monks there is still preserved the head of Oliver Plunkett, the archbishop who was executed at Tyburn in 1681 on an unfounded charge of treason. There was at one time an archbishopric in the town, built by Archbishop Hamilton about 1630; and the Dominicans, the Franciscans, the Carmelites, and the knights of St John had monastic establishments. Of the Dominican buildings there still exists the stately Magdalen tower; the Franciscan friary is a striking ruin; and there are traces more or less distinct of the Augustinian priory, the priory of St. Lawrence, and the hospital of St Mary. At the head of the educational institutions is a classical school endowed and maintained by the public charities are an almshouse for twenty-four aged widows, and a foundation providing houses and annuities for thirty-six clergyman’s widows. There is also a blue-coat school, founded about
DRO—DRO

1727 for the education of freemen's sons. The present building was erected by T. F. Cairnes in 1870. The industrial establishments comprise a large cotton factory, erected by Mr Whitworth in 1864, four extensive saw-mills, three flax-mills, six flour-mills, eight tanneries, five salt-works, four soap works, two extensive breweries, two tanneries, chemical works, and a large engineering factory for the making of steam-engines, iron-bridges, &c. A brisk trade is carried on, especially with Liverpool (which is distant 133 miles due east), and with Glasgow. The harbour has been greatly improved by the company's expenses, and vessels of 20,000 tons can discharge at the quays. In 1873, 707, with a burden of 115,673 tons, entered the port, and the harbour receipts in 1871 were £3627. The tide reaches 2½ miles above the town to Oldbridge, and barges of 50 tons burden can proceed 1½ miles inland to Navan. The river is crossed by a bridge for ordinary traffic, and by a splendid railway viaduct. Assizes, quarter sessions, and petty sessions are held in the town; the parliamentary borough returns one member to Parliament, and the municipal borough is governed by a mayor, 6 aldermen, and 18 councillors. The population of the municipal borough (area, 454 acres) was 17,365 in 1831, 16,815 in 1851, 15,740 in 1861, and 15,510 in 1871. The whole population, with the exception of about 1105, are Roman Catholics. The inhabitants of the parliamentary borough, which has an area of 5765 acres, number 3635.

In the earliest notices the town of Drogheda is called Inver-Colpa or the Port of Colpa; the present name signifies "The Bridge over the River." In 1122 the place is mentioned as the seat of a synod convened by the papal legate, Cardinal Pappuro, in 1224 it was chosen by Lucas de Netterville, archbishop of Armagh, for the foundation of a Dominican friary, and in 1228 the two divisions of the town received separate incorporation from Henry III. But there grew up a strong feeling of hostility between Drogheda versus Oldbrowg. Mr. M. M., in consequence, the vessels landing there cargoes in the latter or southern town, to avoid the pontage duty levied in the former or northern town. At length, after much blood had been shed in the dispute, Philip Bennett, a monk residing in the town, succeeded by his eloquence, on the festival of Corpus Christi, 1412, in persuading the authorities of the two corporations to send to Henry IV. for a new charter sanctioning their combitions.

Drogheda has always been considered by the English a place of much importance. In the reign of Edward III it was closed along with Dublin, Waterford, and Kilkenny, as one of the four staple towns of Ireland. Richard II. received in its Dominican monastery the submission of O'Neal, O'Donnel, and other chieftains of Ulster and Leinster. The right of owing money was bestowed on the town several times held within its walls. In the reign of Edward IV. the mayor received a sword of state, and an annuity of £20. In recognition of the services rendered by the inhabitants at Malpass Bridge against O'Reilly, the still greater honour of having a university with the same privileges as that of Oxford remained a mere paper distinction, owing to the poverty of the town and the unsettled state of the country, and an attempt made by the corporation in modern times to resuscitate their rights proved unsuccessful. In 1496 Fergus's laws were enacted by a parliament held in the town. In the civil wars of 1641 the place was besieged by O'Neal and the Northern Irish forces; but it was gallantly defended by Sir Henry Tchoburne, and after a long blockade was relieved by the Marquis of Ormond. The same nobleman relieved it a second time, when it was invested by the Parliamentary army under Colonel James. In 1649 it was captured by Cromwell, after a short but spirited defence, and nearly every individual within its walls, with distinction of age or scene, was put to the sword. Thirty only escaped, which afterwards transported as slaves to Barbados. In 1690 it was garrisoned by King James's army, but after the decisive battle of the Boyne—the site of which, about three miles from the town, is marked by an obelisk 150 high,—it surrendered to the conqueror without a struggle, in consequence of a threat that quarter would not be granted if the town were taken by storm. Its subsequent history is purely of local interest.

DROHOBYCZ, a town of Austria, in the Galician circle of Sambor, on the Tysminka, a right-hand affluent of the Dniester, at the junction of a branch line from Borysław with the main Galician railway. It possesses a castle, a beautiful Roman Catholic church, a synagogue, and a German high school; and has inhabitants, who number upwards of 12,000, deal in cattle, grain, earthenware, leather, and salt,—the last being obtained from the local brine-wells.

DROITWICH, a municipal and parliamentary borough of England, in Worcestershire, on the Salwarpe, a left-hand tributary of the Severn, about seven miles by rail N.N.E. of Worcester. With the exception of its modern extensions, the town is built in a straggling and irregular fashion, but it numbers among its public edifices a court-chamber and market-house, two churches,—St Andrew's and St Peter's,—several chapels, and a hospital established by Lord Keeper Coventry, the revenues of which maintain about forty men and women, and educate about 100 young persons of both sexes. The principal occupation is the manufacture of the salt obtained from the brine springs, or segetes, to which the town probably owes both its name and its origin; and the annual quantity obtained is about 116,000 tons. These springs were known to the Romans, who had a station on the spot, as was shown by the remains of a villa, with some interesting and valuable relics, discovered during the formation of the Oxford and Wolverhampton railway. In Domesday-book mention is made of a tax levied on the salt, which must consequently have been manufactured in the 11th century. A charter was bestowed on Droitwich by King John. The population of the municipal borough, with its area of 1849 acres, was 3304 in 1871; that of the parliamentary borough, with its area of 27,577 acres, was 9510.

DROME, a department in the south-east of France, formed of parts of Dauphiné and Provence, is bounded W. by the Rhone, which separates it from Ardèche, N. and N.E. by Isère, E. by Hautes Alpes, S.E. by Basses-Alpes, and S. by Vaucluse, and lies between 44° 15' and 5° 15' E. long. To the east it is covered by spurs of the maritime Alps, one of the largest of which forms part of its eastern boundary, and throws off ridges, mostly wooded, that run east and west with tolerable regularity. These ridges divide the department in its whole extent into three great valleys, having a general slope westward to the Rhone, namely, that of the Isère in the north, that of the Drôme, which occupies the central part of the province, and that of the Auvèze, in the south. The Rhone and Isère are both navigable. The former receives the whole of the drainage of the department. The soil consists of clays and argilaceous sand with rolled pebbles. The irrigation canals are numerous. The climate, except in the valleys bordering the Rhone, is rather cold, but on the whole breezy and healthy. Snow is visible on the mountain-tops during the greater part of the year. The principal forest-trees are the pine, beech, and oak. In the valleys flourish the olive, chestnut, vine, almond, mulberry, nut, and other fruit trees, and wheat and madder are grown. Black truffles are abundant. Besides agriculture the principal industries are the rearing of silk-worms and sheep, and the manufacture of waxes, the best of which are the red and white Ermitage, of woollen, cotton, and dyed linen goods, spun and woven silk, paper, oil, ropes, earthenware, and leather. The wool and wood trades are considerable. The mineral products include iron, copper, lead, lignite, marble, granite, black and red potter's clay, mullite, chalk, and cement-stone. Drôme is divided into the arrondissements of Valence, Die, Montélimart, and Nyons, comprising 29 cantons and 366 communes. The capital is Valence. Of the total area of 652,155 hectares (1,610,825 acres) about 514,227 acres are arable, 418,576 meadows, 49,203 meadow. The population in 1872 was 320,417.

DROPSY (contrasted from the old word hydroscopy, from the Greek ὕδρος ὑποπλεσία, water, and ὑδρό, the appearance) signifies a collection of simple aqueous fluid in all or any of the cavities of the body, or in the meshes of its tissues. Dropsy of the subcutaneous connective tissue is termed edema when it is localized and limited in extent; when more diffuse it is termed anasarca; the term edema is also applied to dropsey of some of the intravascular organs, notably to that of the lungs. Hydro-ploraedse signifies an accumulation of fluid within the ventricles of the brain or in the arachnoid cavity; hydrothorax, a collection of fluid in one or both pleural cavities; hydropericardium, in the pericardium; ascites, in the peritoneum; and, when anasarca is conjoined with the accumulation of fluid in one or more of the serous cavities, the dropsey is said to be general.

Dropsey is essentially a symptom and not a specific disease, and ought not to be confounded with inflammatory exudations of a serious character. The transudation is a mere filtrate from the blood produced by increased intravascular pressure, of local or general origin, and occurring through the walls of the capillaries or smaller venules. Its specific gravity varies from 1.008 to 1.014; it is alkaline, occasionally neutral, very rarely feebly acid; it is not the liquor sanguinis, but merely water held in solution a varying proportion of the constituents of the blood serum, chiefly a saline constituent, and those notably of chlorides of sodium, occasionally urea, sometimes cholestrine, always more or less albumen, and a proportionate amount of fibrinous matter. It may be colourless, greenish or reddish from the presence of blood pigment, or yellowish from the presence of bile pigment; transparent, or opalescent, or milky from the presence of fatty matter or of the chloride of sodium, occasionally varying proportion of the constituents of the blood serum, accompanied by escape of albumen; these are the acute congestive form of dropsy, with the accumulation of fluid in one or more of the serous cavities, the dropsey is said to be general.

Dropey is often very considerable, and in the absence of cardiac derangements will be found to appear first about the loose cellular tissue surrounding the eyes, where the vessels, turgid with watery blood, have less efficient support. Dropsey, though often a terminal and always a serious symptom, is yet one which much can be done to ameliorate and in many cases to remove, and this is particularly the case in many local dropseyes and in those of cardiac origin. Lung, kidney, and hepatic dropseyes are less amenable to treatment; yet one case of ascites is on record in which a perfect recovery took place after the woman had been tapped 133 times, and nearly 400 gallons of fluid removed. Diuretics and purgatives are the remedies chiefly employed; but in certain cases diaphoretic and particularly the use of a hot air bath are very effectual, and in a large number paracentoses or tapping is either indispensable, or at events much expedites the cure.

It may be well to mention that there are certain affections which may be termed apurineo dropsey, such as ovarian dropsey, which is only a cystic disease of the ovary; hydroptisis, dropsey of the uterus, due to inflammatory occlusion of the ductus of Hchimpheo, dropsey of the kidney, due to obstruction of the ureter, and subsequent distention of these organs by serous accumulations; other hollow organs may also be similarly affected.

DROSTE-HULSHOFF, Annette Elisabeth, Baroness (1798-1848), a German poetess, was born on an estate of Hulshoff, near Munster, and belonged to the elder branch of the Catholic Westphalian family which about the same time had its reputation increased by the juridical labours of Clemens Augustus von Droste-Hulshoff. She received an education of a more scientific character than usually fell to her sex; and the delicate state of her health obliged her to lead a very quiet and sequestered life, which in its turn fostered the natural sensibility of her temperament, and increased her devotion to literature and study. With the exception of a short time spent at Cologne and Bonn about 1825, she mainly resided at her mother's country seat of Rischhaus, near Munster; but in 1841 she went to the castle of Eyphhausen, in Thuringia, and in 1844 became a guest at the house of her brother-in-law Von Lasaberg, on the borders of the Lake of Constance. She had just purchased an estate in that neighbourhood when she died in May 1848. Besides a volume of Gedichte published during her lifetime (Stuttgart, 1844), we have also from her pen Das geistliche Jahr, nebst einem Anhang religiöser Gedichte, Stuttgart, 1852; and Letzte Gedichte, Hanover, 1860. The popularity of the first work is shown by a third edition in 1873. The characteristics of the author are great perfection of form, delicacy of feeling, and vivid realization of external nature. A number of her poems have been rendered into English by Medwin. See Schucking, Annette von Droste-Hulshoff, Ein Lebensbild, 1871.

DROUAIJS, Jean Germain (1763-1788), a French historical painter, was born at Paris on the 25th November 1763. His father, Henri Drouais, and his grandfather, Hubert Drouais, were well-known portrait painters; and it was from his father that he received his first artistic instruction. He was afterwards instructed to the care of Breaet, an excellent teacher, though his own pictures did not take
high rank. In 1780 David, who had just returned from Rome, opened a school of painting in Paris, and Drouet was one of his earliest and most promising pupils. He adopted the classical style of his master, and gave his whole time to study—painting during the day, and spending a great part of every night in designing. For weeks together it is said that he never left his studio. In 1783 he was admitted to compete for the great prize of painting offered by the Academy, the subject being the Widow of Nain. After inspecting the works of his fellow-contestants, however, he lost hope and destroyed his own canvas, but was censured by the assurance of his master David that he had not done so as he would have won the prize. Next year he was triumphantly successful, the picture of the Woman of Canaan at the Feet of Christ, with which he gained the prize, being judged by competent critics to be worthy of comparison with the works of Poussin. He was carried should high by his fellow-students through the streets to his mother's house, and a place was afterwards found for his picture in the Louvre. His success making him only the more eager to perfect himself in his art, he accompanied David to Rome, where he worked even more assiduously than in Paris. He was most strongly influenced by the remains of ancient art and by the works of Raphael. Goethe, who was at Rome at the time it was finished, has recorded the deep impression made by his picture of Marius at Minturno, which he characterizes as in some respects superior to the work of David, his master. The last picture which he completed was his Philoctetus on the Island of Lemnos. He died of fever on the 15th July 1788. A monument in his memory was erected by his fellow-students in the church of Santa Maria in the Via Latina.

DROUET, JEAN BAPTISTE (1763-1824), one of the Terrorists of the first French Revolution, chiefly noted for the part he played in the arrest of Louis XVI. at Varennes, was born at Sainte-Menouhould in 1763. He served for seven years in the army, and afterwards assisted his father, who was post-master of his native town. The carriages conveying the royal family on their flight to the frontier stopped at his door on the evening of June 21, 1791; and the passengers, travelling under assumed names, were recognized by Drouet, who immediately took his picture of Marius at Minturno, which characterizes as in some respects superior to the work of David, his master. The last picture which he completed was his Philoctetus on the Island of Lemnos. He died of fever on the 15th July 1788. A monument in his memory was erected by his fellow-students in the church of Santa Maria in the Via Latina. Drouet took a brilliant part in the siege of Dantzic, and signed the capitulation of the town, he fought at Mohrungen, and was severely wounded at Friedland (1807). After this battle he was made grand officer of the Legion of Honour, was created Count d'Erlon, and received a pension. He afterwards served with distinction in the Peninsula War, and defeated General Hill at the Col de Mayo. After the first Restoration he was named commander of the 16th military division. He presided at the council of war, at Lille, which acquitted General Exelmans, but in March 1815 he was arrested on suspicion of treason, and suffered a short imprisonment. He was present under Napoleon at Waterloo, and was severely reproached by the emperor for not bringing his division into action. After the second Restoration he quitted France, and did not return till 1825. He was appointed governor of Algeria in 1834, was created marshal of France in 1843, and died at Paris January 25, 1844.

DROWING is one of the various forms of death from suffocation, the asphyxiating agent being water; and, accordingly, all the special characteristic of drownings are asphyxia or apnoea are present—varying in intensity according to the manner of the death, whether it has or has not been attended with violent struggling. In addition, owing to the medium in which the death occurs, certain other symptoms specially characteristic of drowning are absent.

By older authors a peculiar form of death by drowning was described, in which the appearances of asphyxia were wanting, and also the special signs of this form of death. To this the name of synopal asphyxia was given. Hence, in treating of drowning, descriptions of these two forms were given, and in the case of bodies recovered from the water death was said to have occurred either from asphyxia or from syncope. Now, undoubtedly it often happens when persons fall or are thrown into the water that, in consequence of fright or of the shock sustained by violent contact with the surface of the water, no effort is made to save themselves, and death rapidly ensues from syncope. In such cases none of the characteristic signs of drowning are found, and, so far as the examination of the body is concerned, it is impossible to decide upon the exact cause of death. It is quite within the bounds of possibility that in such cases death may have been effected by other means, and the body have been thrown into the water to conceal the true cause of death.

No such uncertainty, however, attends the investigation of a case of drowning by true asphyxia, as it was called. The drowned individual struggles to reach the surface of the water in his efforts to respire, as he does so he draws water into his windpipe which provokes cough. This expels the air from his lungs, and the water which threatened to suffocate him; and as he sinks, in his struggles he endeavours again to respire, but now draws water into his mouth which chokes him, and can only be got rid of by swallowing. Insensability then comes on, and death rapidly but painlessly ensues from a true asphyxia.

If the body be recovered—say within two hours—it is relaxed, and generally presents a palid appearance. The face is slightly congested, the features placid and composed. The lips are livid, and the tongue is either protruded from the mouth, firmly grasped by the teeth, or it is protruded closely to the dental arch with the teeth' service, re-erected by the body. In 1782, and two years later became aide-de-camp to General Lefèvre. He served at the sieges of Valenciennes, Quenouy, and Condé, and under Hoche at the blockade of Ehrenbreitstein. As general of brigade (1799) he fought at Zurich, at the bridge of Schaaffhausen, and at the taking of Constance. In August 1800 he was promoted general of division. He distinguished himself at Ulm and Hohenlinden, and by a skilful manœuvre decided the victory of Jena (1806). Drouet took a brilliant part in the siege of Dantzic, and signed the capitulation of the town, he fought at Mohrungen, and was severely wounded at Friedland (1807). After this battle he was made grand officer of the Legion of Honour, was created Count d'Erlon, and received a pension. He afterwards served with distinction in the Peninsula War, and defeated General Hill at the Col de Mayo. After the first Restoration he was named commander of the 16th military division. He presided at the council of war, at Lille, which acquitted General Exelmans, but in March 1815 he was arrested on suspicion of treason, and suffered a short imprisonment. He was present under Napoleon at Waterloo, and was severely reproached by the emperor for not bringing his division into action. After the second Restoration he quitted France, and did not return till 1825. He was appointed governor of Algeria in 1834, was created marshal of France in 1843, and died at Paris January 25, 1844.
which takes place more or less in all forms of death. On the thighs the skin presents a roughened appearance, owing to the unusual development of the papilla, and to this the name of cutis verrucosa, or goose-skin, has been applied. Among the external signs which we are passing in review the state of the hands and fingers merits special attention. In his dying agony the drowned individual spasmodically clutches for help in all directions, and, should it be a point or a canal to which he has fallen, his nails may be injured, sand or mud may be found beneath them, and, firmly grasped in the hand, may be vegetable structures from the sides or the bottom of the pond; or, on the other hand, his fingers may present traces of recent injury.

Internally, the usual signs of asphyxia or apnea are well marked. These are:—(1) A distorted condition of the right cavities of the heart with dark fluid blood, while the left are well contracted, and are either empty or contain only a small quantity of dark-coloured blood. (2) The lungs are developed, and highly congested. On their being incised, the cut surfaces on pressure give out dark-coloured blood and frothy mucus in large quantity. (3) There is congestion of the mucous lining of the air passages; and (4) dark colour and fluidity of the blood through the body.

Among the signs specially characteristic of this form of death are:—(1) An unusual quantity, and to this the stomach (amounting to one or two pints), which can only be accounted for by water having been swallowed during the last agonies of death. In many cases this cannot be determined with any degree of certainty, the fluid found incised, the cut surfaces on pressure give out dark-coloured blood and frothy mucus in large quantity. (2) The lungs are well contracted, and this, together with any water that may have entered, is churned up along with the verdigris of the body, but, owing to the rapid development of gas in all the soft structures of the body, but especially in the intestines, the body quickly comes to the surface of the water, and decomposition proceeds with great rapidity. All the canals of the body are relaxed, and the pressure of gas is such as to force the froth from the air passages, the water from the stomach, and the blood from the heart.

Almost never,” says Devéeger, the great authority on the effects of putrefaction in the drowned, “can the signs of drowning during life be determined in summer, so quick is the gaseous putrefaction.” Hence, too great caution cannot be exercised by the medical jurist in giving a positive opinion in such cases.

It is remarkable that the progress of putrefaction in persons who have died by drowning should differ widely
from that of the same process in other forms of death. In ordinary cases, the first signs of putrefaction manifest themselves in the lower parts of the abdomen. The rest of the trunk is attacked, then the extremities, and lastly the face. In drowning, on the contrary, the first part of the body to show evidence of decay is the face, and in the course of a few hours, so rapid is the advance of the putrefactive process, that it becomes utterly impossible to recognize the features. Hence it is that it has been chiefly in cases of drowning that difficulties have arisen as to identification, in consequence of that part of the body by which persons are most readily recognized undergoing alteration so rapidly. Devergie, who, from his official connection with the Morgue at Paris, enjoyed unusual facilities for watching the various stages of putrefaction in the drowned, has carefully described them, and we now proceed to give a résumé of his observations. The 1st stage includes a green discoloration of the skin, first noticed on the face and neck, which gradually extends over the body. The 2d is the evolution of gas, distending the abdomen, and causing those changes to which we have already adverted. The 3d is that of brown putrefaction, which affects all the parts of the body previously coloured green. The 4th is that of putrification. The discoloured parts soften, liquefy, and disappear. Under such circumstances the body rapidly decays, and the bones fall asunder. On the other hand, in cool weather the process of liquefaction is arrested, and the soft parts become solidified, owing to their conversion into adipocere, a peculiar kind of animal soap. To this stage— the 6th—Devergie gives the name of saponification. The 6th stage is termed desiccation, or drying, from the continued removal of the fluids from the body, which, thus hardened, is liable, from the action of the elements, to undergo corrosion, and, at the same time long immersion leads to the formation of various incrustations. Devergie treats of these two conditions under the heads of corrosion and incrustation. In the 9th and last stage we have the destruction of the soft parts generally. In the liquid decomposition the part of the body first attacked was the face, and the same order is observed in the later stages—the soft parts of the face, now hardened by their transformation into adipocere, fall off, and leave nothing but a grinning skeleton of a face behind, the rest of the body being comparatively perfect. This peculiar progress of the process of decomposition in the drowned explains the cases recorded of apparently decapitated heads, and of bodies consisting of headless trunks, having been found floating in the sea. These stages of the putrefactive process Devergie states do not follow any definite order or period of sequence, and each case demands careful investigation as to the condition of the body and the time of the year when the drowning occurred, but as the result of his experience he finds that the respective seasons of summer and winter make at least a month's difference in the period at which the earlier changes occur.

As to the treatment of the drowned, a complete revolution has in recent times taken place in its details. To induce a renewal of the inspiration it was formerly recommended that air should be forcibly introduced into the lungs by means of a pair of bellows, and, according to the older directions of the Humane Society, the body was "to be well shaken every ten minutes in order to render the process of animation more certain." These expedients proved singularly ineffective except in cases where the other proposals of the society, such as rubbing and the application of warmth, would of themselves have procured recovery. In 1856 Dr Marshall Hall devised his ready method or postural treatment of the asphyxiated, and by actual results in cases of stillbirth and of drowning, proved that respiration could be imitated by simply changing the position of the body. Since then Dr B. Silvester has suggested a still more simple plan of postural treatment which, along with that of Dr Marshall Hall, has been adopted by the Humane Society and also by the National Life Boat Institution, from whose published directions we give the modern treatment of the drowned by both methods, which is in use in Her Majesty's Fleet, in the Coast-guard Service, and at all the stations of the British Army at home and abroad.

**DIRECTIONS FOR RESTORING THE APPARENTLY DROWNED.**

I. **Send immediately** for medical assistance, blankets, and dry clothing, but proceed to treat the patient **instantly** on the spot, in the open air, with the face downward, whether on shore or afloat, exposing the face, neck, and chest to the wind, except in severe weather, and removing all tight clothing from the neck and chest, especially the braces. The points to be aimed at are—first and immediately, the restoration of breathing, and secondly, after breathing is restored, the promotion of warmth and circulation. The efforts to restore breathing must be commenced immediately and energetically, and persevered in for one or two hours, or until a medical man has pronounced that life is extinct. Efforts to promote warmth and circulation, beyond removing the wet clothes and drying the skin, must not be made until the first appearance of natural breathing, for if circulation of the blood become endangered before breathing has recommenced, the restoration to life will be endangered.

II. **To Restore Breathing.**—To clear the throat. Place the patient on the floor or ground with the face downwards, and one of the arms under the forehead, in which position all fluids will more readily escape by the mouth, and the tongue itself will fall forward, leaving the entrance into the windpipe free. Assure this operation by wring and cleansing the mouth. If satisfactory breathing commences, use the treatment described below to promote warmth. If there be only slight breathing, or no breathing— or if the breathing fail, then—

*To excite breathing.*—Turn the patient well and instantly on the side, supporting the head, and excite the nostrils with snuff, h Ars.

**Fig. 1**—Inspiration (Dr Marshall Hall's method).

**Fig. 2**—Expiration (Dr Marshall Hall's method).

horn, and smelling salts, or tickle the throat with a feather, &c. if they are at hand. Rub the chest and face warm, and dress cold water, or cold and hot water alternately, on them. If there be no success, lose not a moment, but instantly—

*To stimulate breathing.*—Replace the patient on the face, raising and supporting the chest well on a folded coat or other article of dress. Turn the body very gently on the side and a little beyond, and then slowly on the face, back again, repeating these movements cautiously, efficiently, and perseveringly, about fifteen times in the minute, or once every four or five seconds, occasionally varying the position of the chest, and by actual results in cases of stillbirth and of drowning, proved that respiration could be imitated by simply changing the position of the body. Since then Dr B. Silvester has suggested a still more simple plan of postural treatment which, along with that of Dr Marshall Hall, has been adopted by the Humane Society and also by the National Life Boat Institution, from whose published directions we give the modern treatment of the drowned by both methods, which is in use in Her Majesty's Fleet, in the Coast-guard Service, and at all the stations of the British Army at home and abroad.
and air enters the chest.) On each occasion that the body is replaced on the face, make uniform but efficient pressure with break movement on the back between and below the shoulder-blades or bones on each side, burning the presence immediately before turning the body on the side. During the whole of the operations let one person attend solely to the movements of the head and of the arm placed underneath. (This last increases the expansion—the second commences inspiration.) The result is respiration or natural breathing, and, if not too late, life. While the above operations are being proceeded with, dry the hands and feet, and as soon as dry clothing or blankets can be procured, strip the body, and cover or gradually reclothe it, but taking care not to interfere with the efforts to restore breathing. III. Should these efforts not prove successful in the course of from two to five minutes, proceed to imitate breathing by Dr Silvester's method, as follows. Place the patient on the back on a flat surface, inclined a little upwards from the feet; raise and support the head and shoulders on a small firm cushion or folded article of dress placed under the shoulder-blades. Draw forward the patient's tongue, and keep it projecting beyond the lips; an elastic band over the tongue and under the chin will answer this purpose, or a piece of string or tape may be tied round them, or by raising the lower jaw, the teeth may be made to retain the tongue in that position. Remove all tight clothing from about the neck and chest, especially the braces.

**FIG. 3.**—Inspiration (Dr Silvester's method).

**FIG. 4.**—Expiration (Dr Silvester's method).

To imitate the movements of breathing—Standing at the patient's head, grasp the arms just above the elbows, and draw the arms gently and steadily upwards above the head, and keep them stretched upwards for two seconds. (By this means air is drawn into the lungs.) Then turn down the patient's arms, and press them gently and firmly for two seconds against the sides of the chest. (By this means air is pressed out of the lungs.) Repeat these measures alternately, deliberately, and perseveringly, about fifteen times in a minute, until a spontaneous effort to respire is perceived, imme- diately upon which cease to imitate the movements of breathing, and proceed to induce circulation and warmth.

IV.—TREATMENT AFTER NATURAL BREATHING HAS BEEN RESTORED. To promote warmth and circulation—Commence rubbing the limbs upwards, with firm grasping pressure and energy, with handkerchiefs, flannels, &c. (By this the blood is propelled along the veins towards the heart.) The friction must be continued under the blankets or over the dry clothing. Promote the warmth of the body by the application of hot flannels, bottles, and muffs of hot water, heated bricks, &c., to the pit of the stomach, the arms, between the thighs, and to the soles of the feet. If the patient has been carried to a house after respiration has been restored, be careful to let the air play freely about the room.

On the resumption of natural breathing, warm brandy and water should be given; and then, if the power of swallowing has returned, small quantities of wine, warm brandy-and-water, or coffee should be administered. The patient should be kept in bed, and a disposition to sleep encouraged.

**GENERAL OBSERVATIONS.**—The above treatment should be persevered in for some hours, as it is an erroneous opinion that persons are irrevocably dead because life does not soon make its appearance, persons having been restored after persevering for many hours. The appearances which generally accompany death are the following—breathing and the heart's action cease entirely; the eyelids are generally half closed; the pupils dilated; the tongue approaches to the under edges of the lips, and these, as well as the nostrils, are covered with a frothy mucus; coldness and pallor of surface increase. The following cautions should be attended to:—Prevent unnecessary crowding of persons round to body, especially in an apartment. Avoid rough usage, and do not allow the body to remain on the back unless the tongue is secured. Under no circumstances hold the body up by the feet. On no account place the body in a warm bath unless under medical direction, and even then it should only be employed as a momentary measure.

Dr Silvester's method is more generally practised than that of Dr M. Hall,—its special advantages being that it commences by imitating inspiration, and more completely distends the chest. But we are of opinion that the combination of the two methods as recommended above should undoubtedly be practised in every case.

It has frequently been pointed out that in fatal cases of drowning the right auricle of the heart is very much detached, and it has been plausibly urged by Professor Struthers of Aberdeen (Edinburgh Medical Journal, 1857, p. 418) that the movements of respiration may be successfully imitated, and air may enter the lungs, and yet the persons may not recover in consequence of the stoppage of the action of the heart. He recommends that blood should be drawn from the external jugular vein, so as to relieve the engorged auricle, which, from its distension, is paralyzed. The abstraction of a small quantity of blood is all that is required to effect this—from half to one or two tablespoonfuls. Finally, as a last resource, galvanism must be had recourse to. Both this and the blood-letting must be practised by a qualified medical man; but it is important to know that the methods of Dr Hall and Dr Silvester can easily be learned by any one, and that, if early and perseveringly applied, they are attended with a large measure of success. The treatment must be continued for at least eight hours, there should be an absence of extreme pallor, and while any heat of the body remains. The question of the treatment of the drowned cannot be regarded as definitely settled, and the plans of Hall and Silvester have from time to time been subjected to criticism. Among the latest suggestions is that of Dr B. Howard of America, who, by means of what he terms his "direct" method, which mainly consists in pressure of the chest from above (the patient being placed on his back), claims that air is more easily introduced into the lungs, and that the expansion and contraction of the chest are more perfectly attained (see Lancet, August 11, 1877).

At the meeting of the British Medical Association at Manchester 1877, Dr Howard practically demonstrated his plan on the living subject, and there can no doubt that involuntary respiration was readily produced. Further evidence, however, is necessary from actual cases of suspended animation.

DROZ, FRANÇOIS-XAVIER JOSPEH (1773-1850), a French writer on moral and political subjects, was born on October 31, 1773, in the city of Besançon, where his family had furnished men of considerable mark to the legal profession. He was also trained in the law and by his own legal studies led him to Paris in 1802. On the very day after the dethronement of the king, and was present during the massacres of September; but on the declaration of war he joined the volunteer battalion of the Doubs, and for the next three years served in the army.
of the Rhine. Receiving his discharge on the score of ill health, he soon after obtained a much more congenial post in the newly-founded école centrale of his native city, and in 1799 he made his first appearance as an author by an Essai sur l'art ornateur, Paris, Fructidor, An VII, in which he acknowledged his indebtedness more especially to Hugh Blair. This early reference to Scottish literature is interesting in connection with the peculiarly Scottish tone of mind which is observable in his writings, and has attracted the notice of Sainte-Beuve. Removing to Paris in 1803, he became intimate not only with the like-minded Ducis, but also with the sceptical Calzas; and it was at the philosopher's advice that, in order to catch the public ear, he produced the romance of Luna, which Sainte-Beuve has characterized as a muddled echo of Florian and Werther. Like several other literary men of the time, he obtained a post in the revenue office known as the Drouts réunis, then under the control of M. François of Nantes; but from 1814 he devoted himself exclusively to literature and became a contributor to various journals. Already favourably noticed by his Essai sur l'art d'être heureux, Paris, 1806, his Éloge de Montaigne, 1813, and his Essai sur le beau dans les arts, 1815, he not only gained the Montyon prize in 1823 by his work De la philosophie morbide ou des différents systèmes sur la science de la vie, but also in 1824 obtained admission to the Académie Française. The main doctrine enunciated in this treatise is that society will never be in a proper state till men have been educated to think of their duties and not of their rights. It was followed in 1825 by Application de la morale à la philosophie et à la politique, and in 1829 by Économie politique, ou principes de la science des fraudes, a methodical and clearly written treatise, which has had the honour of being edited by Michel Chevalier in 1854. His next and greatest work was a Histoire du régime de Louis XVI. (3 vols. Paris, 1838-1842), the result of very careful and prolonged study, and marked by greater vigour of style and deeper powers of thought than he had previously displayed. As he advanced in life Droz had become more and more decidedly religious, and the last work of his prolific pen was Pensees du Christianisme, 1842. Few have left so blameless a reputation: in the words of Sainte-Beuve, he was born and he remained all his life the man of the good and the just.

**DRUIDISM**, the name usually given to the religious system of the ancient Gauls and Britons. The word Druid, one form or other of which is used in early Celtic records to designate a class of priests corresponding to the Megri or wise men of the ancient Persians, is of uncertain etymology. The derivation from the Greek δρυς, an oak, though as old as the days of the elder Pliny, is probably fanciful.

We find in Caesar the first and at the same time the most circumstantial account of the Druids to be met with in the classical writers. In the digression on the manners and customs of Gaul and Germany which occupies a portion of the sixth book of his Gallic war, he tells us that all men of any rank and dignity in Gaul were included among either the Druids or the nobles. The former were the religious guides of the people as well as the chief expounders and guardians of the law. On those who refused to submit to their decisions they had the power of inflicting severe penalties, of which excommunication from society was the most dreaded. As they were not a hereditary caste, and enjoyed exemption from service in the field as well as from payment of taxes, admission to the order was eagerly sought after by the youth of Gaul. The course of training to which a novice had to submit was protracted, extending sometimes over twenty years. All instruction was communicated orally, but for certain purposes he had a written language in which they used the Greek characters. The president of the order, whose office was elective and who enjoyed the dignity for life, had supreme authority among them. They taught that the soul was immortal. Astrology, geography, physical science, and natural theology were their favourite studies. Britain was the head-quarters of Druidism, but once every year a general assembly of the order was held within the territories of the Carnutes in Gaul, probably in the neighbourhood of the modern Dreux. The Gauls in extreme cases offered human sacrifices, usually criminals. Their chief deity was identified with Caesar with the Mercury of the Romans. Writing a few years later, Cicero, in his treatise on divination, introduces his brother Quintus as remarking on the existence among the Gaunds of augurs or soothsayers, known by the name of Druids. With one of these, Divitius, an Æduae, Quintus says he was well acquainted. Cicero's contemporary, Diodorus Siculus, informs us that there were among the ancient Gauls bards, certain philosophers and theologians named Druids, and soothsayers. He also hints at some connection between their philosophy and that of Pythagoras. The geographers, Strabo and Pomponius Mela, add little to our knowledge of the Druids. Lucan, in his Pharsalia, mentions, among the Gallic and other tribes that relapsed into their former ways, the Presbyter Caesar's crossing the Rubicon, "the worshippers with bloody rites of Teutates, Hesus, and Tanarus," and refers immediately afterwards to the bards and Druids. Something more noteworthy is told by the elder Pliny. According to him the Gallic Druids held the mystic tree in the highest veneration. Groves of oak were their chosen retreats. Whatever grew on that tree was thought to be a gift from heaven, more especially the mistletoe. When thus found the latter was cut with a golden knife by a priest clad in a white robe, two white bulls being sacrificed on the spot. The name given by the Druids signified in their language All-Hail, and its virtues were believed to be very great. Two other herbs, called selago and samolus, were likewise greatly valued by them for their medicinal efficacy. But the most remarkable of all the Druidical charms was the angumeum, or snake's egg. It was said to be produced from the saliva and frothy sweat of a number of serpents writhing in an entangled mass, and to be tossed up into the air as soon as formed. The fortunate Druid who managed, as it fell, to catch it, encased it in gold, rode off at full speed on a horse that had been in waiting for him, pursued by the serpents till they were stopped by the intervention of a running stream. A genuine specimen of this egg when thrown into the water would float against the current, even if tossed in gold. Pliny declares that he had seen one. "It is," he says, "about the size of a moderately large round apple, and has a cartilaginous rind studded with cavities like those on the arms of a polypus." Tacitus, in describing the attack made on the island of Mona (Anglesea) by the Romans under Suetonius Paulinus, represents the legionsaries as being awe-struck on landing by the appearance of a band of Druids who, with hands uplifted towards heaven, poured forth terrible imprecations on the heads of the invaders. The courage of the Romans, however, soon overcame such fears; the Britons were put to flight; and the groves of Mona, the scene of so many a sacrifice and bloody rite, were cut down. The annalists Lampridius and Vopiscus, two of the Scriptorum Historiae Augustae, introduce us, if the "Dryas" of these writers be connected, as is probable, with the "Druids" with other Druids, as other Druids, who, however, are simply prophetic women. For example, Vopiscus tells us, on the authority of his grandfather, who
had the story from the future emperor himself, that it had been foretold to Diocletian by one of these women that he would wear the purple after he had slain a wild boar. Many years afterwards, when Diocletian found himself on the death of Numerian, unexpectedly declared emperor by the troops, he at once cut down with his sword Arrius Aper, regarding whom dark suspicions were afloat, explaining, “At length I have slain the fatted wild boar,” and thus fulfilled the prophecy delivered to him in Gaul by the wise woman. Anonimus of Bordeaux, tutor of Gratian, son of the Emperor Valentinian, in his Professores, or notices of the professors of his native city, apostrophizes the rhetorician Attius Patera as sprung from a race of Druids and from the priesthood of Belenus, and as deriving his name of Patera from being connected through the latter with the mysteries of Apollo. He also addresses another as keeper of the temple of Belenus, and as the offspring of the Druids. Lastly, Ammianus Marcellinus, after noticing the foundation of Marseille by a colony of Phocæans, goes on to state that when the people in those parts had been gradually civilized, learned sibyls, which had been begotten by the bards, the Enahges (probably a corruption of the Odários, i.e., Vates, of Strabo), and the Druids, throve vigorously. Of these, he says the Druids were intellectually superior to the others, and were formed into unions in accordance with the precepts of Pythagoras.

The early Christian fathers seem most to mention the Druids. Origen, Clement of Alexandria, and others speak of them as philosophers or priests among the Gauls, but in a manner that shows they knew almost nothing about them. In early Irish poems and tales, however, a class of persons called by this name is frequently referred to, who also appear as Magi in certain well-known lives of Irish saints written in Latin. These Irish Druids were a kind of sorcerers. They were said to be in league with the demons of paganism, and to be able by this agency to do good to their friends and mischief to their enemies. The followers of this first maintenance of Christianity in Ireland and Scotland seem to have thought it necessary, in order to prove the superiority of the new faith, to spread the belief that its apostles also were gifted with supernatural powers, which they could use more especially for the purpose of counteracting the malice of these Druids. Thus Adamnan, in his life of Columba, reproduces that saint as miraculously baffling the machinations of Broichan, the Druid of the Fintiah kung Brude, when they met at the court of the latter near the mouth of the Ness.

To John Toland probably belongs the credit of being the first to plan, for he did little more, a connected history of the Druids, in which the scanty notices of ancient writers were to be expanded and largely supplemented by details drawn from other sources. This he did in three letters addressed to Viscount Molesworth, and first published from the author's papers in 1726, some years after his death. A little later, Pelloutier, in his Histoire des Celtes, carried out a portion of Toland's design by giving a lengthened account of the origin, position, and influence of Druidism among the early Celtic tribes. On the foundations thus laid others were not slow to build. It is from Cæsar and Pliny, of course, that the materials have been chiefly derived. But fragments of very doubtful value were eagerly appropriated from every quarter; and in this way an imposing structure was reared, the solidity of which till very recently few ever thought of doubting. If we may trust these writers, the ancient priesthood of Brittain and Gaul, in pomp of ritual not less than in learning and influence, rivalled the hierarchies of later days. Clad in white and wearing ornaments of gold, they celebrated their mystic rites in the depths of the forest. The House mentioned by Lucan was said, on the authority of a remark by Lactantius, to be their chief deity. But they had other gods, especially Apollo, whom they worshipped under the name of Belenus, supposed to be the Phœnixan Baal. They believed in metempsychosis, or the doctrine of the transmigration of souls. That their philosophy was identical with that of Pythagoras was held as certain, though whether Pythagoras was the instructor of the Druids or the Druids of Pythagoras, or whether indeed both did not derive these tenets from a common source, were most questions. Pythagoras' friend Abares, the mysterious Hyperborean philosopher who rode on an arrow, the gift of Apollo, must have been a British Druid. Botany, astronomy, medicine, and latters were all subjects studied by the Druids; though, in spite of their boasted erudition, many of their rites were barbarous in the extreme. In mechanics they had attained to no mean skill, since the ponderous megalithic remains of Britain and France could have been set up only by them. Stone circles like Stennis and Cailarnish were ancient temples, once surrounding groves sacred to Druidism. According to Strabo and Sticheni, the cathedral of the arch­druid of all Britain, and Aventicum with its avenues had been originally constructed in the form of a circle with a serpent attached to it—the circle being regarded as the symbol of the Supreme Being, and the serpent of the divine Son. Dolmens or cromlechs were transformed into altars, and even the mênhir or stone pillar, and the rock­ing-stone, were pressed into the service of the druidic priesthood. In the neighbourhood of the circles, as well as on the tops of mountains, may be seen cairns sur­mounted each by a flat stone, on which Druid fires were lighted. Over their countrymen the authority of the Druids was almost unbounded, continuing to assert itself long after the order had passed away. With Druidism every unexplained custom and almost every relic of Celtic antiquity were held to be connected, and the superstitions that still linger in the ancient homes of the Celtic race were set down as derived from the same source. Its decadence is attributed by these writers to the hostility of the Romans. Ardent lovers of their country as well as of liberty, the Druids, it is asserted, were the uncompromising foes of Roman rule in the west. Hence sprang the orders issued for their suppression by Claudius, to which reference is made both by Pliny and Strabo. In the end, Rome proved too strong for Druidism, and the political power of its priesthood was soon broken, especially in Gaul and South Britain. Some, among whom Herodotus is prominent, maintain that, after the destruction of pagan Druidism as a system, the order was revived as a corrupt form of Christianity, in which the truths of the latter were largely mixed up with the rites of Mithras, the sun god of the Persians. This hypothesis, to which its supporters have given the name of neo-Druidism, has already been noticed in the article Celtic Literature (vol. v. p. 318).

These views were for a long time generally received in this country as well as on the Continent. In France, Druidism has proved an attractive subject to some writers of a high order of ability, who have discussed it, if not from a more critical, at least from a more philosophical, standpoint. Amédée Thierry, in his Histoire des Gaulois, while adopting in the main the opinions of Toland, Pelloutier, and their followers, finds in the accounts that have come down to us traces of two distinct systems of religion in ancient Gaul. One of these was a worship of natural phenomena and objects, akin to the polytheism of the Greeks; the other a kind of metaphysical pantheism, strikingly resembling the religions of some Eastern nations. The latter, according to him, was the foundation of Druidism, and had been brought into the country when the Cynic branch of the Gauls entered it under a leader named Huitou, or Hesus,
defied after his death. The more ancient inhabitants, also a Gaulish race, were the polytheists, whose religious belief, however, the Cynni did not altogether destroy but rather amalgamated with their own. Thirry further thinks that Druidism was on the decline in Gaul before the days of Caesar. At a time the Gallic nobles on the one hand, and the people on the other, became alike jealous of a priestly authority that controlled both and had succeeded in greatly reducing their political influence. For a while the Druids retained their power as a religious and learned order, and preserved many of their privileges, but even at the date of Caesar's invasion there had so diminished that Britain, and not Gaul, was recognized as their chief seat; but the most distinguished among the expounders of Druidism is undoubtedly Jean Reynaud, one of the chief of a small school of thinkers whose metaphysical speculations have exercised in France a real, if an indirect and quiet, influence. Reynaud, who was of a mystical cast of mind, began in 1836, along with Pierre Leroux, the publication of L'Encyclopédie Nouvelle, which, however, was never finished. For this the former wrote the article "Druidisme," which he afterwards enlarged and gave to the world separately under the title of L'Esprit de la Gaule, dedicated to his friend, the historian Henri Martin. It is an elaborate and in some respects able essay. Reynaud maintains that the ancient Druids were the first to teach clearly the doctrine of the soul's immortality and that they had originally as high conceptions of the true nature of God as the Jews themselves. If they afterwards encouraged the worship of subordinate deities, it was for the purpose of reconciling to Druidism that class of uneducated minds for which the cultus of demons and angels has more attraction than the worship of the Unseen One. Hence, radically the same word as the Aria of the Greeks, was the type of an absolute supreme Being whose symbol on earth was the oak, and was quite distinct from His, the leader of the Cynonic Gauls. The misletoe, when found growing on the latter, represented man, a creature entirely dependent on God for support, and yet with an individual existence of his own. Human sacrifices were a natural consequence of the idea, dominant now as in the days of the Druids, that the higher the victim the more complete the atonement offered to the Deity for the sins of man. Druidism declined and at last disappeared, because, according to Reynaud, one element was wanting in its system both of morals and of religion, necessary to the true development of man or society—clarity or love. The Druids aimed indeed at the improvement of both, but failed to prescribe the true means of promoting it. Christianity supplied what was needed, and Druidism disappeared—not, however, till it had accomplished what was its special mission, the preservation in Western Europe of the idea of the unity of God. How far all this is mere theory founded on insufficient data, or an attempt, more or less successful, to prove the existence among the Gallic tribes of certain ideas regarding the true nature of God and his relation to man, which afterwards degenerated into the grossest superstition, it would be out of place to discuss here. Reynaud's views have been to a great extent accepted by Henri Martin, one of the foremost of French historical writers; and both countenance the neo-Druidical fancies of Davies and Herbert. In Germany the latest authority on Druidism seems to be Barth—Ueber die Druiden der Kelten—"Over the Druids of the Celts"—which closely the views long popular in this country. To judge from the article "Druiden" in the last edition (1875) of Meyer's Conversations Lexicon, nothing fresher has yet found currency there.

DRU, a musical instrument of percussion, which is supposed to have been introduced into Europe from the East by the Moors or after the Crusades. In certain forms, however, it was known in Europe in classical times. The Greek and Roman symposium seems from descriptions and iconographical representations to have included not only tambourines but kettledrums of a small size, or at least instruments convex on one side like the kettle-drum. The instrument designated in Scripture a timbrel (Heb topk) was undoubtedly a kind of tambourine, such as might be conveniently played by females. In India and Egypt the use of drums in a considerable variety of forms may be traced back to the earliest historic times. The tam-tam or tomtom of India, a cylindrical drum of some size beaten with the fingers, had its counterpart in Egypt at least as early as 1600 b.c. Among savage races, whose music has not risen above the primitive or percussive stage, the drum is naturally the chief, and in many cases the sole instrument employed. Three principal forms of drum are in general use in the modern orchestra,—the common or side drum, the base or Turkish drum, and the kettledrum. The first is composed of a cylinder of wood, or, more generally, of metal, covered at each end with vellum or parchment, the tension of which is regulated by strings. As its name indicates, it is worn at the side of the performer, who beats upon the upper side with two sticks. Its distinctive though not its exclusive use is to accompany the military file band. The base drum is a larger instrument of the same kind, the cylinder being composed of oak. It is beaten at both ends with drum-sticks furnished with leather pads. It is an important constituent of the full military band, and is also employed in the orchestra, especially by more modern composers. The kettledrum is the most important form of the instrument in orchestral as distinct from military music. It is composed of a bass of brass or copper, almost hemispherical in shape, covered with vellum attached to an iron ring, and is usually placed upon an iron tripod. By means of screws it is capable of being tuned within certain necessarily narrow limits. Kettledrums are always used in pairs, one being tuned to the key-note and the other to the fourth below. The music is usually written in the key of C, and the key in which it is to be played, if different, is indicated in words at the beginning of the passage. The three forms of drum just described are essential in every complete orchestra. In addition other percussive instruments, such as the gong and the tambourine, are sometimes introduced for the sake of particular effects.

DRUMMOND, HENRY (1786-1860), an English banker, politician, and miscellaneous writer, remarkable for the versatility of his gifts and the eccentricity of his character, was born on the 9th December 1786. He was the eldest son of Henry Drummond, a prominent London banker, and a daughter of the first Lord Melville. He was educated at Harrow and at Christ Church, Oxford. His name is per-
Drummond, William (1855–1849), of Hawthorden, a Scottish poet of the Scottish school, and descendant of an old family of noble blood, was born at Hawthorden, near Edinburgh, on the 13th December 1855. His father, John Drummond, was the first laird of Hawthorden; and his mother, Susannah Fowler, was well-connected, her brother William being private secretary to Queen Anne, and a man of literary tastes. Drummond received his early education at the Edinburgh High School, and graduated as M.A. of the recently founded (1832) metropolitian university in July 1605. The years 1607 and 1608 were spent at Bourges and Paris in the study of law; and, in 1609, Drummond was again in Scotland, where, by the death of his father in the following year, he became laird of Hawthorden at the early age of twenty-four. The list of books he read up to this time indicates a strong preference for the finer and more imaginative, as distinguished from the argumentative kinds of literature. Accordingly, on finding himself his own master, Drummond naturally abandoned law for the muse; "for," says his biographer in 1711, "the delicacy of his wit always run on the pleasantness and usefulness of history, and on the fame and softness of poetry." He was a good linguist, and read Latin, Greek, Italian, Spanish, French, and Hebrew. He had already written several poems, chiefly sonnets; and some early letters, which have been preserved, show a fine command of pure English, as well as Drummond's critical sagacity in abandoning the Scottish dialect for the language raised to literary supremacy by the illustrious Elizabethans. Drummond's first publication appeared in 1615, and was an elegy on the death of Henry, prince of Wales, called Years on the Death of Malcolm.

As might have been expected from Spenser's influence, it is pastoral throughout. Milton, in his Lycidas, has at once initiated and surpassed this early poem of Drummond's. In 1614 Drummond for the first time met Sir William Alexander, known later as earl of Stirling, the author of a tremendous poem on Doom's day. In the following year Drummond sustained a dreadful blow in the death of Miss Cunningham of Barns, to whom he was engaged to be married. In 1616, the year of Shakespeare's death, appeared Poems: Amorous, Funeral, Divine, Pastoral: in Sonnets, Songs, Satyrs, Madrigals, being substantially the poetry of his love and loss. Drummond's next poem is entitled Perish Festivity: A Panegyric to the King's Most Excellent Majesty, and celebrates James's visit to Scotland in 1617. In 1618 there was an interesting correspondence between Drummond and Drayton; and, about the close of the same year, or about the beginning of 1619, Drummond was honoured with a visit of a fortnight or more from the great literary dictator of the time—Ben Jonson. Drummond, as tradition relates, sat awaiting Jonson's arrival under the shade of a fine sycamore, and exclaimed when Jonson came in sight, "Welcome, welcome, royal Ben!" Upon which the dramatist rejoined, "Thank ye, thank ye, Hawthorden." The famous account of their conversations, long supposed to be lost, was discovered in the Advocate's Library, Edinburgh, by Mr David Laing, and, after being read to the Society of Scottish Antiquaries in 1832, appeared, ten years later, as a publication of the Shakespeare Society. The conversations are full of interesting items, some going to the origin of his poem, whom he frankly told that he "was too good and simple, and that oft a man's modesty made a fool of his wit."
The next few years in Drummond's life are comparatively uneventful, being marked only by correspondence with Sir William Alexander and Drayton. In 1623, the year of a great famine and consequent mortality in Scotland, appeared the poet's fourth publication, entitled *Flowers of Scotia* by William Drummond of Hawthornedene to which adjoined his *Cypresse Groove*. From 1625 till 1630 Drummond was probably for the most part engaged in traveling on the Continent. In 1637, however, he seems to have been home for a short time, as, in that year, he appears in the entirely new character of the holder of a patent for the construction of military machines, entitled "Litora Magistra Gulielmi Drummond de Fabrica Machinarum Militariam, Anno 1627." The same year, 1627, is the date of Drummond's magnificent gift of about 500 volumes to the library of Edinburgh University. This collection, to which Drummond afterwards made additions, is kept in a separate cabinet, and is particularly rich in the English poets. In 1630 Drummond again began to reside permanently at Hawthordene, and, in 1631, he received his last letter from Drayton, who died in London on the 23rd of December. In 1633 Drummond married Elizabeth Logan, by whom he had five sons and four daughters. In 1633 Charles made his coronation visit to Scotland; and Drummond's pen was employed in writing congratulatory speeches and poetry. As Drummond naturally preferred Episcopacy to Presbyterianism, we are not surprised to learn that he approved of the main object Charles had in view in this visit, although his peace-loving nature was averse to the means employed in establishing Episcopacy. Drummond was a true Scottish gentleman in his pride of blood. Partly to please the earl of Perth, partly to satisfy his own curiosity, the poet had studied the genealogy of the family very carefully, and had given due prominence to the fact that Annabella Drummond, daughter of Sir John Drummond of Stobbhall, was the queen of Robert III. This investigation was the real secret of Drummond's interest in Scottish history, and so we find that he now began his *History of the Lives and Reigns of the Five Jameses, Kings of Scotland*—a work which did not appear till 1655, and is remarkable only for its good literary style. His next work was called forth by the king's enforced submission to the oppression of his Scottish subjects. It is entitled *Irene, or a Remonstrance for Concord, Anity, and Love amongst His Majesty's Subjects*, and embodies Drummond's political creed of submission to authority as the only logical refuge from democracy, which he hated. In 1639 Drummond had also to sign the Covenant in self-protection, but was uneasy under the burden, as existing squabbles by him testify. Drummond's next work *Nanayaia: or a Defence of a Petition tendered to the Lords of the Council of Scotland by certain Noblemen and Gentlemen, January, 1643*, is a political pamphlet in support of those royalists in Scotland who wished to espouse the king's cause against the English Parliament. Its burden is a passionate invective on the intolerance of the then dominant Presbyterian clergy; but Irene fails to do justice to the substantial work they had done. Drummond's subsequent works were chiefly royalist pamphlets, written with more or less caution, as the times required.

After being an invalid for several months the poet died on the 4th December 1649, and was buried in the churchyard of Lasswade, a neighbouring village.

The only works of Drummond which call for special notice are the *Cypresse Groove* and the poems. The *Cypresse Groove*, one of the noblest prose poems in literature, exhibits great wealth of illustration, much fine thinking, and an extraordinary command of musical English. It is an essay on the folly of the fear of death, and shows how much the author was impressed with the comparative insufficiency of this world. *This globe of the earth,* says he, "which seemeth huge to us, in respect of the universe, and compared with that wide pavilion of heaven, is less than little, of no sensible quantity, and but as a point" (1711 edition, p 123). Death, he argues, from many of its accidental associations, appears to be more dreadful than it really is. Its unversality, and a correct estimate of human life, ought to nerve us against the fear of death. Further we should remember that death is not annihilation, but the vestibule to immortality and a higher life. The essay, which is composed throughout in a strain of lofty idealism, is entitled in the form of a vision.

A noteworthy feature in Drummond's poetry is that it manifests no characteristic Scottish element, but owes its birth and inspiration rather to the English and Italian masters. This was owing partly to his anti-Presbyterian bias and his long residence abroad, but it was also natural, on other grounds, for a quiet, cultured, and meditative poet to imitate the Elizabethans and the great Italian writers. Drummond was essentially a follower of Spenser, delighting in the description of outer nature, and, amid all his sensuousness, and even in those lines most conspicuously Luten with lustrous beauty, there is a dash of melancholy thoughtfulness—a tendency deepened by the death of his first love. Drummond was so successful as a writer of sonnets that he was called "the Scottish Petrarch," and his sonnets are still ranked immediately after Shakespeare's, Milton's, and Wordsworth's. Most of his poems are steeped in the pro-Copernican ideas of astronomy, and are marked by a sense of the smallness of the visible in comparison with the infinite lying beyond. Thus is one of Drummond's favourite moods, and he is constantly harping upon such phrases as "the All," "this great All." Even in such of his poems as may be called more distinctively Christian, this philosophic conception is at work. Drummond's poems are distinguished by pensive beauty, sweetness of versification, and richly worded descriptions, but lack vigour and originality. Altogether this poet is to be remembered as the best representative of "sweetness and light" amid much that was dull and ephemeral in contemporary Scottish literature.

There are several editions of his works. (1) Hall's edition of the prose works, published in 1625. (2) Philips's edition of the poems, published in 1640. (3) A new edition of his poems, issued by Lord Dundurness and David Irving, issued in 1832. (4) The complete edition of Drummond's poems and sonnets, published in 1655. The only collected edition of the prose writings was published in 1711. Drummond's life has been ably written by Professor Macon (1873) (T. G.).

DRUNKENNESS may be either an act or a habit, the latter consisting in frequent repetitions of the former. As an act it may be an accident, most usually arising from the incautious use of one or other of the commonly employed intoxicating agents, as a habit it is one of the most degrading forms of vice which can result from the enfeeblement of the moral principle by persistent self-indulgence. Drunkenness is a mere complexity of symptoms which may arise from many different causes. To be drunk is simply to be sopheptic, and the close resemblance between the pathological and the toxic phenomena has been the cause of many untoward accidents. Cold alone may produce such peculiar effects that Captain Perry has said, in his *Journal*, "I cannot help thinking that many a man may have been punished for intoxication who was only suffering from the benumbing effects of frost; for I have more than once seen our people in a state so exactly resembling that of the most stupid intoxication, that I should certainly have charged them with the same offence had I not been quite sure that no poisonous fluids were afforded them on Melville Island to procure anything stronger than snow water."
But, apart from the pathological causes of seeming drunkenness, this condition may be actually produced by a multitude of agents whose use is so wide-spread throughout the world as inevitably to lead to the belief that their moderate employment must deserve some important object in the economy of nature. Moreover, the physiological action of all these agents gradually shades into each other, all producing or being capable of producing consecutive paralysis of the various parts of the nervous system, but only in doses of a certain amount, which vary with the agent, the race, and the individual. Even the cup so often said to “cheer, but not inebriate,” cannot be regarded as altogether free from the last-named effect. Teas-sets are well known to be affected with palpitation and irregularity of the heart, as well as with more or less sleeplessness, mental irritability, and muscular tremors, which in some culminate in paralysis; while positive intoxication has been known to be the result of the excessive use of strong tea (Third Annual Report of the Massachusetts Board of Health, p. 129). In short, from tea to haschisch we have, through hops, alcohol, tobacco, and opium, a graded scale of intoxicants, which, in moderate use of the same agent has-particularly of late, prolonged his stage is by no means always or readily produced. It is a stage is by no means always or readily produced. It is

The effects of intoxicants are variously modified by the temperament of the individual and the nature of the inebriant. When that is alcohol, its action on an average individual is first to fill him with a serene and perfect self-complacency. His feelings and faculties are exalted into a state of great activity and buoyancy, so that his language becomes enthusiastic, and his conversation vivacious. But of the two great influences which regulate the prevalence of intemperance, that of race far exceeds that of temperature. A glance at the map of the world, coupled with some knowledge of its history, teaches us that, whether in temperate, subtropical, or tropical regions, wherever the Teuton is, there drunkenness prevails; and the wild orgies in which Tacitus tells us the Teuton of his day indulged in the cold climate of northern Europe are reproduced with wonderful circumstantiality irrespective of climate or temperature. It may be, as a recent speaker has said, that “a national love for strong drink is a characteristic of the nobler and more energetic populations of the world;” it may be, as he goes on to say, that it “accompanies public and private enterprise, constancy of purpose, liberality of thought, and aptitude for war;” it, as he further adds, “exhibits itself prominently in strong and nervous constitutions, and assumes in very many instances the character of a curative of itself.” In other words, in certain constitutions the moderate use of stimulants excites to action rather than to a sensual key, and the pleasurable stimulus of action becomes the reward of human effort. Even the most timid individuals less likely to fall into degrading habits of excess.

The effects of intoxicants are variously modified by the temperament of the individual and the nature of the inebriant. When that is alcohol, its action on an average individual is first to fill him with a serene and perfect self-complacency. His feelings and faculties are exalted into a state of great activity and buoyancy, so that his language becomes enthusiastic, and his conversation vivacious. But of the two great influences which regulate the prevalence of intemperance, that of race far exceeds that of temperature. A glance at the map of the world, coupled with some knowledge of its history, teaches us that, whether in temperate, subtropical, or tropical regions, wherever the Teuton is, there drunkenness prevails; and the wild orgies in which Tacitus tells us the Teuton of his day indulged in the cold climate of northern Europe are reproduced with wonderful circumstantiality irrespective of climate or temperature. It may be, as a recent speaker has said, that “a national love for strong drink is a characteristic of the nobler and more energetic populations of the world;” it may be, as he goes on to say, that it “accompanies public and private enterprise, constancy of purpose, liberality of thought, and aptitude for war;” it, as he further adds, “exhibits itself prominently in strong and nervous constitutions, and assumes in very many instances the character of a curative of itself.” In other words, in certain constitutions the moderate use of stimulants excites to action rather than to a sensual key, and the pleasurable stimulus of action becomes the reward of human effort. Even the most timid individuals less likely to fall into degrading habits of excess.
The poison primarily affects the cerebral lobes, and the other parts of the cerebro-spinal system are consecutively involved, till in the state of dead drunkenness, the parts not invaded by a benumbing paralysis are those automatic centres in the medulla oblongata, which regulate and maintain the circulation and respiration. But even these centres are not unaf f ected; the paralysis of these as of the other sections of the cerebro-spinal system varies in its incompleteness, and at times becomes complete, the coma of drunkenness terminating in death. More usually the intoxicant is gradually eliminated, and the individual restored to consciousness, a consciousness disturbed by the secondary results of the agent he has abused, and which vary with the nature of that agent. Whether, however, directly or indirectly, through the nervous system the stomach suffers in every case; thus nutrition is interfered with by the defective ingestion of food, as well as by the mal-assimilation of that which is ingested; and from this cause, as well as by the peculiar local action of the various poisons, we have the various organic degenerations induced which in most cases shorten the drunkard's days.

The primary discomforts of an act of drunkenness are readily removed for the time by a repetition of the cause. Thus what has been an act may readily become a habit, all the more readily that each repetition more and more enfolds both the will and the judgment, till they become utterly unfit to resist the temptation to indulgence supplied by the knowledge of the temporary relief to suffering which is sure to follow, and in spite of the consciousness that each repetition of the act only forges their chains more tightly. From this condition there is no hope of relief but in enforced abstinence; any one in this condition must be regarded as temporarily insane, and ought to be placed in an inebriate asylum till he regain sufficient self-control to enable him to overcome his love for drink. The desire for stimulants is one of the strongest instincts of human nature. It cannot be annihilated, but may be regulated by reason, conscience, education, or by law when it encroaches on the rights of others or is injurious to the individual himself. By the Intoxicating Liquors Licensing Act of 1872 any one found drunk on a highway or public place or in a licensed house is liable to a fine of 10s., on a repetition of the offence within twelve months to one of 20s., and on a third offence within twelve months to one of 40s. To be drunk or riotous, or to be drunk while in charge of a horse, a carriage, or a gun is punishable with a fine of 20s. or imprisonment for one month. And by the Police and Improvement Act of 1884, 25 Vict. c. 101, § 264, six persons found drunk on the streets are subject to a fine of 40s. or 14 days' imprisonment, wherever that Act has been adopted. These Acts, properly enforced, ought to restrain the public exhibitions of drunkenness; while for those seasonal feasts who ruin their own health and debauch their families, without perhaps ever appearing in public oppressively drunk, the only remedy which appears to promise hope of reform would seem to be the power of temporarily confining them to an inebriate asylum. (n. w. s.)

DRUSES, a people of Syria remarkable for the pertinacity and success with which they have defended their independence against the encroachments of Turkish supremacy, and for the profession of a form of religious belief, which, in the words of Dean Milman, is "one of the most extraordinary aberrations which ever extensively affected the mind of man." The greater part of the people, and the great convenience we shall distinguish as the Western Druses, occupy the mountainous region of Lebanon and Anti-Lebanon; but there are also extensive settlements in the Haurn or Auranitis; a considerable colony exists at Safed, in Palestine proper, to the north-west of the Sea of Tiberias; and it is believed that a number of Crypto-Druses—Druses, however, by religion only, and not by race—still maintain themselves in the neighbourhood of Cairo. The Western Druses are found as far north as Beyrount, as far south as Sur or Tyre, and as far east as Damascus; in the north they are intermingled with Maronites, and in the south with Greeks and Melchites. They form the exclusive population of about 120 towns and villages, and share with the Christians the occupation of nearly 230 more, their total number, not reckoning women and children, has been calculated at from 60,000 to 65,000 men. The chief town of the district which they occupy, though not their most populous settlement, is Deur-el-Kamar—the Convent of the Moon—situated about 15 miles south-east of Beyrount, in the district of Mansaaf, it was the seat of the powerful family of the Abu Nekads, and in its vicinity is the palace of Efsteddin, formerly occupied by the emir Beuchr Shebaa, Ammatam and Bakhlin in the Lebanon, and Hasheya and Rosheya in the Anti-Lebanon, rank as sacred cities, and serve as rallying-points in time of war.

The Eastern or Hauranite Druses are less known, and preserve their ancient customs and characteristics perhaps more perfectly than their western brethren. The date at which they first settled in the district is not ascertained, but for many generations the Hauran has been the chosen refuge of rebels and malcontents from the west, and has consequently increased its population at the expense of the Lebanon. The same process of emigration is still going on, and the Turkish Government has to be careful not to press too heavily on the defaulting Druse of the west, lest it needlessly augment the power of the more independent community. The number in the Hauran was stated by Cyril Graham at 7000 men in 1857, at present it must be much nearer 10,000. The principal town is Kunawat, the residence of the most influential of the Ockals.

In many respects the Druses are a mysterious people, and, in spite of the great additions made to our knowledge in the present century, many important questions in regard to them still await solution. Of their origin and ethnographical affinity no absolutely certain information has been obtained. Though they speak Arabic with a correctness that would do credit to the people of Mecca, and their feudal aristocracy refer to their Arab descent with feelings of pride, it is pretty generally agreed that, whatever may be true of certain families, the main body of the people does not belong to the Semitic family. Mr Cyril Graham regards them as of Indo-Teutonic race, and describes them as "fair-haired, of light complexion, strong and active, and often as tall as northern Europeans." Their own tradition vaguely connects them with China, where they firmly believe that to this day there exist numerous adherents of their creed, and whence they expect the advent of their promised deliverer. The mere fact that they possess a knowledge of the Celestial Empire in such contrast to the geographical ignorance of the other Syrian races is in itself remarkable enough; though it would be rash to assert that it is practically significant. According to an opinion mentioned by Sandys, and pretty often to be met with in the older accounts, they derive their name from a count of Duria, and are mainly the descendants of a band of the crusaders who were left behind, and finally forgot their country and language and creed, but this story is disproved by the fact that allusion is made to their existence at an earlier date than that of Sandys's mention, and the number of their present name, which is properly Durus, dates no further back than about the 11th century, and throws
DRUSES

no light on the question of affinity; and just as little is to be learned from the various explanations current among ourselves—those put in possession (of the faith), from the Arabic verb darasa, those who read the book of Hamze, as if from darasa, the clever ones, from Durs; the shehids, from Turs, and so on. It is well known, however, that the district which they now occupy has over an age, received extraneous additions to its population; and, in the absence of more precise information, it seems at least certain that, whatever may have been the original nucleus of his race, the Druse of the present day carries the mingled blood of a various ancestry, in like manner as his religion combines the products of many different intellectual moments. The presence of a Kurdish element is un doubted, and its influence may probably be traced in the peculiar position granted to the women.  

The rise and progress of the religion which gives unity to the race can be stated with considerable precision. As a system of thought it may be traced in some of its leading principles to the Shiite sect of the Batenians, or Batmiya, whose main doctrine was that "every outer has its inner, and every passage in the Koran an allegorical sense," and to the Karamatians, or Karmiita, who pushed this method to its furthest limits; as a creed it is, somewhat more recently, in the year 386 A.H. (996 A.D.) Hakim Bimarushli (i.e., he who judges by the command of God), the sixth of the Fatimitc caliphs, began to reign; and during the next twenty-five years he indulged in a tyranny at once so terrible and so fantastic that little doubt can be entertained of his insanity. As madmen in general do, he believed that he held direct intercourse with the deity, or even that he was an incarnation of the divine intelligence; and in 407 A.H., or 1016 A.D., his claims were made known in the mosque at Cairo, and supported by the testimony of Ismael Darazi. The people showed such bitter hostility to the new gospel that Darazi was forced to seek safety in flight; but even in absence he was faithful to his god, and succeeded in winning over the ignarant inhabitants of Lebanon. According to Druse authority this great conversion took place in the year 410 A.H. Meanwhile the endeavours of the caliph to get his divinity acknowledged by the people of Cairo continued. The advocacy of Hasan ben Hadara Fargani was without effect; but in 405 A.H. the new religion found a more successful apostle in the person of Hamze ben Ali ben Ahmed, a Persian mystic, fatemaker by trade, who became Hakim's vizier, gave form and substance to his creed, and by his ingenious adaptation of its various dogmas to the prejudices of existing sects finally substituted an extensive body of adherents. In 411 the caliph was assassinated by contrivance of his sister Sitt Almulk; but it was given out by Hamze that he had only withdrawn for a season, and his followers were encouraged to look forward with confidence to his triumphant return. Darazi, who had acted independently in his apostolate, was branded by Hamze as a heretic, and thus, by a curious anomaly, he who expressed the greatest devotion to the mysteries—in contradistinction from whom all other members of the Druse community, whatever may be their position or attainments, are called Djehel' or Ignorant. About 15 per cent. of the adult population belong to this order. Admission is granted to any Druse of either sex who expresses willingness to conform to the laws of the society, and during a year of probation gives sufficient proof of sincerity and stability of purpose. There appears to be no formal distinction of rank among the various members; and though the emir Beshir Sheshab used to appoint a shahik of the Ockals, this person thus designated obtained no further authority. His influence depends on exceptional sanctity or ability. All are required to abstain from tobacco and wine; the women are

1 Cf. Lord Carnarvon's suggestive account of the Yezidis.
DRUSES 485

to wear neither gold nor silver, nor silk, nor brocade, and although neither celibacy nor retirement from the affairs of the world is either imperative or customary, unusual respect is shown to those who voluntarily submit themselves to ascetic discipline. While the Ockals mingle frankly with the common people, and are remarkably free from what in Europe would be called clerical pretension, they are none the less careful to maintain their privileges. They are distinguished by the wearing of a white turban, emblematic of the purity of their life. Their food must be purchased with money lawfully acquired, and lest they should unwittingly partake of any that is ceremonially unclean, they require those dajahs whose hospitality they share to supply their wants from a store set apart for their exclusive use. The ideal Ockal is grave, calm, and dignified, with an infinite capacity of keeping a secret, and a devotion that knows no limits to the interests of his creed. On Thursday evening, the commencement of the weekly day of rest, the long been persuaded that the Druses

of course styled the calf by

ance is the mother of suspicion as well as of either statement. The calf, if calf there be, is probably a symbol of the exorable heroys of Darazi, who is frequently styled the calf by his orthodox opponents. Ignorance is the mother of suspicion as well as of devotion, and accordingly the Christian inhabitants of the Lebanon have long been persuaded that the Druses in their secret assemblies are guilty of the most nefarious practices. Of this allegation, so frequently repeated by European writers, there seems to be little evidence, and it is certain that the sacred books of the religion inculcate what is on the whole a high-toned morality. Colonel Churchill, in his last volume, asserts that while the majority of the people follow the pure teaching of Boháeddn, there still exists a party which indulges in the "dark and unscrupulous libertinism of Darazi."

The Druses, like the Arabs, have a high reputation for hospitality, and they give special welcome to the English, whom they regard as their particular friends and allies. Whoever presents himself at their door in the quality of a suppliant or passenger is sure of being entertained with food and lodging in the most generous manner. Volney often saw the lowest peasants give their last morsel of bread to the hungry traveller; and their only answer to the accusation of impiety was, "God is great and liberal, and all men are brethren." Bogyary at the same time is altogether unknown among the common people, and the Ockals are not a mendacious order. It would be easy to illustrate by many a striking incident the fidelity with which they keep the pledge to give to the guest who has eaten of their bread and salt. Nor is their hospitality unassociated with other virtues. "There was nothing," says Lord Carnarvon, "which surprised me more than the self-possession, the delicate appreciation of washes and feel-

ings, the social ease, and to a great extent the refinement which distinguished the conversation and manners of some of the Druse chiefs whom I then met, and on which no drawing-room of London or Paris could have conferred an additional polish, and a similar testimony is borne by Mr. Chassaud, who was brought up in the city of Beyrouth, and had abundant opportunities of observation. There is a darker side, indeed, to the picture, though, after all, while his merits are in the main peculiarly his own, the Druse only gives additional intensity to the ruthlessness and revengefulness of so many of the Eastern nations.

Polygamy is not permitted. Among the old feudal families intermarriage is often restricted to one or two houses, and the daughter of a sheik will rather remain a virgin than bring disgrace on her blood by a misalliance. The marriage of near relations is naturally the consequence, but, whatever may have been formerly the case, it no longer appears to be the custom for brother and sister to wed. All prenuptial arrangements on the part of the woman are conducted by the father, who cannot act, however, without her consent. On the wedding day a number of Ockals and a few of the bridegroom's relations go to the bride's house; the marriage contract is drawn up and read, and the bride, completely enveloped in a veil, is led off on horseback to her husband, accompanied by her friends, both male and female. As she approaches her future home, the bridegroom's party alludes forth, and a mock contest, with blank cartridge, ensues. Ultimately the bride is successful; shouts of welcome follow her into the harem, where she is received and cared for by the women of her husband's family. After a little she is left alone, the bridegroom enters, lifts her veil, takes his first glance at his wife, replaces it, and withdraws. The revels continue for several days. Divorce is freely allowed; but when once obtained it cannot be cancelled, though either party is free to marry again. Births are rarely celebrated with any public or private jubilation. When a sheik dies, all the sheiks in the mountain are at once informed. Next day they assemble, and the dead body is borne forth in an open coffin to meet all those whom it is especially wished to honour. All day long the mourners walk up and down the median, or tilt-yard, in parties of fifty and sixty, singing and reciting eulogy or dirge. At midnight the corpse rushes into the "ichroom" and kills the dead man's hands and face and beard. A little before sunset the burial takes place. The women watch afar off, while the men follow silently to the grave. A few passages from the Korâan are read by the Ockals, and then the remains are laid in the mausoleum, or the mausoleums are built without doorways, and the wall has to be broken down to admit each new tenant. Those who die in the odour of sanctity are buried in their own houses: the tomb is in the form of an altar, and stands east and west, and the body is laid on its side with the face looking to the south.

Education, according to Eastern ideas, receives considerable attention among the Druses; and all their ladies, in contrast to the majority of their countrywomen, can both read and write. The defence and the diffusion of their religion were originally undertaken in great measure by means of little books or treatises; and from an early period several of the wealthiest sheiks have prided themselves on their collection of manuscripts. For a people so small in number, their literature, though almost purely theological, is remarkably extensive—a fact which may probably be ascribed to the influence of the Semitic element. In spite of the excessive care with which their manuscripts have been guarded (and they are enjoined if need be to kill any alien found in possession of their sacred books), a considerable number have perished, and are now only known by fragments.
number, undoubtedly genuine, have found their way to Europe. A copy of the Book of the Testimonies to the Mohammadans, consisting of seventy treatises, in four folio volumes, was found in the house of the chief Ockal at Bahkh, and presented in 1700 to Louis XIV. by Nusrali Ibn Gida, a Syrian doctor. Other manuscripts are to be found at Rome in the Vatican, at Oxford in the Bodleian, at Vienna, at Leyden at Upsala, and at Munich, and the text got possession of the seven standard works of Druce theology while at Damascus. The Munich collection was presented to the king of Bavaria by Clothey, the chief physician in the Egyptian army during its occupation of Syria; and for a number of the other manuscripts, the history of the Druce nationality by the emir Haider Shehab is quoted by Urquhart.

From an early period, the internal organization of the Druces has been constructed after a patriarcho-feudal type, which, as usual, has placed some amount of patrilineal power in the hands of the chiefs or sheiks, and given rise to an endless succession of petty feuds and confederations between the various clans or families. Into the picturesque souvenirs of the resulting history, composed and recollected by Turkish encroachments and intrigues, it would be useless to enter; and the current of the reader may easily be grated by turning to Colonels Churchill's invaluable, in scanes of diffuse and desultory volumes. The following, however, may be mentioned as among the most important of the clans, which at one period or another have acquired an individual position in the Lebanon region. The Tseckis or Tsechis, now extinct, who had their seat at Abveh or Obveh, in the Shabab, a short distance to the S. of the Baalbek; the Tallisack family, originally the two branches of the Kassem, one branch of which has its principal residence at Hettat, and the other at Allehy, about nine and ten miles respectively S.E. of Beyrout; the Abudalisaks with their seat at Khdada, about four miles S. of Hettat; the Casus of Busur, nearly two miles to S. of Hettat, an offshoot of the Tseckis; the house of Rasian with its seat at Shweirat, seven miles S. of Beyrout; Amunidah, now settled at Abveh, remarkable for their attention to religion; the house of Jumilil in Dsmbelbat with its splendid mansion at Mubar; the eastern branch of the Lebanon the Cufes, or Aleleh-Awalik, the Alue-Nekada, formerly the feudal lords of Deul-el-Kamar; the house of Abu-Hammar, a family of the elder Nishabur. A history of the Druce nationality by the emir Haider Shehab is quoted by Urquhart.

In January 1842 the Turkish Government appointed Omer Pasha, as administrator of the Druces and Maronites, with a council of four chiefs from each party; the position of the latter was that of the Ottoman emir in the S. of the Lebanon, with full powers, to assist the chief of the other party, to hold office for three years. The decision fell on Daud Pasha, a Catholic Armenian, who was installed in 4th of July. In spite of many difficulties, and especially the obstinate conduct of the Turks, he succeeded in restoring order; and by the formation of a military force from the inhabitants of the Lebanon he rendered unnecessary the presence of the Turkish soldiery. He was reappointed for five years at the close of his first term; and his administration seems to have been a permanent pacification.
church, he studied Greek and Latin at Ghent, and philosophy at Louvain; but his father having been outlawed for his religion, and deprived of his estate, retired to England, where the son followed him in 1567. He found an admirable teacher of Hebrew in Chevalier, the celebrated Orientalist, with whom he resided for some time at Cambridge. In 1572 he became professor of Oriental languages at Oxford. Upon the pacification of Ghent (1576) he returned with his father to their own country, and was appointed professor of Oriental languages at Leyden in the following year. In 1585 he removed to Freeland, and was admitted professor of Hebrew in the university of Franeker, an office which he discharged with great honour till his death, which happened in February 1616. He acquired so extended a reputation as a professor, that his classes were frequented by students from all the Protestant countries of Europe. His works prove him to have been well skilled in Hebrew and in Jewish antiquities; and in 1600 the States-General employed him, at a salary of 400 florins a year, to write notes on the most difficult passages in the Old Testament; but, as he was frequently interrupted in prosecuting this undertaking, was not published until after his death. As the friend of Arminius, he was charged by the orthodox and dominant party with unfairness in the execution of this task, and the last sixteen years of his life were, therefore, somewhat embittered by controversy. He carried on an extensive correspondence with the learned in different countries; for, besides letters in Hebrew, Greek, and other languages, there were found amongst his papers upwards of 2000 written in Latin. He had a son, John, who died in England at the age of twenty-one, and was accounted a prodigy of learning. He had mastered Hebrew at the age of nine, and Scaliger said that he was a better Hebrew scholar than his father. He wrote a large number of letters in Hebrew, besides notes on the Proverbs of Solomon and other works. Fagius states the number of the printed works and treatises of the elder Drusus at forty-eight, and of the unprinted at upwards of twenty. Of the former more than two-thirds were inserted in the collection entitled Otium Sacrum, see Anotatia Doctissimorum Virorum in Vetus et Novum Testamentum (Amsterdam, 1698, in 9 vols. folio, or London, 1699, in 10 vols. folio). Amongst the works of Drusus not to be found in this collection may be mentioned: Alphabetum Hebraicum rotat. (1534, 4to); 2 Tabulae in Grammaticam Chaldæam ad usum Juventutis, (1602, 8vo), S An edition of Ephraem Syrus, (Prague, 1607, 12mo), 4. Opuscula grammaticalia: Grammaticæ medii aevi, (1609, 4to), 5. Lecturae in obitum J. Scaligri, (1609, 4to), and 6. Grammatica Lingua Syriane (1615, 4to).}

DRUSUS, Marcus Livius, a patrician of the age of the Gracchi, and a colleague of Caius Gracchus in the tribuneship, 123 B.C. He was a creature of the senatorial party, and was employed by them to offset the measures of the popular tribune. Gracchus had proposed to found three colonies outside Italy; Drusus provided twelve in Italy. Gracchus had proposed to distribute allotments to the poorer citizens subject to a state rent-charge; Drusus promised them free of all charge. Gracchus had proposed to give the Latiuns the citizenship; Drusus added immunity from corporal punishment, even in the field. The bill thus censured was swallowed; the people fomented their champion, who fell an easy victim to the hired braves of Opimius. Drusus was rewarded for his services by the consularship, which he held, 112 B.C. He received Macedonia for his province, where he distinguished himself in a campaign against the Scordisci, where he drove across the Danube into Dacia, being the first Roman general who reached that river. It is probable that he is the Drusus mentioned by Plutarch as having died in the year of his censorship, 109 B.C.

DRUSUS, Marcus Livius, son of the preceding, and, like his father, during the first part of his career a thorough supporter of the optimates. From his earliest youth he devoted himself to politics, was assiduous as a pleader in the law-courts, and lavished in gifts and shows the large fortune which he inherited. By such popular acts he rose to be tribune of the people, 91 B.C. In the agitation which was then raging for the transfer of the judicial functions from the equites to the senate, he proposed a measure which restored to the senate their office of judges, while the numbers were doubled by the admission of 300 equites. But the senate was lukewarm, and the knights whose occupation was threatened offered the most violent opposition. In order, therefore, to catch the popular votes, he coupled with this measure others for the establishment of colonies in Italy and Sicily, and the distribution of corn at a reduced rate. By help of these riders the bill was carried, but not till its most factious opponent, the consul Philippus, had been arrested by Drusus and carried off to prison. To strengthen his hands Drusus now sought a closer alliance with the Italians, promising them the long coveted boon of the Roman franchise. The senate, who had before suspected his aims, broke out into open opposition. His laws were abrogated as informal, and each party armed its adherents for the civil struggle which was now inevitable. It was only prevented, or rather postponed, by the assassination of Drusus. One evening as he was returning to his house he was struck by a dagger, and fell at the foot of his father's bust, exclaiming with his dying breath, "When will the republic find again a citizen like me!" His character is hard to decipher, and is one of the most problems of Roman history. To some he has appeared an unscrupulous adventurer, who deserted his own order to gratify his selfish ambition; others have pronounced him the ablest and wisest of the Roman demagogues. That he was proud and ambitious there can be no question. When a quaestor in Asia he refuses to wear the robes of office, "ne quid ipso esse insignius." When summoned before the senate he holds them come to him—"they will find me in the Cuma Hostilia—and they came. No less certain is it that the reforms he advocated were, on the whole, salutary and needful. The corruption of the equites was flagrant, the claims of the Italians to the franchises were just and pressing. Drusus was the Minerva of the social revolution of Rome, and had his measures been carried Rome might have been spared the most terrible of her civil wars.

DRYADES, or Hamadryades, in Greek Mythology, were nympha of trees and woods, each particular tree or wood being the habitation of its own special Dryad, just as each river was the abode of its own local god. From being so closely identified with trees, the Dryades came to be thought of as having been, like the trees, produced from the earth, as Hesiod says, Theog., 129.

DRYANDER, Jonas (1748-1810), a Swedish naturalist of eminence, and a pupil of Linnaeus, was born in 1748. By his uncle, Dr Lars Montius, to whom his education was entrusted, he was sent to the university of Gottingen, whence he removed to Lund. After taking his degree there in 1776, he studied at Upsala, and then became for a time tutor to a young Swedish nobleman. He next visited England, and, on the death of his friend Dr Solander in 1782, he succeeded him as librarian to Sir Joseph Banks. He was librarian to the Royal Society and also to the Linnean Society. Of the latter, in 1768, he was one of the first founders, and, when it was incorporated by royal charter in 1802, he was chiefly concerned in the drawing up of its laws and regulations. He was vice-president of the society till the time of his death, which took place in October 1810. Besides papers in the Transactions of the Linnean and other societies, Dryander published Dissertationum Philosophicorum, Ser. Praeh. (Upsala, 1774); and Observations Historico-Naturalia, 8 vols. (Stockholm, 1774-1805). He also edited the first and part of the second edition of Linnaeus's Nova Organographia, and Roxburgh's Plants of the Coast of Commodore.
DRYDEN, John (1631-1700), the poet, born on the 9th of August 1631, at Aldwinkle, in Northamptonshire, was of Cumberland stock, though his family had been settled for three generations in Northamptonshire, had acquired estates and a baronetcy, and intermarried with landed families in that county. His great-grandfather, who first carried the name south, and acquired by marriage the estate of Cunnas Ashby, is said to have been so proud of the great scholar's friendship that he gave the name of Erasmus to his eldest son. The name Erasmus was borne by the poet's father, the third son of Sir Erasmus Dryden. The connections and connections of the family were Puritan and anti-monarchical. Sir Erasmus Dryden went to prison rather than pay loan money to Charles I; the poet's uncle, Sir John Dryden, and his father Erasmus, served on Government commissions during the Commonwealth. His mother's family, the Pickeringes, were still more prominent on the Puritan side. Sir Gilbert Pickering, his cousin, was chamberlain to the Protector, and was made a peer in 1669.

Dryden's education was such as became a scion of these respectable families of squires and rectors, among whom the chance contact with Erasmus had left a certain tradition of scholarship. His father, whose only fortune, added to his wife's, the daughter of the rector of Aldwinkle All Saints, was not large, and whose family, of whom the poet was the eldest, amounted to fourteen, procured him admission to Westminster School as a king's scholar, under the famous Dr Busby. Some elegiac verses which Dryden wrote there on the death of a young Lord Hastings, in 1649, had the distinction of being published in a volume called Laetysm Mournam, among other elegies by "divers persons of nobility and worth" in commemoration of the same event. He appeared soon after again in print, among writers of commendatory verses to King's scholar, under the famous Dryden's next appearance was in the making a "John Dryden of Trinity Coll," having gone up from Westminster to Cambridge in May 1650. He was elected a scholar of Trinity on the Westminster foundation in October of the same year, and took his degree of B.A. in 1654. The only record of incident of his college residence is some unexplained contumacy to the vice-chancellor, for which he was "put out of commons" and "gated" for a fortnight. No inference can be built upon this as to Dryden's habit at the university. Contumacy to authorities was not a feature in his later life. His father died in 1654, leaving him master of two-thirds of a small estate near Blakeley, worth about £60 a year. The next three years he is said to have spent at Cambridge. It was then probably that he laid the foundation of that habit of learned discussion of literary methods which is so remarkable a feature in the prefaces to his plays and poems. Not content with doing a thing, like writers who are suddenly placed under the necessity of writing, Dryden must always be arguing as to how it ought to be done, pushing on argumentative justification in advance of execution. Whether or not he spent the three years before 1657 at Cambridge, there can be little doubt, judging from internal evidence, that he spent them somewhere in study; for his first considerable poem bears indisputable marks of scholarly habits, as well as of a command of verse that could not have been acquired without practice.

The middle of 1657 is given as the date of his leaving the university to take up his residence in London. In one of his many subsequent literary quarrels, it was said by Shadwell that he had been clerk to Sir Gilbert Pickering, his cousin, the favourite of Cromwell; and nothing could be more likely than that he obtained some employment under his powerful cousin when he came to London. He first emerged from obscurity with his Heroic Stanzas to the memory of the Protector, who died September 1658. That these stanzas should have made him a name as a poet does not appear surprising when we compare them with Waller's verses on the same occasion. Dryden took some time to consider them, and it was impossible that they should not give an impression of his intellectual strength. The name was not new; it was obvious that he must or must not; and his imagination were saturated with Donne's elegiac strains when he wrote; yet when we look beneath the surface, we find unmistakable traces that the pupil was not without decided tendencies that ran counter to the practice of the master. It is plainly not by accident that each stanza contains one clear-cut brilliant point. The poem is an academic exercise, and it seems to be animated by an undercurrent of strong continuous protest against the irregularities tolerated by the authorities. Dryden had studied the ancient classics for himself, and their method of uniformity and elaborate finish commended itself to his robust and orderly mind. In itself the poem is a magnificent tribute to the memory of Cromwell. Now that the glittering style of the so-called "metaphysical poets" has gone very far out of fashion, it requires an effort, a deliberate dismissal of prejudices, to enjoy such a poem. A poet writing now on such a subject as this would present his grandeur in a much more direct and simple way. Yet judged in the spirit of its own style, Dryden's is a noble poem. The recognition of Cromwell's greatness is full and ample. The thought in each stanza, the inclosing design of each of the parts of the edifice, is massive and imposing, although the massiveness is not presented in its naked simplicity, so as to hold the foremost place in the eye—the gaze being arrested by glittering accidents, so that the essential grandeur of the mass is disguised and diminished. We are not invited to dwell upon the grand outline; we are not called upon to surrender ourselves to its simple impressiveness; but it is there, although the author does not insist upon it, and rather deprecates it, waves it off, and challenges our admiration of some artificial centre of attraction. It is the ornamental centre upon which the art of the poet has laboured, not the effect of the massive whole; still there is loftiness and nobility in the scope of the work, if our prejudices in favour of a less admired workmanship permit us to feel it.

From a moral point of view, Dryden's next appearance as a poet is not creditable. To those who regard the poet as a seer with a sacred mission, and refuse the name altogether to a literary manufacturer to order, it comes with a certain shock to find Dryden, the hereditary Puritan, the panegyrst of Cromwell, hailing the return of King Charles in Astraea Redux, deploring his long absence, and proclaiming the despair with which he had seen "the rebel thrive, the loyal crew." From a literary point of view also, Astraea Redux is very inferior to the Heroic Stanzas; Dryden had need of Waller's clever excuse that it is easier to praise a bad man than a good, because the essence of poetry is fiction. And it was not merely in thus hastening to welcome the coming guest, and recant all praise of his rival, that Dryden showed a shamelessly accommodating spirit, and placed himself in such an unpleasant contrast to the greater poet who was waiting his fate in all but friendless blindness. It might have been expected of one with his Puritan connections and scholarly training that, if he purposed making a living by the stage, which was restored with Charles, his literary as well as his moral conscience would have reminded him to make some effort to raise it at least not to lower its tone. But Dryden seems to have had no higher ambition than to make some money by his pen. He naturally first thought of tragedy,—his own genius, as he has informed us, inclining him rather to
that species of composition, and in the first year of the Restoration he wrote a tragedy on the fate of the duke of Guise. But some friends advised him that its construction was not suited to the requirements of the stage, so he put it aside, and used only one scene of the original play later on, when he again attempted the subject with a more practised hand. Having failed to write a suitable tragedy, he next turned his attention to comedy, although, as he admitted, he had little natural turn for it. He was very frank afterwards in explaining his reasons for writing comedy. "I confess," he said, in a short essay in his own defence, printed before The Indian Emperor, "my chief endeavours are to delight the age in which I live. If the humour of this be for low comedy, small accidents, and raiillery, I will force my genius to obey it, though with more reputation I could write in verse. I know I am not so fitted by nature to write comedy; I want that gaiety of humour which is required to it. My conversation is slow and dull, my humour saturnine and reserved, in short, I am none of those who endeavour to break pots in company or make repartees. So that those who decry my comedies do me no injury, except it be in point of profit. reputation in them is the last thing to which I shall pretend." This of course, was said by Dryden standing at bay; there was some bravado, but also a great deal of frank truth in it. He was really as unadapted a playwright as the age demanded comedies, and he endeavoured to supply the kind of comedy that the age demanded. His first attempt was unsuccessful. Bawdy, intricate, and coarsely humorous dialogue seemed to him to be part of the popular demand, and, looking about for something to suit him in a Spanish source, and wrote The Wild Gallant. The play was acted in February 1663, by Killigrew's company in Vere Street. It was not a success, although the most farcical incident received a certain interest and probability from a story which was current at the time. That a student, fresh from his library, trying to hit the taste of the groundlings with ribald farce, should make the ingredients too strong even for their palates, was not natural. Pepys showed good judgment in pronouncing the play "so poor a thing as ever I saw in my life." That such a play should be written by Dryden, and acted in by one of the daughters of Stephen Marshall, must have been a bitter thought for Puritans at the time. Dryden never learned moderation in his humour; there is a student's clumsiness and extravagance in his indecency; the plays of Etherege, a man of the world, have not the uncouth notoriety of Dryden's. Of this he seems to have been conscious, for when the play was revived, in 1667, he complained in the epilogue of the difficulty of comic wit, and admitted the right of a common audience to judge of the wit's success. Dryden, indeed, took a lesson from the failure of The Wild Gallant; his next comedy, The Rival Ladies, also founded on a Spanish plot, produced before the end of 1663, was correctly described by Pepys as "a very innocent and most pretty witty play," though there was much in it which the taste of the time would consider indecent. But he never quite conquered his tendency to extravagance. The Wild Gallant was not the only victim. The Assumption, or Love in a Nursery, produced in 1673, shared the same fate; and even as late as 1680, when he had had twenty years' experience to gain, his The Keepsake, or the Kind Keeper, was prohibited, after three representations, as being too indecent for the stage. Dislike to indecency we are apt to think a somewhat ludicrous pretex to be made by Restoration playwrights, and probably there were some other real reasons of composition of Limerick; all there is is a certain savagery in the spirit of Dryden's indecency which we do not find in his most licentious contemporaries. The undissembled force of the man earned him to an excess from which more dexterous writers held back.

After the production of The Rival Ladies in 1663, Dryden assisted Sir Robert Howard in the composition of a tragedy in heroic verse, The Indian Queen, produced with great splendour in January 1664. It was probably through this collaboration that Dryden made the acquaintance of Lady Elizabeth Howard, Sir Robert's sister, whom he married on the 1st of December 1663. Lady Elizabeth's reputation was somewhat compromised before this union, and, though she brought some small addition to the poet's income, she does not seem to have added to his happiness. The Indian Queen was a great success, one of the greatest since the reopening of the theatres. This was in all likelihood due much less to the heroic verse and the exclusion of comic scenes from the tragedy than to the magnificent scenic accessories—the battles and sacrifices on the stage, the aerial demons singing in the air, and the god of dreams ascending through a trap. The novelty of these Indian spectacles, as well as of the Indian characters, with the splendid Queen Zempha, acted by Mrs Marshall in a real Indian dress of feathers presented to her by Mrs Aphra Behn, as the centre of the play, was the chief secret of the success of The Indian Queen. These melodramatic properties were so marked a novelty that they could not fail to draw the town. The heroic verse formed but a small ingredient in the play, still, being also a novelty which had just been introduced by Davenant in The Siege of Rhodes, it interested the scholarly part of the audience, and helped to consolidate the success of the stage. Dryden was tempted to try the same tragedy a second time, the follow up The Indian Queen with The Indian Emperor, which was acted in 1665, and also proved a success.

But Dryden was not content with writing tragedies in heroic verse. Taking it up with enthusiasm as the only thing which the Elizabethan dramatists had left for their successors to excel in, he propounded the propriety of rhyme in serious plays as a thesis for discussion, and made it the prominent question of the day among men of letters. He took up the question immediately after the success of The Indian Queen, in the preface to an edition of The Rival Ladies. In that first statement of his case, he considered the chief objection to the use of rhyme, and urged his chief argument in its favour. Rhyme was not natural, some people had said; to which he answers that it is as natural as blank verse, and that much of its unnaturalness is not in the fault of the rhyme but of the writer, who had not sufficient command of language to rhyme easily. In favour of rhyme he has to say that it at once stimulates the imagination, and prevents it from being too discursive in its flights. During the Great Plague, when the theatres were closed, and Dryden was living in the country at the house of his father-in-law, the earl of Berkshire, he occupied a considerable part of his time in thinking over the principles of dramatic composition, and threw his meditations on the subject of rhyme into the form of a dialogue, which he called an Essay of Dramatic Poetry, and published in 1668. One of the main topics of the essay was the admissibility of rhyme in serious plays. Dryden making Neander, the interlocutor, who represents himself, repeat with fresh illustrations all that he had said in its favour. By this time, however, Sir R. Howard, his brother-in-law, whom he had joined in writing the rhymed Indian Queen, had changed his mind about the heroic couplet, and made some offensive comments on Dryden's essay in a hasty-toisy preface to The Duke of Lerma. Dryden at once replied to his brother-in-law in a master-piece of sarcastic retort and vigorous reasoning, publishing his reply as a preface to The Indian Emperor. It is the ablest and most complete statement of his views about the employment of rhymed couplets in tragedy.
Before his return to town at the end of 1666, when the theatres were reopened, Dryden wrote a poem on the Dutch war and the Queen's death. The poem is in quatrains, the metre of his Heroic Stanzas in praise of Cromwell, which Dryden chose, he tells us, "because he had ever judged it more noble and of greater dignity both for the sound and number than any other verse in use amongst us." The preface to the poem contains an interesting discussion of what he calls "wit-writing," introduced by the remark that "the composition of all poems is or ought to be of wit." His description of the Fire is a famous specimen of this wit-writing, much more careless and daring, and much more difficult to sympathize with, than the graver conceits in his panegyric of the Protector. In Annea Mirabilis the poet apostrophizes the newly founded Royal Society, of which he had been elected a member in 1662, more probably through personal connection than on the ground of scientific attainments.

From the reopening of the theatres in 1666, till November 1668, the date of his Absalom and Achitophel, Dryden produced nothing but plays. The stage was his chief source of income. Secret Love, or the Maiden Queen, a tragi-comedy, produced in March 1667, does not come up to our expectations as the first-fruit of the author's rest from composition and prolonged study of dramatic art. The prologue claims that it is written with pains and thought, by the exactest rules, with strict observance of the unities, and "a mingled chime of Jonson's humour and of Corneille's rhyme;" but it owed its success chiefly to the charm of Nell Gwynne's acting in the part of Florimel. It is noticeable that only the more passionate parts of the dialogue are rhymed, Dryden's theory apparently being that rhyme is then demanded for the elevation of the style. His next play, Sir Martin Marall, an adaptation from Molière's L'Estronde, was produced at the Duke's Theatre, in the name of the duke of Newcastle. It was about this time that Dryden became a retained writer under contract for the King's Theatre, receiving from it £300 or £400 a year, till it was burnt down in 1672, and about £200 for six years more till the beginning of 1678. If Sir Martin Marall was written but not produced before this contract was entered into, one can understand why it was announced as the duke of Newcastle's. His co-operation with Davenant in a new version of Shakespeare's Tempest—for his share in making Dryden can hardly be pardoned on the ground that the chief alterations were happy thoughts of Davenant's, seeing that he affirms he never worked at anything with more delight—must also be supposed to be anterior to the completion of his contract with the Theatre Royal. The existence of the contract came to light from Dryden's non-fulfilment of its terms. He was engaged to write three plays a year, and he contributed only ten plays during the ten years of his engagement, finally exhausting the patience of his partners by joining in the composition of a play for the rival house. In adapting L'Estronde, Dryden did not catch Molière's lightness of touch; his alterations go towards making the comedy into a farce. Perhaps all the more on this account Sir Martin Marall had a great run at the theatre in Lincoln's Inn Fields. As we have said, there is always a certain coarseness in Dryden's humour, apart from the coarseness of his age,—a certain forcible roughness of touch which belongs to the character of the man. His An Evening's Love, or the Mock Astrologer, an adaptation from the younger Corneille, produced at the King's Theatre in 1668, seemed to Pepys "very smutty, and nothing so good as The Maiden Queen or The Indian Emperor of Dryden making." Evelyn thought it foolish and profane, and was gruved "to see how the stage was degenerated and polluted by the licentious times." Ladies à la Mode, another of Dryden's contract comedies, produced in 1668, was "so mean a thing," Pepys says, that it was only once acted, and Dryden never published it. Of his other plays, in the course of 1670—The Nunnery (1672), Limberham, or the Kind Keeper, only the first was moderately successful. The failure was not due to want of ribaldry.

While Dryden met with such indifferent success in his willing efforts to supply the demand of the age for low comedy, he struck upon a really popular and profitable vein in heroic tragedy. Tyrannic Love, or the Royal Martyr, a Roman play, in which St Catherine is introduced, and with her some striking supernatural machinery, was produced in 1669. It is in rhymed couplets, but the author again did not trust solely for success to them; for, besides the magic incantations, the singing angels, and the view of Paradise, he made Nell Gwynne, who had stabbed herself as Valeria, start to life again as she was being carried off the stage, and speak a notionally funny epilogue, in violent contrast to the serious character of the play. Almiznor and Almahide, or the Conquest of Granada, a tragedy in two parts, appeared in 1670. It seems to have given the crowning touch of provocation to the wits, who had never ceased to ridicule the popular taste for these extravagant heroic plays. Dryden almost invited burlesque in his epilogue to The Conquest of Granada, in which he charged the dust of the Elizabethan age with coarseness and mechanical humour, and its conceptions of love and honour with meanness, and claimed for his own time and his own plays an advance in these respects. The Rehearsal, written by the duke of Buckingham, with the assistance, it was said, of Clifforld, Sprat, and others, and produced in 1671, was a severe and just punishment for this boast. Dryden is here unmercifully ridiculed under the name of Bayes, he having obtained the laureateship from the king (with a pension of £300 a year and a butt of Canary wine) in 1670. It is said that The Rehearsal was begun in 1663 and ready for representation before the Plague. But this probably only means that Buckingham and his friends were so tickled with the absurdities of Davenant's operatic hero in The Siege of Rhodes, and the extravagant heros of The Indian Queen, that they resolved to burlesque them. Materials accumulated upon them as the fashion continued, and by the time Dryden had produced his Tyrannic Love, and his Conquest of Granada, he had so established himself as the chief offender as to naturally become the centre of the burlesque. It is commonly said that Dryden passed over the attack on himself without reply, either because he admitted its justice or because he feared to offend the king's favourite. But this is not strictly so; his reply is contained in the dedication and preface to his Conquest of Granada; and his prose defence of the epilogue was published in 1672, in which, so far from laughing with his censors, he addresses them from the eminence of success, saying that "with the common good fortune of prosperous gamesters he can be content to sit quietly." Heroic verse, he assures them, is so established that few tragedies are likely henceforward to be written in any other metre, and he retorts upon their exposure of improbabilities in his plays, by criticizing the ridiculous incoherent stories and mean writing of Shakespeare and Jonson. Dignified reassertion of his positions was Dryden's way of meeting the ridicule of The Rehearsal. In the course of a year or two, The Conquest of Granada being attacked also by Settle, a rival playwright who had obtained considerable success, he had an opportunity of taking revenge in a style more suited to his sharp temper and power of severe writing.

Dryden's reply to The Rehearsal was lofty and firm. But though he put a bold face on a practice which it is but fair to suppose that he adopted only to supply a popular
demand, he did not write many more heroic plays in rhyme. Perhaps the ridicule of The Rehearsal had destroyed their popularity. His next tragedy, Ambrosia, an exhibition of certain atrocities committed by the Dutch on English merchants in the East Indies, put on the stage to inflame the public mind in view of the Dutch war, was written, with the exception of a few passages, in prose, and those passages in blank verse. An opera which he wrote in rhymed couplets, called The State of Innocence, or the Fall of Man, an attempt to turn part of Paradise Lost into rhyme, as a proof of its superiority to blank verse, was produced by an apology for heroic poetry and poetic licence, and published in 1674, but it was never acted. The redeeming circumstance about the performance is the adulation professed by the adapter for his original, which he pronounces "undoubtedly one of the greatest, most noble, and most sublime poems which either this age or nation has produced." Dryden is said to have had the elder poet's leave "to tag his verses." Aurengzebe was Dryden's last rhymed tragedy. In the prelude he confessed that he had grown weary of his long-loved mistress rhyme. But the stings of The Rehearsal had stimulated him to do his utmost to justify his devotion to her mistress. He claims that Aurengzebe is "the most correct" of his plays, and it is certainly superior, both in versification and in moderation of language, to its predecessors. It was acted in 1678, and published in the following year.

If Dryden had died in 1676, at the age of forty-five, he would have left a very inconsiderable name behind him. The fray between him and Settle might have been looked upon as a passage at arms between equals. After the production of Aurengzebe he seems to have rested for an interval from writing, enabled to do so, probably, by an additional pension of £100 granted to him by the king. During this interval he would seem to have reconsidered the principles of dramatic composition, and to have made a particular study of the works of Shakespeare. The fruits of this appeared in All for Love, or the World Well Lost, a version of the story of Antony and Cleopatra, produced in 1678, which must be regarded as a new departure in his dramatic career, a very remarkable departure for a man of his age, and a wonderful proof of undiminished openness and plasticity of mind. In his previous writings on dramatic theory, Dryden, while admiring the rhyme of the French dramatists as an advance in art, did not give the same praise to the regularity of their plots; he was disposed to give the preference to the irregular structure of the English dramatists, as being more favourable to variety both of action and of character. But now he abandoned rhyme, and, if we might judge from All for Love, and the precepts laid down in his grounds of criticism in tragedy, the chief point in which he aimed at excelling the Elizabethans was in giving greater unity to his plot. He upheld still the superiority of Shakespeare to the French dramatists in the delineation of character, but he thought that the scope of the action might be restricted, and the parts bound more closely together with advantage. All for Love and Antony and Cleopatra are two excellent plays for the comparison of the two methods. Dryden gave all his strength to All for Love, writing the play for himself, as he said, and not for the public. Carrying out the idea expressed in the title, he represents the two lovers as being more entirely under the spell of love than Shakespeare's Antony and Cleopatra. Shakespeare's Antony is moved by other impulses than the passion for Cleopatra; it is his master motive, but it has to maintain a struggle for supremacy; "Roman thoughts" strike in upon him even in the very height of the passion of his mistress, he cannot bear the yoke, and breaks away from her of his own impulse at the call of spontaneously reawakened ambition. Dryden's Antony is so deeply sunk in love that no other impulse has power to stir him; it takes much persuasion and skilful artifice to detach him from Cleopatra even in thought, and his soul returns to her violently before the rupture has been completed. On the other hand, Dryden's Cleopatra is so completely enmeshed by love for Antony that she is incapable of using the calculated caprices and meretricious coquettices which Shakespeare's Cleopatra deliberately practises as the highest art of love, the surest way of maintaining her empire over her great captain's heart. It is with difficulty that Dryden's Cleopatra will agree, on the earnest solicitation of a wily counsellor, to begin a hiring for Dolabella to excite Antony's jealousy, and she cannot keep up the pretence through a few sentences. The characters of the two lovers are thus very much contracted, indeed almost overwhelmed, beneath the pressure of the one ruling motive. And as Dryden thus introduces a greater regularity of character into the drama, so he also very much contracts the action, in order to give probability to this temporary subjugation of individual character. The action of Dryden's play takes place wholly in Alexandria, within the compass of a few days; it does not, like Shakespeare's, extend over several years, and present incessant changes of scene Dryden chooses, as it were, a fragment of an historical action, a single moment during which motives play within a narrow circle, the culminating point in the relations between his two persons. Antony devotes his whole play, also, to those relations; only what bears upon them is admitted. In Shakespeare's play we get a certain historical perspective, in which the love of Antony and Cleopatra appears in its true proportions beneath the firmament that overhangs human affairs. In Dryden's play this love is our universe, all the other concerns of the world retire into a shadowy, indistinct background. If we rise from a comparison of the plays with an impression that the Elizabethan drama is a higher type of drama, taking Dryden's own definition of the word as "a just and lively image of human nature," we rise also with an impression of Dryden's power such as we get from nothing else that he had written since his Heroic Stanzas, twenty years before.

It was twelve years before Dryden produced another tragedy worthy of the powers shown in All for Love. Don Sebastian was acted and published in 1690. In the interval, to sum up briefly Dryden's work as a dramatist, he wrote Oedipus (1678) and The Duke of Guise (1683) in conjunction with Lee, Troilus and Cressida, 1679; The Spanish Fruits, 1681; Elizabethan Drama, 1685; Amphitryon, 1690. In Troilus and Cressida he follows Shakespeare closely in the plot, but the dialogue is rewritten throughout, and not for the better. The versification and the language of the first and the third acts of Oedipus, which with the general plan of the play were Dryden's contribution to the joint work, bear marked evidence of his recent study of Shakespeare. The plot of Don Sebastian is more intricate than that of All for Love. It has also more of the characteristics of his heroic dramas; the extravagance of sentiment and the suddenness of impulse remind us occasionally of The Indian Emperor; but the characters are much more elaborately studied than in Dryden's earlier plays, and the verse is snappy and powerful. It would be difficult to say whether Don Sebastian or All for Love is his best play; they share the palm between them. Dryden's subsequent plays are not remarkable. Their titles and dates are—King Arthur, an opera, 1691; Cleomenes, 1692, Love Triumphs, 1694.

Soon after Dryden's abandonment of heroic couplés in tragedy, he found new and more congenial work for his favourite instrument in satire. As usual the idea was not original to Dryden, though he struck in with his majestic step and energy divine, and immediately took the lead.
His pioneer was Mulgrave's *Essay on Satire*, an attack on Rochester and the court, circulated in 1679. Dryden himself was suspected of the authorship, and engaged by hired ruffians as the author; but it is not likely that he attacked the king on whom he was dependent for the greater part of his income. In the same year Oldham's satire on the Jesuits had immense popularity, chiefly owing to the excitement about the Popish plot, and its extension towards the close of 1681, on the side of the court, at the moment when Shaftesbury, baffled in his efforts to exclude the duke of York from the throne as a papist, and secure the succession of the duke of Monmouth, was wasting his trial for high treason. *Absalom and Achitophel* produced a great stir. Nine editions were sold in rapid succession in the course of a year. It was a new thing for the public to have the leading men of the day held up to laughter, contempt, and indignation under disguises which a little trouble enabled them to penetrate. There was no compunction in Dryden's ridicule and invective. Delicate wit was not one of Dryden's gifts; the motions of his weapon were sweeping, and the blows hard and trenchant. The advantage he had gained by his recent studies of character was fully used in his portraits of Shaftesbury and Buckingham, Achitophel and Zimri. In these portraits he shows considerable art in the introduction of redeeming traits to the general outline of malignity and depravity. Against Buckingham Dryden had old scores to pay off, but he was too practised in the language of eulogy and invective to need any personal stimulus. "Glorious John" had a mind superior to petty hatreds, as well as, it must be admitted, to petty friendships, and it is not impossible that the fact that his pension had not been paid since the beginning of 1680 weighed with him in writing this satire to gain the favour of the court. In a play produced in 1681, *The Spanish Friar*, he had written on the other side, gratifying the popular feeling by attacking the Papists. Three other satires, viz. which he followed up *Absalom and Achitophel*, dealt with smaller game than this master-piece, though one of them was hardly inferior in point of literary merit, *The Medal*; written in ridicule of the medal struck to commemorate Shaftesbury's acquittal. Then Dryden had to take vengeance on the literary champions of the Whig party, who had opened upon him all their artillery. Their leader, Shadwell, he essayed to demolish under the nickname of "MacFlecknoe." Besides a separate poem under that title, he contributed a long passage to a second part of *Aubelom and Achitophel*, written chiefly by Nahum Tate, in which Ferguson, Forbes, Settle, and Shadwell were victims of his stinging lash. *Religio Laceri*, which came immediately after, in November 1682, though nominally an exposition of a layman's creed, and deservedly was admired as such, was not without a political purpose. It attacked the Papists, but declared the "fanatics" to be still more dangerous, which fitted in with Charles's policy of conciliating the church by persecuting the Non-conformists.

Dryden's next poem in heroic couplets was in a different strain. On the accession of James, in 1685, he became a Roman Catholic. There has been much discussion as to whether this conversion was or was not sincere. It can only be said that the coincidence between his change of faith and his change of patron was suspicious, and that Dryden's character for consistency is certainly not of a kind to quench suspicion. The force of the coincidence cannot be removed by such pleas as that his wife had been a Roman Catholic for several years, or that he was converted by his son, who was educated at Cambridge, even if there were any evidence for these statements. Scott denied Dryden's conversion, as Macaulay denounced it, from party motives; on any other grounds, it is not worth discussing. Nothing can be clearer than that Dryden all his life through regarded his literary powers as a means of subsistence, and had little scruple about accepting a brief on any side. *The Hind and Panther*, published in 1687, is an ingenious argument for Roman Catholicism, put into the mouth of "a milk-white hind, immortal and unchanged." There is considerable beauty in the picture of this tender creature, and its enemies in the forest are not spared. One can understand the admiration that the poem received when such allegories were in fashion. It was the chief cause of the veneration with which Dryden was regarded by Pope, who, himself educated in the Roman Catholic faith, was taken as a boy of twelve to see the veteran poet in his chair of honour and authority at Will's coffee-house. It was also very open to ridicule, and was treated in this spirit by Prior and Montagu, the future earl of Halifax. Dryden's other literary services to James were a savage reply to Stillingfleet—who had attacked two papers published by the king immediately after his accession, one said to have been written by his late brother, in advocacy of the Church of Rome, the other by his late wife explaining the reasons for her conversion—and a translation of a life of Xavier in prose. He had written also a panegyric of Charles, and a eulogy of James under the title of *Britannia Rediviva*, which it is interesting to compare with his other productions of the same kind. Dryden did not abjure his new faith on the Revolution, and so lost his office and pension as laureate and historiographer royal. For this act of constancy he deserves credit, if the new powers would have considered his services worth having after his frequent apostasies. His rival Shadwell reigned in his stead. Dryden was once more thrown mainly upon his pen for support. He turned again to the stage and wrote the plays which we have enumerated. A great feature in the last decade of his life was his translations from the classics. A volume of miscellanies published in 1688 had contained some translations from Virgil, Horace, Lucretius, and Theocritus. He now produced translations more deliberately as a saleable commodity. A volume of miscellanies, which appeared in 1693, contained translations from Homer and Ovid. In the same year he published a translation of the satires of Juvenal and Persius, written with the assistance of his two elder sons. Johnson passes on this work the just criticism that "though, like all other productions of Dryden, it may have shining parts, it seems to have been written merely for wages, in an uniform mediocrity." When Dryden took his farewell of the stage in 1694, he announced his intention of devoting himself to a translation of the whole of Virgil. On this he seems really to have laboured, and great expectations were formed of it. It was published in 1697, and proved a great success. To judge it by its fidelity as a reproduction of the original would be to apply too high a standard, but it is an interesting rendering of Virgil into the English. It was also a very open to ridicule, and was treated in this spirit by Prior and Montagu, the future earl of Halifax. Dryden's other literary services to James were a savage reply to Stillingfleet—who had attacked two papers published by the king immediately after his accession, one said to have been written by his late brother in advocacy of the Church of Rome, the other by his late wife explaining the reasons for her conversion—and a translation of a life of Xavier in prose. He had written also a panegyric of Charles, and a eulogy of James under the title of *Britannia Rediviva*, which it is interesting to compare with his other productions of the same kind.
not well be on good terms with both courts. However, he was not molested in London by the Government, and in private he was treated with the respect due to his old age and his admitted position as the greatest of living English poets. His death took place on the 1st of May 1700.

Dryden's conversion to Catholicism had a great indirect influence on the preservation of his fame. It was this which gained him the discipleship and loving imitation of Pope. He thus became by accident, as it were, the literary father and chief model of the greatest poet of the next generation. If his fame had stood simply upon his merits as a poet, he would in all likelihood have been a much less imposing figure in literary history than he is now. The splendid force of his satire must always be admired, but there is surprisingly little of the vast mass of his writings that can be considered worthy of lasting remembrance. He showed little inventive genius. He was simply a masterly littérateur of immense intellectual energy, whose one lucky hit was the first splendid application of heroic couplets to satire and religious, moral, and political argument. Upon this lucky hit superadded another, the accidental discipleship of Pope. Dryden lent his gift of verse to the service of politics, and his fame profited by the connection. It would be unjust to say that his fame was due to this, but it was helped by this; apart from the attachment of Pope, he owed to party also something of the favour of Johnson and the personal championship and editorial zeal of Scott.

The standard edition of Dryden is Scott's. There is an admirable edition of his poetical works in the Globe series, by Mr. W. D. Cooper, enlivened with an elaborate and accurate memoir and note-taking notes. His two best plays, All for Love and Don Sebastian, have recently been reprinted by Mr. J. L. Seton (W. M.)

DRY ROT, a disease in timber, apparently infectious, which occasioned the destruction of its fibres, and reduces it eventually to a mass of dry dust. It is produced most readily in a warm, moist, stagnant atmosphere, while common or wet rot is the result of the exposure of wood to repeated changes of climatic conditions. In both diseases, however, a kind of spontaneous combustion or decomposition goes on in the wood; water, carbonic acid gas, and probably carburetted hydrogen are evolved, and a putrefying substance, or humus, remains. Though the growth of fungi undoubtedly accelerates the progress of dry rot, it would seem that the true origin of the disease is the incipient decomposition of the sap in wood, and that by virtue of this decomposition the fungi obtain a nidus for their growth. The most formidable of the dry rot fungi is the species Mérulius lacrymans, which is particularly destructive of coniferous wood; other species are Polyporus hybrida, which thrives in oak-built ships, and P. destructor and Thelithena puteana, found in a variety of wooden structures. The nature of ship's cargoes has a considerable influence on the duration of their timbers,—hemp, pepper, and cotton being highly favourable, and lime and coal unfavourable, to the development of dry rot. The commonest precaution against the occurrence of that disease is to deprive the wood of its moisture by exposure to the open air; or, in other words, to season it. Charring, steaming, boiling, and smoke-curing are other modes of desiccation which have been resorted to. At one time a Mr. Lukin attempted the rapid seasoning of logs of green oak at Woolwich, and by boiling them in pulvreted charcoal; but the process, though it lessened the weight and dimensions of the wood, started its fibres from one another. He then sought to replace the moisture of heated wood by the products of the distillation of pitch-pine saw-dust; but, before the operation was judged to be complete, an explosion took place, which proved fatal to eight workmen, and wounded twelve, the experiment, therefore, was not repeated. Davison and Symington's patent process of artificial drying, which has been found to yield good results, consists in exposing the wood to a current of air moving at the rate of about 45 miles an hour, and having a temperature of 110° to 112° Fahr.

The falling of trees when void of fresh sap, as a means of obviating the rotting of timber, is a practice of very ancient origin. Vitrus divulga (iv. cap. 9) that, to secure good timber, trees should be cut to the pith, so as to allow of the escape of their sap, which by drying in the wood would injure its quality; also that felling should take place only from early autumn until the end of winter. The supposed superior quality of wood cut in winter, and the early practice in England of felling oak timber at that season, may be inferred from a statute of James I., which enacted "that no person or persons shall fell, or cause to be felled, any oaken trees meet to be barked, when bark is worth 2s. a cart-load (timber for the needful building and repairation of houses, ships, or mulls only excepted), but between the first day of April and last day of June, not even for the king's use, out of barking time, except for building or repairing his Majesty's houses or ships." In giving testimony before a committee of the House of Commons in March 1771, Mr. Barnard of Deptford expressed it as his opinion that to secure durable timber for ship-building, trees should be barked in spring and not felled till the succeeding winter. In France, so long ago as 1669, a royal decree limited the felling of timber from the 1st October to the 15th April, and, in an order issued to the commissioners of forests, Napoleon I. directed that the felling of naval timber should take place only from November 1 to March 15, and during the decrease of the moon, on account of the rapid decay of timber, through the fermentation of its sap, if cut at other seasons. The burling of wood in water, which dissolves out or alters its putrificable constituents, has long been practised as a means of seasoning. The old "Resistance" frigate, which went down in Malta harbour, remained under water for some months, and on being raised was found to be entirely freed from the dry rot fungus that had previously covered her, similarly, in the ship "Eden," the progress of rot was completely arrested by 18 months' submersion in Plymouth Sound, so that after remaining a year at home in excellent condition she was sent out to the East Indies. It was an ancient practice in England to place timber for threshing-floors and oak planks for wainscoting in running water to season them. Whale and other oils have been recommended for the preservation of timber, advantageously used; indeed the Dutch ships have been recommended for the preservation of wood; and in 1737 a patent for the employment of hot oil was taken out by a Mr. Emerson. Common salt, but for the attraction of its impurities for moisture, might be advantageously used; indeed the Dutch ship-builders, having observed that the busses in which herring were stored away in pickle lasted longer than any other craft, adopted the practice of filling up with salt, not only the vacant spaces between the planks, but also holes bored for its reception in the large timbers.

Among the many processes for the prevention of dry and wet rot in wood by impregnating it with material capable of precipitating its coagulable constituents in a permanently unsoluble and impuisscrable form, the following may be enumerated—Ryan's (1852), in which, according to Sir Humphry Davy's suggestion, a solution of corrosive sublimate is employed; Sir W. Burnett's (1836), M. Brent's (1837), Margary's (1837), and Payne's (1841), which consist respectively in the use of zinc chloride, copperas, copper sulphate, and copperas followed by sodium carbonate; and Bethell's (1835), for the treatment of the wood with crude creosote or oil of tar. The application of solution of copper sulphate, containing about a quarter of a
pound of the salt to each gallon of water, according to Margary's patent, has been found very efficacious in the case of timber not liable to the solvent action of water; but of all processes the most satisfactory is Bethell's. In this the wood is injected with heavy tar-oil in cylinders 6 feet in diameter and 20 to 30 feet in length, at a temperature of 120° Fahr., and under a pressure of 150 lb. to the square inch, so that ordinary fir timber absorbs on the average 8 to 10 lb. of the liquid per foot. Timber thus prepared has been found not only durable, but also exempt from the attacks of insects and other pests.

DU BARRY GOMARD DE VAUBERNIER, MARIE JEANNE, COUNTESS (1746-1793), mistress of Louis XV, was the daughter of Vaubernier, a clerk of the customs at Vaucouleurs, and was born there on the 19th August 1745. She received little or no education, and, coming to Paris while yet very young, she entered the house of a “mar­­chande de modes.” She soon fell a victim to the temptations which there beset her, and lived with her lover, took his place, and in concert with her governed the monarch. The favour of Louis for the courtiers and ministers was in this she succeeded; but her lover, Du Barry to form the design of receiving her into his house, in order to make it more attractive to the dupes from whom by gambling he won money to furnish him with the means of dissipation. Her success surpassing his expectations, his hopes took a higher flight, and he presented her to Lebel, valet de chambre of Louis XV, with the intention that she should become the mistress of the king. In this she succeeded; but as the favour shown by Louis to a courtesy roused murmurs in the court and remonstrances from his ministers and the members of the royal family, Louis, who was too infatuated to remove her, met their wishes half-way by securing for her a nominal husband. Count Jean Du Barry was married himself, but his brother William offered himself for the ceremony, and after its performance the Countess Du Barry was presented at court on the 22d April 1789. Her influence over the monarch was absolute until his death, and courtiers and ministers were in favour or disgrace with him in exact accordance with her wishes. The Duc de Choiseul, who refused to acknowledge her, was disgraced in 1771; and the Duc d’Alguillon, who had the reputation of being her lover, took his place, and in concert with her governed the monarch. The favour of Louis for the Countess Du Barry continued to estrange her from his children and from the royal family, and this isolation induced him to build for her the magnificent mansion of Luciennes. At his death in 1774 an order of his successor banished her to L’Abbaye-du-Font-aux-Dames, near Meaux, but the queen interceding for her, the king in the following year gave her permission to reside at Luciennes with a pension. Having gone to England in 1792 to endeavour to raise money on her jewels, she was on her return accused before the Revolutionary tribunal of having dissipated the treasures of the state, conspired against the republic, and worn, in London, “mourning for the tyrant.” She was condemned to death December 7, 1793, and beheaded the same evening.

DUBLIN, a maritime county of Ireland, situated in the province of Leinster, and containing the Irish metropolis. It is bounded on the N. by the county Meath, E. by the Irish Sea, S. by Wicklow, and W. by Kildare and Meath. While the exception of Louth and Carlow, Dublin is the smallest county in Ireland. Its greatest length is 32 miles, its greatest breadth 18; and the area is 354 square miles, or 226,585 acres.

Geology.—The greater part of the county consists on the eastern extremity of the treat bed of flint limestone that extends over the middle of the island, widening as it spreads westward. It rises in its southern part into a range of mountains, which forms the verge of an elevated district, extending thence for more than thirty miles to the south through the county of Wicklow. Through this tract a large body of granite passes in a south-western direction, commencing at Blackrock and passing by Dundrum and Rathfarnham, and forming the loftiest summit in the county, bounded on its eastern and western sides by incumbent rocks of great variety of structure and relations; micaceous schist exists at Killiney and Rathfarnham, and argillaceous schist, on both sides of the granite and quartz rock, in the eastern side alone, forming the promontory of Bray Head, and reappearing in the more northern part of the county, where it forms the picturesque peninsula of Howth, and rises to the height of 567 feet above the level of the sea. The country near Bray presents, within a small space, an instructive series of rocks; and at Killiney schistose beds are to be seen, of considerable extent, reposing on granite.

Near Booterstown, a mass of compact limestone is visible within a few fathoms of the granite. Calp, or "black quarry stone," a variety of limestones, is the prevailing rock in the immediate vicinity of Dublin, and is much used for building; and the granite of Dalkey and the neighbourhood is also much used for architectural purposes in the city and environs; quantities of it are exported to England. Petrifications abound in many parts of the limestone country. In the peninsula of Howth gray ore of manganese, brown ironstone, and brown iron-ore occur in abundance.

Surface.—The northern portion of the county is flat, and the soil good, particularly on the borders of Meath, but on the southern side the land rises into elevations of considerable height. The mountains are chiefly covered with heath, except where a substitute in the ground affords a nucleus for the formation of bog, with which about 2000 acres are covered. There are also a few small tracts of bog in the northern part of the county. The mountain district is well adapted for timber, to the growth of which some attention has lately been paid.

Coast.—The northern coast of the county from Balbriggan to Howth has generally a sandy shore, and affords only the small harbours of Balbriggan and Skerries. In the promontory of Howth, the coast suddenly assumes a bolder aspect; and between the town of Howth and the picturesque rocky islet of Ireland’s Eye an artificial harbour has been constructed, at an expense of above one-third of a million sterling, which is useful only to vessels of small burthen, and those engaged in the fisheries. Soon after the harbour was finished it was discovered that a shifting sand­­bank was likely to render the refuge quite useless; and the slow but certain filling up of the harbour is made apparent at low tide. Kingstown harbour, on the south side of Dublin Bay, is by far the best in the county. It was commenced in 1816, and was not quite finished until 1859,—at a total expenditure of £825,000. A quay runs out into the harbour to a distance of 500 feet, at which vessels drawing 24 feet of water may unload at any state of the tide. The petty harbours of Ballock and Coolmore are on this coast, the former being quite dry save at high tide, and the mouth of the latter being much higher than the bed. Balbriggan is little better, and that at Skerries is hardly to be mentioned. Opposite Coolamore harbour lies Dalkey Island, and the sound between the island and the south side of Dalkey is much used in certain conditions of weather. The island is 22 acres in extent, and stand about midway between Kingstown harbour and the beautiful bay of Killiney. North of Howth lies Lambay Island.
about 600 acres in area, the property of Lord Talbot de Malahide. Shell-fish, especially lobsters, are caught here in abundance. Small inlet lies not far off, the most interesting of which is that known as Inispatrick, noted as the spot upon which St Patrick first landed in Ireland, and where he built his first church. Ireland's Eye, off Howth, is a very picturesque rock standing on about 54 acres of grass land. It has afforded great room for geological discussion.

The fishing districts are Dublin and Howth. The chief stations are Howth and Skerries, the former of which is much used by the Manx and Cornish fishermen, who resort in considerable numbers to the harbour during the fishing season. Dublin Bay haddocks and herrings have long been esteemed, and justly, for their superior quality and flavour.

**Rivers and Mountains**—The chief river in the county is the Liffey, which rises in the Wicklow Mountains about twelve miles south-west of Dublin, and, after running about 50 miles, empties itself into Dublin Bay. The course of the river is so tortuous that 40 miles may be traversed and only 10 gained in direction. The scenery along the banks of the Liffey is remarkable for its beauty. The mountains which occupy the southern border of the county are the extremities of the great group guarding the adjacent county of Wicklow. The principal summits are the Three Rock Mountain and Garry Castle, the former having an elevation of 1536 feet, and the latter of 1596, and the group formed by Kippure and the Seefin range, Kippure being 2527, and Seefin 2150 feet high. But the grandest features of these hills are the great natural ravines which open in them, the most extraordinary being the Sculp, through which the traveller passes from Dublin to Wicklow.

**Agriculture.**—Of the 226,895 acres which form the area of the county, 100,336 acres were returned in 1871 as under tillage, 91,503 as pasture, 47,716 wood, 15,700 in towns, and 14,470 waste, bog, mountain, and water. The face of the county has indeed changed but little during the century, and the statistics as to the treatment of the soil exhibit an almost stationary result. The growth of the towns suburban to the city has made the only appreciable change, and that change has been not inconsiderable. The farms are in general small. Near Dublin, particularly on the southern side of the city, a very considerable portion of the county consists of ornamental grounds, and the rents are proportionately high.

The produce of the crops is generally greater than in any other county—not so much on account of any natural superiority in the soil, as by reason of the facilities afforded by the neighbourhood of a large city, and the greater expenditure of capital on the land. Of cereals the principal crops are oats and wheat; and of green crops, potatoes. In live stock the county is particularly rich in proportion to its extent. The following tables give the acreage of crops and numbers of stock in 1873 and 1876—

As regards the division of the land, the number of holdings in the county has somewhat diminished within recent years. In 1853, there were 9016 separate holdings, while in 1876 there were only 8792. According to the Owners' Returns of 1876, the county was divided in 1874 among 4100 proprietors, of whom 3256, or 61%, owned less than one acre of ground, a proportion almost identical with the average of Leinster. From the same authority it appears that the total area held amounted to 217,457 acres, giving an average of 53 acres per property (that of the province being 187), and the total valuation amounted to £686,794, giving an average of £3.2s. 2d. per acre, as against 18s. 11d. for the whole province. Fourteen proprietors owned more than 2000 acres each, and 57,992 acres in all, or 26% per cent. of the area, viz:—Charles Cobbe, 9663 acres; Earl of Howth, 7377; Sir C. W. Donville, 6252; George Woods, 4111; Sir Roger Palmer, 3974; Lord Langford, 3639; Ion Trant Hamilton, 2947; Mrs White, 3422; W. W. Hackett, 3198; Eyre Coote's representatives, 3107; B. Q. Alexander, 2973; Earl of Pembroke, 2269; Lord Annaly, 2139; Marquis of Lansdowne, 2132.

The manufactures of the county are mainly confined to the city of Dublin and its neighbourhood. There is, however, a manufacture of cotton hosiery at Balbriggan of some importance.

**Administration.**—There are nine baronies in the county:—1 and 2, Balrothery East and West, containing Rush and Lucan (population 1800), Skerries (2336), and Balbriggan (3323); 3, Coolock, containing Clontarf (3412), and several minor villages; 4, Nethercross, containing the ancient parliamentary borough of Swords (1008), and the village of Glaneuvin, 5, Newcastle, containing the village of Lucan, and Newcastle, which was represented in the Irish Parliament by two members; 6, Uppercross, and Rathdown, containing the towns of Dundrum (540), Blackrock (8089), Kingstown (16378), Dalkey (2584), and Killiney (2290), 8 Castleknock, in which is situated the Phoenix Park, and 9, Dublin, containing the city and many outlying villages. The village of Donnybrook, famous for its fair and accompanying riotous pleasure, is now part of Pembroke township, one of the richest and most beautiful suburbs of the city.

The nine baronies, including the city, are divided into 99 parishes, all within the archdeaconry of Dublin. The county proper, excluding the capital, contains 222,709 acres; the rateable property is valued at £700,854, the population at the last census (1871) was 158,936; and the number of houses, 28,803. Between 1841 and 1871 the increase of population was nearly 13 5 per cent, although between May 1851 and December 1871 there emigrated from the county 58,774 persons. In 1871, 70% per cent. of the total population were Roman Catholics in the city that denomination forms 79 per cent. The numbers of the last religious census were—Catholics, 111,934; Episcopalians, 39,269; Presbyterians, 2395, and various, 4688. There are two poor-law unions, Balrothery and Rathdown, but portions of the county are in unions situated in adjacent counties. The average daily number of paupers in the county workhouses in 1875 was 674.

Dublin is the head-quarters of the military district, and of the general commanding-in-chief and staff of Ireland.

The total number of children receiving education in 1834-26 was reported in a parliamentary return to be 23,008. In 1855, there were 159 national schools in operation, attended by 28,799 children, and in 1876 there were 52,137 children attending the national schools.

Previous to the union with Great Britain, this county returned ten representatives to the Irish Parliament,—two for the county, two for the city, two for the university, and two for each of the boroughs of Swords and Newcastle. The number of representatives was reduced to five by the Act of Union, one member being withdrawn from the university, and the boroughs of Swords and Newcastle disfranchised. The Reform Act of 1832 restored the second member to the university, leaving the representatives in other respects unchanged.
History.—It is stated by Ptolemy that the county Dublin was inhabited by the tribe of the Ethans, who swelt for the most part in Meath county, but on their settling in Dublin founded the city Eblans, now presumed to be Dublin. Later writers affirm that the Ethans were driven out by the Danes, who held sway until the battle of Clontarf (1014) resulted in the overturn of their power. When the English landed, the people to the north of the Liffey were known among the Irish as Fingale, or white foreigners, and those living south of the river were called Duakghall, or black foreigners. The Rev. Caesar Otway professed to be able to discern signs of the different races even as late as his day; but the modern observer will fail to catch any marks whereby different portions of the community may be distinguished.

In 1210, King John formed this district into a county, comprising the chief portion of country within the English pale. The limits of the county were, however, uncertain, and underwent many changes before they were fixed. Although so near the seat of government, 67,142 acres of profitable land were forfeited in the Rebellion of 1641, and 34,536 acres in the Revolution of 1688. In 1662 the boundaries were definitely marked, the country inhabited by the O'Toole's and the O'Byrnes being formed into the county of Wicklow. The absence of any considerable towns decreases the interest in Dublin county, and it has no historic fields to boast of. In 1867 the most formidable of the Fenian risings took place near the village of Tallaght, about seven miles from the city. The rebels, who numbered from 500 to 700, were found wandering at dawn, some by a small force of constabulary who, having in vain called upon them to yield, fired and wounded five of them, but the great bulk of them were overtaken by the troops under Lord Strathearn, who captured them with ease and marched them into the city.

In the reign of James II. the population of Dublin was 64,483; in 1728 it had more than doubled; in 1753 it was 161,000; in 1798 Whitelaw estimated it at 192,000; according to the first census taken in 1821, it was 185,881; it was 232,726 in 1841, 254,808 in 1861, and 246,326 in 1871. This last decrease is due to the recent increase in wealth and the consequent extra-city residence of the traders and merchants. The suburbs of Dublin have wonderfully improved within the past twenty years, and constitute at present the chief of the many attractions which the stranger is wont to admire. The outlying townships of Rathmines and Rathgar, Kingswood and Donnybrook, Clontarf and Dalkey, are all inhabited by persons engaged in the commerce of the city. If we include these populations, the city may be said to contain about 330,000 souls. The parliamentary borough, whose limits are more extensive than much of the munifico population, covers an area of 3501 acres, and contained in 1871 a population of 207,717 persons. It returns two members to the imperial parliament.
The rainfall is nearly 33 inches; rain or snow falls on 200 days per annum; and the wind blows from the N. or E. for 120 days. The average death-rate is 27 per 1000.

The plan of the city is singularly simple. The Liffey flows almost through the centre from west to east, and the bridges connect long lines of streets running north and south. The communications between the two sides of the city are ample, there being 9 bridges in a distance of about a mile and a half, and ferries for the two miles of shipping between the last bridge and the mouth of the river. Sackville Street is the finest avenue in Dublin; the houses, however, are not uniform, and the street is not long enough for its width, while the Nelson Pillar, itself a beautiful object, blocks the View and prevents the mass of the houses from being properly seen. It is therefore necessary to have a purlieu, a small street or walk, which will be in the space between the last bridge and the mouth of the river.

The condition of the various orders of the community is perhaps best shown by citing the census returns as to the number of families occupying the four different classes of houses. There were 5635 families in houses of the 1st class, 10,223 families in the 2d class, 10,619 in the 3d class, and 25,723 in the 4th class. The 58,110 families thus hold 23,896 houses. Another way of estimating Dublin society is by taking the occupations of the people. In 1871 there were 267 lawyers in Dublin, 256 barristers, 370 attorneys, 49 architects, 215 accountants, 460 bootmakers, 296 tailors, 19,509 domestic servants, 83 photographers, 1000 coachmen and coachwomen, 1600 drapers and mercers, 1250 carmen and carriers, 936 cabinetmakers, 3500 clerks, 177 civil engineers, 394 fishmongers, 36 glovers, 376 physicians, 11,530 labourers, 4500 milliners, 1477 printers, 31 sculptors, 223 watch and clock makers, 458 wine and spirit merchants.

Judges, lawyers, and doctors may be said to constitute the higher society of Dublin, of the 182 peers of Ireland only two have residences in the capital.

The lord lieutenant lives in Dublin Castle in winter, and in the Viceregal Lodge, Phoenix Park, in summer. He is assisted in the executive by a privy council, nominated by the Crown, and his chief secretary, who must have a seat in the House of Commons. Lords justices govern in the temporary absence of the lord-lieutenant—the lord chancellor, the commander-in-chief, and another privy councillor usually being appointed. Prior to the Act of 1863 disestablishing and disestablishing the Irish branch of the Established Church, the archbishop of Dublin was invariably named a lord justice, but in future the archbishop may or may not have a seat at the Council Board.

Dublin is the seat of the Irish courts of law and equity, from which appeal lies only to the House of Lords. The judicial functions are exercised by the lord chancellor, a lord justice of appeal, a vice chancellor, the master of the rolls, and four judges in each of the three classes of Queen's bench, common pleas, and exchequer. There are also judges (1) in the court of admiralty, (2) in the bankruptcy court, and (3) in the landed estates court for the sale and transfer of estates in Ireland. The recorder's court determines civil bills and city criminal cases.

Local Government. The municipality is under the government of the lord mayor and corporation. Previous to the Municipal Reform Act of 1840 the corporation consisted of the lord mayor, 2 sheriffs, 24 aldermen, 124 common councilmen, 28 sheriffs, and 96 representatives of the 25 civic guilds. At present the corporation consists of 15 aldermen and 45 councillors, being 6 geason alderman and 3 councillors for each of the 15 wards into which the city is divided. An alderman or councillor is annually elected lord mayor. The income of the body arises from rents on property, customs, and taxes. The yield in 1872 was £296,604, the expenditure £255,944, and the debt £337,476. The debt in 1875 was £296,604, the expenditure £255,944, and the debt £337,476. Under an Act passed in 1817 the corporation have the right to form and every year three names of persons eligible for the office of high sheriff to the viceroy, one of which shall be selected by him. The lord mayor holds a weekly court for debts above 40s. and under £10, and for the settlement of cases between masters and servants. He is also clerk of the markets, and supervises weights and measures and deals with cases of adulteration. A court of consistory determines debts under 40s. and is presided over by the last ex-mayor. A competent fire-brigade is maintained by the corporation. The average number of fires per annum is between 60 and 65; 12 lives have been lost in ten years, and property to the value of £485,800 has been saved in the same period. The city coroner is a corporate officer. There were 422 incipits in 1875. Under an Act applicable only to Dublin the local rates are collected by a collector-general, and are distributed by him to the different authorities concerned.
Irish Constabulary. The police are under the control of two commissioners, and consist of 7 superintendents, 76 inspectors, 64 sub-inspectors, and 440 constables. A local police rate of 8d. in the £1 produces about £30,000 a year; and the taxes on hackney cars, driven licenses, pawnbrokers' licenses, and publications of the police rules, average about £16,000. These two sums (£44,000), together with a Treasury grant averaging £26,000 a year, maintain the force, and pay the commissioners and superintendents and the four police magistrates. The police are inspectors of the hackney carriages, which number nearly 2000. They carry out the laws affecting the sale of liquor, and the number of houses in Dublin is 1012. A farce of the crime and offences committed in the city is afforded by the following statistics taken from official sources—Number of persons arrested (1876, 45,439), number convicted either summarily or after trial before a superior judge, 59,920; of those convicted, 12,348 (6627 males and 4719 females) were charged with drunkenness; 88 persons were sentenced to penal servitude (68 for five years); and 400 were sent to jail. Quarter sessions are held in the city by the recorder; and a commission of oyer and terminer is held twice a year by two of the superior judges.

Military.—A large military force is usually maintained in the city. Dublin which is the headquarters of the military district of Dublin and of the staff of Ireland, consisting of the commander of the forces, adjutant-general, and quartermaster-general. The troops are accommodated in seven barracks, the most extensive of which is the Royal Barracks, consisting of five squares, affording quarters for 10 field officers, 83 officers, 2000 non-commissioned officers and privates, and 460 horses, together with a hospital for 260 patients. Richmond Barracks, for infantry, occupies an elevated healthy situation, on the banks of the Grand Canal, beyond Kilmainham, forming a substantial fabric, with extensive exercise grounds and yards, covering altogether an area of 18 acres, and furnishing accommodation for 76 officers and 1600 non-commissioned officers and privates, and stabling for 260 horses, and a hospital for 100 patients. Portobello barracks, for cavalry and artillery, is on the bank of the same canal, near Harold's Cross, and can accommodate 80 officers and 560 non-commissioned officers and privates, stabling for 460 horses, and a large hospital. At Island Bridge, near Kilmainham, there is an extensive artillery barrack, and there is another for artillery at the Pigeon House Fort in the bay. Beside these, there are barracks for infantry at Great Ship Street, near the castle; at Aldborough House, a fine massive building erected in 1765 at a cost of £45,000; and at Beggar's Bush, on the South Circular Road. In the Phoenix Park is Mackenzie's Fort and magazine. The magazine is surrounded by a dry ditch, and is entered by a drawbridge. It is defended by a dozen 24-pounders.

Poor Law.—There are two poor law unions in the city—North and South, governed by two boards of guardians. The average daily number of paupers in both is 4832, and the annual expenditure of both £74,560.

Religious.—The following tables show the population of the different religious denominations in 1841, 1851, 1861, and 1871, and the number of Roman Catholics and Protestants of the Episcopal church in each parish (when part is mentioned, the rest of the parish is in Dublin county):

Total | 265,926 | 265,926 | 265,926 | 265,926 | 147,111 | 119,815 |

Besides the above mentioned religious denominations there were 4517 Presbyterians, 1853 Baptists, and 4904 of "other persuasions." The proportion of Catholics to the total population was equal to 79 per cent.

Education.—The means of education in Dublin are ample. The incessant contests between the various religious denominations have had the effect of imparting energy to all engaged in teaching.

Trinity College, founded by Queen Elizabeth, is the greatest foundation in the country. The corporation now consists of a provost, 7 senior fellows, 26 junior fellows, and 70 scholars. Two studentships, one mathematical and one classical, have been recently added to the honour list. The successful competitor is entitled to £100 a year for seven years; there are no duties to be fulfilled and no residence is required. A vacancy among the fellows is filled up by the provost and a select number of the fellows, after a very severe examination for ten days in metaphysics, mathematics, natural philosophy, ethics, history, chronology, Latin, Greek, and Hebrew. Fellowships are held for life. Until the year 1840 the fellows were bound to celibacy, but that restriction was then removed. The scholars are chosen from among the undergraduates, after an examination in mathematics or Greek and Latin. The pecuniary advantages attaching to scholarships lasts for four years. Students, after an examination, are admitted as fellows, companions, pensioners, or sizars; the last class is limited to thirty, and is partially maintained out of the College funds. Noblemen, noblemen's sons, and baronets have the privilege of forming a separate order with peculiar advantages, on the payment of additional charges. The course of general instruction extends over four years, the principal studies of each year being successively mathematics, logic, natural philosophy and astronomy, classics, and ethics; and four commencements are held every year for the purpose of conferring degrees. A medical school is attached to the university, and also a school of civil engineering, and diplomas in surgery and civil engineering are granted by the board on the completion of the prescribed courses. The library, which is one of the four scheduled in the Copyright Act, consists of about 190,000 printed volumes and 1500 manuscripts; and the number is increased annually by about 2000 volumes, partly purchased and partly obtained free under the Act. There are also a botanic garden and a museum. The funds of the College, arising from lands and the fees of the students, are managed solely by the provost and seven senior fellows, who form a board, to which also the Academic Council, the whole governing body and literary, both in its executive and its legislative branches, is committed. The buildings, which include a large extent of ground, now nearly in the middle of the city, consist of one very large and two smaller squares. In these is the chapel, the hall for examinations, the museum, the library, the dining hall, the printing office, and chambers for the fellows and students. Attached to the buildings is a large park for the recreation of the students, and a smaller enclosure for the provost and fellows. The provost's residence and the medical school are apart from the main body of the buildings. The college library is at Dunsmuir, about five miles north-west of Dublin; it is amply furnished with astronomical instruments. It was endowed by Dr Francis Andrews, provost of Trinity College, was erected in 1785, and in 1791 was placed by statute under the management of the Royal Astronomer of Ireland, an appointment first filled by Dr Henry Usher, and subsequently by Dr Brunckley, bishop of Cloyne. The Magnetic Observatory of Dublin was erected in the years 1837–8, in the gardens attached to Trinity College, and at the expense of the university. A series of observations was begun in 1838, and has been continued ever since. The annual income of
Trinity College is set down as about £65,000 a year. The average number of students on the books is about 1300. By an Act passed in 1875, known as Fawcett's Act, all tests were abolished, and the prizes and honours of all grants hitherto reserved for Protestants of the Established Church were thrown open to all. Examinations for women are now held under the direction of the College.

The Queen's University, founded in 1850, has quarters in Dublin Castle; but the three colleges are in Cork, Belfast, and Galway. Dublin has no share in the advantages of the university, which are considerable.

The Roman Catholic University derives its entire support from voluntary contributions. There is an annual collection on a certain Sunday in November, and this realizes about £3000. The management is in the hands of the Catholic bishops. The medical school in connection with the university has attained great repute in Ireland.

The Royal College of Science, controlled by the Science and Art Department, is conducted by ten professors. The number of students is said to be greater than 30, amongst whom four royal scholarships and some royal exhibitions (value £50 for two and three years respectively) are divided. The Parliamentary grant is £6902 per annum. The Royal Dublin Society and the Royal Irish Academy are devoted to science and art. The one receives £7500 a year, and the other £1300. The Royal Dublin Society's Act is £200, and the National Gallery £2340 a year. The Zoological Society, having its gardens in the Phoenix Park, has £500 a year.

Schools—In 1871 there were in the city 356 schools—257 primary and 198 higher. In attendance at the primary schools were 16,782 Roman Catholics, 4692 Episcopalian, and 842 Presbyterians, and some for orphans, for the unemployed, some for the orphan daughters, and for women. The total of 29,617 were illiterate. Dublin was, by Government, receives a grant of £100, donations, &c., from voluntary contributions. There is a constant supply of boarders, from whom four royal scholarships and 1242 Presbyterians and others; in attendance at the superior are 1491 Roman Catholics, 234 Presbyterians, and 1566 Presbyterians and others. This gives a general total of 59,617.

The education of all classes in Dublin is shown in the following figures—In 1871, 162,561 of seven years and upwards could read and write, 24,224 could read but could not write, and 55,633 were illiterate.

Charities—Dublin can boast a goodly number of charities. There are 113 charitable institutions, some for the deaf and dumb, the blind, the destitute, the distressed, the unemployed, for the education of the reduced, and for the sons and daughters of clergy-men, and some for orphans, for idiots, for convalescent patients. The Royal Institution, for the daughters of soldiers, was established in 1864 by a Scotch gentleman named Drummond, who left £20,000 to found the asylum. The Hospital and Foundling Institution, commonly called the Blue School, was founded in 1760. About 1860, the school buildings are very handsome, and cost £21,000. The annual income is £4000 a year. The education is of a very superior character. In 1850 the Irish Parliament House were erected the parliament met in the school building. Molyneux Asylum for the blind, a splendid building near the city, is a refuge and instruction to 70 females. There are 90 hospitals, of which the chief are—the Westmoreland Lock, parliamentary grant £2300; Stevens, parliamentary grant £1300, donations, &c., £4177; the Meath, parliamentary grant £500, city grant £750, donations £1915, Cork Street Fever, parliamentary grant £2250, donations £1295; House of Industry Hospitals (3), parliamentary grant £4743, donations £593; Rotonde Lyng-in, parliamentary grant, £700, city £300, donations £3287; Cleebe Lyng-in, parliamentary grant £290, city £360, donations £1977; Incurables, parliamentary grant £250, city £110, donations £4000, St Mark's Eye and Ear, parliamentary grant £106, city £100, donations £735. These 11 hospitals in all, are maintained and received from Parliament, £15,722, from the city authorizes £1560, from subscriptions £19,853. Total income of all £26,636. Of the houses supported by voluntary contributions the Adelainers (Protestant), the Mater Misericordiae, St Vincent's, and the City of Dublin hospitals are the most important.

The principal institutions for the blind are the Institute of the Holy Name, founded in 1745, pursuant to the will of Dean Swift, and conducted by governors appointed by the charter of incorporation. The Richmond Lunatic Asylum, erected near the House of Industry, and made use of by the lunatics, was, by special act of the legislature, in 1782, converted into the Royal Lunatic Asylum. The Roman Catholic Church has charge of a number of special charities, some of them educational and some of them for the relief of suffering.

Libraries, &c.—The principal library in Dublin, for the number and value of its books, is that of Trinity College. It is open to all, whether they are students of that university, but admission is obtained by others by special favour. It contains about 120,000 printed volumes, and 1500 manuscripts. The King's Inns Library is next in value. The right of reading in it is confined to the members of the King's Inn's Society. There are, besides, barristers, attorneys, and law students. Marsh's Library, attached to St. Patrick's, founded by Dr. Marsh, in 1654, contains about 15,000 volumes, and is open to the public, but, from the very small portion of its funds appropriated to purchase, it is very deficient in modern publications. It possesses some valuable manuscripts. The want of a library is partly supplied by the tracts and works printed under the request of the society, for sale, and the purchase of which is attempted to be supplied by a society formed in 1791 (the Dublin Literary Society), which collected a large number of books, tracts, and works, and the sale of which is managed by the committee of the society.

The Royal Irish Academy's Library is valuable of its kind. It contains many ancient manuscripts, and works dealing with science and antiquities.

Public Buildings.—Dublin has several noble edifices. The first and greatest is the Bank of Ireland, formerly the House of Parliament, which occupies five acres. There are three fronts. The principal, towards College Green, a colonnade of the Ionic order, formed of a façade and two projecting wings, for much admirability of its elevation. The western front, a portico of four Ionic columns, is connected with the other by a colonnade of the same order, forming the quadrant of a circle. The eastern front, which was the entrance of the House of Lords, was, by their special wish, a colonnade of the Corinthian order, which the architect found great difficulty in uniting with the other parts. The apartment for the Lords, a fine room, is hung with tapestry. That of the commons, having been burned in 1792, was reconstructed after a more elegant design, in the form of a circle surrounded by pillars, between which was a gallery for hearers. This fine hall was taken down by the bank directors, and converted into a square room, now the cash-office. The House of Lords remains in its original condition, and is but seldom used.

Trinity College is in itself a source of legitimate pride to the city. The front is plain and the courts are large and well proportioned. On the left is the examination hall, containing full length portraits of the queen founder, of Molynex, of Edmund Burke, Bishop Berkeley, and other celebrities. On the right stand the chapel and the dining hall, both by the same architect. The dining hall is a very handsome interior, and the latter having portraits of...
The installations for municipal purposes. The centre hall contains statues and monumets; the river, 315 feet stands on the site of the ancient Dominican monastery of entablature and cornice; on the apex is a figure of Hibernia,ing portico of six fluted Ionic columns, supportmg land, whose tomb the church lands were accustomed to pay their rents. The building. It is in possession of the corporation, and is used projectmg cornice. The other three fronts are composed of which may be seen to advantage. The south front, facing the Church consists of a boldly projectmg campanile. The library presents a rather motley appearance. The greater portion of it is dingy, being built of brick; but the chapel and tower are very handsome. The castle stands on ten acres, but the apartments are small, with the exception of St Patrick's Hall, which is used on the occasion of investing knights of the order of St Patrick. 

The custom-house is considered one of the chief ornaments of the city. It was erected at a cost of about £400,000, and opened in 1791. It stands on the north side of the river below Carlisle Bridge, and presents four fronts, three of which may be seen to advantage. The south front, facing the river, 375 feet in length, is built of Portland stone, finished in the Doric order, with an entablature and bold projecting cornice. The other three fronts are composed of granite, and from the centre rises a dome to the height of 125 feet, surmounted by a figure of Hope.

The Four Courts, in which the superior courts are held, stands on the site of the ancient Dominican monastery of St Saviour, on King's Inn Quay. It is an extensive and imposing structure, erected between the years 1785 and 1800, at a cost of £200,000.

The city hall, formerly the royal exchange, is a handsome building. It is in possession of the corporation, and is used for municipal purposes. The central hall contains statues of George III., of Grattan by Chantrey (a superb work), of O'Connell by Hogan, of Lucas, and of Drummond.

The post-office stands in Sackville Street. It is built of granite, and is about 120 feet high, 255 in length, and 150 in depth. The centre of the front consists of a boldly projectmg portico of six fluted Ionic columns, supporting an entablature and cornice; on the apex is a figure of Hibernia, and Mercury and Fidelity at the sides. The first stone was laid in 1815, and the cost of the pile was £50,000.

Churches.—St Patrick's Cathedral, a noble edifice, was restored by the late Sir Benjamin L. Guinness, Bart., at a cost of £130,000; Christ Church Cathedral is now in course of restoration by Mr Henry Roe, and the estimated cost is much over £100,000; Mr Roe has also presented a synod house to the Church of Ireland at a cost of £27,000; the late Mr Findlater gave the Presbyterian body a beautiful church which he erected at a cost of £6,000; the Roman Catholics have raised about 16 magnificent edifices in the last twenty years; most of the Protestant parish churches have been either rebuilt or restored; the Unitarians have two houses, one of them of noble aspect; and the Methodists, the Moravians, the Friends, the Baptists, and the Jews have all provided themselves with suitable places of worship. There are no less than 93 churches of all denominations and a synagogue in Dublin, and at least 70 of these are beautiful modern buildings.

The two cathedral churches of St Patrick and Christ Church are superior to all other edifices in character and interest. The foundation of Christ Church, the older building of the two, is attributed to the Danes in 1038; but it dates its elevation to a deanery and chapter from 1541. The entire length of the nave and choir is 250 feet, that of the transept 110 feet, and the extreme breadth of either 80 feet. Christ Church does not contain many monuments. Among the most interesting is that of Strongbow, the invader of Ireland, whose tomb was long the place at which the tenants of the church lands were accustomed to pay their rents. The monument was injured by the fall of one of the cathedral walls; but it was afterwards repaired, and is still to be seen in good preservation, with a smaller tomb by its side, supposed to be that of Strongbow's son, who was killed by his father. Synods were occasionally held in this church, and parliaments also, before the Commons' Hall was destroyed in 1565 by the accidental explosion of 144 barrels of gunpowder in a neighbouring street. Here also the impostor Lambert Simnel was crowned.

The cathedral of St Patrick was founded in 1190 by John Comyn, archbishop of Dublin. It was burnt about a hundred years after its first erection, but was again raised from its ruins in increased splendour. At the Reformation it was dissolved, and the building was used for some of the purposes of the courts of justice. Edward VI. contemplated its change into a university, but the project was defeated and a university established elsewhere. In the succeeding reign of Mary, St Patrick's Cathedral was restored to its primary destination. The installations of the knights of St Patrick, the first of which took place in 1783, were originally held here. This cathedral contains the monuments of several illustrious persons, among which the most celebrated are those of Dean Swift; of Mrs Hester Johnson, immortalized under the name of "Stella:" of Archbishop Marsh; of the first earl of Cork; and of Duke Schomberg, who fell at the battle of the Boyne. The tablet over Schomberg's grave contains what Lord Macaulay calls a "furious libel." In the cathedral may be seen the chain ball which killed St Ruth at the battle of Aughirm, and the spurs which he wore when shot. A fine statue of Sir Benjamin Lee Guinness, Bart., the restorer of the cathedral, stands in the aisle.

The Roman Catholic churches are for the most part old and in poor localities. The new churches are, however, of greater proportions and of considerable beauty. The principal is the church of the Augustinians in Thomas Street. This is perhaps the loftiest building in the city. The pro-cathedral in Marlborough Street is a building of great dimensions, highly ornamented internally in the Grecian style, and having a fine Doric portico forming the principal front. The building was commenced in 1816, at an estimated cost of £52,000. St Paul's, on Arran Quay, is an elegant building in the Ionic style. The church of St Francis Xavier was erected at a cost of £18,000, from a Roman Ionic design.

Places of Amusement, &c.—Dublin has a winter palace, on the plan of the London Crystal Palace. The scheme advancing public entertainment failed, and Sir Arthur Guinness, Bart., purchased it from the subscribers for £13,000. It is used now for various purposes. There are three theatres—the Royal (second in size only to Drury Lane and Covent Garden), the Gaiety, and the Queen's Theatre. There are two or three musical societies, which are supported by the middle classes; but very little music of a superior character is afforded to the citizens at large.

The Phoenix Park, just touching the north-west boundary, is seven miles in circumference, and includes an area of 1759 acres. The park is in itself beautiful, and the nearness of the Dublin and Wicklow mountains adds greatly to its attractions. The Viceregal Lodge and the Chief Secretary's Lodge are the only buildings inside the gates. They have little pretension beyond their size.

Monuments.—There are nine of Foley's best statues in Dublin—the Prince Consort, Grattan, Burke, Goldsmith, Guinness, Stokes, Corrigan, and Lord Carlisle; and that of O'Connell may be added. Among the other memorials is that of Strongbow, the invader of Ireland, whose tomb was long the place at which the tenants of the church lands were accustomed to pay their rents. Wellington's monument stands in the Phoenix Park, on an obelisk 200 feet high, bearing on the sides the names of his victories, and scenes in relief from the greater battles on the pedestal. There are statues to King William,
to Smith O'Brien, to Lord Eglinton, to William Dargan, to Nelson (already noticed), and to Thomas Moore.

Commerce.—Dublin has little of the bustle which should mark so large a city, and as a matter of fact Belfast is said to transact a greater general trade. There is, too, a spirit of foolish pride which tends to disguise trade; and the tendency to be poor and genteel in the civil service, at the bar, in the constabulary, in the army, in professional life, rather than prosperous in business, is one of the most unfortunate and strongly marked characteristics of Dublin society. That this is attributable to the lingering yet potent influence of an unhappy past is held by some; while others attribute the weakness to the viceroy's office and the effects of a sham court. About the tune of the legislature there occurred many events which were passed, and they entered, and 213 cleared the port of Dublin; and porter. The whisky trade has been greatly extended. All exportation was soon stopped, and the custo...
In 1534 Lord Thomas Fitzgerald, better known as Silken Thomas, or because of a fantastic fringe was in the helmet of his followers), a young man of rash courage and good abilities, son of the Lord Deputy Kildare, believing his father, who was imprisoned in the Tower of London, to have been beheaded, organized a rebellion against the English Government, and marched with his followers from the manor of the septs of Kildare, in Thomond County, through Duan's Gate to St. Mary's Abbey, where, in the council chamber, he proclaimed himself a rebel. On his appearing before the wall with a powerful force, the citizens were misled into the belief that he was afraid to give admission of his troops to besiege the castle, but, on hearing that he had met with a reverse in another quarter, they suddenly closed their gates and detained his men as prisoners. He then attacked the city itself, but, finding it too strong to be seized by a coup de main, he raised the siege on condition of being allowed to carry away a number of the children of some of the principal citizens who had fallen into his hands. After much resentment of fortune, Lord Thomas and others concerned in it were executed at Tyburn in 1536.

At the breaking out of the civil war in 1641, a conspiracy of the Irish septa, under the direction of Roger Moore, to seize Dublin Castle, was disclosed by one Owen Connolly on the eve of the day on which the attempt was to be made, and the city was thus preserved for the king's party; but the Irish without commenced an indiscriminate extermination of the Protestant population. In 1648 Dublin was besieged, but without success, by the Irish army of 16,000 foot and 1600 horse, under the guidance of the Prince Thomas Rumpa, and others, banded together to restore and establish in Ireland the exercise of the Roman Catholic religion. The city had been put in an effusive state of defence by the government, and, in the following year, to prevent it falling into the hands of the Irish, the government ordered it on condition to Colonel Jones, commander of the Parliamentary forces. In 1649 Ormond was totally defeated at the battle of Aughrim, near Old Rathmines, in an attempt to recover possession. The same Cromwell landed in Dublin, as commander-in-chief under the Parliament, with 2000 foot and 600 horse, and proceeded thence on his career of conquest.

When James II. landed in Ireland in 1689, to assert his right to the British throne, he held a parliament in Dublin, which passed several acts of attorney in favour of 3000 Protestants. The governor of the city, Colonel Luttrell, at the same time issued a proclamation ordering all Protestants not housekeepers, excepting those following some trade, to depart from the city within 24 hours, under pain of death or imprisonment, and restricting those who were allowed to remain in various ways. In the hope of relieving his financial difficulties, the king erected a mint, where money was coined of the "worst kind of old brass, gun, and the refuse of metals, melted down together," of the nominal value of £1,586,800, with which his troops were paid, and tradesmen were compelled to receive it under penalty of being hanged in case of refusal. Under these regulations the entire coinage was put into circulation. After his defeat the battle of the Boyne, James returned to Dublin, but left it again before daybreak the next day; and William III. advancing by slow marches, on his arrival encamped at Juncas, and having decided to attack the town, moved forward the following day to lay siege to St. Patrick's Cathedral to return thanks for his victory.

In 1768 a convention of delegates from all the volunteer corps in Ireland assembled in Dublin for the purpose of procuring a reform in parliament, but the House of Commons refused to enter into the proposition, and the convention separated without coming to any practical result. In May 1798 the breaking out of a conspiracy planned by the United Irishmen to seize the city was prevented by the capture of Lord Edward Fitzgerald, son of the duke of Leinster and husband of the celebrated smeared of ruin. Lord Edward was in prison for the wounds received in the encounter which preceded his capture.

In 1800 the Act of Union between Great Britain and Ireland was passed in both parliaments, and on the 1st January following the imperial standard of the United Kingdom was hoisted on Dublin Castle.

In 1803 an insurrection, headed by Robert Emmett, a young barrister of much promise, broke out, but was immediately quelled, with the loss of some lives in the tumult, and the death of its leaders on the scaffold. In 1848 William Smith O'Brien, M.P., for Limerick, raised a rebellion in Tipperary, and the lower classes of Dublin were greatly agitated. O'Brien, however, to tame and judicious disposition of the military and police forces the city was saved from much bloodshed. In 1867 the most serious insurrection contemporary, that known as the Fenian conspiracy, came to light. The reality of it proved by a ship being found laden with gunpowder in the Liverpool docks, and another with 4000 pikes heads in Dublin. The Habeas Corpus was suspended at one sitting by both Houses of Parliament and about 500 arrests were made in Dublin in a few hours. Dublin城堡 was fortified; and the citizens lived in a state of terror for several weeks together.

DUBNO, a town in European Russia, the seat of a department in the government of Volhynia. It lies 154 miles west of Zhitomir, in 50° 25' N. lat. and 25° 4' E. long. Occupying a peninsula formed by the river Iva, it is almost surrounded by water and marsh; and in its eastern corner it is defended by a somewhat dilapidated citadel separated by dry ditches from the rest of the town. It also possesses five Greek churches, of which two—the Transfiguration and the Exaltation of the Holy Rood—were formerly monasteries; it also has a Roman Catholic church and convent, a Jewish synagogue, a hospital for poor Jews, and various other Jewish institutions. Beer, mead, tobacco, bricks, and leather are all manufactured in the town; but a large number of the inhabitants, who are mainly of Jewish blood, obtain their living in other places.

Dubno is first mentioned in the chronicle under the name of Duben in 1100, when it formed one of the towns offered to David of Vladimir in compensation for the loss of his principality. In 1148 it received a charter from the grand duke of Lithuania, which was afterwards changed about 1507 for the Magdeburg rights. The Tartars, against whose attacks it had been so long subjected, in the 17th century, laid waste the neighbourhood in 1577, but were gallantly repulsed from the town by Yarush of Ostrog. In 1793 it passed into the possession of the Polish nation, but its ground-rent is still due; in 1795 it was incorporated with Russia, and in 1796 it received its present rank. Population, 7600.

DUBOFKA, a burgh in European Russia, in the government of Saratoff, about 324 miles to the N.N.W. of Tarnowitz, on the right bank of the Volga, near its junction with the river Dubofka, and on the post-road from Astrakhan. With the exception of about 200, all the houses are built of wood; but among its public buildings it numbers four Greek churches, a prison, a large public school, and a hospital capable of containing several hundred patients. Besides leather, tallow, soap, and tobacco, its inhabitants manufacture mustard on a large scale, obtaining the seed partly from their own fields and partly from other districts. They had formerly a very extensive share in the transport trade between the Volga and the Don, which was largely carried on by means of oxen, and supported a number of auxiliary crafts; but the opening of the railway about 1860 struck a sudden and fatal blow at the trade. A great fair, lasting for a whole month, is held in the town every year, and produces a circulation of about 1,000,000 rubles, or upwards of £141,000. Dubofka, already in existence at an earlier date, was colonized by Cossacks in 1745, and became their chief settlement on the Volga, the residence of their ataman, and the seat of their military chancery. In 1770 it was fortified with wooden ramparts by Falk. Having given its support to the insurrection of Pugachev, it was punished by the removal of 517 of its inhabitants to the Caucasus, where they formed a separate polt, or regiment. Their place was supplied by immigrants from the neighbouring governments and the country of the Little Russians, who were soon led by the advantages of their position to devote themselves exclusively to trade. Population in 1873, 12,737.

DUBOIS, Guillaume (1656-1723), cardinal, archbishop of Cambrai, and first minister of France, was born at Brives-la-Grille, in Limousin, September 6, 1656. He was the son of an apothecary, and at twelve years of age was sent to Paris to study in the college of St Michael, where he at the same time served in the household of the principal. He then engaged himself as a private tutor, and at length was appointed preceptor to the young duke of Chartres, afterwards the regent duke of Burgundy. As a youth, astute, ambitious, and unrestrained by conscience, Dubois ingratiated himself with his pupil, and, while he gave him
formal school lessons, at the same time pandered to his evil passions, and encouraged him in their indulgence. He gained the favour of Louis XIV. by bringing about the marriage of his pupil with Mademoiselle de Blous, a natural but legitimated daughter of the king; and for this service he was rewarded with the gift of the abbey of St Just in Picardy. He was present with his pupil at the battle of Steunilkirk, and "faced fire," says Marshal Luxembourg, "like a grenadier." Sent to join the French embassy in London, he made himself so active that by the request of the ambassador he was recalled. When the duke of Orleans became regent (1715), Dubs, who had for some years acted as his secretary, was made councillor of state, and the chief power passed gradually into his hands. His ambition grew with what it fed on. To counteract the intrigues of Cardinal Alberoni, first minister of Spain, he suggested an alliance with England, and succeeded in negotiating the Triple Alliance (1717). He was now made minister of foreign affairs. But he coveted the chief dignities of the church no less than political offices; and he impudently prayed the regent to give him the archbishopric of Cambrai, the richest in France. His demand was supported by George I, and the regent yielded. In one day all the usual orders were conferred on him, and even the great preacher Masillon consented to take part in the ceremonies. His next aim was the cardinalate, and, after long opposition on the part of the Pope, Clement XI, the red hat was given to him by Innocent XIII. (1721). In the following year he was named first minister of France (August). He was soon以後 at the French Academy; and, to the disgrace of the French clergy, he was named president of their assembly. While the projects of Law were bringing financial ruin upon the kingdom, Dubois was accumulating from various sources an immense private fortune. In addition to his share possessed the revenues of seven abbeys. He was, however, a prey to the most terrible pains of body and agony of mind. His health was ruined by his debaucheries, and a surgical operation became necessary. This was almost immediately followed by his death, at Versailles, August 10, 1723. His portrait was thus drawn by the duke of St Simon. "He was a little, pitiful, wizened, hermaphrodite man, in a flaxen coat, his face surrounded by some intellect. All the vices—perfidy, avance, debauchery, ambition, latracy—fought within him for the mastery. He was so consummate a liar that, when taken in the fact, he could brazenly deny it. Even his wit and knowledge of the world were spoiled, and his affected gravity was touched with sadness, by the odour of falsehood which escaped through every pore of his body." In 1789 appeared "L'histoire du Cardinal Dubos," attributed to one of his secretaries; and in 1815 his Mémoires secrets et correspondance intime, edited by L. de Savignies.

DUBOS, JEAN BAPTISTE (1670-1742), an eminent French author, was born at Beauvais in December 1670. After studying for the church he renounced theology for the study of public law and politics. He was employed by M. de Tocque, minister of foreign affairs, and by the regent and Cardinal Dubois in several secret missions, in which he acquitted himself with great success. He was rewarded with a pension and several benefices. Having obtained these, he retired from political life, and devoted himself to history and literature. He gained such distinction as an author that in 1720 he was elected a member of the French Academy, of which, in 1722, he was appointed perpetual secretary in the room of M. Dacier. He died at Paris on the 28th of March 1742, at the age of seventy-two, repeating as he expired the well-known prayer of an ancient, "Holy in law, not a punish work." His first work was "L'Histoire des quatre Gardiens prouvé et illustré par des Médaillés" (Paris, 1695, 12mo), which, in spite of its ingenuity, did not succeed in altering the common opinion, which only admits three emperors of this name. About the commencement of the war of 1701, being charged with different negotiations both in Holland and in England, with the design to engage those powers if possible to adopt a pacific line of policy, he, in order to promote the objects of his mission, published a work entitled Les Intérêts de l'Angleterre mal entendus dans la Guerre présente, Amsterdam, 1703, 12mo. But as this work contained indiscreet disclosures, of which the enemy took advantage, and predictions which were not fulfilled, a wag took occasion to remark that the title ought to be read thus: Les Intérêts de l'Angleterre mal entendus par l'Able Dubos. It is remarkable as containing a distinct prophecy of the revolt of the American colonies from Great Britain. His next work was "L'Histoire de la Ligue de Cambrai" (Paris, 1709, 1728, and 1755, 3 vols 12mo), a full, clear, and interesting history, which obtained the commendation of Voltaire. In 1734 he published his "Histoire Critique de l'établissement de la Monarchie Française dans les Gaules, 3 vols 4to," a work the object of which was to prove that the Franks had entered Gaul, not as conquerors, but at the request of the nation, which, according to him, had called them in to govern it. But this system, though unfolded with a degree of skill and ability which at first procured it many zealous partisans, was vigorously refuted by Montesquieu at the end of the thirteenth book of the "Esprit des Lois." His "Récensions critiques sur la Poésie et sur la Peinture," published for the first time in 1719, 2 vols 12mo; but often reprinted in three volumes, constitutes one of the works in which the theory of the arts is explained with the utmost sagacity and discrimination. Like his history of the League of Cambrai, it was highly praised by Voltaire. The work was rendered more remarkable by the fact that its author had no practical acquaintance with any one of the arts whose principles he discussed. Besides the works above enumerated, a manifesto of Maximilian, elector of Bavaria, against the emperor Leopold, relative to the succession in Spain, has been attributed to Dubos, chiefly, it appears, from the excellence of the style.

DUBOSSARI, or NOVVE DUBOSSARI, a town of European Russia, in the government of Mogileff, 11 miles east of Orsha, on the left bank of the Dniester, 101 miles from Odessa, in 47° 16' N. lat. and 29° 9' E. long. It occupies a picturesque position, is surrounded by fertile fields and gardens, has two churches, a synagogue, and a public hospital, and contains from 7000 to 8000 inhabitants—9000 Moldavians, 1200 Jews—who are mainly dependent on the trade in the local wine and tobacco, though they also deal in timber, cattle, and grain. Dubossar was founded in keeping with the terms of the Russian peace of 1795, and received the epithet Novve, or New, to distinguish it from the old town of Dubossar (Tombasar, or Tymbashar), on the right bank of the Dniester, in Bessarabia, which had been of considerable importance under the Tartar domination.

DUBROVNA, a town of European Russia, in the government of Mogileff, 11 miles east of Orsha, on the highway to Smolensk, in 54° 34' N. lat. and 30° 41' 9" E. long. Its wooden houses are ranged for the most part along the left bank of the Dniester, and in the neighbourhood of the two streams Dubrovensk and Smuka; and among its public buildings are six orthodox churches, a Roman Catholic chapel, a synagogue, a hospital, and a Jewish high school supported by Government. The town is mentioned at a pretty early date, and frequently appears in the history of the 16th century. In 1514 it requested to be received into allegiance to Vasili Ivanovitch of Moscow; but after his defeat near Orsha it returned to Lithuania. In 1535 it was burned by Vasili Shukai;
and in 1562, 1563, and 1580 it suffered a similar fate. The population, which is predominantly Jewish, amounts to 504.

DUBUQUE, a city of the United States, capital of a county of the same name in Iowa, situated on the right bank of the Mississippi, 155 miles west of Chicago. The business portion occupies a terrace at no great heights above the river, and the rest of the city is picturesquely arranged on the bluffs below. Several of its fourteen churches, besides a so-called cathedral, are edifices of considerable pretensions; and the building erected by the United States for the custom-house, post-offices, and other Government purposes is constructed of marble. The educational institutions are the high school and a theological seminary for German Presbyterians. As a port of delivery, a railway junction, and the centre of the lead region of Iowa, Dubuque has an extensive and varied trade, and engages in a large number of manufacturing industries; of lead alone its exports amount to 20,000,000 lb. annually. The name of the city is derived from a French Canadian, who received permission from the Spanish Government to carry on mining in the vicinity, and settled on the spot in 1788. The first real settlement was in 1833; incorporation as a town was obtained in 1837, and a city charter in 1849. Population in 1860, 3108; in 1875, 25,161.

DUCANGE, CHARLES DEFFRESNE, SIGNEUR (1610–1688), a most learned historical and philological writer, was born at Amiens, December 18, 1610. His father, who was royal provost of Beauquesne, sent him at an early age to the Jesuits' College in Amiens, where he soon distinguished himself. Having completed the usual course at this seminary, he applied himself to the study of law at Orleans, and afterwards went to Paris, where he was received as advocate before the parliament in August 1631. Meeting with little success as a barrister, he returned to his native district, where he applied himself to the study of history.

After the death of his father, Ducange married at Amiens, on 19th July 1658, Catherine Du Bois, daughter of a treasurer of France; and, in 1647, he purchased the office of his father-in-law, the duties of which in no degree interfered with the great literary works in which he had engaged. The plague, which in 1668 desolated Amiens, forced him to leave that city. He established himself at Paris, where he continued to reside until his death, which occurred on the 23rd October 1688. In the archives of Paris he was enabled to consult charters, diplomas, titles, manuscripts, and a multitude of printed documents, which were not to be met with elsewhere. His industry was exemplary and unremitting; and the number of his literary works would be incredible, if the originals, all written in his own hand, were not still extant. He was distinguished above nearly all the writers of his time by his linguistic acquirements, his accurate and varied knowledge, and his critical sagacity.

Of his numerous published works noted below the most important are the Glossarium ad Scriptores medici et infusion Graecitatis, and his Glossarium ad Scriptores medici et infusion Graecitatis, which are indispensable aids to the student of the history and literature of the Middle Ages. To the three volumes of Ducange's Latin glossary three supplementary volumes were added by the Benedictines of St Maur (1733), and a further addition of four volumes was made by Carpentier, a Benedictine, in 1765. The edition published at Paris in that year accordingly consisted of ten volumes. The edition by G. A. L. Henschel (8 vols., Paris, 1846–47) includes those supplements and further additions by the editor.

Ducange published the following works—1. Histoire de l'Empire de Constantinople sous les Empereurs Francois. Paris, 1867, folio. 2. Traité Historique du Chef de S. Jean-Baptiste. Paris, 1668, 4to. 3. Histoire de S. Louis, Roi de France, écrite par Jean, sire de Joinville. Paris, 1668, folio. 4. Joanna Cunnami Historie de rebus gestis a Joanna et Manuele Commune ibn VI, Grece et Lutnia, cum Notis hactenus. Paris, 1778, folio. 5. Mémoires sur le projet d'un nouveau Recueil des Historiens de France, avec le plan général de ce Recueil, inserter in the Bibliotheca Historica de la France, by Feré Leelong. 6. Glossarium ad Scriptores medici et infusion Graecitatis. Paris, 1678, 4to. fol. 7. Lettre du Sieur N., Conseiller du Roi, a son ami M. de Boullanger, comte d'Hercouval, au sujet des Echoes qui se publiaient en Flamand contre les ER. PP. Henchenu et Pepsbroch, Jesuites. Paris, 1832, 4to. 8. Historia Byzantina duplici commentario illustrata. Paris, 1840, fol. 9. Joanna Cunnami Annales ad exercito Mandi ad mortem Alexii Commune, Grece et Lutnia, cum Notis. Paris, 1868, 2 vols. fol. 10. Glossarium ad Scriptores medici et infusion Graecitatis. Paris, 2 vols. fol. 11. Chronicon Paschalii a Mundo condito ad Heraclius Imperatoris antiquo vigesimo. Paris, 1869, fol. The last work was passing through the press when Ducange died; and, on his decease, it was edited by Balaiz, and published with an eulogy of the author prefixed. His autograph manuscripts, and his extensive and valuable library, passed to his eldest son, Philippe Deffresne, who died unmarried, four years after. François Deffresne, the second son, and two sisters, then received the succession and sold the library, which the greater part of the manuscripts was purchased by the Abbé Du Champs, who handed them over to a bookseller called Marette, who re-sold part of them to Baron Hebenstorf. The remaining part was acquired by D'Holster, the genealogist. But the French Government, aware of the importance of all the writings of Ducange, succeeded, after much trouble, in collecting the greater portion of these manuscripts, which were preserved in the library of Paris. Among these manuscripts was one entitled Gallia, a work of great erudition, being a history of France, divided into seven epochs, with a number of illustrations.

See Furet's Essai sur la vie et les ouvrages de Ducange (Paris, 1859).

DUCAS, Michael, a Greek historian who flourished under Constantine XII., about 1450. The dates of his birth and death are unknown. He belonged to the illustrious family of his name that gave several emperors to Constantinople, and he is supposed to have held a high office at the court of Constantine XII. After the fall of Constantinople, he was employed in various diplomatic missions by the princes of Lesbo, where he had taken refuge. He was successful in securing a semi-independence for Lesbo until 1462, when it was taken and annexed to Turkey by Sultan Mahomet II. It is known that Ducas survived this event, but there is no record of his subsequent life. He is the author of a history beginning with the death of John Palaeologus I., and extending as far as the capture of Lesbo in 1462. There is a preliminary chapter giving a chronology from Adam to D'Ostian, the genealogist. But the French Government, aware of the importance of all the writings of Ducange, succeeded, after much trouble, in collecting the greater portion of these manuscripts, which were preserved in the library of Paris. Among these manuscripts was one entitled Gallia, a work of great erudition, being a history of France, divided into seven epochs, with a number of illustrations.

The edition of 1640 was issued by Bullialdus at Paris in 1640 with a Latin version and notes. This edition was reprinted at Venice in 1739. The work was edited by Beckler for the Bonn series of the Byzantine historians (Bonn, 1834). A French translation was incorporated by President Comenius in his Historia de Constantinopoli (Paris, 1672). An early Italian translation, discovered by Vo Banke at Venice, is appended to the Bonn edition.

DUCHENE, ANDRÉ (Latin, DUCHENTUS or Quercus-Truncus) (1584–1640), a French geographer and historian, generally styled the father of French history, was born at Ille-Bouchard, in the province of Touraine, in May 1584. He was educated at Loudun and afterwards at Paris, where he studied under Julius Caesar Boulanger. From his earliest years he devoted himself to geographical research, and his first work, Egriquirum seu Selectarum Locionum et Antiquitatum Liber, dedicated to Boulanger, and published in his eighteenth year, displayed great erudition. He enjoyed the patronage of Cardinal Richelieu, a native of the same district with himself, through whose influence he was appointed his geographer and geographer to the king. He died in 1640, in consequence of having
and I am Council. Napoleon wished him to accept some post of honor under his own contrivance and invention; and though his sanction by their supposed kinsmanship be produced nothing more original than the old story which the author received what was secured and the failure of Watteau, and the death of Voltaire. Equally successful was the author, who had been growing Within the success of his work. Marshal Belleisle procured and genealogical histories of illustrious French families, of Juvenal, and where his father, originally from Chartier, had been run over by a Duck and his country house at France. His Lives of the French Cardinals and of the Saints of France have been published by the Rollandists, MబBILLON, and others. He published a translation of the Satires of Juvenal, and editions of the works of Abelard, Alain Chartier, and Étienne Pasquier.

DUCIS, JEAN FRANÇOIS (August 22, 1733–March 31, 1816), a French dramatic poet, famous more especially for his adaptations of Shakespeare to the Parian stage of the 18th century. He was born and brought up at Versailles, where his father, originally from Savoy, held the position of a respectable linen-draper; and all through life he retained the simple tastes and straightforward independence fostered by his bourgeois education. The friendship of Marshal Belleisle procured him an appointment as clerk, and even after he ceased to discharge the duties of his post secured the continuance of his salary. In 1768 the passion for the theatre which had been growing within him during the previous years found vent in the tragedy of Amélie, and the failure of this first attempt was fully compensated by the success of his Hamlet in 1767, and of Romeo and Juliette in 1772. Edipe chez Admeté, united partly from Euripides and partly from Sophocles, appeared in 1776, and secured him in the following year the chair in the Academy left vacant by the death of Voltaire. Equally successful was Le Ros Lorr in 1783, at the representation of which the author received what was then the rare honour of being called before the curtain. Macbeth in 1783 did not take so well, and Jean sans Peur in 1791 was almost a failure; but Oedipe in 1792, supported by the acting of Talma, obtained immense applause. The next appearance of the author was no longer as an adapter or imitator of foreign models, but as a dramatist with a plot and characters of his own contrivance and invention; and though his contrivance produced nothing more original than the old story of unlawful love between brother and sister ultimately obtaining sanction by their supposed kinship being disproved, the poetic charm of the verse and its vivid picturing of desert life secured for Abéfour, ou la famille arabe, a flattering reception. On the failure of a similar piece, Pêcher et Waldmar, ou la famille des Sibères, Ducis ceased to write for the stage; and the rest of his life was spent in quiet retirement at Versailles. He had been named a member of the Council of the Ancients in 1789, but he never discharged the functions of the office; and, when at a later date Napoleon wished him to accept some post of honour under the empire, he escaped from his solicitations by a happy brushsmere.—General, do you like wild duck shooting? I am something of a wild duck myself; and, when hunting with a beaucoc, he had little sympathy with the fierce, sceptical, and tragic times in which his lot was cast. "Abas!" he said in the midst of the Revolution, "tragedy is abroad in the streets; if I step outside of my door, I have blood to my very ankles. I have too often seen Atreus in cloaks, to venture to bring an Atreus on the stage." Though actuated by what seems to have been an honest and ardent admiration of the great English dramatist, Ducis is not in any deep sense of the word Shakespearean. His ignorance of the English language left him at the mercy of such translators as Letourneur and La Place, and even this modified Shakespeare still had to undergo a process of purification and correction before he could be presented to the fastidious criticism of French taste. That such was the case was not, however, the fault of Ducis, and his works, defective as they were, did good service in modifying the judgment of his fellow countrymen. He did not pretend to reproduce, but to excerpt and retouch, and consequently the French play sometimes differs from its English namesake in everything almost but the name. The plot is different, the characters are different, the motif different, and the scenic arrangement different. The result is really a new play, and a new play, as it is said, with undoubted merits of its own. Le banquet de Familiq, a poem in four cantos, 1771, Au Ros de Sarlatino, 1775, Discours de réception à l'académique française, 1779, Épître à l'amitié, 1786, and a Recueil de Poëmes, 1850, complete the list of Ducis's publications. An edition of his works in three volumes appeared in 1813; Oeuvres posthumes were edited by Campenon in 1826; and Hamlet, Edipe chez Admeté, Macbeth, and Atéfour are reprinted in vol. ii. of Didot's Choix d'œuvres tragiques.

See Campenon, Essais de mémoires sur Ducis, 1824, Oeuvres Lévy, Étude sur la personne et les ouvrages de Ducis, 1852, based on Ducis's own memoirs preserved in the library at Versailles; Sainte-Beuve, Oeuvres du monde, t. vi, and Nouveaux textes, t. iv; Villermain, Tableau de la litt. au XVIIIe siècle.

DUCK, a word cognate with the Dutch Duiker (Germ. Tauch-ent— and in Bavaria Duck-ent)— and in Brazilian Duck-ent, the general English name for a large number of birds forming the greater part of the Family Anatidae of modern ornithologists. Technically the term Duck is restricted to the female, the male being called Drake, and in one species Mallard (Fr. Malarit).

The Anatidae may be at once divided into six more or less well marked Subfamilies—(1) the Cypriotes or Swans, (2) the Anserinae or Geese—which are each very distinct, (3) the Anatinae or Fresh-water Ducks, (4) those commonly called Fuligulinae or Sea-Ducks, (5) the Ernematurne or Spiny-tailed Ducks, and (6) the Megapodi or Margaridae. Of the Anatinae, which may be considered the typical group, we propose to treat here only, and especially of the Anas boschas of Linnæus, the common Wild Duck, which from every point of view is by far the most important species, as it is the most plentiful, the most widely distributed, and the best known—being indeed the origin of all our domestic breeds. It inhabits the greater part of the northern hemisphere, reaching in winter so far as the Isthmus of Panama in the New World, and in the Old being abundant at the same season in Egypt and India, while in summer it ranges throughout the Four-Countries, Greenland, Iceland, Lapland, and Siberia. Most of those which fill our markets are no doubt bred in more northern climates, but a considerable proportion of them are yet produced in the British Islands, though not in anything like the numbers that used to be supplied before the draining of the great Freshwater and other marshy places. The Wild Duck pairs very early in the year—the period being somewhat delayed by hard weather, and the ceremonies of courtship, which requires some little time. Soon after these are performed, the respective couples separate in search of suitable nesting places, which are generally found, by those that remain with us, about the middle of March. The spot chosen is sometimes near

VII. — 64
a river or pond, but often far removed from water, and may be in a furze-bush, on a dry heath, at the bottom of a thick hedge-row, or even in any convenient hole in a tree. A little dry grass is generally collected, and on it the eggs, from 9 to 11 in number, are laid. So soon as incubation commences the mother begins to dive herself of the down which grows thickly beneath her breast-feathers, and adds it to the nest-furniture, so that the eggs are deeply imbedded in this heat-retaining substance—a portion of which she is always careful to pull, as a coverlet, over her treasures when she quits them for food. She is seldom absent from the nest, however, but once, or at most twice, a day, and then she dares not leave it until her mate has arrived. After several circling flights of observation has assured her she may do so unobserved. Joining him the pair betake themselves to some quiet spot where she may bathe and otherwise refresh herself. Then they return to the nest, and after cautiously reconnoitring the neighbourhood, she loses no time in resitting herself on her eggs, which, when she is settled, repairs again to the water, and passes his day listlessly in the company of his bretheren, who have the same duties, hopes, and cares. Short and infrequent as are the absences of the Duck when incubation begins, they become shorter and more infrequent towards its close, and for the last day or two of the 28 days necessary to develop the young it is probable that she will not stir from the nest at all. When all the fertile eggs are hatched her next care is to get the brood safely to the water. This, when the distance is great, necessarily demands great caution, and so cunningly is it done that but few persons have encountered the mother and offspring as they make the dangerous journey.1 If disturbed the young instantly hide as they best can, while the mother quacks loudly, feigns lameness, and flutters off to divert the attention of the intruder from her brood, who lie motionless at her warning notes. Once arrived at the water they are comparatively free from harm, though other perils present themselves from its inmates in the form of Pikes and other voracious fishes, which seize the Ducklings as they disport in quest of insects on the surface or dive beneath it. Throughout the summer the Duck continues her care unremittingly, until the young are full grown and feathered; but it is no part of the Mallard's duty to look after his offspring, and indeed he speedily becomes incapable of helping them, for towards the end of May he begins to undergo that remarkable deviation from the normal form of the so-called Penguin-Duck, in which the bird assumes an upright attitude and its wings are much diminished in size. A remarkable breed also is that often named (though quite fancifully) the "Buenos-Ayres" Duck, wherein the whole plumage is of a deep black, beautifully glossed or bronzed. But this saturation, so to speak, of colour only lasts in the individual for a few years, and as the birds grow older they become mottled with white, though as long as their reproductive power lasts they "breed true." The amount of variation in domestic Ducks, however, is not comparable to that found among Pigeons, no doubt from the absence of the competition which Pigeon-fanciers have so long exercised. One of the most curious effects of domestication in the Duck, however, is, that whereas the wild Mallard is not only strictly monogamous, but, as Waterton believed, a most faithful husband—remaining paired for life, the civilized Drake is notoriously polygamous.

Very nearly allied to the common Wild Duck are considerable number of species found in various parts of the world in which there is little difference of plumage between the sexes—both being of a dusky hue—such as Anas obscura of North America, A. superciliosa of Australia, A. pacificus of India, A. melier of Madagascar, A. zanzibarica of South Africa, and some others. It would be impossible here to enter upon the other genera of Anatidae. We must content ourselves by saying that both in Europe and in North America there are the groups represented by the Shoveller, Garganey, Gadwall, Teal, Pintail, and Widgeon—each of which, according to some systematists, is the type of a distinct genus. Then there is the group Anas with its beautiful representatives the Wood-Duck (A. sponsa) in America and the Mandarin-Duck (A. galericulata) in Eastern Asia. Besides there are the Sheldrakes (Tadorna), confined to the Old World and remarkably developed in the Australian Region; the Musk-Duck (Claria) of South America, which is often domesticated and in that condition will produce fertile hybrids with the common Duck; and finally the Tree-Ducks (Denrocygna), which are almost limited to the Tropics. (A. W.)

Duckworth, Sir John Thomas (1748-1817), admiral, was born at Leatherhead, in Surrey, on the 28th February 1748. He entered the navy in 1759, and obtained his commission as lieutenant in June 1770, when he was appointed to the "Princess Royal," the flagship of Admiral Byron, in which he sailed to the West Indies. While serving on board this vessel he took part in the engagement with the French fleet under Count D'Estaing. In July 1779 he became commander, and was appointed to the "Rover" sloop; in June of the following year he attained the rank of post-captain. Soon afterwards he returned to England in charge of a convoy. The outbreak of the war with France gave him his first opportunity of obtaining marked distinction. Appointed first to the "Orion" and then to the "Queen" in the Channel Fleet, under the command of Lord Howe, he took part in the three days' naval engagement with the Brest fleet, which terminated in a glorious victory on the 1st June 1794. For his conduct on this occasion he received a gold medal and the thanks of Parliament. He next proceeded to the West Indies, where he was stationed for some time at St Domingo. In 1798 he commanded the "Leviathan" in the Mediterranean, and had charge of the naval detachment which, in conjunction with a military force, captured Minorca. Early in 1799 he was raised to the rank of rear-admiral, and sent to the West Indies to succeed Lord Hugh Seymour. During the voyage out he captured the Spanish convoy of eleven merchants. In March 1801 he was the naval commander of the combined force which reduced the islands of St Bartholomew and St Martin, a

1 When Ducks breed in trees, the precise way in which the young get to the ground is still a matter of uncertainty. The mother is supposed to carry them in her bill, and most likely does so, but further observation on this point is required.
service for which he was rewarded with the order of the Bath and a pension of £1000 a year. Promoted to be vice-admiral of the blue, he was appointed in 1804 to the Jamaica station. Two years later, while cruising off Cudiz with Lord Collingwood, he was detached with his squadron to pursue a French fleet that had been sent to the relief of St Domingo. He came up with the enemy on the 6th February 1806, and, after two hours’ fighting, inflicted a signal defeat upon them, capturing three of their five vessels and stranding the other two. For this, the most distinguished service of his life, he received the thanks of the Jamaica Assembly, with a sword of the value of a thousand guineas, the thanks of the English Parliament, and the freedom of the city of London. In 1807 he was again sent to the Mediterranean to watch the movements of the Turks. In command of the “Royal George” he forced the passage of the Dardanelles, but sustained considerable loss in effecting his return, the Turks having strengthened their position. He held the command of the Newfoundland fleet for four years from 1810, and at the close of that period he was made a baronet. In 1815 he was appointed to the chief command at Plymouth, which he held until his death on the 14th April 1817. Sir John Duckworth sat in Parliament for some time as member for New Romney.

DUCLOS, CHARLES PIRAU (1704—1772), a French author, was born at Dinant, in Brittany, in 1704. At an early age he was sent to study at Paris. After some time spent in dissipation he began to cultivate the society of the wits of the time, and became a member of that club or association of young men who published their joint efforts in light literature under the titles of Recueil de ces Membres, Élèves de la St Jean, (Élue de Pères, etc.). His romance of Acapou and Zarphile, which was composed after a series of plates which had been engraved for another work, was one of the fruits of this association, and was produced in consequence of a sort of wager amongst its members. Duclos had previously written two other romances which were more favourably received—The Baroness of Luc, and the Confessions of the Count de ***. His first serious publication was the History of Louis XI, which is dry and epigrammatical in style, but displays considerable powers of research and impartiality. The reputation of Duclos as an author was confirmed by the publication of his Considérations sur la Manue, a work which is much and justly praised by Laharpe, as containing a great deal of sound and ingenious reflection. It was translated into English and German. The Mémoires pour servir à l’Histoire du dix-huitième Siècle, which were intended by the author as a sort of sequel to the preceding work, are nevertheless much inferior in respect of both style and matter, and are, in reality, little better than a kind of romance. In consequence of his History of Louis XI, he was appointed historiographer of France, when that place became vacant on Voltaire’s retirement to Prussia. His Secret Memoirs of the reign of Louis XIV, and Louis XV, and his Considerations on Italy, were not published until after the Revolution. The former work is highly spoken of by Chamfort. Duclos became a member of the Academy of Inscriptions in 1739, and of the French Academy in 1747. Of the latter he was appointed perpetual secretary in 1755. Both academies were indebted to him not only for many valuable contributions, but also for several useful regulations and improvements. As a member of the Academy of Inscriptions, he composed several memoirs on the Druids, on the origin and revolutions of the Celtic and French languages, on trial by battle and proof by ordeal, and on scenic representations and the ancient drama. As a member of the French Academy, he assisted in compiling the new edition of the Dictionnaire, which was published in 1762; and he made some just and philosophical remarks on the Port Royal Grammar. On several occasions he distinguished himself by vindicating the honour and prerogatives of the societies to which he belonged, and the dignity of the literary character in general. He used to say of himself, “I shall leave behind me a name dear to literary men.” The citizens of Dinant, whose interests he always hotly defended with zeal, appointed him mayor of their town in 1744, though he was resident at Paris. He was afterwards elected deputy from the commons to the assembly of the states of Brittany, and upon the requisition of this body the king granted him letters of nobility. In 1766 he was advised to retire from France for some time, having rendered himself obnoxious to the Government by the opinions he had expressed on the dispute between the Duc d’Aiguillon and M. de la Chaibiats, the friend and countryman of Duclos. Accordingly he set out for Italy; and on his return he wrote an account of his travels, which is also praised by Chamfort. He died at Paris, March 26, 1772, in the sixty-ninth year of his age. The character of Duclos was singular in its union of impertinence and prudence. Rousseau described him very laconically as a man droit et adroit. In his manners he displayed a sort of bluntness in society, which frequently rendered him disagreeable, and his caustic wit on many occasions created enemies. To those who knew him, however, he was a pleasant companion. A considerable number of his bos mots have been preserved by his biographers. A complete edition of the works of Duclos, including an unfinished autobiography, was published by Desessart, at Paris, in 10 vols. 8vo, 1806.

DUDEVANT, ARMBINTTE LUCILE AUBRE (1804—1876), known to all the world as the second, if not the greatest, of French novelists, by her assumed name of George Sand, was born at Paris 5th July 1804, and died 8th June 1876. Her life is as fantastic and eventful as any of her fictions, and the main secret of her success has been her power to clothe in artistic form her varied experiences of men and places.

It is no easy task to set down in a short space the outward events of her life, and to trace the development of her genius, not only because of the abundance of materials she has left behind her, but still more from the subtle way in which she has interwoven fact and fiction. In the History of her Life, which covers half a century, the omissions are no less surprising than the revelations, and though she never indulges in the self-illusions of Dichtung und Wahrheit, which perplex or muddle the biographers of Goethe, yet she wisely refuses to satisfy the curiosity of the public on the most delicate episodes of her life. If, to fill up the blanks, we turn to her novels, George Sand justly warns us that in trying to raise the mask and identify her with any one of her characters, we shall not only lose our pains, but show that we mistake the fundamental conditions of art. Yet by the help of critics to supply the missing clue (and no writer of this century has so provoked criticism), it is possible to decipher the chief lines of the most remarkable woman of this age, and the greatest authoress in the world’s history.

Aurore was the daughter of Lieutenant Dupin and of his newly-married mistress Sophie Delaborde, the daughter of a Paris bird-fancier. Her paternal grandfather was M. Dupin de Franceuil, a farmer-general of the revenue, who had married Mlle. Rinteau, widow of Count Horn (a natural son of Louis XV.), and natural daughter of Marshal Saxe, the most famous of the many illegitimate children of Augustus the Strong by the lovely counteress of Kongsmark. This strange pedigree has been traced in detail by George Sand, and she recognizes it as one of the elements which went to mould her character. She boasts of the royal blood which she inherited through her father, and, disregarding the bar sinister, claims relationship with Charles X.
and Louis XVIII., and she proclaims herself as frankly a daughter of the people, endued by nature with the instincts of her class. Her birth itself was romantic. Her father was playing a country dance at the house of a fellow officer, the future husband of Sophie's sister, when he was told that his wife, who had not long left the room, had borne him a daughter. "She will be fortunate," said the aunt, so she was borne among the roses to the sound of music."

Passing by her infantile recollections, which go back further than even those of Dickens, we find her at the age of three crossing the Pyrenees to join her father who was on Murat's staff, occupying with her parents a suite of rooms in the royal palace, adopted as the child of the regiment, nursed by rough old sergeants, and dressed in a complete suit of uniform to please the general.

For the next ten years she lived at Nohant, near Le Châtre in Berry, the country house of her grandmother. Here her character was shaped, and she was one of the child's affection, and the struggle between the mother and grandmother was one of the bitterest of Aurore's childish troubles.

Next to the grandmother, the most important person in the household at Nohant was Deschatre. He was an ex-abbé who had shown his devotion to his mistress when her life was threatened, and henceforward was installed at Nohant as factotum. He was maire of the village, he managed the estate, doctored the neighbourhood, played piquet with Madame, was tutor to Aurore's half-brother, and, in addition to his other duties, undertook the education of the girl. The tutor was a more sugar to the taste that satisfied the love of country scenes and country life which neither absence, politics, nor dissipation could uproot; here she learnt to understand the ways and thoughts of the peasants, and laid up that rich store of scenes and characters which a marvellously retentive memory enabled her to draw upon at will. The progress of her mind during these early years well deserves to be recorded. Education, in the strict sense of the word, she had none. A few months after her return from Spain her father was killed by a fall from his horse. He was a man of remarkable literary gifts as well as a good soldier, and his letters, which are included in her life, show in a less degree the vivid force of description and clear insight into character which he bequeathed to his daughter. "Character," says George Sand, "is in a great measure hereditary: if my readers wish to know me they must know my father." On his death the mother resigned, though not without a struggle, the care of Aurore to her grandmother, Mme. Dupin de Francueil, a good and wise old woman who, though not in a fit of home-sickness, found herself one evening in the convent chapel. In a strange reverie she sat through vespers. Time passed unnoticed, the prayers were over, the chapel was being closed.

"I had forgotten all; I knew not what was passing in me; with my soul rather than my senses, I breathed an air of ineffable sweetness. All at once a sudden shock passed through my body, my eyes swam, and I seemed wrapped in a dædal white mist. I heard a voice murmur in my ear: 'Pâles, ma maîtresse ...' I turned round thinking that it was one of the sisters talking to me—I was alone. I indulged in vain illusion; I believed in no miracle; it was not sensible of the sort of hallucination into which I had fallen; I neither sought to intensify nor to escape from it. Only I felt that faith was laying hold of me—by the heart, as I have said, but not, as I then supposed, by the head. With gratitude and joy that the tears rolled down my cheeks. I felt as if nature and instinct had embraced and accepted that ideal of justice, tenderness, and holiness which I had never doubted, but with which I had never held direct communion, and now at last I felt that the communion was consummated, as though an invincible barrier had been broken down between the source of infinite light and the smiling fire of my heart. An endless vista stretched before me, and I longed to start upon my way. There was no more doubt or inexperience. That I should repent on the morrow and rally myself to my over-wrought existence never once entered my thoughts. I was like one who never casts a look behind, who hesitates before some Rubicon to be crossed, but having touched the further bank sees no more the shores he has just left."

Such is the story of her conversion as told by herself. It reads more like a chapter from the life of Sts Thérèse and Madame Guyon than of the author of Lélia. Yet no one can doubt the sincerity of her narrative, or even the permanence of her religious feelings under all her many phases of faith and aberrations of conduct. A recent critic has sought in religion the secret of the charm of her character and the plasticity of her genius. But, except we take religion in the vague sense of the vision and the faculty divine, this is a one-sided view. "Half poet and half mystic" is the verdict she pronounces on herself, and we may add that her element of mysticism was always subordinate to the poetic.

"Je fus toujours tourmentée des choses divines," ever that my mind embraced and accepted that ideal of justice, tenderness, and holiness which I had never doubted, but with which I had never held direct communion, and now at last I felt that the communion was consummated, as though an invincible barrier had been broken down between the source of infinite light and the smiling fire of my heart. An endless vista stretched before me, and I longed to start upon my way. There was no more doubt or inexperience. That I should repent on the morrow and rally myself to my over-wrought existence never once entered my thoughts. I was like one who never casts a look behind, who hesitates before some Rubicon to be crossed, but having touched the further bank sees no more the shores he has just left."

Again in 1830 Aurore exchanged the restraint of a convent for freedom, being recalled to Nohant by Mme. de Francueil, who had no intention of letting her granddaughter grow up a dévote. She rode across country with her brother, she went out shooting with Deschatre, she sat by the cottage doors on the long summer evenings and heard the flax-dressers tell their tales of witches and warlocks. She read widely though unsystematically Aristotle, Leibnitz, Locke, Condillac, and fed her imagination with René and Childe Harold. Her confessor lent her the De Imitatione for all the world, she took it. "I breathed an all' of the convent chapeL In a strange reverie she sat through vespers. Time passed unnoticed, the prayers were over, the chapel was being closed.

"I had forgotten all; I knew not what was passing in me; with my soul rather than my senses, I breathed an air of ineffable sweetness. All at once a sudden shock passed through my body, my eyes swam, and I seemed wrapped in a dædal white mist. I heard a voice murmur in my ear: 'Pâles, ma maîtresse ...' I turned round thinking that it was one of the sisters talking to me—I was alone. I indulged in vain illusion; I believed in no miracle; it was not sensible of the sort of hallucination into which I had fallen; I neither sought to intensify nor to escape from it. Only I felt that faith was laying hold of me—by the heart, as I have said, but not, as I then supposed, by the head. With gratitude and joy that the tears rolled down my cheeks. I felt as if nature and instinct had embraced and accepted that ideal of justice, tenderness, and holiness which I had never doubted, but with which I had never held direct communion, and now at last I felt that the communion was consummated, as though an invincible barrier had been broken down between the source of infinite light and the smiling fire of my heart. An endless vista stretched before me, and I longed to start upon my way. There was no more doubt or inexperience. That I should repent on the morrow and rally myself to my over-wrought existence never once entered my thoughts. I was like one who never casts a look behind, who hesitates before some Rubicon to be crossed, but having touched the further bank sees no more the shores he has just left."

Such is the story of her conversion as told by herself. It reads more like a chapter from the life of Sts Thérèse and Madame Guyon than of the author of Lélia. Yet no one can doubt the sincerity of her narrative, or even the permanence of her religious feelings under all her many phases of faith and aberrations of conduct. A recent critic has sought in religion the secret of the charm of her character and the plasticity of her genius. But, except we take religion in the vague sense of the vision and the faculty divine, this is a one-sided view. "Half poet and half mystic" is the verdict she pronounces on herself, and we may add that her element of mysticism was always subordinate to the poetic.
of inclination, and the first years of her married life, during which her son and daughter, Maurice and Solange, were born, were at least calm and peaceful. Soon differences arose. Her husband seems to have been neither better nor worse than the Berroche squires around him, but she found herself mated, as to a clown, yet to a belles lettres whose heart was in his farm and cattle. After nine years of passive endurance she determined to put an end to a connection which had grown intolerable, and in 1831 an amicable separation was agreed upon. Nohant was surrendered to the husband, and, taking her daughter with her, she went to seek her fortune in Paris with no provision but an allowance of £60 a year. After vain attempts to support herself by some of those expedients to which her Bon and daughter, but an allowance of fifteen francs. But there neither rendered to the law student already known to her Ftqaro, and, was a college student, and made the acquaintance of the whole living was the beginning of an raw material was woven by the quiet beauty and pastoral melancholy of the Vallée Noire and the banks of the Indre. Her Bohemian life at Paris—her vie de gamme, as she calls it—in which she adopted not only the dress but the life of a college student, and made the acquaintance of the whole Paris world between the artist and the artisan, is sketched by her in an allegory which is worth quoting if only as a specimen of the simple perfection of her style.

"I care little about growing old, I care far more not to grow old alone, but I have never met the being with whom I could have died, or if I ever met him I knew not how to keep him fast to a story and weep. There was a good artist called Watteau, the best aquafortiste engraver of his day. He loved beauty, and it was his work to engrave as well as himself. She left husband and home to go and live with him. The world condemned them, then, as they were poor and modest, but they forgave each other. Five years afterwards their retrial was discovered. In a convent in the environs of Paris called le Mont St. Denis, there sat at the same table an old man engraving and an old woman whom he called his muse and also engraving. The last design they were at work upon represented the Moulin St. Denis, the house of Marguerite, with the device: 'Un valle perversum Salva divina operatus' (It hangs in my room over a portrait of the original of which no one else has seen). For a year the person who gave me this portrait sat with me every night at a little table and lived by the same work. At daybreak we consulted together on our work for the day, and at night we supped at the same little table, chatting the whole on art, and even on marriage. The future broke faith with us. Pray for me, O Marguerite Lecomte!"

Her third novel, Lëtie, marks the climax of her rebellion against society. It was written in a fit of deep depression, religious and political, and as a wild dêbâcle, the passionate wail of a woman whose affections have been blighted, and whose jaundiced eyes see nothing but a lifeless, loveless, godless world. But like Goethe in his Werther she "hid her bosom of that perilous stuff," and, though once and again she inveighed against society, she never more lost faith in the moral government of the world.

Of her unfortunate relations with A. de Musset, and her voyage to Italy in his company, which followed the publication of Lëtie, nothing need be said except as they affected her literary career. As the motives of Indiana and Valentine are an unhappy marriage, so the novels of the period (1833-1835), Jacques, André, and Leonce Leon, are the outcome of an unhappy liaison. Her creed, the opposite of Shakespeare's, is, that love must alter as it alteration finds, and that no ties are binding but the mutual passion of the hour. Lëtie et lui is a woman's version of the quarrel between a man and woman, and if true it ought never to have been told. The moral of the tale is worth giving in George Sand's own words, "God makes certain men of genius to wander in the tempest and to create in pain. I studied you in your light and in your darkness, and know that you are not to be weighed in the balance like other men." The measure she here metes to De Musset we may fairly measure to her again.

To this Italian journey we owe some of her most charming pictures of scenery. Venice was the only town she loved for itself, and it exercised over her the same fascination as over Byron, Shelley, and Goethe. The opening scenes of Consuelo are worthy to take rank with "Othway, Radvilfe, Schiller, Shakespeare's Art," with the 4th canto of Childe Harold, Shelley's Lyric, and Goethe's Venetian Epigrams. The Lettres d'un voyageur mark the calm which succeeded the Sturm und Drang period. They are specially valuable to the student of George Sand, as they give her views of men and things, not extracted and distorted by the exigencies of a novel. In Michel de Bourges (the "Edmond" of the letter) is made the acquaintance of another of those celebrated men who influenced for a time her life and writings. He conducted the suit which ended in a judicial separation from her husband (1835), and sought to convert her to the extreme republicanism of which he was the foremost advocate and defender. Thus Lovelace of politics laid siege to her intellect as persistently as Richardson's hero (for nine mortal hours he declaimed to her, pacing to and fro before her hotel at Bourges, and at Paris he locked her into her own room that she might reflect at leisure on his suit), but though she coquetted with his communist theories, her artist nature rebelled against his extravagant radicalism. She sought safety in flight, but Manprat, which she published this year, bears marks of his influence. The Lettres à Maria, of 1837, are a tribute to the broad and noble Catholicism of Lamartine, and an eloquent expression of the doctrine of Christian hope. In Spiritualism (1838) she returns to her proper creed, a philosophical theism founded on sentiment and unfettered by dogma. Consuelo (1844) and Luigiari Fioriani (1847) were inspired by Chopin, whose declining health she tended for many years with motherly care.

La Compagnie du Tour de France (1840) and Le mensuel
In conclusion, a few words must be said of her style, though much of its delicate charm escapes foreign critics, for it is by her style that she will chiefly live. It is simple and unaffected, yet full of subtle turns and picturesque expressions. Her dialogue is sparkling, her narrative clear and flowing, her descriptions exact, and her eloquence grandiose yet never meretricious. Topin is reminded of the language of Rousseau, with something more of ease and fineness, the grace of Bernard St. Pierre, without his over-refinement, the warmth and eloquence of our greatest orators, and that without effort or strainning.” Niard pronounced George Sand the master of French prose writing. To Thackeray her diction recalled the sound of country bells falling softly and softly on the ear; it stirred the nerves of Mill like a symphony of Haydn or Mozart.

One of the greatest of English novelists seems by the name she has adopted to provoke comparison with George Sand. Psychological analysis and insight into the problems of modern life, she is at least her equal; in her range of knowledge, in self-control, and in practical common sense she is greatly her superior; but in unity of design, in harmony of treatment, in that purity and simplicity of language so felicitous and yet so unstudied, in all those qualities which make the best of George Sand’s novels masterpieces of art, she is as much her inferior. Eliot is a great moralist, a great teacher; George Sand, whatever we may think of her doctrine and her morality, is by universal consent a supreme artist.

She has stayed in many camps, and lent her pen to many causes, she has had many friends and many lovers, but to one cause only has she remained constant—the cause of human progress; and the only master in whose service she has never wearied is art.

(p. a.)

DUDLEY, a parliamentary and municipal borough of England, in a detached portion of the county of Worcestershire surrounded by the county of Stafford. It lies in the centre of the “Black Country,” about eight miles W.N.W. of Birmingham, at a junction on the Great Western railway. The town is generally well-built, its streets are well-paved, and there is a fair supply of water. The principal buildings are the parish church of St. Thomas, rebuilt in 1819 at a cost of £25,000, and restored in 1863, several old churches, of which the most recent is St. Luke’s, erected in 1876; the town-hall, the county court, the Guest hospital (formerly the blind asylum), endowed (1868) by Joseph Guest, with a legacy of £20,000 (1861), the school of art, the new dispensary (1866), and the mechanics’ institute (1861). Among the educational establishments are a free grammar-school, a subscription library, and a geological society with a small scientific museum. On a hill to the north are the extensive remains of an ancient castle, surrounded by beautiful grounds; and in the market-place stands a fountain, erected by the Earl of Dudley at a cost of £3000, on the occasion of his marriage. The manufacture of coal, iron-ore, and limestone gives its peculiar character to the industries of the place. According to the census of 1871, 5442 men were engaged in the iron manufacture, 1040 as makers of engines or machines, and 3501 in the coal-mines; while the nail manufacture along gave employment to 1267 males and 3019 females. Among the various articles produced are fire-irons, stoves, shovelers, edge tools, chains, anchors, and especially anvils and vice. The glass-works, brass foundries, and brickworks are also of importance; and tanning, brewing, and malting are extensively carried on. The parliamentary borough has an area of 7718 acres, and returns one member to Parliament. In 1871 the population of the municipal borough, which has an area of 3680 acres, was 43,782; that of the parliamentary borough was 82,249.
DUDLEY, EARLS OF, see NORTHUMBRELAND.

DUEL, a deadly combat between two persons. The word duel is used in two distinct senses—(1) the judicial combat, a form of trial which prevailed in the Middle Ages, ordained by law as a proof of guilt or innocence, and (2) the modern duel, a pre-arranged combat with deadly weapons between two private persons to settle some private quarrel.

Though dueling is in England obsolete, and in other countries fast obsolescent, yet it must still command our attention as the latest survival of feudalism, and its history will always be studied as one of the most curious developments of mediæval society.

On the origin of the duel a vast amount of perverse ingenuity has been spent. Writers of the 16th and 17th centuries commonly began their treatises with an account of the combats between David and Goliah, Hector and Achilles, the Horatii and Curatii. By etymology it is true that duelium is the same word as belium, and in this sense the origin of the duel must be traced to the earliest condition of society, when every man's hand was against his neighbour. But, in the specialized sense which the word now bears, the duel was a peculiar institution of comparatively recent origin, a local custom which never spread beyond the limits of civilized Europe. It is easily distinguished both from the casual affrays of savages and the set battles of the champions of contending nations. An account of the judicial duel will clearly show that it is the direct parent of the modern duel. In the year 501 Gondebalch, king of the Burgundians, passed a law authorizing the wager of battle, and in the preamble he gives his reason for introducing this new form of trial. It is that his subjects may no longer take oaths upon uncertain matters, or forswear themselves upon certain. Here is one proof among many that the judicial duel was introduced to correct the abuses of compurgation by oath. Like the other ordeals, such as the cross, the corned, and the oath on the gospels, were in the hands of the clergy, and were manipulated by them in the interest of the church or of themselves. In the wager of battle each man felt that his cause was in his own hands, and, though might was right, yet even this was better than the business of priests. Nor, as Montesquieu has pointed out, was the trial so irrational as it would seem to modern eyes. Among a warlike people cowardice is a sign of other vices, vices which are most hateful and most prejudicial to a simple community, of meanness, lying, and fraud. It shows an indiscour to public opinion, a neglect of the education of the day, which consisted mainly in the use of arms and warlike exercises. In a war, the law was neither better nor worse than the received morality of the time. From this jurisdiction none was exempt; women, minors, and ecclesiastics were required to appear by proxy, and adverse witnesses, and even the judge himself, were liable to be challenged and must give their words by force of arms. Those who are curious to observe the formalities and legal rules of a judicial combat find them described at length in the 28th book of Montesquieu's Esprit des Lois. On these regulations he well remarks that, as there are an infinity of wise things conducted in a very foolish manner, so there are some foolish things conducted in a very wise manner. For our present purpose it is sufficient to observe the development of the idea of personal honour from which the modern duel directly sprang. In the ancient laws of the Swedes we find that if any man shall say to another, "You are not a man equal to other men," or "You have not the heart of a man," and the other shall reply, "I am a man as good as you," they shall meet on the highway, and then follow the legal regulations for the combat. What is this but the modern challenge? By the law of the Lombards if one man call another arga, the insulted party might defy the other to mortal combat. What is arga but the dammer Junger of the German student? Beaumanoir thus describes a legal process under Louis le Debonnare. —The appellant begins by a declaration before the judge that the appellant and the defendant are the parties to a certain crime; if the appelless answers that he accuses the judge, the judge then ordains the duel. Is this not the modern point of honour, by which to be given the lie is an insult which can only be wiped out by blood?

From Germany the trial by judicial combat rapidly spread to every country of Europe. In France it was first confined to criminal cases, but this restriction was removed by Louis IX., who made it legal in civil matters as well, with the one proviso that in cases of debt the amount must exceed twelve deniers. By Philippe le Bel it was again confined in civil cases to questions of disputed inheritance, and forbidden altogether during the war between England and France. In 1385 a duel was fought, the result of which was so preposterous that even the most superstitious began to lose faith in the efficacy of such a judgment of God. A certain Jacques Legren was accused by the wife of Jean Carrouge of having introduced himself by night in the guise of her husband, and thus abused her. A duel was ordained by the Parliament, which was fought in the presence of Charles VI. Legren was defeated and hanged on the spot. Not long after a criminal arrested for some other offence confessed himself to be the author of the outrage. No institution could long survive so open a confutation. Henceforward the duel in France ceases to be an appeal to Heaven, and becomes merely a satisfaction of wounded honour. The last instance of a duel authorized by the magistrates, and conducted according to the forms of law, was the famous one between François de Vivonne de la Châtaignerie and Guy Chabot de Jarnac. The duel was fought on the 10th of July 1447 in the court-yard of the château of St Germain-en-Laye, in the presence of the king and a large assembly of courtiers. It was memorable in two ways. It enriched the French language with a new phrase; a sly and unforeseen blow, such as that by which De Jarnac worsted La Châtaignerie has since been called a coup de Jarnac. And Henry, grewed at the death of his favourite, swore a solemn oath that he would never again permit a duel to be fought. This led to the first of the many royal edicts against duelling.

In England, it is now generally agreed that the wager of battle did not exist before the time of the Norman Conquest. Some previous examples have been adduced, but
on examination they will be seen to belong rather to the class of single combats between the champions of two opposing armies. One such instance is worth quoting as a cæsum illustrative of the supererogation of the time. It occurs in a rare tract printed in London, 1610, The Duelio, or Single Combat. "Danish rumpus and the bad aspect of Mars having breached the common mother earth with her sonner’s blood streams, under the reigne of Edmund, a Saxon monarch, missioen compendium (so worthy Camden expresseth it) ballo utriusque gentía fata Edunmundo Anglorum et Canuto Danorum regibus commissum fuerunt, quis anguuli certaminis de summa imperij in hac insula (that is, the Eight in Glosstershire deponerunt.) By the laws of William the Conqueror the trial by battle was only compulsory when the opposite parties were both Normans, in other cases it was optional. As the two nations were gradually merged into one, this form of trial spread, and until the reign of Henry II. it was the only mode for determining a suit for the recovery of land. The method of procedure is admirably described by Shakespeare in the opening scene in Richard II., where Henry Bolingbroke, duke of Hereford, challenges Thomas duke of Norfolk, and in the mock-heroic battle between Horner the Armourer and his man Peter in Henry VI., and by Sir W. Scott in the Fair Maid of Perth, where Henry Gow appears before the king as the champion of Magdalen Frondoute. The judicial duel never took root in England as it did in France. In civil suits it was superseded by the grand assize of Henry II., and in cases of felony by indictment at the prosecution of the Crown. One of the latest instances occurred in the reign of Elizabeth, 1571, when the lists were actually prepared and the justices of the common pleas appeared at Tonthill Fields as uumphires of the combat. Fortunately the petitioner failed to put in an appearance, and was consequently nonsuited (See Spelman, Glossary, s.v. "Campus"). As late as 1817 Lord Ellenborough, in the case of Thornton v. Ashford, pronounced that the general law of the land is that there shall be a trial by battle in cases of appeal unless the party brings himself within some of the exceptions. Thornton was accused of murdering Mary Ashford, and claimed his right to challenge the appellant, the brother of the murdered girl, to wage of battle. His suit was allowed, and, the challenge being refused, the accused escaped. Next year the law was abolished (59 Geo. III., c. 46).

In sketching the history of the judicial combat we have traced the parentage of the modern duel. Strip the former of its legality, and divest it of its religious sanction, and the latter remains. We are justified, then, in dating the commencement of duelling from the abolition of the wager of battle. To pursue its history we must return to France, the country where it first arose, and the soil on which it has most flourished. The causes which made it indigenous to France are sufficiently explained by the condition of society and the national character. As Cunkle has pointed out, duelling is a special development of chivalry, and chivalry is one of the phases of the protective spirit which was predominant in France up to the time of the Revolution. Add to this the keen sense of personal honour, the susceptibility, and the pugnacity which distinguish the French race. Montaigne, when touching on this subject in his essays, says, "Put three Frenchmen together on the plains of Libya, and they will not be a month in company without scratching one another’s eyes out." The title chapter of Audigier’s Ancien usage des duels is headed, "Pourquoi les seuls Français se battent en duel." English literature abounds with allusions to this characteristic of the French nation. Lord Herbert of Cherbury, who was ambassador at the court of Louis XIII., says, "There is scarce a Frenchman worth looking on who has not killed his man in a duel." Ben Jonson, in his Magnetic Lady, makes Compass, the scholar and soldier, thus describe France, "that garden of humanity" —

There every gentleman professing arms
Thanks he is bound in honour to embrace
The bearing of another.
Without or questioning the cause or asking
Least colour of a reason.

Duels were not common before the 16th century. Hallam attributes their prevalence to the barbarous custom of wearing swords as a part of domestic dress, a fashion which was not introduced till the later part of the 15th century. In 1560 the states-general at Orleans supplicated Charles IX. to put a stop to duelling. Hence the famous ordinance of 1566, drawn up by the Chancelleur de l’Hopital, which served as the basis of the successive ordinances of the following kings. Under the frivolous and sanguinary reign of Henry III., "who was as eager for excitement as a woman," the rage for duels spread till it became almost an epidemic. In 1602 the combined remonstrances of the church and the magistrates extorted from the king an edict condemning to death whoever should give or accept a challenge or act as second. But public opinion was revolted by such rigour, and the statute remained a dead letter. A duel forms a fit conclusion to the reign. A hair-brained youth named L’Estoile Mariavoix swore that he would not survive his beloved king, and threw his carpet into the air. It was at once picked up, and Mariavoix soon obtained the death he had courted. Henry IV. began his reign by an edict against duels, but he was known in private to favour them; and, when De Cresqui asked leave to fight Don Philip of Savoy, he is reported to have said, "Go, and if I were not a king I would be your second."

Fontenay-Maruell says, in his Mémories, that in the eight years between 1601 and 1609, 2000 men of noble birth fell in duels. In 1609 a more effective measure was taken at the instance of Sully by the establishment of a court of honour. The edict decrees that all aggrieved persons shall address themselves to the king, either directly or through the medium of the constables, marshals, &c.; that the king shall decide, whether, if an accommodation could not be effected, permission to fight should be given; that the aggressor, if pronounced guilty, shall in any case be suspended from any public office or employment, and be mulcted of one-third of his revenue till he has satisfied the aggrieved party; that any one giving or receiving a challenge shall forfeit all right of reparation and all his offices; that any one who kills his adversary in an unauthorized duel shall suffer death without burial, and his children shall be reduced to villanage; that seconds, if they take part in a duel, shall suffer death, if not, shall be degraded from the profession of arms. This edict has been pronounced by Henri Martin "the wisest decree of the ancient monarchy on a matter which involves so many delicate and profound questions of morals, politics, and religion touching civil rights" (Histoire de France, x. 466).

In the succeeding reign the mania for duels revived. De Houssaye tells us that in Paris when friends met the first question was, "Who fought yesterday? Who is to fight to-day?" They fought by night and day, by moonlight and by torch-light, in the public streets and squares. A hasty word, a misconceived gesture, a question about the colour of a riband or an embroidered letter, such were the commonest pretexts for a duel. The slightest and most frivolous the dispute, the less were they inclined to submit them to the king for adjudication. Often, like gladiators or prize-fighters, they fought for the pure love of fighting. A misunderstanding is cleared up on the ground. "N’im­porte," cry the principals, "puisqu’aucuns sommes ici, battous-ous." Secondis, as Montaigne tells us, are no
DUEL

513

longer witnessed, but must take part themselves unless they would be thought wanting in affection or courage; and he goes on to complain that men are no longer contented with a single second, "c'était anciennement des duels, ce sont à cette heure des rencontres et des bains. There is no more striking instance of Richepanse's firmness and power as a statesman than his conduct in the matter of duelling. In his Testament Politique he has assigned his reasons for disapproving it as a statesman and ecclesiastic. But this disapproval was turned to active detestation by a private cause. His elder brother, the head of the house, had fallen in a duel stabbed to the heart by an enemy of the cardinal. Already four edicts had been published under Louis XIII. with little or no effect, when in 1626 there was published a fifth edict condemning to death any one who had killed his adversary in a duel, or had been found guilty of sending a challenge a second time. Banishment and partial confiscation of goods were awarded for lesser offences. But this edict differed from preceding ones not so much in its severity as in the fact that it was the first which was actually enforced. The edict was thus enforced by imposing the penalties of banishment and fines, but, these proving ineffectual to stay the evil, he determined to make a terrible example. To quote his own words to the king, "Il s'agit de couper la gorge aux duel ex aux c Nice de votre Majesté." The count de Bottleville, a renommist who had already been engaged in twenty-one affairs of honour, deter-
mained out of pure bravado to fight a twenty-second time. The duel took place at mid-day on the Place Royal. De Bottleville was arrested with his second, the count de Chopelle, they were tried by Parliament, condemned, and, in spite of all the influence of the powerful house of Montmorency, of which De Bottleville was a branch, they were both beheaded at Grève, June 21, 1627. For a short time the ardour of duellists was cooled. But the lesson soon lost its effect. Only five years later we read in the Mercure de France that two gentlemen who had killed one another in a duel were, by the cardinal's orders, hanged on a gallows, stripped, and with their heads downwards, in the sight of all the people. This was a move in the right direction, since, for fashionable wits, ridicule and ignominy is a more drastic remedy than death. It was on this principle that Caracoil, prince of Molf, when viceroy of Piedmont, finding that his officers were being devaluated by duelling, proclaimed that all duels should be fought on the parapet of the Fonte Vecchio, and if one of the combatants chanced to fall into the river he should on no account be pulled out. Under the long reign of Louis XIV. many celebrated duels took place, of which the most remarkable were that between the duke of Guise and Count Coligny, the last fought on the Place Royal, and that between the dukes of Beaufort and Nemours, each attended by four friends. Of the ten combatants, Nemours and two others were killed on the spot, and none escaped without some wound. No less than eleven edicts against duelling were issued under le Grand Monarque. That of 1643 established a supreme court of honour composed of the marshals of France; but the most famous was that of 1672, which confirmed the enactments of his predecessors, Henry IV. and Louis XII. At the same time a solemn agreement was entered into by the principal nobility that they would never engage in a duel on any pretence whatever. A medal was struck to commemorate this occasion, and the firmness of the king, in refusing pardon to all offenders, contributed more to restrain this scourge of society than all the efforts of his predecessors.

The subsequent history of duelling in France may be summarized as follows. The two great Frenchmen whose writings precluded the French Revolution both set their faces against it. Voltaire had indeed, as a young man, in obedience to the dictates of society, once sought satisfaction from a nobleman for a brutal insult, and had reflected on his temerity in the solitude of the Bastille. Henceforward he inveighed against the practice, not only for its absurdity, but also for its aristocratic exclusiveness. Rousseau had said of duelling, "It is not an institution of honour, but a horrible and barbarous custom, which a courageous man despises and a good man abhors." Then came the Revolution, which levelled at a blow the huge structure of feudalism, and with it the duel, its instrument and favourite Pasca tamen sibiacerit prince vestigia fresulis. With this reaction against the revolutionary spirit and return to feudal ideas the duel reappears. Under the Directory it again became fashionable among the upper classes. Napoleon was a sworn foe to it. "Bon dueliste maurus solidat" is one of his best known sayings, and, when the king of Sweden sent him a challenge, he replied that he would order a fencing-master to attend him as plenipotentiary. After the battle of Waterloo duels such as Ney loves to depict were frequent between disbanded French officers and officers of the allies in occupation. The restoration of the Bourbons brought with it a fresh crop of duels. Since then they have been chiefly confined to military circles, and a small section of Parisian journalists. Yet a list of duels fought within the last fifty years in France would occupy no inconsiderable space, and would include some of the most famous names, in literature and politics, Émile de Girardin, Armand Carrel, Lamartine, Alexandre Dumas, Ledru Rollin, Edmond About, Sainte-Beuve, and M. Thiers. Even at the present hour men like Paul de Casamagner exercise, as a statesman and écrivain, and an editor of the Pays must be an adept with swords and pistols no less than a skilled writer.

As a complete history of duelling would far exceed the limits of this article, we have preferred to trace in some detail its rise and fall in the country where it has most prevailed. We are thus compelled to pass by other nations, and conclude with a brief epitome of its annals at home. Duelling did not begin in England till some hundred years after it had arisen in France. There is no instance of a private duel fought in this country before the 16th century, and they are rare before the reign of James I. A very fair notion of the comparative popularity of duelling, and of the feeling with which it was regarded at various periods, might be gathered by examining the part it plays in the novels and lighter literature of the times. The earliest duels we remember in fiction are that in the Jouuvetaine between Sir Percivale Shafton and Halbert Gibbons, and that in Kenilworth between Tressilian and Varney. (That in Anne of Gerstein either is an anachronism or must reckon as a wager by battle.) Under James I. we have the encounter between Nigel and Lord Dalgarne. The greater evil of war, as we observed in French history, expels the lesser, and the literature of the Commonwealth is in this respect a blank. With the Restoration there came a reaction against Puritan morality, and a return to the gallantry and loose manners of French society, which is best represented by the theatre of the day. The drama of

1 Volturle met the Chevalier Bfohan-Chabot at the house of the Marquis de Sully. The Chevalier, offended by Volturle's free speech, incautiously asked the Marquis, "Who is that young man?" "One," replied Voltaire, "who, if he does not parse a great name, honours that he bears." The Chevalier said nothing at the time, but, hearing that Voltaire had inveighed against him, he called upon Voltaire in his coach, and told him he must be free of his footmen. Voltaire set to work to learn fencing, and then sought the Chevalier in the theatre, and publicly challenged him. A duel was fought, and the Chevalier's expenses were the only satisfaction that the philosopher could obtain. "Monseigneur, en quelque affaire d'interest vous voulez pour une point e'gale, Parmeur dous j'ay a me plaire; il peut en ce monde meus. Rousseaun manque alors." The Chevalier was said to employ his capital in petty usury.
the Restoration abounds in duels. Passing on to the reign of Queen Anne, we find the subject frequently discussed in the *Tatler* and the *Spectator*, and Addison points in his happiest way the moral to a contemporary duel between Mr. Thornhill and Sir Cholmeley Dering. "I come not," says Spinmont to King Pharamond, "I come not to implore your pardon, I come to relate my sorrow, a sorrow too great for human speech to support." "Know that this morning I have killed in a duel the man whom all men living I love best." No reader of Esmond can forget Thackeray's description of the doubly fatal duel between the duke of Hamilton and Lord Mohun, which is historical, or the less life-like though fictitious duel between Lord Mohun and Lord Castleraigh. Throughout the reigns of the Georges they are frequent. Richardson expresses his opinion on the subject in six voluminous letters to the Literary Repositor. Sheridan, like Farquhar in a previous generation, not only dramatized a duel, but fought two himself. Byron thus commemorates the bloodless duel between T. Moore and Lord Jeffrey:

*Can none remember that eventful day,*
*That ever glorious almost fatal fray,*
*Where Little's leadless pistols met the eye,*
*And Bow Street myrmidons stood laughing by!*

As we approach our own times they become rarer in fiction. Thackeray, indeed, who represents an older generation, and the worse side of aristocratic society, abounds in duels. His royal highness the late lamented commander-in-chief had the greatest respect for Major Macmurdie, as a man who had conducted scores of affairs for his acquaintance with the greatest prudence and skill, and Rawdon Crawley's duelling pistols, "the same which I shot Captain Marker," have become a household word. Dickens, on the other hand, who depicts contemporary English life, and mostly in the middle classes, in all his numerous works has only three, and George Eliot never once refers to a duel. Tennyson, by using a poet's privilege, but laid the scene of a duel in the year of the Crimean war, but he echoes the spirit of the times when he stigmatizes "the Christless code that must have life for a blow."

To pass from fiction to fact, a list of the celebrated public men who in the last century have fought duels will suffice to show the magnitude of the evil:—Fox, Pitt, William Pulteney and Lord Harvey, Canning and Lord Castleraigh, the duke of York, the duke of Richmond, Wilkes, Sir Francis Burdett, Grattan, Daniel O'Connell. For particulars we must refer the reader to the respective correspondences, of which we find the subject frequently discussed in the *Esmond*. The next important date is the year 1843, when publicists that Bentham was the first to point out clearly this defect of the law, and propose a remedy. In his *Introduction to the Principles of Morals and Legislation*, published in 1789, Bentham discusses the subject with his usual boldness and logical precision. In his exposition of the absurdity of duelling considered as a branch of moral justice, and its inefficiency as a punishment, he only restates in a clearer form the arguments of Paley. So far there is nothing novel in his treatment of the subject. But he soon parts company with the Christian moralist and proceeds to show that duelling does, however rudely and imperfectly, correct and repress a real social evil. "It entirely effaces a blot which an insult imprints upon the honour. Vulgar moralists, by condemning public opinion upon this point, only confirm the fact." He then points out the true remedy for the evil. It is to extend the same legal protection to offences against honour as to offences against the person. The legal satisfactions which he suggests are some of them extremely grotesque. Thus for an insult to a woman, the man is to be dressed in a woman's clothes, and the retort to be inflicted by the hand of a woman. But the principle indicated is a sound one, that in offences against honour the punishment must be analogous to the injury. Doubtless, if Bentham were alive, he would allow that the necessity for such a scheme of legislation had in a great measure passed away. That duels have since become extinct is no doubt principally owing to social changes, but it may...
be in part ascribed to improvements in legal remedies in the sense which Bentham indicated. A notable instance is Lord Campbell's Act of 1843, by which, in the case of a newspaper libel, a public apology coupled with a pecuniary payment is allowed to bar a plea. In the Indian Code there are special enactments concerning duelling, which is punished not as murder but as a civil disability.

Suggestions have from time to time been made for the establishment of courts of honour, but the need of such tribunals is doubtful, while the objections to them are obvious. The present tendency of political philosophy is to contract rather than extend the province of law, and any interference with social life is justly resented. Real offences against reputation are sufficiently punished, and the rules of the lawyers, that mere securnity or opprobrious words, which neither of themselves import nor are attended with any hurtful effects, are not punishable, seems on the whole a wise one. What in a higher rank is looked upon as a gross insult may in a lower rank be regarded as a mere pleasantry or a harmless joke. Among the lower orders offences against honour can hardly be said to exist, the learned professions have each its own tribunal to which its members are amenable, and the highest ranks of society, however imperfect their standard of morality may be, are perfectly competent to enforce that standard by means of social penalties without resorting either to trial by law or trial by battle.

DUF—DUF

Switzerland. He had already proved his fitness for the task by making a cadastral survey of the canton of Geneva, and publishing a map of the canton in four sheets on the scale of 1:23,000. The larger part occupied thirty-two years, and was accomplished with complete success. The map in 25 sheets on the scale of 1:23,000 was published at intervals between 1842 and 1853, and is an admirable specimen of cartography. In recognition of the ability with which Dufour had carried out his task, the Federal Council in 1863 ordered the highest peak of Monte Rosa to be named Dufour Spitsre. In 1867 Dufour received the command of the Federal Army, which was employed in reducing the revolted Catholic cantons to submission. The quickness and thoroughness with which he performed the painful task, and the wise moderation with which he treated his vanquished fellow-countrJemen, were acknowledged by a gift of 60,000 francs from the Duets and various honours from different cities and cantons of the confederation. In politics he belonged to the moderate conservative party, and he consequently lost a good deal of his popularity in 1848. In 1867 he presided over the International Conference which framed the so-called Geneva Convention as to the treatment of the wounded in time of war. He died on the 14th July 1875. Dufour was the author of a Mémorie sur l'état des anciens et de celui du moyen-âge (1840), De la fortification permanente (1850), Manuel de tactique pour les officiers de toutes armes (1842), and various other works in military science.

DUFRENOY, Pierre Armand, geologist and mineralogist, was born at Souvan, in the department of Semur-Douze, in France, in 1792, and died March 20, 1857. After leaving the Imperial Lyceum in 1811, he studied till 1815 at the Polytechnic School, and then, at the age of twenty-one, entered the corps of mines. In conjunction with M. Elie de Beaumont he in 1841 published a great geological map of France, the result of investigations carried on during thirteen years (1823-1836). Five years (1836-41) were spent in writing the text to accompany the map. The two authors had already together published L'opinion métallurgique en Angleterre (1827, 2d ed. 1837-39), Mémôr• pour servir à une description géologique de la France (1830-38), and a Mémorie sur Cantal et Mont-Dore (1833) of other literary productions. After his death, Dufreney became an accountant of the iron-mines of the eastern Pyrenees (1834), a trauùte on mineralogy (1844, 2d ed. 1856-60), and numerous papers contributed to the Annales des Mines and other scientific publications, one of the most interesting of which is entitled "Des terrains sédimentaires du Néolithique," and now a member of the Academy of Sciences, a commander of the Legion of Honour, an inspector-general of mines, and professor of geology at L'Ecole des Ponts et Chaussées, and of mineralogy at the Imperial School of Mines, of which latter institution he was the director.

DUFRESNY, Charles Rivière (1618-1728), a French dramatist, better remembered by the comedy of his own life than by any of the numerous plays which he contributed to the Théâtre Italien and the Théâtre Français, the fact that his grandfather was an illegitimate son of Henry IV procured him the liberal patronage of Louis XIV, who not only gave him the post of vice-de-chambre, but adopted his name now to one lucrative privilege and now to another. The poet, however, appeared as eager to squander as the king was to bestow, and the pathetic confession of exhausted generosity—"I cannot enrich Dufresny,"—was probably taken by the careless spendthrift as a signal compliment; though to one of his friends who ceased him with the remark that poverty is no sin, he replied, "It is a sin." On Louis' death he was almost as excommunicated as Louis had ever lived, but he obtained 200,000 francs from the duke of Orleans in answer to an ingenious request.
that his highness for his own glory would leave Dufresny in his excessive indulgence as a sole example of the condition of the whole kingdom before the golden days of his regency. As if to furnish a piquant commentary on the proverb that poverty makes us acquainted with strange bedfellows, he married his washerwoman in discharge of her bill—a whimsicality which supplied Le Sage with an episode in the Double Bonheur, and was made the subject of a volume by J. M. Deschamps—Charles Dufresny, on le mariage surprenant. Clever, versatile, and superficial, he obtained in his own day a considerable reputation not only as an author and a wit, but also as a landscape gardener and architectural designer: to his great patron he furnished plans for the park at Versailles, and was appointed in return overseer of the royal grounds. He died at Paris in 1728 in a house—la maison de Plaine—which he had built with the regent's bounty. His plays, destitute for the most part of all higher qualities, but abound in sprightly wit and pithy sayings, are no longer acted; though a few of the many in the six volumes of his Théâtre (Paris, 1747) are still read. L'Esprit de contradiction (first acted in 1700), Le double venage (1702), La coquette du village, and Le mariage fast and farrare are reprinted in the second volume of Dolido's Choix d'œuvres des auteurs comiques, and his contributions to the théâtres Haliacres produced in collaboration with Deschamps or Desnoettes, may be found in Gherard's collection. A volume of Poèmes divers, two volumes of Nouvelles historiques, Loye, 1692, and Les amusements sérieux et comiques d'un Siamois, 1697, a work to which Montesquieu was indebted for the idea of his Lettres Persanes, complete the list of Dufresny's writings. Two volumes of Oeuvres Choisis were edited by Auger in 1801.

DUGDALE, Sir William (1605—1666), an eminent English antiquary, the only son of John Dugdale, who belonged to an old Lancashire family, but had sold his property in that county and bought the estate of Shustoke, near Colehill, in Warwickshire, was born on the 12th September 1605. He received the early part of his education from Thomas Sibley, a curate near Shustoke, and attended from his tenth to his fifteenth year the Free School at Coventry, whence returning to his father, he read with him for some time law and history. In compliance with his father's wish, who was old and infirm, and desired to see him married before he died, he was married at the early age of seventeen to the daughter of a gentleman in the county of Stafford. He lived in his wife's father's house until the death of his own father in 1624, and soon thereafter went to reside at Fillongley, near Shustoke, an estate formerly purchased for him by his father. In 1623 he purchased the manor of Blyth, in the parish of Shustoke, and, preferring it as a place of residence, removed thither in 1626. His inclination to the study of antiquities manifested itself at an early age, and received its first encouragement from Samuel Roger, the barrister of Lincoln's Inn. After his settlement at Blyth Hall he made the acquaintance of some gentlemen interested in antiquities, who enabled him to obtain a sight of the old deeds and evidences of the county families of Warwickshire, and a divers antient writings of consequence, with the view of his writing a history of that county. In 1633 he accompanied Sir Simon Archer to London, and was by him introduced to Sir Henry Spelman, which led to his acquaintance with Thomas, earl of Arundell, then earl marshal of England, by whom he was, in 1638, created a pursuivant of arms extraordinary by the name of Blanche Lyon, and in 1639 governor-pursuivant in ordinary. About this time he agreed to write his work on Monastery Foundations, and, having a lodging in the Herald's Office, he soon spent much of his time in London in order to augment his collections out of the records of the Tower and other places in the city. In 1641 Sir Christopher Hatton, a member of the House of Commons, dreading the near approach of the revolutionary storm which soon thereafter broke over England, and the ruin that might then ensue, got him to make exact drafts of all the monuments in Westminster Abbey and the principal churches in England, including Peterborough, Ely, Norwich, Lincoln, Newark, Beverley, Southwell, Selby, Kingston-upon-Hull, Chester, Tamworth, and Warwick. He received and obeyed, in June 1642, the summons of Charles I. to attend him at York, whither, on the outbreak of the revolution, the king had betaken himself for the sake of greater security. Learning the spread of the revolution in Warwickshire, Charles deputed him to summon to surrender the castle of Banbury, in Oxford, and the castle of Warwick, which were being rapidly filled with ammunition and rebels. Banbury obeyed, but Warwick, being better prepared, contested the summons and its inmates were proclaimed traitors. He also summoned the city of Coventry; and, accompanying Sir Richard Wylly, as guide, he was present at the battle of Cudworth Field, the result of which he communicated to the king. He remained at Oxford with the king till the surrender of the garrison in 1646, and witnessed the battle of Edgehill, of the field of which he made afterwards an exact survey, noting how the armies were drawn up, and where and in what direction the various movements took place, and marking the graves of the slain. In November 1642 he was admitted M.A. of the university, and in 1644 the king created him Chester-Harward. While at Oxford he made a journey to Worcester, where—with the purpose of increasing his collections for his history of Warwickshire—he perused the registers of the bishop and of the dean and chapter; and during his Oxford leisure he applied himself also to the search for antiquities in the libraries and in the private houses. When Oxford surrendered he continued his antiquarian researches in London, along with Richard Dukworth, for their joint work on the monasteries, which was published successively in single volumes in 1655, 1664, and 1673. At the Restoration he obtained the office of Norroy king-at-arms, and in 1677 was created greater principal king-at-arms, and was knighted. He died at Blyth Hall, 10th February 1686.

Besides the works on Warwickshire, published in 1656, and Monasticon Anglicanum, republished in 6 vols in 1817—30, and again in 8 volumes in 1646, Sir William Dugdale is the author of History of St Paul's Cathedral (1658), the Barons of England (3 vols, 1674—6), and other works of less importance. His MSS, many of which were sold by himself up to 1678, with his diary and correspondence, and an index to his manuscript collections, was edited by William Hamper, and published in 1827.

DUGONG (Halicoerus), a genus of herbivorous Cetacea, forming, along with the Sea-Cows (Manatus), and the now extinct Rhytina, the sub-order Sireni. In this genus the head is small, and is abruptly truncated in front, the snout being remarkably obtuse and furnished with bristles. The intermaxillary bones are enormously developed, and from these proceed two large incisor teeth or tusks, which are well developed in the male, but which in the female are arrested in their growth, and remain concealed beneath the surface. There are never more than five molar teeth on each side of either jaw, or twenty in all, and these are flat on the grinding surface. The flippers are unpivoted with nails, and the tail is broad, and differs from that of the manatees in being crescent-shaped instead of rounded. The bones are very hard and firm, and take a polish equal to that of ivory. The dugongs frequent the shallow waters of the tropical seas, extending from the east coast of Africa, north of the mouth of the Zambesi river, along the shores of the Indian, Malay, and Australian seas, where they may be seen basking on the surface of the water, or browsing on submarine pastures of Algae and Fuct, for which the
trick obuse lips and truncated snout preeminently fit them. They are gregarious, feeding in large numbers in localities where they are not often disturbed. The female produces a single young one at a birth, and is remarkable for the great affection it shows for its offspring, so that when the young dugong is caught there is no difficulty in capturing the mother with it. There are two species—the Indian Dugong (Halocerus indicus) and the Australian Dugong (Halocerus australis). The former is very abundant along the shores of the Indian Ocean, and is captured in large numbers by the Malayan, who esteem its flesh as a great delicacy; while the lean portions, especially of young specimens, are regarded by Europeans even as excellent eating. It is generally taken by spearing, the main object of the hunter being to raise the tail out of the water, when the animal becomes perfectly powerless. It seldom attains a length of more than 8 or 10 feet. The Australian Dugong is a larger species, attaining sometimes a length of 15 feet. It occurs along the Australian coast from Moreton Bay to Cape York, and is highly valued by the natives, who hunt for it with spears, and gorg themselves with its flesh, when they are too exhausted to secure a carcass. In recent years the oil obtained from the blubber of this species has been largely used in Australia as a substitute for cod-liver oil. It does not contain soine, but is said to possess all the therapeutic qualities of cod-liver oil without its nauseous taste. A full grown dugong yields from 10 to 12 gallons of oil, and this, according to Bennett, "forms in cold weather a thick mass, and requires to be melted before a fire previously to being used." According to the same authority, the flesh of the Australian dugong is easy of digestion, the muscular fibre when fresh resembling beef, and when salted having the flavour of excellent bacon. In the earliest Australian dugong fishery, natives were employed to harpoon these cetaceans, they soon, however, became too wary to allow themselves to be approached near enough for this purpose, and the harpoon was abandoned for the net. The latter is spread at night, and in its meshes dugongs are caught in considerable numbers. The skin is nearly half an inch thick, and can be made into gelatine or glue.

DUGUAY-TROUIN, René (1673-1736), a famous French admiral, was the son of a sea captain, and was born at St Malo on the 10th June 1673. He was originally intended for the church, and studied with that view at Rennes and Caen; but on the breaking out of the war with England and Holland in 1689 he obtained leave to enter the marines. Accordingly he embarked in the capacity of a volunteer on board a small vessel of 18 guns, equipped by his family, and during the first three months his courage was tried by a violent tempest, an imminent shipwreck, the boarding of an English ship, and the threatened destruction of his own vessel by fire. The following year, as a volunteer in a vessel of 26 guns, he carried off the honours in a bloody combat with an English fleet of five merchant vessels. The courage he then showed was so remarkable that in 1691, at the age of eighteen, he obtained the command of a frigate of 14 guns, when, having been thrown by a tempest on the coast of Ireland, he burned two English ships in the river Limerick. In 1694 his vessel of 40 guns was captured by the English, and, being taken prisoner, he was confined in the castle of Plymouth, where, however, he made love to the daughter of the jailer, and by her aid managed to escape. He then obtained command of a vessel of 48 guns, and made a capture of English vessels on the Irish coast. In 1696 he made a brilliant capture of Dutch vessels, and the king hearing an account of the affair raised him in 1697 to the rank of captain of a frigate. In 1704-5 he desolated the coasts of England. In 1706 he was raised to the rank of captain of a vessel of the line. In 1707 he was made chevalier of the order of St Louis, and captured the greater part of an English convoy of troops and munitions bound for Portugal. His most glorious action was the capture in 1711 of Rio Janeiro, on which he imposed a heavy contribution. In 1715 he was made chief of a squadron, and in 1726 commander of the order of St Louis and lieutenant-general. In 1731 he commanded a squadron for the protection of French commerce in the Levant. He died 27th September 1736.

DU GUESCLIN, Bertrand (c. 1314-1380), constable of France, the most famous French warrior of his age, was born of an ancient but undistinguished family, at the castle of La Motte-Broon, near Rennes, about 1314. The date is doubtful, the authorities varying between 1311 and 1324. The name is spelt in various ways in contemporary records, e.g., Clasquin, Clayquin, Guyayquin, etc. The familiar form is found on his monument at St Deux, and in some legal documents of the time. In his boyhood Bertrand was a dull learner, spending his time in open air sports and exercises, and could neither read nor write. He was remarkable for ugliness, and was an object of aversion to his parents. He first made himself a name as a soldier at the tournament held at Rennes in 1336 to celebrate the marriage of Charles of Blois with Jeanne de Penthièvre, at which he unseated the most famous competitors. But this playing at fighting was not enough for his ambition, and in the war which followed between Charles of Blois and John de Montfort, for the possession of the duchy of Brittany, he served his apprenticeship as a soldier. As he was not a great baron with a body of vassals at his command, he put himself at the head of a band of adventurers, and fought on the side of Charles and of France. He distinguished himself by a brilliant action at the siege of Yenne in 1312, and after that he disappears from history for some years. In 1331, having shortly before been made a knight, he was sent into England with the lords of Brittany to treat for the ransom of Charles of Blois, who had been defeated and captured by the English in 1347. When Rennes was besieged by the duke of Lancaster, in 1356, Du Guesclin forced his way with a handful of men into the town, and successfully defended it till June 1357, when the siege was raised in pursuance of the treaty of Bordeaux. For this service he was rewarded with the lordship of Rochefort. At the expiration of the truce he distinguished himself by the defence of Dinan, and here he engaged in single combat with Sir Thomas Canterbury. Shortly afterwards he married, and about the same time he passed into the service of France, and greatly distinguished himself at the siege of Melun (1359). In April 1364, in conjunction with Boucicaut, he recovered Montes and Meulan from the king of Navarre, and in May he defeated the Navarrese under Capitul de Buch at Cocherel, and took their leader prisoner. The king now created him marshal of Normandy and count of Longueville. At the battle of Aaray, in September of the same year, Charles of Blois was defeated and killed, and Du Guesclin taken prisoner, by Sir John Chandos. The grand companies beginning, after the close of the war, to play a part of brigands in France, it was necessary to get rid of them. Du Guesclin was ransomed for 100,000 crowns, and was charged to lead them out of France. He marched with them into Spain, visiting Avignon on the way, and extorting from the Pope a large sum of money and his abdication. Du Guesclin now supported the party of Trastamara against Peter the Cruel, set the former upon the throne of Castile (1366), and was made constable of Castile and count of Trastamara. In the following year he was defeated and captured by the Black Prince, ally of Peter the Cruel at Najara, but was soon released for a heavy ransom. Once more he fought for Henry, reinstated him on the throne.
(1389), and was created duke of Molins. In May 1370, at the command of Charles V, who named him constable of France, he returned to France. The War had just been declared against England, and Du Guise was called to take part in it. For nearly ten years he was engaged in fighting against the English in the south and the west of France, recovering from them the provinces of Poitou, Guienne, and Aquitaine, and the powerful duchy of a united France. In 1373, when the duke of Brittany sought English aid against a threatened invasion by Charles V, Du Guise was sent at the head of a powerful army to seize the duchy, which he did; and two years later he frustrated by a defensive policy the attempt of the duke with an English army to recover it.

In 1379 that the king entertained suspicions of his fidelity to him, he resolved to give up his constable's sword and retire to Spain. His resolution was at first proof against remonstrance; but ultimately he received back the sword, and continued in the service of France. In 1380 he was sent into Languedoc to suppress disturbances and brigandage, provoked by the harsh government of the duke of Anjou. His first act was to lay siege to the fortress of Châteauneuf Randon, held by the English, strongly garrisoned and well provisioned. A day was fixed conditionally for the capitulation. Meanwhile the great warrior was as smitten with a mortal illness, and died, July 13, 1380. The commander led out the garrison and deposed the keys of the castle on the coffin of the hero. Du Guise lost his first wife in 1371, and married a second in 1373, but he left no legitimate children. His remains are interred, by order of the king, in the church of St. Denis.

Of the numerous recent biographies of Du Guise, the most recent is the learned work by D. F. Jamison (Charleston, 1865), which was translated into French by J. Bassac by order of Marshal Count Rambaud, minister of war, and published in 1866.

DUHALDE, Jean Baptiste (1674–1743), geographical writer, was born at Paris, February 3, 1714. In 1743 he entered into the Society of Jesus, and some time afterwards he was appointed to succeed Father Legobien, who had been intrusted with the duty of collecting and arranging the letters which they received from their missionaries in different quarters of the globe. He was also for some time secretary for the famous Father Le Teller, confessor to the king of France. He died August 18, 1743. Duhaldale is represented as a man of mild and amiable character, and as remarkably alike for his unaffected piety and unweared industry. He was the author of some Latin poems, which do not evince any superior degree of excellence. The productions for which he is principally distinguished are—

1. Lettres Édifiantes et Curieuses écrites des Missions Étrangères, which he edited with great ability from the ninth to the twenty-sixth volume inclusive, and which have been translated into English and German; and (2) Description géographique, historique, chronologique, politique, et physique de l'Empire de la Chine et de la Tartarie Chinoise, Paris, 1735, in four volumes large folio, with figures and an atlas by D'Anville. This work, the first in which China is described with so much exactness and detail, is a beautiful specimen of French typograph. An English translation by Brookes was published in 1736 in 4 vols.

DUHAMEL, Jean Baptiste (1624–1706), a French astronomer and physician, was the son of an advocate, and was born at Vire, in Normandy, in 1624. He commenced his studies at Caen, and completed them at Paris. At the age of eighteen he wrote a treatise on the Spherae of Theodorus, and added to it a tract on trigonometry, designed as an introduction to astronomy. At the age of twenty-one he became cure of Neully-sur-Marne, but without neglecting the duties of his calling, he continued to cultivate the physical sciences with zeal. In 1655 he was named almoner of the king; in 1653 he obtained the presidency of the council of the church of Burgundy. In 1660, when Louis XIV. established the Royal Academy of Sciences, he was appointed perpetual secretary. He was preparing a history of the Academy when he died, August 6, 1706. He published numerous works on philosophy, divinity, and physical science.

DUHAMEL DU LANCEAU, Henry Louis (1700–1782), a celebrated French botanist and agriculturist, was the son of Alexandre Duhamel, lord of Denanvilliers, and was born at Paris in 1700. He was placed at the Collège d'Harcourt, but made little progress in his studies, except that, notwithstanding the imperfect manner in which the natural sciences were then taught, he acquired such a taste for those branches of knowledge as led him to attend the lessons of Dufay and Bernard de Jussieu at the Jardin des Plantes. He spent his time between the capital, where he pursued his botanical studies and held intercourse with scientists, and his estates at Gâtinais, where he employed his knowledge in agricultural experiments. Having been requested by the Academy of Sciences to investigate the cause of the disease which was destroying the saffron plant in Gâtinais, he discovered that its destruction was owing to a parasitical fungus which attacked itself to its roots. The work in which he demonstrated his discovery was judged worthy to appear in the transactions of the Academy, and gained him admission to that body in 1728. From then until his death he basied himself chiefly with making experiments in vegetable physiology, and recording and publishing his observations. Having learned from Sir Hans Sloane that madder possesses the property of giving colour to the bones, he fed animals successively on food mixed and unmixed with madder; and he found that their bones in general exhibited concentric strata of red and white, whilst the softer parts showed in the meantime signs of having been progressively extended. From a number of experiments he was led to believe himself able to explain the growth of bones, and to demonstrate a parallel between the manner of their growth and that of trees. Along with the celebrated naturalist Buffon, he made numerous experiments on the growth and strength of wood, one of the results of which was that he recommended the bark to be taken off the trees several years before they are cut down. He experimented also on the growth of the mistletoe, on layer planting, on smut in corn, and on the production of soda and potash by different vegetables. From the year 1740 he made meteorological observations, and kept records of the influence of the weather on agricultural production. Having been appointed inspector-general of marine, he applied his scientific acquirements to the improvement of nautical knowledge, subjecting everything to the test of facts and experiments. Duhamel's aim in his researches was rather to be useful than to gratify his own curiosity or to win fame. He made himself accessible to all who sought information from him, and his modesty was as great as his knowledge. He was scrupulous in the practice of his religious duties. He died August 13, 1782.

His works are generally of an elementary character, and from the minute details of their information are rather prolix. They number nearly 90 separate publications, the principal of which are—Traité des arbres et arbustes qui se cultivent en France en pleine terre; Éléments de l'architecture navale; Traité général des pêches maritimes et fluviales; Éléments d'agriculture: La physique des arbres, Des semis et plantations des arbres et de leur culture. De l'exploitation des bois; Traité des arbres fruitiers.

DUISBURG, a town of Prussia, at the head of a circle in the government of Dusseldorf, situated at an important railway junction in the curve between the Rhine and the Ruhr, and communicating with both rivers by a canal. It has a fine Gothic church—Salwetzkirche—of the 15th century, a gymnasium, and an orphan asylum, and is also
the seat of a great Protestant Diakonieanstalt, or Deacon's Institute, founded in 1844 by Engelbert, and forming the centre of a large organization for philanthropic action. Its importance, however, is mainly due to the great development of its industry, which deals on an extensive scale with various branches of engineering and the iron manufacture, as well as with cotton—both yarn and cloth—tobacco, sugar, and a number of chemical stuffs, such as alum, soda, and Prussian blue. Probably known to the Romans as Castrum Deutons, and mentioned under the Frankish kings as Desargum, Dussburg early attained the rank of an imperial free town, passed in 1299 to Cleves, and afterwards to Brandenburg, and from 1655 to 1818 was the seat of a university, transferred in the latter year to Dusseldorf.

Population in 1871, 30,533.

DUKE (Latin, dux), next to the princes and princesesses of the blood royal, and the four archbishops of England and Ireland, the highest order and rank of the British peerage. The title of duke was introduced into England when, by a charter dated 17th March 1337, the lordships, castles, lands, &c., constituting the earldom of Cornwall, were erected by King Edward III. into a duchy, and were conferred upon his eldest son Prince Edward of Woodstock, afterwards so well and honourably known as the Black Prince, who thus as Duke of Cornwall was the first English duke. When, in 1343, he was created to the dignity of Prince of Wales, the Black Prince was invested with a coronet, a gold ring and a silver rod. And, as duke of Cornwall, he had already been invested with a sword. The second of the English dukes was Henry, Earl of Lancaster, Derby, and Leicester, and count of Providence, who in 1351 was created Duke of Lancaster.

Of the form and ornament of the princely coronet of the Black Prince no representation or descriptive record is known to exist, nor is it known whether any distinctive coronet was ever assigned to the prince as the insign of his ducal rank. As now worn, a duke’s coronet has eight golden leaves of a conventional type (commonly called, but without any reason whatever, “strawberry-leaves”), set erect upon a circlet of gold, and having their stalks so connected as to form them into a wreath. In representations, three only of the leaves, with two half leaves, are shown. Of late years this coronet has inclosed, and in representations is shown to inclose, a cap of crimson velvet, surmounted by a rich golden tassel, and lined and guarded with ermine (Fig. 1), but, still more recently, the coronet is commonly represented, with much better taste, with neither cap or lining of any kind, as in Fig. 2. The opinion is prevalent that this distinctive form of coronet appears for the first time placed about the basinet of Prince John of Eltham, the younger brother of Edward III., who died in 1356, in his monumental effigy in Westminster Abbey. That there is no foundation for such a supposed origin of the ducal coronet is evident from the effigy itself, since the decorations of the headdress and of the rest of the armour are precisely the same, and they also are identical with similar decorations that appear in other effigies of about the same date. The decoration, however, that is carved upon the basinet of Prince John may probably have suggested the crest-coronet, which in the 15th century so frequently supported roughly Cruzes. It must be added that the basinet in the effigy of Prince John certainly once was inclosed by a plain narrow fillet, probably of gold, for the reception of which a channel still appears, slightly sunk in the alabaster immediately below the band of conventional leafage that is carved in low relief. The effigy of the Black Prince himself (1376), at Canterbury, exhibits on the basinet a decorative accessory that may possibly have been the prototype of the leaf-crowned circlet re-trusted to dukes in later times. From the jewelled band or fillet that encompases this basinet there rise sixteen leaves, with a second series of the same number of tresses of much smaller size alternating with the larger leaves, the stalks of the whole being composed. These larger leaves differ very slightly from those that are carved upon the armour of Prince John of Eltham, and they are in exact accordance with a favourite form of decorative foliage in general use when the effigy was executed. In his will, Lionel, Duke of Clarence, who died in 1388, bequeathed the “two golden circles,” with one of which he states that he himself had “created a duke,” while with the other his elder brother, the Black Prince, had been “created a prince.” It may be accepted as certain that for a considerable time the coronets of “both” dukes and earls were decorated rather after an arbitrary than in accordance with any established rule. Thus, more than a century after the death of the Black Prince, the coronet of John de la Pole, KG, Duke of Suffolk, has the circlet heightened with fleurs-de-lis alternating with clusters of three small tails. The exact period at which the distinctive enframements of the coronets of the different orders in the British peerage was determined and established still remains undecided.

In early times, the rank, dignity, and title of duke were directly associated with power, authority, and local possessions, which constituted and were inseparable from his dukedom; but, after a while, these associations gradually became weakened, and at length for the most part they ceased to exist of necessity, so that at the present day the connection between a duke and the locality that gives the title to his dukedom may be very slight indeed.

This same title, duke, is borne still, with their princely rank and title, by the princes of the royal family, as it was in the days of Edward III., but these royal dukedoms, notwithstanding that they constitute peerages and are hereditary, are created chiefly with a view to connect the members of the reigning house with the great cities or with certain provinces of the realm. The old royal dukedom of York is now so far in abeyance that since the last duke of York died without issue, no duke of York has been created. The rival royal dukedom of Lancaster, since the accession of Henry IV., has been merged in the crown. The dukedom of Cornwall is held by the heir apparent, At various periods also, and in different countries, this same title, duke, has been in use to denote certain princes who were the actual sovereigns of small states, or others who, while vassals of some great suzerain, enjoyed in an approximate degree a virtual independence. The term duke, again, was introduced into their English version by the translators of the Old Testament, as a becoming title for certain chieftains and potentates, the Oriental sheiks of a remote antiquity.

A duke in the British peerage, not of royal rank, is styled “Your Grace,” and he as “Most Noble,” his wife as “a duchess,” and she as “Most Noble Dame.” All their sons are “lords,” and all their daughters are “ladies.” But their eldest son bears his father’s “second title,” since each of the higher ranks of nobility has one or more of the lower ranks associated with it; thus a duke’s eldest son always ranks as a marquis, and generally bears that title. The parliamentary mantle...
or robe of a duke is scarlet, and has four doublings of ermine. The royal dukes have coronets as princes. The coronet of a duchess is the same as that of her husband.

The titles arch-duchess and arch-duchesse, grand-duke and grand-duchesse, are in use on the Continent, the former in Austria and the latter in Russia, to distinguish the princes and princesses of the imperial families. The title grand-duke has also been applied to certain of the minor Continental independent princes.

DUKINFIELD, a township and local board district of England, in East Cheshire, forming part of the parliamentary borough of STAPLEBRIDGE, which see.

DULCAMARA, so named from its taste, at first bitter and eventually sweet, is a drug consisting of the dried young branches of Solanum Dulcamara, Ritter-sweet or Woody Nightshade—a woody perennial of the natural order Solanaceae. It has a slender shrubby and climbing stem; flowers in lateral or terminal cymes, with a hypogynous purple corolla, and yellow anthers converging into a cone; and fruit a red, oval, scarlet berry. For medical purposes the branches are collected in autumn when the leaves are shed. Dulcamara contains an alkaloid solanum, C₁₆H₂₈NO₁₆ (Zwenger and Kind), besides a sweet and bitter principle, dulcamarine or pyroclorine, and other matters. The drug was formerly supposed to be efficacious in a great variety of complaints. It appears to have some effect on the skin and kidneys, and the infusion is now administered in chronic skin diseases, cachectic conditions of the system, and rheumatic affections.

See D. Carlyle, Das Solanum, Strasburg, 1864; Garred, Mediera Medica, 4th ed. 1874.

DULCIGNO, a town of Turkey in Europe, in the Albanian sanjak of Scutari, occupying a bold promontory on the Adriatic, eighteen miles W.S.W. of the town of Scutari. It has a strong castle, is the seat of a Catholic bishop, and numbers about 8000 inhabitants, who are mainly engaged in agriculture, but also carry on a little ship-building and a certain amount of foreign commerce. The Turkish Olkin, or Olgon, preserves more distinctly the ancient name of Olcium, by which Dulcigno was known to the Romans, who obtained possession of it about 167 B.C., during the war with the Carthaginians, the Illyrian king. In modern history the town is noted for the defeat of the Venetians in 1718; and its inhabitants long remarkable for their piracies.

DULUTH, a city and lake port of the state of Minnesota, advantageously situated at the south-west extremity of Lake Superior, about 150 miles north-east of St Paul. It forms the eastern terminus of the Northern Pacific railroad and the northern terminus of the Lake Superior and Mississippi railroad. A ship canal, 250 feet wide, which has been cut across Minnesota point, gives ready access to the town from the lake. Duluth stands on the site of an activity overlooking the lake. It possesses docks, and contains several manufactories. Owning to its position the rise of the town has been very rapid. In 1860 there were not 75 inhabitants, whereas a census in 1875 showed the population to be 5000. It derives its name from Jean Du Luth, a French officer who visited the spot in the 17th century.

DULWICH, a village of England, in the county of Surrey, five miles from London Bridge, remarkable for its college and picture gallery. The manor, which had belonged to the Cluniac monks of Bermondsey, was granted by Henry VIII., in 1541, to Thomas Calton; and his grandson, Sir Francis Calton, sold it in 1606 to Edward Alleyn, whose name is indissolubly associated with the place by his princely foundation. Dulwich College, or, as he quantitatively and piously called it, "God's Gift College" (see Alleyn, vol. I. p. 584), was opened with great state on September 13, 1619, in the presence of Lord Chancellor Bacon, Lord Arundell, Inigo Jones, and other distinguished men. According to the letters patent the scholars and students were to be chosen in equal proportions from the parishes of St Giles (Cambwells), St Botolph without Bishopsgate, and St Saviour's (Southwark), and "that part of the parish of St Giles without Cripplegate which is in the county of Middlesex." By a series of statutes signed in 1626, a few years before his death, Alleyn ordained that his school should be for the instruction of 80 boys consisting of three distinct classes:—(1) the twelve poor scholars; (2) children of inhabitants of Dulwich (who were to be taught freely); and (3) "tows or foreign schollers," who were to pay such allowance as the master and wardens shall appoint. That it was the founder's intention to establish a great public school upon the model of Westminster and St Paul's, with a liberal provision for university training, is conclusively shown by the statutes; but he was scarcely dead when his grand project was overthrown, and for more than two centuries the educational benefits for God's Gift College were restricted to the twelve poor scholars. In 1858, however, the foundation was entirely reconstituted by Act of Parliament. The government of the college is now vested in 19 governors, of whom 14 are nominated by the Court of Chancery and 5 elected by the body of free scholars already mentioned. The first head of the reconstituted college, and the first also who has borne the name of Alleyn, is the Rev. A. J. Carver, D.D. The revenue is at present (1877) more than £17,000 a year, with the prospect of a large and progressive increase. After provision for the expenses of management and the maintenance of the chapel and library, the surplus is divided into four portions, of which three are assigned to the educational and one to the library fund of the college. The educational foundation comprises two distinct schools, the "Upper" and the "Lower." In the latter the curriculum of study, as defined by Act of Parliament, includes, besides ancient and modern languages and mathematics, drawing and designing, civil engineering, physics, chemistry, and other branches of science; in the former it is rather limited to that adopted in so-called middle-class schools. The Upper School contained in 1877 nearly 600 boys, and the Lower nearly 600 girls. The buildings of the Upper School are a splendid pile, designed by Mr Charles Barry, in the "Northern Italian style of the 13th century." They are said to form the most commodious and complete, as probably they have proved the most costly, fabric erected for educational purposes in recent times. The main architectural feature is the interior of the great hall, which will compare advantageously with some of the best college halls at Oxford or Cambridge. There are about 25 acres of play-ground and cricket-field included within the boundary fence of the college. Dulwich College possesses one advantage peculiar to itself in its splendid picture gallery, bequeathed to the college by Sir F. P. Bourgeois, R.A., in 1811, with a separate endowment of £250 a year. The pictures most widely known and most highly appreciated are probably the exquisite Murillos and the choice specimens of the Dutch school. The surplus income of the gallery fund is devoted to instruction in drawing and design in the two schools.

See W. Harnett Blanch, Dulwich College and Edward Alleyn, 1877.

DUMANGAS, a town of the Philippines, in the island of Panay, near the mouth of the river Jaluar. It is situated in a fertile plain, and deals in rice, trepang, and pine. Population stated at 25,000.

DUMARSAIS, CÉSAR CHESNEAU (1676-1756), a French philologist, was born at Marseilles, July 7, 1676. His father died while he was yet an infant; and his mother,
D U M — D U M

by her extravagance, disquieted his patrimony. He was educated in his native town by the Fathers of the Oratory, into whose congregation he entered, but feeling the restrains on his liberty too severe, he left it at the age of twenty-five, and repaired to Paris, where he married, and was admitted an advocate in 1704. He soon, however, quitted the bar, separated from his wife, to whom he gave up the little he possessed, and went to reside with the President de Mansions, in the capacity of tutor to his son. He was afterwards successively tutor to the son of Law, the projector, and the son of the Marquis de Bafremont. It was during this last period that he published the results of his grammatical investigations, which were received with great indifference. On terminating his engagement with the Marquis de Bafremont he opened an establishment for education in the faubourg St Victor, which scarcely afforded him the means of subsistence. He strove to eke out his scanty income by contributions to the Encyclopædia, but his last years were spent in very straitened circumstances. He died at Paris on the 11th June 1756, at the age of eighty. Dumas possessed no ordinary talents; his researches are distinguished alike by their accuracy, ingenuity, and depth. As a man, he combined the greatest purity of morals and simplicity of character with a rare degree of mildness in his misfortunes, yet during the greater part of his life he was left to languish in obscurity, and his merits scarcely attracted any notice until nearly half a century after his death. His works on philosophy and general grammar, however, are worthy of attention. Of these, the best are his Principes de Grammaire and his Histoire des Troupes D'Allemberg and Voltaire both paid a just and discriminating tribute to the merits of Dumas. An edition of his works was collected by Duchosal and Milon, and published at Paris in 1737, in seven vols. 8vo. In 1804, the French Institute proposed a prize for an éloge on Dumas, which was gained by De Girando, whose work was published at Paris in 1805, in 8vo. An earlier éloge by D'Allemberg is to be found in the Mélanges de Littérature, and prefixed to the above-mentioned edition of the works of Dumas.

DUMAS, ALEXANDRE (1802-1870), one of the most remarkable characters that the 19th century has produced, was the son of General Dumas and of Marie Labouret, an innkeeper's daughter. His father was an officer of remarkable gallantry, for who his dashes exploits had obtained the odd title of the "Horatius Cocles of the Tuileries." He was a cousin of the illegitimate son of the Marquis Dury de la Paillette, and of Louise Dumas, a black woman of St. Domingo. Long after, his grandson was to excite the laughter of Paris by claiming this title, and the family arms. The general had an insubordinate temper, and excited the dislike and suspicion of Napoleon, who sent him back from Egypt to languish in obscurity, and die of disappointment at Villers-Cotterets in the year 1806.

Alexandre Dumas was born on July 4, 1802, at Villers-Cotterets, where he was brought up under the care of an affectuose and pious mother. Some of the most graceful passages of autobiography are to be found in those pages of his memoirs which are devoted to an account of his boyhood, and which present an excellent picture of French country town life. He seems to have been an ulla and a troublesome youth, and, though places were found for him with notaries and other functionaries, he could not settle to business. The family means were slender. They were soon almost reduced to poverty, and in the year 1833 Alexandre set off for Paris to seek his fortune. The memory of where he was to make such good use of slender opportunities, that within five years his name became famous. Within a few days of his arrival, an old friend of his father's, General Foy, obtained a clerk's place for him in the duke of Orleans's establishment, worth only £50 a year, but it seemed a fortune. A friend, De Loven, and he now joined their talents in a light farce called Le Chasse et l'Amour (produced September 22, 1825). This was succeeded by a dramatic piece, written with the assistance of one of his friends, and called La Nocè et l'Enterrément (November 21, 1826), known in England as the amusing Illustrious Stranger. Meanwhile the visit of Macready and other English players to Paris had introduced him to Shakespeare, and had set him to work on a grand romantic and historical drama which he called Christine. The young clerk had the boldness to look forward to having it presented on the boards of the first theatre in France, and, with an energy and spirit that should encourage every friendless Separatist, sat every resource he could command at work. Charles Nodier introduced him to Baron Taylor, the literary director of the theatre. The agent, if we are to credit Dumas, was so enchanted with the work that he accepted it and submitted it to the company at once. It is more probable that, from the rather corrupt fashion which then regulated such matters, the privilege was secured by the influence of the duke of Orleans. But it happened that another Christine was supported by even greater influence, and Dumas's had to be withdrawn. In a short time he had written Henri III., which was produced (February 11, 1829) with the most extraordinary results. This piece was important as being the first success of the well-known "Roman of the school." Henri III., it is said, bought its author about £2000. But the revolution of July now broke out and interrupted every literary scheme. It was, however, welcomed by the creole's son, who flung himself with ardour into the struggle. And here begins that double interest in his life, which was as a venturesome as that of some of his own heroes, and suggests the career of Bonnemout Collin. He has, of course, made his own share in the exciting scenes of the Three Days as conspicuous as possible, and his expedition to Soissonns, and almost single-handed capture of a powder magazine, a general, and officers were heartily laughed at and wholly disbelieved. Allowing for emblemship, and nothing more, it is believed that the Duke of Orleans, and King Louis Philippe, always treated him with a good humour and contempt.

He now returned to his dramatic labours, and produced Antony (1831), one of the earliest of those gross outrages on public morality which have helped to make congruous mid-Victorian the favourite theme of the French drama. But by this time he had found that the slow production of dramas scarcely offered a profitable field for his talents. The successful founding of the Revue des Deux Mondes tempted him into trying his skill on historical romances, professedly in imitation of Sir Walter Scott. And this would seem to be the first opening of that seam which was to be worked later with such extraordinary profit. Here he introduced that daring system of working up the ideas of others, which he had already carried out in his dramatic labours. His successful pieces of Henri III., and Christine proved to consist of whole scenes stolen from Schiller and other writers almost without changing a word, though the arrangement of the plot and situations are masterly and original. A piece of his, called the Tour de Arelle (produced 1832), which caused a perfect furor in Paris, is said to have cost him £5000. But even this was not enough, however, to a more serious charge of plagiarism. In consequence of a duel he was directed to leave France for a time, and set off—in July 1833—for a tour through
Switzerland, which suggested to him a series of those odd books of travels made up of long extracts from old memoirs, guide-books, imaginary dialogues, and adventures.

In 1842 he married an actress named Idô Ferrier, who had performed in his plays; but the union was not a happy one, and, after a rather extravagant career, the lady retired to a deserted house, where she died in the year 1859. Hitherto his success, though remarkable, could not be called European, and he was not to be distinguished from the crowd of French professional littérateurs. But in 1844 the famous Monte Christo appeared, which may be said to have excited more universal interest than any romance since Balzac's Contes de l'Espagne. The extraordinary colour, the never-failing spirit, the endless surprises, and the air of nature which was cast over even the most extravagant situations, made this work worthy of the popularity it enjoyed in almost every country of the world. It was followed by the less famous Three Musketeers. These productions were the more remarkable as they were written from day to day for the readers of a newspaper, and thus firmly established the feuilleton as a necessary element of French literature. In this, as in other departments where he was successful, Dumas was not original, and only took up the idea of a successful predecessor. Eugène de Secondat, whose Duf Erant had enjoyed much popularity in this shape.

This triumph made him, as it were, irresponsible in the literary world, and suggested to him a series of wholesale operations for supplying the public with books, the history of which makes an extraordinary chapter in literature. He contracted for innumerable stories, each of great length, and to be published at the same time, almost any one of which would be beyond the powers of a single writer. In a single year, 1844, he issued some forty volumes, and later on he engaged himself even more deeply to meet these heavy demands. He began by employing one or two assistants, whose aid he furnished his two great stories; and it may be said that, with his constant supervision and inspiration, his daily direction, suggestion of incidents, manipulation of the ideas of others, consultation, &c., he might almost fairly claim the credit of having written the less famous Monte Cristo and the Three Musketeers. His most valuable assistant was Maquet. Indeed, the chief credit of Dumas's most important stories has been claimed for him; but as he afterwards often tried his powers alone, and with but poor success, it seems probable that his share in Dumas's works was no more than what has been described. But presently the popular writer found that even this form of partnership was too great a tax upon his time, and he began to proceed upon the simpler process of ordering works from clever young writers, to whom he suggested a subject and perhaps a mere outline of treatment—and then issuing their work with his name. Some care in the selection was at first exercised, but later he accepted any stuff that was brought to him—travels, essays, stories—and endorsed them with his name. Indeed a volume could be filled with the odd details and complicated ramifications of this system, which was exposed in the most unsparing fashion by Grenier de Cassagnes, Jacques alias De Mirécourt, and Quérard. Dumas justified his system of appropriating from dead and living authors by a theory of what he called "conquering." "All human phenomena," he says, "are public property. The man of genius does not steal, he only conquers. Everything one arrives in his turn and at his hour, seizes what his ancestors have left, and puts it into new shapes and combinations."

In the meantime he was earning vast sums. Leaving the work of composition to his journeymen, he now entered on a new and reckless course, with a view of dazzling his countrymen and gratifying his own Eastern taste. In this view he built a vast theatre for the production of his own works, and a gorgeous castle at St Germain, on the model of a palace in a fairy tale, on which he lavished every adornment. While these follies were in progress, he succeeded in getting himself attached to the suite of the young duke of Montpensier, then (1840) setting out for Madrid to be married, and received his congé d'armes from the Government to visit Algeria, with a view to making it popular by a lively account from his pen. He was granted a passage to Oran on board one of the Government mail-boats, but, through an awkward misconception, was allowed to divert this vessel from her regular service, and used her for visiting Carthage, Tunis, and other places. On his return there was much scandal, and the minis try was very severely interrogated as to the irregularity of allowing "a contractor for stories" to make so free with public property. It was explained that this was entirely owing to a misrepresentation of the popular writer's. Another rebuff, too, was waiting him; for, having completely neglected his engagements to the various newspapers while making this agreeable tour, he found himself engaged in heavy law-suits with no less than seven journals, including the Constitutionnel et la Presse. After defending himself in person, a performance that was the entertainment of all Paris, he was cast in damages. The Duke, whose name was Carabas, and his actor wife, his actress daughters. His theatre, after opening with one of his pieces which took two nights to perform, fell on evil days, and the revolution of 1848 plunged it into difficulties. In these new scenes he was by no means popular, being suspected from his;//sacrosanct attendance on the Orleans family. By this time all his best works had been written; and he was now only to attract attention by some extravagant literary somersault or impudent attempt at "humbugging" the public. He attempted newspapers like the Moniteur, of which he would grow tired after a few numbers, to every article in which his name stood out. His next excursion was joining Carabals, whose messenger and lieutenant he constituted himself, and, in reward for some trifling service, he claimed the appointment of "director of the museum and explorations" at Naples, an office he was presently forced to resign. After this he was reduced to all manner of devices to maintain himself, always borrowing and obtaining money by shifts and pretences which in another could not be called honest. It becomes, indeed, painful to follow the stages in this rapid decay,—to find him reduced to writing "puffs" for tradesmen, to exhibiting himself in shop windows, and to introducing grand schemes to the public which was impossible to read without hearty laughter. A scandalous infatuation, too, was to be associated with his old age, which last excited the contempt pity of all who knew him. To the last he was full of schemes, devised with the fertility and roseate imagination of a Micawber; and to the last, unfortunately, he was devoted to pleasure. The result was a breaking up of his health, and even a decay of his faculties. When the war of 1870 broke out he was removed from Paris to Puyis, near Dieppe, and there affectionately attended by his son and daughter. He died on the 5th of December in the same year. He was even poorer than when he began the world; and the brilliant novelist, who had earned more than £1,000 a year, had hardly a sou left. On the 16th April 1872, when the war was over, his remains were removed to Villers-Cotterets, and interred in presence of the leading littérateurs of Paris.

The works that bear Dumas's name are said to amount to some 1200 volumes. His dialogue is often full of spirit and dramatic propriety—and this, too, in spite of the temptation, to a man paid by the line, to "spin out" his matter to the utmost extent. He left about sixty dramas, of which not more than three or four will be remembered, but two, the Marriage of Louis XIV, and
Mille de Belle Isle, belong to the repertoire of the Con(write number) French. These will always be listened to with delight. His most popular stories have been mentioned, but even now their unique expansion and compelling development, owing to the necessities of the feuilleton system, are found to be serious obstacles to their popularity.

He left a daughter, Madame Petel, who has written a few romances, and a son, the well-known "Alexandre Felis," who, unlike his father, has been distinguished by slow and careful work. He is best known of his romances La Dame aux Camelias, which has been translated in every language in which romances are written, and by a number of dramas which deal satirically with the characters, follies, and manners of society under the second empire (p. 5).

Dumas, Mathieu, Count (1753-1837), a French general and military historian, was born at Montpellier of a noble family, on the 23rd November 1753. He joined the army in 1774, and entered upon active service in 1780, as aide-de-camp to Rochambeau, commander-in-chief of the army sent to aid the Americans in their war against England. He had a share in all the principal engagements that occurred during a period of nearly two years. Shortly after the capture of Yorktown, in which he took part, he joined the expedition under Vaudreuil intended to make an attack on Jamaica. On the conclusion of peace with England in 1783 he returned to France, where he soon afterwards received his commission as major. In 1784 he was sent to explore the archipelago and the coasts of Turkey, a service in which he was engaged for two years, and which he performed with great thoroughness. He was present at the siege of Amsterdam in 1787, where he cooperated with the Dutch against the Prussians. At the Revolution he acted with Lafayette and the constitutional liberal party, whose aim was to effect a complete reform without abolishing monarchy. He was intrusted by the Assembly with the command of the escort which conducted Louis XVI to Paris from Varennes, where he had been arrested. In 1791 he was appointed to a command at Metz, where he rendered important service in improving the discipline of the troops, and in organizing the first battalion of horse artillery that was formed in France. Chosen a member of the Legislative Assembly in the same year by the department of Saine-et-Oise, he advocated firmness and eloquence the principles and policy of the constitutional party to which he belonged. In the following year he was elected president of the Assembly. When the extreme republicans gained the ascendancy, however, he became a minority man, and deserted the party to make his escape to England. Returning after a brief interval under the apprehension that his father-in-law would be held responsible for his absence, he arrived in Paris in the midst of the Reign of Terror, and fled to home to avoid the fate of his friends Barnave and Dupont Duteurtre. Soon after his return to France he was elected a member of the Council of Ancients. On the triumph of the extreme revolutionists in 1797, Dumas, being proscribed as a monarchist, made his escape to Holstein, where he enjoyed the hospitality of Count Stolberg. During this exile he wrote the first part of his Précis des Événements Militaires, which was published anonymously in monthly numbers at Hamburg in 1800. Recalled to his native country when Bonaparte became first consul, he declined the presidency of Bordeaux, preferring a military appointment. Intrusted with the organization of the army of reserve at Dijon, he was on the completion of the task appointed chief of the staff to that army. In 1801 he was nominated a councillor of state, and in the same year he was chosen to propose and defend in the Corps Législatif the formation of the Legion of Honour, of which order he afterwards (1810) became grand officer. Attached to the household of Joseph Bonaparte, Dumas went in 1806 to Naples, where he became minister of war. On the transfer of Joseph to the throne of Spain, and the accession of Murat to that of Naples, Dumas rejoined the French army, with which he served in Spain during the campaigns of 1809, and in Germany during that of 1813. After the Battle of Wagram, Dumas was employed in negotiating the armistice, and he was left by Napoleon at Vienna in order to superintend the evacuation of Austrian territory by the French troops. In the disastrous Russian expedition of 1812 he held the post of intendant-general of the army, which involved the charge of the entire administrative department. He shared the horrors of the retreat from Moscow, and the privations he suffered brought on a dangerous illness, from which, however, he recovered after a brief interval of repose at Dumas. Resuming his duties as intendant-general, he took part in the battles of Lutzen and Bautzen. When the decisive defeat of Leipzig occurred, Dumas, who was stationed with the besieged army in Dresden, was employed to negotiate the unavoidable capitulation, the terms of which, though agreed to by the opposing general, were not ratified by the allied sovereigns. Dumas, who had gone to report the matter to the emperor, was consequently arrested and imprisoned in Hungary until peace was concluded in 1814. On the accession of Louis XVIII, Dumas received several important commissions in connection with the administration of the army. He had the entire confidence of the king, and would have been appointed minister of marine but for the adverse influence of the party that had been in exile during the empire. When Napoleon returned from Elba, Dumas at first kept himself in retirement, but he was persuaded by Joseph Bonaparte to present himself to the emperor, who intrusted him with the task of organizing the National Guard. This brought him into disfavour with the Bourbons, and he was obliged to retire upon half-pay when Louis XVIII was restored to the throne. He devoted his leisure to the continuation of his Précis des Événements Militaires, of which nineteen volumes, embracing the history of the war from 1798 to the Peace of Tilsit in 1807, appeared between 1817 and 1826. A growing weakness of sight, ending in total blindness, prevented him from carrying the work further, but he translated Napoleon's History of the Peninsular War as a sort of continuation to it. In 1818 Dumas was restored to favour through the influence of Gouvion Saint-Cyr, and admitted a member of the Council of State. In 1828 he was chosen a deputy by the first arrondissement of Paris. After the revolution of 1830, in the events of which he took an active part, Dumas was created a peer of France, and re-entered the Council of State as president of the war committee. He died at Paris on the 16th October 1837."
DUMBARTON

The parishes of Cumbernauld and Kirkintilloch, belonging to Stirlingshire till the earl of Wigtoun, whose property it was, became heritage of Dumbartonshire and annexed it to this county, which, as a whole, contains 570 square miles, or 127,677 statute acres, and is divided into 15 parishes. The county is in a shape a crescent, having a convex coast-line of 35 miles, formed by the Clyde on the south for 15, and Loch Long on the west for 20 miles. Along its eastern side for a distance of 24 miles stretches Loch Lomond, the "queen of Scottish lakes," studded with small islands, which number 30 in all, and most of which, with about two-thirds of the shore, are in Dumbartonshire. There are other fresh-water lakes in the county, but they are of a minor description. The Gare Loch is an arm of the sea about six miles long by one broad, and forms with Loch Long the peninsula of Roseneath, nearly detaching it from the mainland. Besides the Clyde, the only river of any note which can be said to belong to this county is the Leven, which flows for six miles through a fine valley, joins the Clyde at Dumbarton Castle.

The mountainous districts are marked by numerous cascades and lesser streams, falling for the most part into Loch Lomond, of which the chief are the Falloch, Lomond, and Dumbarton rocks. The river Falloch, rising in the eastern border, drains the detached portion of the country. About two-thirds of Dumbartonshire are hilly and mountainous. The most elevated regions are in the west and north-west, between Loch Long and Loch Lomond, and to the north of Loch Lomond. The extreme north attains an elevation of 3000 feet, and Finnart, on Loch Long, is 2400 feet high. While this mountainous character prevails in the north of the county, in the eastern detached district and along the Clyde and the Leven it is lowland—marked, however, by the rising of abrupt eminences such as the hills of Kilpatrick and Cardross, and the rocks of Dumbarton and Dumbuck. In scenery it is unsurpassed in Scotland, not only for what it embraces but for the magnificent and extensive views which it commands. The climate varies with the character of the county, but is on the whole salubrious, though much more humid than in many parts of Scotland. The prevailing winds are from the west and south-west, but easterly winds are frequent in the spring months. Frosts are seldom severe, and, except on the mountains, snow never lies long. In the southern districts of the county Old Red Sandstone strata stretches from Rosneath to Loch Lomond, limestone is found in the higher grounds of Kilpatrick, Dumbarton, and Row; the hills of Dumbuck and Kilpatrick and Dumbarton Rock are composed of trap; while muca slate, quartz, and talc principally constitute its northern formations. Clay-slate is likewise found, and has been wrought with success at Luss, Camstradden, and Roseneath. Coal measures also exist, and there are pits for working coal in several districts. Ironstone is found in considerable quantities in connection with limestone in the parishes of Kirkintilloch and Cumbernauld.

The lands of Dumbartonshire, which extend chiefly along the Clyde and the Leven, and are composed of rich black soil, gravelly soil, and clay, are divided into farms ranging from 30 to 300 acres, and in some cases to 700 or 800 acres. From the proximity to Glasgow and other large towns, the farmers have the double advantage of good markets and a ready market for all kinds of both stock and produce, and, under the stimulus of this, great progress has been made. Special attention has been given to the construction of farm buildings, the erection of fences, and the use of proper drainage, as well as to the rearing of cattle and the management of sheep stock, principally the Ayrshire breed. Black-faced sheep and black cattle are pastured on the hilly lands, and Cheviot sheep and Ayrshire stock on the low grounds. In 1876 Dumbartonshire had 1717 horses, 15,183 cattle, 71,202 sheep, and 11,511 pigs. Oats and wheat are grown in quantities; large crops of potatoes are raised; turnips, barley, and beans are also grown. In 1876 there were 9862 acres under corn crops, of which 7350 were under oats and 1149 under wheat, while 4443 under green crops. On the banks and islands of Loch Lomond there are some yew trees of large size, and evidently of a very great age. There are few large estates in the county; the largest being Rossdhu (Sir James Colquhoun, Bart.), 67,041 acres, Strathleven (Mrs. Ewing), 9180, Roseneath (duke of Argyll), 6798, and Cumbernauld (Hon. Cornwallis Fleming), 3593. The whole number of landowners having one acre and upwards is 706, possessing 152,968 acres, of the annual value of £251,134.

The banks of the Leven, whose waters as well as being constant are singularly soft and pure, have long been celebrated for their bleachings of cotton, dyeworks, and print-works. Bleaching was carried on in the Vale of Leven upwards of 150 years ago. The printing of cotton began at Levenfield in 1788, and has for some time been the chief manufacturing industry in Dumbartonshire. There are extensive ship-building yards, engine-works, foundries, tanneries, and breweries. At Dalmuir extensive works for the repair of the dredging plant belonging to the Clyde Trust were erected by the trustees in 1867, costing £25,000. A large patent ship for taking on the dressers used on the Clyde forms part of these works, at which three steam forges-hammers are in constant operation. In 1850 a line of railway, already completed from Bowling to Dumbarton, was extended up the Vale of Leven to Dalloch. In 1838 the Glasgow railway to Helsinburgh was opened, running through Bowling, Dumbarton, and Cardross, and, with the steam communication on the Clyde and the lochs, abundant facilities for every kind of traffic to all parts of the county. The Forth and Clyde Canal, begun in 1768 and opened for traffic in 1775, passes through Dumbartonshire for more than 18 miles, and is carried over the valley of the Kelvin by an aqueduct. At Bowling there is a harbour with quays, forming a tidal basin of 7½ acres. The county is somewhat rich in antiquities, connected both with the period of the Roman occupation and with that of the aboriginal inhabitants of Scotland. The wall of Antoninus runs along the north of the eastern part and through the south-east corner of the main district to Kilpatrick. Remains of Roman workmanship have been found at Duntocher and in the parish of Cumbernauld, as well as at the castle. The Caledonians, Picts, &c., are commemorated by rude forts and tumuli here and there; and there are several remains of old baronial castles. Rob Roy's district lies to the north; the clans had encounters in Glenfinnan; and the county is associated with the heroic Wallace and Bruce, the latter having built a residence at Cardross, in which he died. In 1815, Henry Bell, from whose designs the first steamer built...
on the Clyde, "the Comet," was constructed, and who indeed was the first to put into operation the idea of employing steam for navigation purposes, lived at Helensburgh, where he died in 1830. A monument to him was erected near Bowling. The celebrated ship-building firm of Napper & Sons had its origin in a smith's foundry business at Dumbarton.

Several important watering-places, including Helensburgh, Kilcreggan, Rosneath, &c., are situated in Dumbartonshire. The other principal towns and villages are Kirkintilloch, Alexandria, Dunosher, Bonhill, Renton, Kilgrinburn, Kilpatrick, Cardross. The leading gentlemen's seats are Rosslau (Sir James Colquhoun, Bart.), Rosneath, (duke of Argyle), Garcube House (Sir George Campbell), Tillichowan Castle (J. Campbell), Bonhill Castle, and Shandon (now a hydro pathetic establishment), built by the late Robert Napper.

Dumbarton, a royal parliamentary and municipal burgh and seaport-town of Scotland, capital of Dumbartonshire, is situated at the confluence of the rivers Clyde and Leven, 14 miles north-west from Glasgow. It is a very ancient place, and is said to have been once the capital of a kingdom of the Britons in the vale of the Clyde Alcluhy, "the rock upon the Clyde," was the name of this ancient capital of the Britons, but whether it was situated on the site of the present town, or confined within the precincts of the castle, cannot be exactly ascertained. The site had previously been used as a naval station by the Romans, who called it Theodisma. At a subsequent period, Dumbarton was the capital of the earldom of Lennox, but was given up by Earl Maldwyn to Alexander II, by whom it was erected into a royal burgh in the year 1221, and declared to be free of all imposts and burgh taxes. It afterwards received other charters from succeeding monarchs, and finally it obtained a confirmation of the whole from James VI. Among other privileges conferred was that of levying customs and dues on all vessels on the Clyde from the Kevern to the head of Loch Long, and ships within these bounds had to pay duties at Dumbarton. Offers dues on foreign vessels coming into the Clyde were also levied. In 1700 these rights were transferred to Glasgow by a contract, but were subsequently vested in a special trust created by successive Acts of Parliament. The town is principally built upon the eastern bank of the Leven, which almost encircles it, and is chiefly composed of one main street running in a semicircular form round the head or west end of the peninsula and parallel to the river. A good stone bridge of five arches, 300 feet long, connects the town with Bridgeend, a suburb on the western side of the Leven. The waters of the Leven form the harbour. For seventy years the staple trade of Dumbarton was the manufacture of crown glass, commenced in 1777 and discontinued after the abolition of the glass duty. As many as 300 hands were employed in the business. But for many years its principal trade has been ship-building, and particularly the construction of iron steamers. By the natural port of the Clyde, Dumbarton has the distinction of originating in Britain the formation of steam navigation companies. In 1815 a joint-stock company was formed in Dumbarton to run a steamer from that town to Glasgow, and their steamer, the "Duke of Wellington," was built by McIachlan in Dumbarton. The next steamer was built by William Denny in 1820, from which date the ship building of the town may be said to have started. But it was not till 1844, on the application of iron to the purposes of ship-building, that the trade assumed the important proportions to which it was raised by the firm of Denny and by others. The Dennyqunt Forge Company, which is amongst the largest and most unique in Great Britain, both as respects the building itself and the machinery employed, was opened in 1855. Extensive harbour improvements were entered upon in 1852, and successfully carried out. In 1874 the total tonnage of iron vessels launched in Dumbarton amounted to 32,000 tons, in 1870 to 37,000, in 1876 to 17,500. Some of the vessels built in Dumbarton are among the most magnificent employed in the British trade. The General Police Act has been in operation in Dumbarton since 1855. In 1857 the sanction of Parliament was obtained to a bill for extending the municipal boundaries so as to include West Bridgeford. The embankment of the Broad Meadow, a project which had been entertained for 200 years, was accomplished in 1859, securing for the town a considerable tract of agricultural land and 20 acres of recreation ground. Since 1860 the burgh has been supplied with water drawn from the Long Craggs. A fine cemetery, a mile from the town, was formed in 1854, and the old Dumbarton parish churchyard has been closed by authority since 1856.

The disadvantage Dumbarton long laboured under of having access to the river steamers merely by ferry boats is now obviated by a pier recently constructed from the foot of Dumbarton Rock, at a cost of from £4000 to £5000.

The situation of Dumbarton Castle is eminently picturesque. The battlements of the fort are perched on the summit of a rocky mount, shooting up to the height of 206 feet sheer out of the alluvial plain on the east side of the mouth of the river Leven. To the east of the castle there are rocky eminences on the verge of the Clyde, of a similar form, though less isolated. The Rock of Dumbarton measures a mile in circumference at the base. It diminishes in breadth near the top, which is divided into two summits of different heights. The rock is basaltic, and has a tendency to columnar formation. Some parts of it have a magnetic quality. The fortress, naturally strong, possesses several batteries, which command a very extensive range. According to a provision in the Treaty of Union, the defences are kept in constant repair, and a garrison is maintained in the castle.

The affairs of the burgh are managed by a provost, 2 bailies, and 16 councillors, to whom are added the provost, the bailies, and the council, and borough buildings are good. Dumbarton joins with Port Glasgow, Renfrew, Rutherglen, and Kilmarnock in returning a member to Parliament. In 1871 the population amounted to 11,401.

DUMDUUM, or DUMDA, a town and canton in British India, at the head of an administrative subdivision in the district of the Twenty-four Pergamains, in the presidency of Bengal, with a station on the Eastern Bengal railway, 41 miles N.E. of Calcutta, in 22° 37' 53' N. lat. and 84° 26' 1" E. long. It was the head-quarters of the Bengal artillery from 1783 to 1853, when they were transferred to Meerut as a more central station, and its possession of a cannon foundry and a percussion-cap factory procured for it the half jocular name of the Woolwich of India. The barracks—still occupied by small detachments—are brick-built and commodious, and among the other buildings are St Stephen's Protestant church, a Roman Catholic chapel, a European and native hospital, a large bazaar, and an English school. The population in 1871 amounted to 5173, of whom 1201 were Mahometans, 1053 Christians, and 2556 Hindus. The males numbered 3414, the females 1765. It was at Dumduum that the treaty of 1757 was signed, by which the nawab of Bengalred the privileges of the English, allowed Calcutta to be fortified and bestowed freedom of trade, and in 1857 it was the scene of the first open resistence of the sepoys to the use of greased cartridges.
DUMFRIES, one of the three Scottish border counties, lies in an elliptical form on the north side of the Solway Firth, its other boundaries being from Lanark, Peebles, and Selkirk on the N., Roxburgh on the E., Ayr and Kirkcudbright on the W., and Cumberland on the S. Its greatest length is fully 50 miles, its breadth 33, its circumference 190, and the area is 1103 square miles or 720,205 acres. The coast-line on the Solway measures 21 miles. Towards this end the county slopes down from a high mountain range, by which it is cinctured on the north, the intermediate pace being extremely irregular, lofty hills alternating with wide stretches of table land or rich fertile holms, and in other instances the surface looking like a vast undulating mass that by some natural process had suddenly become fixed and rigid. Among the leading features of the county are the three dales by which it is cleft from north to south, and through which run the rivers that give name to them, the Nith, Annan, and Esk. Over-looking these rise numerous elevations, the highest being Whitecoomb in the east, 2651 feet; Hartfell in the north, 2561 feet; Queensberry, also in the north, 2285 feet, which gives to the duke of Buccleuch his secondary title, and the title of marquis to a branch of the house of Douglas; and Etrick Pen, 2659 feet, the latter standing sentinel over an extensive district. The Nith is the chief river of the county. Starting from its mountain cradle near Dalvelloch, in Ayrshire, it takes a south-westerly sweep, watering the old burgh of Sanquhar, at the head of Nithsdale, and further down the modern village of Thornhill, near which stands the ducal castle of Drumlanrig. As the river proceeds it passes on the one hand Dalwallan, where Patrick Miller made his first fruitful experiments in steam navigation, and on the other the acres of Elibank, which Robert Burns turned over with his plough. At Auldghirch Bridge, near Blackwood, the dale narrows considerably, then it expands till around and below the burgh of Dumfries it appears as a spacious plain, with gentle acclivities or bold elevations rising on every side. The Nith is swelled by numerous streams at various stages, its latest and largest acquisition being the Cluden, the confluence taking place about a mile above Dumfries, and the absorbing river reaching the Solway about eight miles below that burgh, its whole course measuring about 50 miles. An upland spot, where the counties of Lanark, Peebles, and Dumfries converge, gives birth to three streams, according to the popular saying, "Annan, Tweed, and Clyde, All arise from one hillock." The first-named river, after a rapid course from its highland source, five miles above Moffat, receives several tributaries a little south of that town, then proceeds at a leisurely pace down the dale, which, narrowed at first by rocks or ridges, expands into a fertile basin termed the "Howe of Annandale," studded with hamlets and spangled by the MIME Inelock of Lochmaben,—that venerable royal burgh, which claims to have been the birth-place of King Robert Bruce, and the prosperous town of Lockerbie occupying conspicuous places on the western and eastern banks, other rivulets, including the Dryfe (flowing past the scene of a fierce clan battle fought between the Maxwells and Johnstones in 1675), giving increased volume to the stream below Bruce's burgh, the valley narrowing again as the water grows wider and deeper. When little more than a mile from the sea it passes Annan, the second town in the county, its entire length being nearly 40 miles. During about a mile of its course the Esk divides Dumfries and Galloway into its two prongs, the eastern being from Selkirkshire frontier it flows southward past the baronial town of Langholm, and, after being a Scottish stream to the extent of 30 miles, it enters English ground, waters Longtown, describes a westward curve, and then falls like its two sister streams into the Solway, its entire course extending to about 40 miles. Besides the lakes in Annandale already referred to, Loch Skene, lying under the shadow of Whitecoomb hill, 1303 feet above sea-level, is the only one of consequence, its water finds an outlet by leaping over a rocky height of 300 feet, forming a cascade termed the Gray Mare's Tail. Another small but exceedingly picturesque waterfall in Morton parish is called Cruchgo Linn. The chief mineral waters of the county are those of the well at Moffat, and another about five miles distant, called Hartfell Spa, situated in a cleft of the hill from which it takes its name. The former are reckoned beneficial for chronic gout, rheumatism, and liver complaints; and the latter acts as a mild astringent and powerful tonic. Owng to the great repute of these waters, and the romantic scenery of the surrounding district, Moffat during summer and early autumn becomes a favourite and fashionable place of resort. A small chalybeate at Brow, on the Solway, possesses considerable virtue, and is rendered interesting from the circumstance that it was partaken of by Burns during his last illness, though without avail. Generally speaking the climate is mild and salubrious, with a mean temperature of 53° Fahr.; the average rainfall supplying sometimes more than enough of moisture. The soils are chiefly gravel or sandy loam and clay, except where river and estuary have formed rich alluvial tracts. At no very distant date it was roughly computed that there were 80 square miles of arable land lying along the sea coast, 232 miles chiefly upland, and 98 miles mountainous, yielding nothing but heather and game, but by the application of bone manure, draining, planting, and green crop husbandry, all this is changed, no fewer than 213,784 acres being under the plough—even the huge expanse of Lochmoss, lying in the parishes of Tinwald, Dumfries, and Torthorwald, becoming by degrees less of a drawback to the agricultural enterprise of its proprietors, though much of the surface of the county still wears a pastoral aspect drawn from one of its chief rural industries, sheep-breeding. In 1876 there were 49,975 acres under corn crops, of which 45,292 were oats and 546 wheat; 25,669 were under turnips, 3,323 miles chiefly upland, and 988 miles mountainous. In 1875 there were 14,060 acres of meadow land, of which 8,649 were grass under rotation. These figures differ little from those for 1873, except that 1291 acres were then in wheat. With abundance of coal at the two extremities—Sanquhar and Canonbie; with limestone at Kilhead, Closeburn, and Bacjarg; with lead mines at Wanlockhead, the produce of which when undergoing refinement yields a large percentage of silver; with gold dust and even nuggets of that metal in the same district, but now no longer searched for systematically, as they were with considerable success in the 16th and 17th centuries; with sandstone quarries in various quarters; with woolen mills at Langholm; with numerous manufactures centring in the county town; with some little sea-borne traffic; and with good salmon fisheries in the Nith, along the Carlawcock shore, and at Annan Water-Foot on the Solway,—the county itself is still essentially an agricultural one, and as such it takes high rank. Early in the 15th century the district breeders of Galloway cattle began to send stock to the south; and, before the current century was far advanced, some 15,000 head of heavy cattle were annually driven from Dumfriesshire and Galloway to the English markets. Forty years ago the number had increased to 20,000, their value on an average being at least £200,000. For some years past Ayrshire dairy cattle and shorthorns have superseded the old stock on most farms of the county, and its trade in live stock generally has considerably decreased. Few store cattle are...
The sheep trade of Dumfries is of comparatively recent origin, is now of great extent. Cheviot predominates, the frugal, black-faced breed still occupying the higher sheep walks, while half-bred lambs, the produce of Cheviot ewes crossed by Leicester or other long-wooled rams, are fattened on the richer pastures yielded by low-lying farms, supplemented by turnips in winter, and are thus made ready for the butcher when fifteen months old. For nearly a hundred years pig-rearing has occupied a place in the rural economy of the county. A sum of £50,000 represented an annual trade in pork about sixty years ago. Influenced by large imports of bacon from America, the curing of ocears has of late decreased. In 1876 the number sold in the public markets of the county was under 8000, the value of which, allowing for those disposed off privately, would not exceed £45,000, a few years back the annual value ran from £70,000 to £75,000. As regards quality and flavour, the Dumfries ham still maintains the high character they have long held in the English markets.

Three leading highways, one in each valley, with numerous branch roads, intersect the county. It possesses also ample railway communication,—the Glasgow and South-Western line, completed in 1850, extending through Nithsdale and Lower Annandale, and, soon after passing Gretna Green (famous in days of yore for its matrimonial celebrations), crossing the little border river Sark, and the Caledonian line, completed in 1849, traversing Moffatdale and Upper Annandale, and also a portion of England as far as Carlisle.

In a Parliamentary Blue Book (1874) the acreage of the county is given at 676,071, and its yearly value (1872) at £955,511, 17s., the owners numbering 4177, of whom 886 possessed more than one acre each, the value per acre being 17s. 7d. as compared with 20s. for all Scotland. From the valuation roll for 1876 we learn that the chief proprietor, the duke of Buccleuch and Queensberry, owns 253,514 acres, yielding an annual revenue of £57,810. The names of other leading proprietors, with their extent of land and incomes from it, are,—Mr. J. J. Hope Johnstone of Annandale, £4,070 acres, with a rental of £58,684, earl of Mansfield, 14,342 acres, £15,938, marquis of Queensberry, 13,243, £13,982, Mr Villiers and Viscountess Cole of Closeburn, 1,360, £11,658, Sir J. J. Hope Johnstone of Closeburn, 1,360, £11,658.

As regards the extent of murder and incomes from it, are,—Mr. J. J. Hope Johnstone of Annandale, £4,070 acres, with a rental of £58,684, earl of Mansfield, 14,342 acres, £15,938, marquis of Queensberry, 13,243, £13,982, Mr Villiers and Viscountess Cole of Closeburn, 1,360, £11,658, Sir J. J. Hope Johnstone of Closeburn, 1,360, £11,658.

A few of the principal firms are those of Walter Scott and Sons, owners of 370,000 acres, and of the best in Scotland, and next to those of Hawick in extent. Prior to 1817, however, the prosperity of Dumfries depended much on its position as the capital of a rich rural district, which it still is, but soon after that date it began to bulk largely as a manufacturing town in connection with the tweed trade, and to its development the growth of the burgh in size and importance is principally due. The principal firm, that of Walter Scott and Sons, usually employs about 1400 workers, with 400 looms and 30,000 spindles. Nearly all the business traffic of and from Dumfries is now carried on by rail, the vessels belonging to the port numbering only two or three, and its revenue—burdened by heavy interest on a sum borrowed to erect a large sea-dyke, which has been of little benefit—is insufficient to cover the expenditure.

The origin of two places of worship in connection with the Established Church (St Mary's and Greyfriars) is noticed below, a third, St Michael's, is a stately mansion in the form of droveldale mansions, British motives and camps, Roman roads and camps, Anglo-Saxon relics, the chief of the latter being the Runic monument at Ruthwell, which tells the story of the cross in characters as old as the days of the Heptarchy. As the county is also dotted with "chilled castles breathing stern march," and other time-worn tokens of bye-gone ages, it presents a rich call for archaeological research.

Dumfries, beautifully situated on the left bank of the Nith, about eight miles from the Solway Firth, is the capital of the county just described.

The irregular yet decided progress of the town can be traced through the Middle Ages, and more recently till our own day, when it wears an attractive and flourishing aspect. A serious check was given to its prosperity by a visitation of cholera, which cut off more than 500 of its inhabitants in 1832. Since a copious supply of good water was obtained from a neighbouring loch, and other sanitary improvements were introduced, the salubrity of the burgh has been fairly established, and its size and trade—promoted also by its railway intercourse and the establishment of the tweed manufacture—have greatly increased. Few Scotch provincial towns have gone forward with such a gigantic stride during the last thirty years, and its steps in advance have been especially remarkable during the latter half of that period, as shown chiefly by the bundle of its business streets, the formation of new thoroughfares, and the numerous suburban villas which now envelop the old burgh proper.

From time immemorial the town has possessed a great weekly cattle market, which, though reduced since 1848 by the establishment of competing markets, and the substitution of sheep for cattle on many surrounding farms, is still second to none on the north side of the border. The average number of cattle sold on the Sands during five years ending 1872 was nearly 14,000 yearly, in 1876 the number was 18,413, besides 6844 sold at the auction marts. Vast herds are also sent direct south from the railway station. A still larger trade is now done in sheep, the average number offered for sale during five years ending 1872 being 37,000, while 29,980 were sold at market in 1876, and 42,958 by auction. There is also a weekly market for pork, beginning in November and ending about the end of March.

Among the special industries of Dumfries, clog-making and basket-making have long occupied an important place, their traffic in timber has grown to be immense, a hundred acres of nursery ground help to beautify the town, and supply material for an extensive trade in seeds, flowers, and other plants; the conscious skill in holes and leather gives labour to about 150 hands, while nearly the same number are engaged at iron works. More extensive than any of these is the hosiery manufacture, which, dating a century back, now gives employment to about 450 hands (including warehousemen), the goods produced ranking as the best in Scotland, and next to those of Hawick in extent.

Prior to 1817, however, the prosperity of Dumfries depended much on its position as the capital of a rich rural district, which it still is, but soon after that date it began to bulk largely as a manufacturing town in connection with the tweed trade, and to its development the growth of the burgh in size and importance is principally due. The principal firm, that of Walter Scott and Sons, usually employs about 1400 workers, with 400 looms and 30,000 spindles. Nearly all the business traffic of and from Dumfries is now carried on by rail, the vessels belonging to the port numbering only two or three, and its revenue—burdened by heavy interest on a sum borrowed to erect a large sea-dyke, which has been of little benefit—is insufficient to cover the expenditure.

DUMFRIES
dating from 1746. Before the lower interior was rescaled in 1869, it contained a pew which Burns and his family occupied. The poet's remains are to be found in a magnificent mausoleum in the surrounding churchyard; and besides this paramount distinction the cemetery is richer with monumental erections than that of any other provincial town in the United Kingdom. Among the other ecclesiastical buildings are three Free churches, three belonging to the United Free Presbyterians, two to the Congregationalists, one to the Wesleyan, the Scottish Episcopal, the Catholic Apostolic, and the Roman Catholic, while two other denominations—the Baptists and Evangelical Union—are also represented. Dumfries has three newspapers, two of them published twice a week and one weekly. It has long been able to boast of a well-equipped grammar-school—the Academy. The town possesses its full share of benevolent institutions. Its oldest one, Moorhead's Hospital, erected in 1753, gives accommodation to decayed householders. A hospital for the reception of persons suffering from Hansen's disease has been in existence since 1776, under the name of the Dumfriesshire and Galloway Royal Infirmary, but the building now used as such, an imposing edifice in the Northern Italian style, was only opened a few years back; 398 patients were treated in 1876, at a total outlay of £2137. Crowning an eminence situated a little to the south of the town stands a noble building resembling a Greek cross; this is the Crichton Royal Institution for lunatics, due to the munificence of Dr James Crichton of Frasers' Carse, whose bequest of £100,000 was applied in erecting and partly endowing the asylum. Since it was opened, nearly forty years ago, it has been, considerably enlarged, and also supplemented (in 1845) by the Southern Counties' Asylum for pauper inmates chiefly; usually the patients number about 500, nearly a third, as middle and upper class patients, being housed in the older portion of the establishment. The old infirmary building is now used as a commercial academy connected with the Marist Brotherhood, and dedicated to St Joseph. In it about 70 youths receive education; belonging to the establishment there is a novitiate adjoining the Roman Catholic chapel, where 14 members of the order are under training for missionary service at home or abroad. Several of the banking establishments possess a fine appearance, but the county buildings in Buccleuch Street (Scotch Baronial in design), Greyfriars' Church fronting the head of High Street (Pointed Gothic), and the new infirmary are the most imposing edifices within the burgh. It has a theatre royal, opened in 1792, which was almost entirely reconstructed at a cost of £2000 in 1876, and its interior is now, site considered, as handsome as that of any similar place of entertainment throughout the kingdom. There is no object in the town that can vie with Devorgilla's Bridge as regards archaeological interest. Built of stone about 1280, it had no equal at that period in Scotland, though the popular story which assigns to it thirteen arches is belied by indisputable documents which show that they never numbered more than nine. A second stone bridge was built in 1733–5, at an expense of about £5000; and a small iron foot bridge, which cost nearly £2000, was opened on the closing day of 1875. The associations of Dumfries with Burns, however, and the memorials it possesses of the national bard, draw to it more travellers annually than all its other attractions—seaside, antiquarian, or social.

The town council consists of 25 members, including a provost, 3 bailies, a dean of guild, and a treasurer. Four other royal burghs combine to form a parliamentary constituency with Dumfries, namely, Annan, Kirkcudbright, Sanquhar, and Thornhill. Cheese. The Five Carlins of Dumfries's ballads, being represented by one member. In 1861 the population within the royalty was 15,347; in 1871 it had increased to 15,704. As a parliamentary borough Dumfries includes a large portion of the Nith, its population as such amounting in 1871 to 8,826.

History—The precise circumstances of the origin of Dumfries are not imperfectly known; but the first fortlet built by the Selgovian Britons formed the nucleus of the town, an hypothesis that is supported by its name, which, according to Calvins, means "beyond the Enclosure." On the castle and town are many curious monuments. The oldest existing charter is one granted by Robert I., dated 1095. Male a royal burgh by William the Lion, Dumfries thereby acquired important privileges; and another stimulus to its prosperity was supplied when Devorgilla, daughter of Alen, Lord of Galloway, connected that province with the town by building a stone bridge over the Nith. It was the son of that munificent lady, John Balliol, whom Edward I. of England selected as heir to the Scott all throne from the numerous competitors for it who placed their claims at his disposal. During the troubles that ensued, Nithsdale and Galloway supported Balliol, and or his withdrawal from public life they for the most part preserved the possessions of the castle and town, and established a new barony in the person of the young Pretender, who, converting the Nithdale and Galloway supported Balliol, and or his withdrawal from public life they for the most part preserved the possessions of the castle and town, and established a new barony in the person of the young Pretender, who, converting the

When the Union with England was under debate, the provost of Dumfries, as its representative in the Scottish Parliament, voted against the measure; and the Arts of Union were publicly burned (Nov. 20, 1706) by a party of Cameronians at the market cross, with the enthusiastic approval of the populace. About some days afterwards the habitants were invited to visit from Viscount Kenmure, but they manifestly such a bold front that the Jacobite chief acted on Falstaff's maxim, "Dissent is the better part of valor." Less vigorous and less than a week of the rebellion, they allowed the town to be peacefully occupied by the young Pretender, who, conveying No 5 of theinent now as the Commercial Hotel into a little palace, was there for three days towards the close of December 1745. In order at once to recruit his own exchequer and punish the luggies for their pretensions to the house of Hanover, the prince demands £2000 in money; also 1000 pairs of shoes for his kicked followers, whose footgear had nearly vanished during their forlorn journey from the south; and, if he had been de facto king, he stayed the
DUM — DUM

DUMONT, JEAN, a well-known publicist, was born in France in the 17th century, the precise date being unknown. He followed the profession of arms, but, not obtaining promotion so rapidly as he expected, he quitted the service and travelled through different parts of Europe. He stopped in Holland with the intention of there publishing an account of his travels. But in the interval, at the request of his bookseller, he wrote and published several pamphlets, which were eagerly bought after, owing to the unceremonious manner in which he treated the ministry of France. Thus freedom having deprived him of all hope of employment in his own country, he thought of forming a permanent establishment in that where he resided, and accordingly commenced a course of lectures on public law. The project succeeded far beyond his expectations, and some useful compilations which he published about the same period made him favourably known in other countries. The emperor appointed him his historiographer, and some time afterwards conferred on him the title of Baron de Carlseroon. He died at Vienna in 1726, at an advanced age. Dumont wrote with facility, but his style is deficient in vigour and correctness; his works, however, contain a great number of documents valuable for history.

In the summer of 1726, that season of promise and of hope, especially to a Genevian exile, Dumont suspended his labours in England in order to proceed to Paris along with his friend Durovren, ex-attorney-general of the republic of Geneva. The object of the journey was to obtain through Necker, who had just returned to office, an unrestricted restoration of Genevan liberty, by canceling the treaty of guarantee between France and Switzerland, which prevented the republic from enacting new laws without the consent of the parties to that treaty. The negotiations and proceedings to which this mission gave rise necessarily brought Dumont into connection with most of the leading men in the Constituent Assembly, and made him an interested spectator, sometimes even a participant, indirectly, in the events of the French Revolution.
The same cause also led him to renew his acquaintance with Mirabeau, whom he found occupied with his duties as a deputy, and with the composition of his journal, the *Courrier de Provence*, in which he was assisted by Durovrat, Clavière, and other Genevese patriots. For a time Dumont took an active and very efficient part in the conduct of this journal, supplying it with reports as well as original articles, and also furnishing Mirabeau with speeches to be delivered or rather read in the assembly, as related in his highly instructive and interesting posthumous work entitled "Souvenirs sur Mirabeau" (1833). In fact his friend George Wilson used to relate that one day, when they were dining together at a *table d'hôte* at Versailles, he saw Dumont engaged in writing the most celebrated paragraph of Mirabeau's address to the king for the removal of the troops. He also reported such of Mirabeau's speeches as he did not write, embellishing them from his own stores, which were inexhaustible. But this co-operation, so valuable for Mirabeau, and so self-devoted on the part of Dumont, was destined soon to come to an end; for, being attacked in pamphlets as one of Mirabeau's writers, he felt hurt at the notoriety thus given to his name in connection with a man occupying Mirabeau's peculiar position, and resolved to return to England, which he accordingly did in 1791.

In the eventful years which followed he continued to live chiefly at Lansdowne House, or at Bowood, where the most remarkable men of Europe were frequent guests. Latterly, he formed an intimate friendship with Lord Holland, whom he had known from childhood; and he became a member of the society of familiar friends, the habitual visitors at Holland House, where, during many years, celebrated guests were welcomed of every country, party, religion, and of every liberal profession or station. In 1801 Dumont travelled over various parts of Europe with Lord Henry Petty, afterwards marquis of Lansdowne, and brought back a fresh acquaintance with the mental occupations of the Continental nations, from whom England had for years been widely separated. But Dumont had then opened a new course of more serious occupations, in the editorship of the works of Bentham already mentioned. In 1801 he published the *Traité de la Législation*, the first fruits of his zealous labours to give order, clearness, and vivacity to the profound and original meditations of Bentham, hitherto praised only by a very few patient readers, and but little better known, even by name, to the English than to the European public. In 1814 the restoration of Geneva to independence induced Dumont to return to his native place, and he soon became at once the leader and ornament of the supreme council. He devoted particular attention to the judicial and penal systems of his native state, and many improvements on both are due to him. At the time of his death, he was on the eve of proposing a complete code of law, by which he fondly hoped to make the legislation of Geneva an example to Europe. He died at Milan when on an autumn tour of relaxation in October 1833, in the seventy-first year of his age.

DUMONT D'URVILLE, JULIÉ SÉBASTIEN CÉSAR (1790-1842), a French navigator, born in the town of Condat-sur-Norneau, in Normandy. The death of his father, who before the revolution had held a judicial post in Condat, devolved the care of his education on his mother and his maternal uncle, the Abbé De Croustiles. Failing to pass the entrance examination for the École Polytechnique, he went to sea in 1807 as a *scotte* on board the "Aquilon," and soon attracted the attention of the captain, Maignon, by his studious disposition. During the next twelve years he made his profession in his profession, and through all its multitudinous vicissitudes to increase his scientific and linguistic acquisitions: botany, entomology, English, German, Spanish, Italian, and even Hebrew and Greek were added to the more professional branches. In 1820, while engaged in a survey of the Mediterranean under Captain Gauthier of the "Chevrette," he was fortunate enough to recognize the Venus of Milo in a Greek statue recently unearthed, and to secure its preservation by the report he presented to the French ambassador at Constantinople. A wider field for his energies was furnished in 1822 by the exploring expedition of the "Coquille," under the command of his friend Duperrey; and on its return in 1823 his services were rewarded by promotion to the rank of *captaine de frégate*, and he was intrusted with the control of a similar enterprise. The "Astronome," as he now named the "Coquille," left Toulon on April 25, 1826, and reached Marseilles again on 25th of March 1829,—having traversed the South Atlantic, coasted the Australian continent from King George's Sound to Port Jackson, laid down various parts of New Zealand, and visited the Fiji Islands, the Loyalty Islands, New Caledonia, New Guinea, Amboyna, Van Diemen's Land, the Caroline Islands, Cebes, and Mauritius. Promotion to the rank of *captaine de vaisseau* was bestowed on the commander in August 1829; and in August of the following year he was charged with the delicate task of conveying the exiled King Charles X. to England. His project to undertake a voyage of discovery to the south polar regions was discouraged by Arago and others, who criticised the work of the previous expedition in no measured terms; but at last, in 1837, all difficulties were surmounted, and on 7th September he set sail from Toulon with the "Astronome" and its convoy "La Zélée." On 15th January 1838 they sighted the Antarctic ice, and after their progress southwards was blocked by ice, he proceeded to a continuous bank, which they vainly coasted for 300 miles to the east. Returning westward they visited the South Orkney Islands and part of the New Shetlands, and discovered Joinville Island and Louis Philippe's Land, but were compelled by scarcity of provisions to seek succour at Talcahuano in Chili. There they proceeded across the Pacific and through the Asiatic archipelago, visiting among others the Fiji and the Solomons, coasting New Guinea, and circumnavigating Borneo. In 1840, leaving their sick at Hobart Town, Tasmania, they returned to the Antarctic region, and on the 21st of March found the discovery of Adelie Land, in 140° E. of Greenwich. The 6th of November found them at Toulon. D'Urville was at once appointed rear-admiral, and in 1841 he received the gold medal of the Société de Géographie. On the 8th of May 1843 he was killed along with his wife and son in a railway accident near Meudon. Though many of his observations are no longer regarded as trustworthy on account of the defective character of the instruments employed, he made many important additions to various departments of scientific geography; and his natural history collections were especially valuable. His principal works are—*Enum. plantarum quas in samula Archipel. aut tertioribus Pont. Eurasii, ac, 1822; the Histoire du voyage (5 vols. of the 22) in the great work on the "Astronome" expedition in 1826-1829; the first part of the Histoire du voyage (10 vols. of the 22) in the series devoted to the expedition from 1837 to 1840; Voyages autour du Monde: résumé général des voyages de Mésdaglan, &c., 1833, 1844, &c.*

DUMOZIEZ, CHARLES FRANÇOIS (1739-1823), general of the French republican army, was born at Cambrai in 1739 of a respectable provincial family. His father was a commissary of the royal army, and had acquired some celebrity as a poet; from him young Dumoziez received his earliest instructions. His studies were con-
In 1757, and a public audience which he addressed in the Duc de Choiseul's suite, urging him to realize the cause of the Corsicans against the Genoese, and to arrange a public subscription which he had with the munition on the subject led to a violent altercation, the result of which was a lettre de cachet which forced Dumouriez to leave France. But the expedition which he had advised being afterwards resolved on, Choiseul made him an honourable public reparation, and appointed him quartermaster-general of the troops.

On his return from a pelegrinage tour in Italy, he addressed a memorial to the Duc de Choiseul, urging him to realize the cause of the Corsicans against the Genoese, and to arrange a public subscription which he had with the munition on the subject led to a violent altercation, the result of which was a lettre de cachet which forced Dumouriez to leave France. But the expedition which he had advised being afterwards resolved on, Choiseul made him an honourable public reparation, and appointed him quartermaster-general of the troops.

The political conjuncture of the times offered an unlimited scope for his fertility in diplomatic expedience, and he mingled in all the intrigues of the age. In 1770 he was sent on a secret mission to Poland with the view of neutralizing the efforts of Catherine II., and succeeded in securing fifty senators for the cause of independence, effected a unity of action among the confederates, and disciplined a militia; but, when there was some appearance of the resurrection of Poland being effected, Choiseul lost his place, owing to the machinations of the Duc d'Aiguillon and Madame Du Barry, and Dumouriez was recalled to Paris. He was soon, however, sent back on a similar mission by D'Aiguillon. He endeavoured to assist the revolutionary party in Sweden, and to raise troops in the Hanover towns to menace Stockholm, but this was contrary to the views of the French cabinet, and the Duc d'Aiguillon, having discovered his project, had him arrested and imprisoned in the Bastille for six months. He was afterwards sent to the castle of Caen, from which he was not released until the accession of Louis XVI.

Dumouriez had naturally little inclination to resume the connection with foreign politics which had proved so dangerous, and he accordingly devoted his attention to the internal economy of his own country. He wrote a memoir on the great importance that might be given to the harbour of Chellesburg, one result of which was that he was appointed governor of the place in 1778.

In 1788 Dumouriez was promoted to the rank of major-general. When the revolutionary movement began he pronounced in favour of political reform without breaking with the court. The connections which he held with the leading men of the Girondists greatly advanced his political career. At the opening of the second legislative assembly he was appointed minister for foreign affairs in place of Tollesart, but he held the position for only three months. During his short tenure of office he exerted himself to the utmost in reforming abuses, and in introducing the greatest economy into every department. He held for one month the office of minister of war after the dismissal of his colleagues Poland, Servan, and Chaillot. At length his own resignation followed, which increased his popularity. When the troops of the coalition advanced against France, he was appointed to the command of the army of the north as lieutenant-general under Marshal Lorrain. He made a determined stand against the advance of the Allies, which was decisively checked by the defeat inflicted on them at Valmy on the 20th September 1792. This was followed by a campaign in the Austrian Netherlands, in which Dumouriez was uniformly successful, until he was singularly defeated by Coburg in the battle of Novaeham in January 1793. The execution of Louis had estranged him from the republican party, and, when im consequence of his defeat he was recalled by the Convention and threatened with a charge of treason, he sought refuge in the camp of the Austrians, accompanied by the Duc de Chartres (afterwards Louis Philippe) and his brother.

Lost without hope of return to his native country, Dumouriez wandered a long time an exile in Brussel, England, Switzerland, Germany, Denmark, and St Petersburg. At last in 1804 he took up his permanent residence in England, where the Government conferred on him a pension of £1200 a year. In 1814 and 1815 he endeavoured to procure from Louis XVIII the baton of a maréchal of France, but was refused. He died at Torrville Park, near Henley-on-Thames, on the 14th March 1823. His memoirs, written by himself, were published at Hamburg in 1794. An enlarged edition, under the title La Vie et les Mémoires du General Dumouriez, appeared at Paris in 1822. Dumouriez was also the author of a large number of political pamphlets.

DUNAUBURG, a town of European Russia, at the head of a district in the government of Vitebsk, for the most part on the right bank of the Dvina, 12 miles south-east of Riga, in 55° 55' N lat. and 21° 29' E long., and consists of four portions—the main-town of fortress, the old suburb, the new suburb, and on the left bank of the river the village of Grove. The fortress is of the first class, and forms the most important point in the line of defences of the Dvina, the floating harbour across the river is protected by a splendid tête-de-pont. Among the public buildings are five churches, a Roman Catholic chapel, a Jewish synagogue, a gymnasion, and a theatre, and among the industrial establishments several tanneries and breweries, a saw-mill, a flour-mill, brick and tile works, and foundries. Its position on the railway between Warsaw and St. Petersburg, and its double means of communication with Riga, render the town an important commercial centre, especially for the trade in hemp, tallow, and red timber. There are weekly markets and two large annual fairs. The 23,674 inhabitants registered in 1801, 7501 were Jews, 3994 Roman Catholics, and 690 Protestants. In 1873 the total population was 29,613.

Dunbar, or Dunbar and corporate burgh and seaport of Scotland, is the county town of Haddingtonshire, situated on an eminence near the mouth of the Firth of Forth, 29 miles ENE. of Edinburgh by the North British Railway. The ruins of the castle, the remains of the Grey Friars' monastery founded in 1218, and a mansion house of the Lauderslie family, are the principal objects of historical interest. The parish church is a fine building of red sandstone, with a tower about 107 feet in height, which forms a well-known landmark to seamen, it dates only from 1819, but occupies the site of what was probably the first collegiate church established in Scotland, and stands on the site of the large marble monument of Sir George Home, created by the 3rd and 4th earls of Dunbar and March by James VI. in 1605. The town-hall, the assembly rooms, the public schools, the
mechanic's institute and subscription library, and the benevolent institutions require no special notice. The principal source of wealth is the herring fishing, which forms an extensive curving trade; but ship-building is also carried on, and there are several iron foundries, breweries, and distilleries, as well as a large paper-mill in the vicinity. The harbour, formerly small and shallow, has been greatly enlarged and improved in the course of the present century, at the joint expense of the town and the Fishery Board; but the entrance is rendered somewhat dangerous by the number of craggy islets and sunken rocks. Dunbar unites with Haddington, Jedburgh, Lauder, and North Berwick in returning a member to Parliament. In 1875–6 the value of real property was £11,593. Population in 1871, 3,520.

The castle of Dunbar, mentioned as early as 856, from the strength of its position became of great importance as a bulwark against English invasion, and a town grew up under its protection, which was created a royal burgh by David II. It was captured by Edward I, who defeated the forces of Balliol in the neighbourhood of the town in 1296, it afforded shelter to Edward II. en route from Bannockburn, and it was besieged in 1357 by the English under Montague earl of Salisbury, but was successfully defended by Black Agnes of Dunbar, countess of March and a member of the Douglas family. In the 15th century it was used as her usual residence by Joanna Beaufort, the widow of James I. of Scotland; and in the 16th it served on several occasions as a retreat for the unfortunate Queen Mary. An Act of Parliament had been passed in 1488 ordering the demolition of the castle, but it was reserved for the Regent Murray to effect its destruction in 1547. A battle popularly known as the “race of Dunbar” was fought in 1550 between Cromwell and Leslie, and resulted in the total rout of the Scotch.

DUNBAR, WILLIAM, one of the most distinguished of the early poets of Scotland, is supposed to have been born about 1460. Comparatively little is known about his personal history, but, from an allusion in one of his poems, he seems to have been a native of Lothian.1 In his fifteenth or sixteenth year he was sent to the university of St Andrews, where he received the degree of B.A. in 1477, and that of M.A. in 1479.

Of the events of his life for nearly twenty years after this we possess little information. He mentions, however, in his poems that he had been employed as a preaching friar of the order of St Francis, and as much had made good cheer in every flourishing town in England had ascended the pestilence at Dartmouth and Canterbury, and had crossed the sea at Dover, and instructed the inhabitants of Picardy. He also mentions that this mode of life compelled him to have recourse to many a pious fraud, from whose guilt no holy water could clear him. After this he appears to have entered the service of James IV, by whom he was sent on numerous embassies to foreign princes.2 In 1481 he was residing at Paris, most likely in connection with the Scottish embassy there. The knowledge of the Continent he thus obtained must have had considerable influence in imparting greater strength and energy to his poetical conceptions.

In the year 1500 Dunbar obtained from the king a yearly pension of £10, until he should be promoted to one of greater value. In 1501 he went to England with the ambassadors sent to conclude the negotiations for the marriage of the young King James with the Princess Margaret, daughter of Henry VII. During the festivities on this occasion Dunbar was styled “the Rhymer of Scotland,” and received from Henry a present of £6, 13s. 4d. in December, and a similar sum in January of the subsequent year. On his return to Edinburgh a sum of £2 was paid to him in addition to his salary. In honour of this marriage Dunbar composed his well known poem, The Tristram and the Rose, another in honour of the city of London, and several others in which he described the personal attractions of the young queen. After this he lived much at court writing poems, although at the same time he hoped to obtain preferment in the church.

In 1504 he first performed mass before the king, whose offering on that occasion was £4, 18s., a larger sum than that usually paid for the performance of a priest’s first mass. In 1507 his pension was augmented to £20, and three years afterwards it was raised to £80, to be paid during his life, or until he should be promoted to a benefice of £100 or more. In 1511 he seems to have been in the train of Queen Margaret when she visited the northern part of Scotland, as one of his poems, descriptive of her reception at Aberdeen, is evidently written by an eye-witness.

After the disaster of Flodden, in 1513, Dunbar’s fortunes seem to have changed, and no further mention of him occurs as receiving pension. That he may have obtained church preferment is quite possible, but the probability is that the early death of the king, and the unfortunate queen and the little influence she had after her marriage with the earl of Angus, may have led to neglect of Dunbar in his old age. His poems contain many allusions to the unequal division of the world’s goods. He was alive in 1517, as in that year he wrote a poem on the occasion of the Regent Albany passing into France, in which he laments the distracted state of public affairs in Scotland.3 He is supposed to have died about the year 1520, when he had attained his sixtieth year.

The poems of Dunbar, “the dairling of the Scottish muse,” are about a hundred in number, for the most part of no great length. The Tristram and the Rose, written, as before remarked, on the occasion of the marriage of James IV, is an allegory in which he describes the amity between England and Scotland in consequence of that event. The Golden Targe is a moral poem of great power of imagery, in which the ascendancy of love over reason is shown to be general—the golden shield of reason being insufficient to ward off the shafts of Cupid. The Two Mariy Wemen and the Wedo, a tale in which the poet overthrows three females relating their experiences of married life, is an imitation of Chaucer’s Wife of Bath. The Fresta of Berowe, a tale, is in the Chaucerian style. The Flying of Dunbar and Kennedy is perhaps the most obscure of his poems, though it seems to have been very popular, and frequently imitated in the 16th century. Several of his smaller poems show a quick appreciation of peculiarities of character, but some of them—such as the tournament, or Justis betwixt the Taulejour and Sowter—though ludicrous, are very coarse.

In one called Of a Dance in the Queenes Chamer, he describes himself as one of the performers:

Thain cam in Dunbar the makkur, On all the furth thair was none frakkar, And thair he dastit the dyrre dancun, He heppet lyk a pille wantoun For laff of Mungraife, men tellis me, He truppet quhilke blythe ; A munter dance myght na man see.

Another Dance, that of the Sever Dedicie Syna—In which Mahoun, prince of devils, is described as holding a carnival with Pride, Ira, Envy, Covetousness, Idleness, Treachery, Gluttony, each with a train of followers, while a company of fiends stand by enjoying the sport, encouraging...
the performers with various hot applications—is an extravagant a piece as can well be conceived. In contrast, however, he wrote several poems of a religious character, e.g., Off the Nativity of Christ; Off the Passion of Christ, Off the Resurrection of Christ; and The Maner of Pasying to Confessions, &c.

More fortunate than Douglas and some of the earlier Scottish poets, Dunbar had the satisfaction of seeing his principal work in print The Tractat and the Boe, The Golden Trump, The Flying with Kennedy, and the ballad of Lord Bernard Stewart were printed by Chepman and Myllar in 1568, and are the finest collections of stygic verse extant from the Scottish press.

Several of his poems were preserved in the Alonzo MS. written in 1575, the Ramayntye MS. 1568 preserved in the Advocates' library, the Mruttland MS on the Papyrus Library, and the Rossepath MS. in the University Library, Cambridge. Of these detached poems some appeared in collections edited by Allan Ramsay, John Pentland, and Lord Hailes, in the course of the century. Such isolated works as A Lament for the Destruction of Allan, its People and the R'8 were preserved at the Advocates' library, the Mruttland MS. in the Papyrus Library, and the Rossepath MS. in the University Library, Cambridge. Of these detached poems some appeared in collections edited by Allan Ramsay, John Pentland, and Lord Hailes, in the course of the century.

In consequence of the wide-spread mutiny in the British fleet, he had been left with only the "Adaman," 50, besides his own ship the "Venerable," 74, Admiral Duncan proceeded to his usual station off the Texel, where lay at anchor the Dutch squadron of fifteen sail of the line under the command of Vice-Admiral De Winter. From time to time he caused signals to be made, as if to the main body of a fleet in the offing, a stratagem which probably was the cause of his freedom from molestation until, in the middle of June, reinforcements arrived from England. On October 3 the admiral put into Yarmouth Roads to refit and victual his ships, but, receiving information early on the 9th that the enemy was at sea, he immediately hoisted the signal for giving him chase. On the morning of the 11th De Winter's fleet, consisting of four seventy-fours, seven sixty-fours, four fifty-gun ships, two forty-four-gun frigates and two of thirty-two guns, besides smaller vessels, was sighted lying about nine miles from shore, between the villages of Egmont and Camperdown. The British fleet numbered seven seventy-fours, seven sixty-fours, two fifties, two frigates, with a schoon and several cutters, and was slightly superior in force to that of the Dutch. Shortly after mid-day the British ships, without waiting to form in order, broke through the Dutch line, and an engagement commenced which, after heavy loss on both sides, resulted in the taking by the British of eleven of the enemy's vessels. When the action ceased the ships were in nine fathoms water, within five miles of a lee shore, and there was every sign of an approaching gale. So battered were the prizes that it was found impossible to fit them for future service, and one of them, the "Delt," sank on her lane. In recognition of this victory, Admiral Duncan was, on October 21, created Lord Viscout Duncan of Camperdown, and baron of Dunbar, with an annual pension of £2000 to himself and the two next heirs to his title. In 1600 Lord Duncan withdrew from naval service. He died August 4, 1601.

DUNBAR, THOMAS (1807-1845), a distinguished Scottish portrait and historical painter, was born at Kinclaven, in Perthshire, May 24, 1807. He was educated at the Perth Academy, and afterwards began the study of art, which, however, he speedily abandoned for the more congenial pursuit of art. Commencing his new career under the instruction of Sir William Allan, he early attained distinction as a delineator of the human figure, and his first pictures established his fame so completely, that at a very early age he was appointed professor of oil painting, and afterwards of drawing, in the Trustees' Academy of Edinburgh. In 1840 he produced one of his finest pieces, Prince Charles Edward and the Highlanders entering Edin-

"Valiant," was Commodore Keppel's flagship in the expedition against Belissane in that year, and also in 1762, when it took an important part in the capture of Havana. In 1778, on the recommencement of war with France, Captain Duncan was appointed to the "Suffolk," whence before the close of the year he removed to the "Monarch," one of the Channel Fleet. On January 16, 1780, in an action off Cape St Vincent, between a Spanish squadron under Don Juan de Langara and the British fleet under Sir George Rodney, Captain Duncan in the "Monarch" was the first to engage the enemy, and in 1782, as captain of the "Blenheim," he took part in Lord Howe's relief of Gibraltar. From the rank of rear-admiral of the blue, received in 1789, he was gradually promoted until, in 1799, he became admiral of the white. In February 1795 he hoisted his flag as commander-in-chief of the North-Sea fleet, appointed to harass the Batavian navy. Towards the end of May 1797, though, in consequence of the wide-spread mutiny in the British fleet, he had been left with only the "Adaman," 50, besides his own ship the "Venerable," 74, Admiral Duncan proceeded to his usual station off the Texel, where lay at anchor the Dutch squadron of fifteen sail of the line under the command of Vice-Admiral De Winter. From time to time he caused signals to be made, as if to the main body of a fleet in the offing, a stratagem which probably was the cause of his freedom from molestation until, in the middle of June, reinforcements arrived from England. On October 3 the admiral put into Yarmouth Roads to refit and victual his ships, but, receiving information early on the 9th that the enemy was at sea, he immediately hoisted the signal for giving him chase. On the morning of the 11th De Winter's fleet, consisting of four seventy-fours, seven sixty-fours, two fifties, two frigates, with a schoon and several cutters, and was slightly superior in force to that of the Dutch. Shortly after mid-day the British ships, without waiting to form in order, broke through the Dutch line, and an engagement commenced which, after heavy loss on both sides, resulted in the taking by the British of eleven of the enemy's vessels. When the action ceased the ships were in nine fathoms water, within five miles of a lee shore, and there was every sign of an approaching gale. So battered were the prizes that it was found impossible to fit them for future service, and one of them, the "Delt," sank on her lane. In recognition of this victory, Admiral Duncan was, on October 21, created Lord Viscout Duncan of Camperdown, and baron of Dunbar, with an annual pension of £2000 to himself and the two next heirs to his title. In 1600 Lord Duncan withdrew from naval service. He died August 4, 1601.

DUNBAR, Thomas (1807-1845), a distinguished Scottish portrait and historical painter, was born at Kinclaven, in Perthshire, May 24, 1807. He was educated at the Perth Academy, and afterwards began the study of art, which, however, he speedily abandoned for the more congenial pursuit of art. Commencing his new career under the instruction of Sir William Allan, he early attained distinction as a delineator of the human figure, and his first pictures established his fame so completely, that at a very early age he was appointed professor of oil painting, and afterwards of drawing, in the Trustees' Academy of Edinburgh. In 1840 he produced one of his finest pieces, Prince Charles Edward and the Highlanders entering Edin-
burgh after the Battle of Prestonpans. This painting secured his election as an associate of the Royal Academy in 1843. It was, however, his less famous picture of Charles Edward asleep after Culloden, protected by Flora Macdonald, which, like many other of his pieces, has been often engraved. In 1844 appeared his Cupid and his Martyrdom of John Brown of Priesthill, the last effort of his pen with the exception of a portrait of himself, now in the National Gallery in Edinburgh. He particularly excelled in his portraits of ladies and children. He died at Edinburgh, May 25, 1845.

DUNDALE, a parliamentary borough, seaport, and market-town of Ireland, county Louth, on the south bank of the Castledown river, now its mouth in Dundalk Bay, 50 miles north of Dublin. It consists of one long street intersected by several shorter ones. The parish church is an old and spacious edifice with a curious wooden steeple covered with copper, and the Roman Catholic chapel is a handsome building in the style of King's College Chapel, Cambridge. The other public buildings that may be noted are the Exchange Buildings (containing the town hall and a free library), the county court house and prison, the union workhouse and infirmary, and the cavalry barracks. There are several educational establishments in the town. The municipal government is in the hands of town commissioners, and the port is under the control of harbour commissioners. The county assizes are held in the town, as well as quarter and petty sessions; and it returns one member to Parliament. A brisk trade, chiefly in agricultural and dairy produce, is carried on, and the town contains some manufactories. Distilling and brewing are the principal industrial works, and there are besides a flax and jute spinning mill, salt works, &c. The port and harbour of Dundalk have recently been undergoing extensive improvements. The course of the river has been straightened, and the bar and harbour deepened, so that vessels of considerable draught can come up to the town. In the reign of Edward II. Dundalk was a royal city, and Edward Bruce proclaimed himself king there in 1315. Population in 1851, 9995; and in 1871, 11,377. Area, 1386 acres.

DUNDAS, Henry. See MELVILLE, VISOUNT.

DUNDEE, a royal and parliamentary burgh and seaport, is situated on the east coast of Scotland, in the county of Forfar, on the north bank of the Firth of Tay, twelve miles from the confines of that estuary with the German Ocean. It is the third town in Scotland as regards population, and the second in commercial importance. Its latitude is 56° 27' N., its longitude 2° 58' W.; it is distant from Edinburgh 42 miles N.N.E., from Perth 22 miles E., and from Forfar, the county-town, 14 miles S. It extends nearly three miles along the shores of the Tay, and varies in breadth from half a mile to a mile, and the ground gradually rises towards the hill of Balmag and Dundee Law, the summit of the latter being 533 feet above the sea-level. Its general appearance is pleasing and picturesque, and the surrounding scenery very beautiful.

Dundee is the chief seat of the linen manufacture in Scotland, and from a very early time appears to have had a special reputation in this branch of industry. Hector Boece, a native of the town, in his History and Chronicles of Scotland, thus quaintly refers to it: "Dunde, the town quhair we wer born; quhair mony virtuus and laubourous peppt ar in, making of clath." It was not, however, till the introduction of steam power, in the beginning of the present century, that there was any remarkable development in the flax-spinning in Dundee. The first woollen mill importance was the Bell Mill (which is still extant), built in 1806; and the first power-loom factory was erected in 1836. Side by side with the extension of the linen trade has been that of jute spinning and weaving. Large surges of this material are imported into Dundee direct from India, and it is manipulated on an enormous scale. In fact, the manufacture of flax, hemp, and jute fabrics constitutes the staple trade of the town, and supports, directly or indirectly, the great bulk of the inhabitants. There are upwards of seventy steam spinning-mills and power-loom factories, employing above 50,000 persons.

Some of these buildings are of great size and considerable architectural elegance, those of Messrs Baxter, Messrs Cox, and Messrs Gilroy being especially conspicuous. These three afford employment to above 12,000 hands. The principal textile productions are calabogs, doyles, canvas, sheetings, bagging, jute carpeting, &c.; and the total value of these fabrics annually produced has been estimated at upwards of £7,000,000. Among the other industries of Dundee may be mentioned ship-building, engineering, tanning, and leather manufactures (including shoemaking by machinery); all of which are conducted on a large scale. There are also considerable foundries, breweries, corn and flour mills, and confectionery and fruit-preserving works—Messrs Keiller & Son's "Dundee marmalade" having a most extensive reputation. The prosperity of Dundee is in a large measure due to its commodious harbour and its magnificent docks. The harbour works extend about two miles along the river side, and the docks, five in number, cover an area of 33 acres. Although they cannot compare in extent with those of London or Liverpool, they are probably unsurpassed in the kingdom for stability and convenience. They have cost, from 1813, when the works were begun, to May 1877, £480,000; and the harbour revenue amounted in 1876 to £50,751. The principal imports for year ending May 1876 were

Plan of Dundee.
and Godwill, magnificent structure to Schools, the Convalescent Hospital and hall, Asylum building by beque'lt and Town·House, Tile designed there were built at Dundee, the .. Young Men's Association buildings; of 8 H'g'l believed, in 1864, has appeared, the plague to the last 1,186, has been elected, at the ... the site of the last century, or even later, many of the streets were narrow and irregular, and many of the buildings unhealthy and unlighty, but of late a great change for the better has taken place. Under the Improvement Act of 1871, the narrow gorge of the Murraygate has been swept away, the ugly and continual Bucklemaner Wynd has been transformed into the spacious Victoria Road, with the Victoria Bridge at its upper end, and a dense and dingy mass of buildings between Meadowside and Seagate has been replaced by Commercial Street, which, when completed, will be one of the finest wide thoroughfares in Britain. Many improvements still remain to be accomplished, and although the total cost will probably amount to £1,000,000, it is expected that there will be ultimately a profit on the street improvements. By the aid of local building societies a large number of working men's houses have recently been erected, and a double line of tramways has been laid from the post-office to the west end of the town.

Dundee is well supplied with recreation grounds. The Baxter Park, 55 acres in extent, designed by Sir Joseph Paxton, was presented by Sir David Baxter to the community in 1853, the pavilion contains a marble statue of the donor by Sir John Steell, erected by public subscription. The Baldy Park, a picturesque wooded hill commanding fine prospects on every side, was secured by the police commissioners and opened to the public in 1871. Besides these there are the Magdalen Green, the Barrack Park, the Bleaching Green, and Dundee Law. A magnificent promenade along the river side between Magdalen Point and the Craig Pier has lately been opened. It is called the Esplanade, and includes a space of 84 acres, which when filled up will give ample station and traffic accommodation for the Caledonian and North British railways, and leave the public a clear carriage-way and foot-path by the river side. The expense of the undertaking (about £40,000) is borne in nearly equal proportions by the two railway companies and the Harbour Trust, but although the market have recently been constructed by the police commissioners at the east end of the town Dundee has regular and frequent steam-boat traffic with London, Hull, Newcastle, Liverpool, Leith, and Rotterdam. To render communications with the south more direct, the North British Railway Company designed the Tay Bridge, a colossal work, completed in 1877 (see Bridges, vol. iv p. 340).

The water supply of Dundee is copious and excellent. Thirty years ago works were established at Monekie, but in 1876 the quantity (about 21 million gallons per day) proved insufficient, while the quality deteriorated. The loch of Lutranthal, 20 miles distant, with necessary grounds, was accordingly purchased for £53,310. The surface of the loch, originally 180 acres, has been raised 20 feet, and is now 405 acres in extent, the storage capacity is 257,000,000 cubic feet, the drainage area, 19,000 acres. The main pipe from Lutranthal, 27 inches in diameter, transmitting 8 million gallons per day, conveys the water to Clatto reservoir, four miles from the town, which has an area of 21 acres, and holds 80 million gallons; two pipes from Clatto lead to the service reservoirs. The total cost of the works exceeded £300,000.
Dundee possesses a large number of benevolent institutions, as well as "mortifications" (dating from 1656 downwards) for educational purposes. Among eminent men who were natives of Dundee may be named Hector Boscawen or Bostunus, historian, born about 1645; John and Robert Wedderburn, authors or collectors of the book of Gude and Godlie Ballate published 1578; Sir George MacKenzie, the celebrated lawyer, born in 1636; Bearse, a Relation, author of The Afflicted Man's Companion, born 1680; Viscount Duncan of Camperdown, born 1731; James Ivory, an eminent mathematician, born 1674; and Dr Dick, author of The Christian Philosopher, born 1774. The father of Thomas Hood, author of The Song of the Shirt, was a native of the town, and Hood's first literary production appeared in the Dundee Advertiser, about 1816. Robert Nicoll, "Scotland's second Burns," at one time kept a circulating library in Castle Street, and William Thom, the Inverary poet, rests in the Western Cemetery, where a monument was erected by public subscription over his grave.

**Statutes**—The terrible havoc resulting from the siege of 1651 greatly checked the progress of Dundee, but the following century witnessed the beginning of that rapid and healthy growth which of late has so much attracted attention. The following figures show how the population at successive periods of 30 years since 1655.

In 1875 the burgh numbered 55,971, deaths 3976, marriages 2222. The birth-rate was 37 and the death-rate 22 per 1000. The rainfall in Dundee for 1876 was 45 inches, which is considerably above the average, in fact, the highest of any recorded except 1872, when it was 43 70. The number of "wet days" in 1876 was 230, being 90 above the average. The prevailing winds are westerly.

Preceding 1833, Dundee was grouped with Forfar, Perth, Cupar, and St Andrews in returning a member to Parliament; the Reform Act gave it the privilege of a member for itself, and the Act of 1868 added another. Ffor purely municipal purposes the town is divided into nine wards, the third of which includes the populous and thriving suburb of Lochee. The town council is composed of the provost, dean of guild, 6 bailies, and 30 councillors. It also possesses a corporation capable of carrying on all the public business of the town.

In 1855 the ratespayets orally adopted the Free Libraries Act, and advantage has been largely taken of the privileges thus afforded. The library premises are centrally situated in Albert Square, and include a lending library, reference library, museum, and picture gallery, admission being free. In the lending library there are 25,000 volumes, in the reference library 4500. A fine arts exhibition is occasionally held within the free library buildings, and an Art Union for Dundee has just been sanctioned by the Board of Trade.

There are 78 places of worship in the town, which may be classified as follows:—In connection with the Established Church, 16; Free Church, 50; U.P. Church, 5; Congregationalist, 6; Episcopal, 6, Roman Catholic, 4; Baptist, 8; other denominations, 13.

Lochee, a suburb of Dundee, forming part of the munipality, is situated about two miles to the north by the Comar-Angus roads. Till within recent years only a small country village, it has now a population of 18,000. It contains several flax and jute factories, —of far longer and most comprehensive in the whole district, being the Camperdown Linen Works, belonging to Messrs Cox Brothers and Co. They cover an area of 25 acres, and employ upwards of 300 persons. The most striking external feature, and one of the prominent landmarks in the district, is the stately chimney-stack (283 feet high) in the style of the Italian campaniles, built of polychromed bricks, with gable ormes. Broughty Ferry, three miles distant, towards the mouth of the Firth of Tay, may also be considered as a suburb of Dundee. The town is entered by the ferry, built in 1804, and refers to the castle or fortress, which is mentioned repeatedly during the

**Dundee, John Graham of Claverhouse, Viscount (1643-1689), born in or about the year 1643, was the eldest son of Sir William Graham and Lady Jean Carnegie. Of his youth little record has been kept, but in the year 1659 he appeared in St Andrews as a student of St Leonard's College. His education was upon the whole good, as appears from the varied and valuable correspondence of his later years. Young Graham was destined for a military career; and, having remained in St Andrews for about four years, he proceeded abroad as a volunteer in the service of France. Thereafter, in 1674, he went to Holland, and obtained the post of cornet in one of the cavalry regiments of William, prince of Orange. In 1674 he was raised to the rank of captain, as a reward for having rescued the prince from a marshall where his horse had foundered during a retreat. Shortly afterwards, William having at his disposal the command of the regular regiments in Holland, Graham made application for the post. He was not appointed, and resigned his commission. In the beginning of 1677 he returned to England, bearing, it is said, letters of strong recommendation from William to Charles II, and the Duke of York. Early in 1678 he accepted a lieutenantcy in a troop of horse under the command of his relative the Marquis of Monrose. Promotion immediately followed. He was ex-
presumably nominated by Charles II to the command of one of the newly raised troops of cavalry. From the time, indeed, of his return to Scotland he assumed an influential position. His prestige as a soldier, his uncompromising disposition, and his unswerving fidelity, at once marked him out as a leader upon whom Government could rely. In the end of the year he was despatched with his troops to Galloway to suppress the disorders which prevailed in the district. He had a difficult and unpopular task,—that of carrying out the policy of Lauderdale in the most disaffected part of Scotland. The Act of 1670, imposing the punishment of death and confiscation of goods, was still in operation, and the Covenanters had for years before Graham's return to Scotland propounded the theory that opposition to the Government and the actual slaughter of the king were not only just, but a religious duty. Opposition to Lauderdale's measures, however, was winked at by the duke of Hamilton, and the recent authorized inroad of the Highlanders had widened the area of dissatisfaction. It is not wonderful that the success of Graham in his mission was small. He entered, however, upon his occupation with zeal, and interpreted consistently the orders he received. There is evidence, also, that his efforts were appreciated at headquarters, in his appointment, jointly with the lord of Earls­hall, to the office of sheriff-depute of Dumfrieshire in March 1679, with powers—specially narrated in his commission—of "separating," conventicles, "disorderly baptisms and marriages," and the like.

For some years thereafter the position of Graham was perhaps as difficult and delicate as one man was ever called upon to occupy. In the midst of enemies, and in virtue of the most erroneous but direct orders of his Government, he combined the functions of soldier, spy, prosecutor, and judge. Shortly after the murder of Archbishop Sharp, on 5th May 1679, he was summoned to increased activity. There were reports of an intended gathering in the neighbourhood of Glasgow, and at the head of his dragoons Graham went in pursuit of the rebels. On Sunday the 1st of June, the Covenanters having removed from Loudon Hill to a well-protected position upon the marshy ground of the farm of Drumcllog, Graham, who had gone in search of them, advanced. Hindered from the attack by the nature of the ground, he had to wait till the impiety of his adversaries, who were under better leadership than they ever afterwards enjoyed, induced them to commence an impetuous attack. Headed by the youthful Clelland, the Covenanters charged the cavalry, who in a little turned and fled. The loss of the victors was but three men, while thirty-six dragoons were killed, Graham himself having a narrow escape. This was the only regular engagement he had with the Covenanters. Small as it was, the result raised an enthusiasm in the bosoms of the victors, and was the beginning of an actual rebellion.

On the 22d June Graham was present at the battle of Bothwell Bridge, at the head of his own troop immediately thereafter he was commanded to search the south-western shires for those who had taken part in the unsuccessful rising. In this duty he seems to have been engaged till the early part of 1680, when he disappears for a time from the record of these stringent measures. His powers during these months were of the most sweeping description, and it appears that his ample commission was most liberally used. The gravest accusations against him in reference to this period is that he was a robber.

Graham had for some time been recognized as an adherent of the party who were adverse to measures of lenency and conciliation. During these months he was accordingly despatched to London, along with Lord Linlithgow to influence the mind of Charles II against the indulgent method adopted by Monmouth with the extreme Covenanting party. It is perhaps not to his credit that he succeeded in the object of his mission. He was then in the prime of life, was commandingly handsome in appearance, a lover of sport, and a devoted royalist. Charles seems to have been fascinated by his loyal supporter, and from that moment Graham was destined to rise in rank and honours. On the 21st of April 1660 he obtained a royal grant of the barony of the outlawed Macdowall of Freugh, and the grant was confirmed by subsequent orders upon the Exchequer in Scotland. In April 1660 it appears that his roving commission had been withdrawn by the Privy Council. He is thus free from all concern with the severe measures which followed the Sanquier Declaration of 22d June 1659.

The turbulence occasioned by the passing of the Test Act of 1661 required to be quelled by a strong hand, and in the beginning of the following year Graham was again commissioned to act in the disaffected districts. In the end of January he was appointed to the sheriffs of Wigtown, Dumfries, Kirkcudbright, and Annandale. He was besides acting captain of a troop of dragoons—the pernicious combination of his offices being thus repeated. He appears further to have had powers of life and death in virtue of a commission of justiciary granted to him about the same time. In his dispatches there are indications that he disapproved of a system of indiscriminate punishment, and desired that severe vengeance should only be executed upon ring-leaders and men of rank. Thus, however, applied solely to the harshest measures then known to the law, those of torture and death. Where these were involved, he preferred, after hunting out and seizing his prisoners, to send them to Edinburgh for trial. But within these limits his methods of procedure in the large districts over which he had control were uncompromising, and, if we suppose him to have had sympathy with his orders, most cruel. He quartered on the rebels, ruled their houses, and, to use his own words, "endeavoured to destroy them by eating up their provisions." The effect of his policy, if we believe his own writ, is not overstated as

"Death, desolation, ruin, and decay."

The result of a bitter quarrel with Sir John Dalrymple confirmed the prestige of Graham, who was not only acquit­ted by the verdict of the Privy Council of the grave charges of exaction and oppression preferred against him, but had the satisfaction of seeing Sir John condemned to fine and imprisonment for interference with his proceedings. On 25th December 1662 he was appointed colonel of a new regiment raised in Scotland, and captain of its leading troop. He had still greater honours in view, and in March 1663 he started for Newmarket to demand an audience of the king. In the preceding January the case of the earl of Lauderdale, late Master of Hatton, which involved the question of his malversations with regard to the Scottish mint, was debated in the House of Lords. Master of Hatton was proprietor of the lands and lordship of Dundee and Duddingston, and the decree of the Lords against him was in March 1663 issued for the sum of £73,000. Graham succeeded in having the property of the defaulter transferred to him by royal grant, and in May the additional honour was conferred upon him of nomination to the Privy Council of Scotland.

Shortly afterwards Claverhouse was appointed to be present at the sittings of the recently instituted Circuit Court of Justiciary in Stirling, Glasgow, Dumfries, and Jedburgh. The notable objects of the court were the impeachment and the punishment of rebels. Several were sentenced to death. During the rest of the year he attended the meetings of council. As a statesman he was
incapable of rising to an independent view of affairs, and was unable to overcome his dutiful obedience to superior orders. Although he had had experience of the most disaffected portions of the country, there is but one record of his having interfered to prevent the accustomed irritating measures. He decided declaratively against the proposal to let loose the Highland murderers upon the south of Scotland.

In June 1684 he was again at his old employment—the inspection of the southern shires; and in August, after the ambuscade of Enterkine-hill, he was commissioned as second in command of the forces in Ayr and Clydesdale to search out the rebels and report to head-quarters. By this time he was in possession of Dundie, having on the 10th of June married Lady Jean, daughter of Lord Cochrane. As constable of Dundee it is recorded to his honour that he recommended to the Privy Council the remission of extreme punishment in the case of many petty offences. He resumed from his retirement to take part in a commission of lieutenancy which perambulated as a criminal court the southern districts, and in the end of the year he was again in the same region on the occasion of the disturbances in the town of Kirkcudbright.

Shortly after the death of Charles II. (6th February 1665), Graham, through the jealous efforts of Queensberry, incurred a temporary disgrace by his deposition from the office of privy councillor; but in May he was reinstated, although it is to be observed that his commission of justiciary which had expired was not renewed.

In May 1685 he was ordered with his cavalry to guard the borders, and to scour the south-west in search of rebels. By Act of Privy Council, a certificate was required by all persons over sixteen years of age to free them from the hazard of attack from Government officers. Without that they were at once liable to be called upon oath to abjure the declaration of Renwick, which was alleged to be treasonable. While on this mission he pursued and overtook two men, John Brown and a nephew whom he called John Brownie. Brown, having refused the abjuration oath, was shot dead. The order was within the authorized power of Graham.

Until 1688 there is little more of note in his career. In 1686 he was promoted to the rank of major-general, and advanced to his position of insuperable dignity of provost of Dundee. He appears, however, in the Privy Council in 1688 opposing the proposal that Lieutenant-General Douglas should have command of the whole army which had been ordered to England to aid the failing dynasty.

A week or two after his departure with the army his fascinating influence made itself felt upon James II., and amid the hurry of events he was created viscount of Dundee on 12th November 1688. From York he went to Salisbury, where he advised James to steer more steady measures than the feeble-hearted monarch had the courage to adopt. Throughout the vexed journeyings of the king, Dundee is found accompanying or following him, endeavouring in vain to prompt him to make his stand in England and fight rather than flee from the invader. At last James announced his resolve, with the promise that he would send from France an appointment in favour of Dundee to command the troops in Scotland, and arrangements were entered into for communication with the voluntary exile.

Dundee returned to Scotland in anticipation of the meeting of the Convention, and at once exerted himself to increase the waning resolution of the duke of Gordon with regard to holding Edinburgh Castle for the exiled king. He had conceived the idea of forming a rival Convention at Stirling to sit in the name of James II., but the hesitancy of his associates rendered the design futile, and it was given up. Dundee, however, boldly appeared at the first meeting of Convention on 16th March 1688, and disclosed a plot which he declared he had discovered against his own life, but the matter after some inquiry was departed from.

On the 18th of March, desiring the fears of his promised allies, he left Edinburgh at the head of a company of fifty dragoons, who were strongly attached to his person. He was not long gone ere the news was brought to the alarmed Convention that he had been seen clambering up the west side of the castle rock and holding conference with the duke of Gordon. In excitement and confusion order after order was dispatched in reference to the fugitive, and the Convention sat with locked doors to prevent communication with traitors without. Dundee retired to Dundie. On the 30th of March he was publicly denounced as a traitor, and in the latter half of April attempts were made to secure him at Dundie, and the residence in Glen Ogilvy to which he had retired. But the secrecy and speed of his movements outwitted his pursuers, and he retreated to the north. His career presents strange peculiarities. It was only in 1675 that he had returned to Scotland from abroad. Yet in the short period of intervening years he had, despite the opposition of his superiors in rank, risen from the post of captain, and the social status of a small Scotch laird, to positions as a soldier and statesman and the favourite of his sovereigns, of the greatest dignity, influence, and wealth. Yet it was in that period that he committed those acts on account of which his memory is loaded with reproach. When the ruling dynasty changed, and he who had so often been commissioned to quell insurrection had himself become an outlaw and a rebel, he supported the cause of his exiled monarch with such skill and valour that his name and death are recorded as heroic.

On his march into the Highlands he commenced among the chieftains the diplomatic policy in which he excelled. General Hugh Mackay was now in the field against him, and what was simply a Highland chase began. Mackay started with a body of cavalry, marched to the north, having refused reinforcements from the untrained peasantry of Aberdeenshire, pushed the pursuit further and further to the west. Elgin, and latterly Inverness, were occupied by the Government troops. Dundee had in the meantime been scouring the country from Perth, which on the 11th of May he had plundered, to the wilds of Lochaber, to which he had latterly retired. The clans were assembled by the 28th of May, and on the 29th the castle of Ruthven, near Kingussie, was seized. The army of Dundee was now much superior in numbers to that of Mackay, and the prudent general beat a hasty retreat. Having received reinforcements, however, he again advanced northward, and in Strathdon, in the early part of June, it seemed likely that the opposing forces would meet. But the Highland warriors, laden with plunder, were returning homewards, and the army of Dundee was melting away. The outlawed leader again retired, and Mackay conceived his mission at an end. He proceeded westward, and, having garrisoned Inverness, marched to the south.

Throughout the whole of the campaign Dundee was indefatigable in his exertions with the Highland chiefs and his communications with his exiled king. To the day of his death he believed that formidable succour for his cause was about to arrive from Ireland and France. He justly considered himself at the head of the Stewart interest in Scotland, and his dispatches form a record of the little incidents of the campaign, strangely combined with a revelation of the designs of the statesman. It mattered little to him that on the 24th of July a prize of £10,000 had been placed upon his head. The clans had begun to reassemble, and he was now in command of a considerable force.

Mackay, who had visited Edinburgh to report events, re-
turned to Perth, whence, with an army now amounting to about 4000 men, he proceeded to Dunkeld on the 26th of July. While in the metropolis he had endeavoured to secure the Athole interest, and that the castle of Blair should be held for King William. But he was as usual outwitted by Dundee, who, after unsuccessful negotiations with Lord Murray, won over the Athole factor by the presentation of a commission prepared for the occasion. The castle was at once occupied, and at Dunkeld Mackay received intelligence that the design of his march was frustrated. By ten a.m. of the 27th of July 1689 he was at the entrance to the pass of Killiecrankie.

Dundee had appointed a gathering of the clans at Blair for the 29th, and on the 27th he was at the head of at least 2000 men, including a contingent from Ireland. The reports of scouts that 400 of the enemy had already threaded the pass raised the impatience of the chiefs. But it was not until he received intelligence that the whole army of Mackay had entered the defile that he gave the order to march. With caution he disposed his troops on the hills to the right of the opposing army, which, making its exit from the gully, was forming on the heights. On Mackay's right and beyond the narrow plain were undulating heights backed by Craig Culluch. On one of these Mackay was astonished to observe the movement of the troops of Dunwall To prevent the enemy from gaining an intervening eminence, he at once ordered a flank movement, and his army marched up the face of the hilllock, leaving the Garry in the rear. For several hours the two armies faced each other, Dunwall restraining the impatience of his troops, but at eight in the evening the order was given to advance. Mackay had formed his line three deep, while his opponent had arranged his men in battalions with intervals wide enough to prevent the outflanking of superior numbers. The Highlanders having discharged their firelocks threw them on the ground, and rushed impetuously on the foe. The result was instantaneous; Mackay's line was broken and driven helplessly into the gorge. Dundee, at the head of his cavalry, charged the enemy, but, confusion having arisen as to the leadership of the troop, he was not at once followed. The gallant soldier, waving on his men, was pierced beneath the breastplate by a bullet of the enemy, and fell dying from his horse. Dundee asked "how the day went," and, hearing the answer and the expression of sympathy, replied that "it was the least matter for him seeing the day went well for his master." He was conveyed to the castle of Blair, where within an hour or two of his death he was able to write a short account of the engagement in King James's own hand, in which he set down his sons as killed in battle, in which the Government forces had lost 2000 men as against 900 of the enemy, was in truth the end of the massacre. The Highland camp was broken by treachery, for the controlling and commanding genius of the rebellion was no more.

See Memorials and Letters of Graham of Cleishouse, by Mark Neyler, 1594–62, where the literature of the subject is referred to. The work itself must be read with caution (T S)

DUNDONALD, THOMAS COCHRANE, TENTH EARL OF (1775–1800), known during his brilliant naval career as Lord Cochrane, was born at Annfield, in Lanarkshire, on 11th December 1772. His father, the ninth earl, had great scientific attainments, especially in chemistry, and possessed a genius for invention which ruined his fortune without much benefiting any one. He was so poor that the education of Thomas, his eldest son and heir, was left very much to such voluntary instructors as the parish minister. At the age of seventeen Lord Cochrane joined the navy on board the "Hind," of which his uncle, afterwards Admiral Sir Alexander Cochrane, was at the time captain. His father had previously procured for him a commission in the 7th regiment, but his own preference for the other branch of the service was so decided that it was found necessary to satisfy it. In 1795 he was transferred with his uncle to the frigate "Thetis," which proceeded to the North American station. Soon afterwards he received his lieutenant's commission, and in 1798 he was sent to the Mediterranean to serve in the fleet under the command of Lord Keith. He had already begun to show that rare combination of daring and prudence which probably no British naval officer, save Nelson, ever possessed to a greater degree. As commander of the ship "Speedy," to which he was appointed in 1800, he performed a series of exploits in capturing vessels of immensely larger size than his own which are almost without parallel in the annals of naval warfare. The little "Speedy," with its miserably weak armament of four-pounders, became the terror of the Spanish coasters, and more than once she was honoured by a flag being especially detached to capture her. One of the attacks she ingeniously evaded; another she boldly met (28th February 1801), and actually succeeded in capturing her opponent, the "El Ganio," a Spanish frigate of 32 guns. Her cruise of thirteen months, during which she took upwards of fifty vessels with 122 guns and 534 prisoners, ended in her own capture by three French line of battle ships, after making so gallant a resistance that the French captain, to whom Cochrane delivered up his sword, at once returned it. After a brief imprisonment, Lord Cochrane was exchanged. The promotion to post-rank, to which he was fully entitled, came somewhat tardily in August 1801, and the persistence with which his claims had to be urged laid the foundation of the bad understanding with the authorities at the Admiralty that caused him to be lost to the British service a few years later, while he was still in his prime. Its immediate result being that he was refused further employment, he spent the period of enforced leisure (1802) at the university of Edinburgh, where he wisely endeavoured to repair the defects of his early education. The renewal of hostilities in 1803 brought him the opportunity of such distinction as was likely to be gained in the command of the "Arab," an utterly unseaworthy old collier purchased into the navy, in which he was sent to take part in the blockade of Boulogne. The annus against him in official circles was clearly shown when, on his complaining that his vessel was too small for service, he was sent to the North Sea to protect non-existent fisheries. In 1804, on the advent of Lord Mivllie to the head of the Admiralty, tardy justice was done by his appointment to the command of the new frigate "Pallas" (32), in which, after malappraisables, with which he was supplied, and ten days, he entered Plymouth harbour in charge of men with three golden candlesticks, each five feet high, at the mastheads as a sample of the spoils. Before the "Pallas" was again sent to sea her fortunate captain was returned to Parliament as member for Hoxton, partly through the influence of his fame, but still more through the influence of his prize-money. In her second cruise the "Pallas," after conveying a merchant fleet to Quebec, returned to the coast of France, where she cut out and captured several of the enemy's corvettes, and destroyed many of the signs when in August 1806 Lord Cochrane was transferred to the command of the "Imperieuse" (44), in which he was engaged in two years he did immense damage to the enemy's fleet in the Bay of Biscay and the Mediterranean. One of his most gallant exploits during this period was his defence of Port Louis, which he held for twelve days (November 1805) against overwhelming odds. When he found further resistance impossible he blew up the magazines and returned to his ship. Meanwhile, though his services were so distinguished, his relations with the Admiralty had not become more friendly. At the general election in May 1807 he had been returned.
Dundonald

triumphantly for Westminster in the Radical interest, along with Sir Francis Burdett; and during a brief interval spent at home, while he was in command of the "Impetuous," he had rendered himself still further odious as a critic in Parliament of naval abuses. In 1809, however, the authorities had occasion for a daring service which he alone was found competent and willing to undertake. It had been suggested to them that the French fleet at Basque Roads might be destroyed by means of fire ships, and the hazardous duty was intrusted to Cochrane. On the night of the 11th April he personally piloted the vessels laden with explosives to the entrance of the harbour, where they spread such terror that seven French frigates shipped their cables and ran on shore, five of them being afterwards destroyed. Unfortunately this first success was not followed up as it ought to have been. Lord Gambier, the commander of the blockading fleet, ignoring the repeated and urgent requests of Cochrane, refused to order a general attack, and thus the opportunity of destroying the whole of the enemy's ships was lost. Lord Cochrane was bitterly disappointed, and made no attempt to conceal his opinion of the incompetence of his superior, who found himself compelled to demand a court martial. The trial was worse than a mockery; the court was packed, witnesses were manipulated, and charts fabricated,—with the result that Gambier and Cochrane, by implication disgraced. There was, of course, no further professional employment for one who had been stigmatized as a false accuser.

For four critical years Lord Cochrane held no command, and his country lost the services of one of the few naval heroes she has had worthy to compare with Nelson. In 1813, however, the flotilla at Basque Roads was destroyed, and Sir Alexander Cochrane, who had sought to vindicate himself by a satisfactory explanation, led, in the estimation of Lord Cochrane, to the court was packed, witnesses that the greater the odds that had been done him, and was therefore, accepted as a welcome delverance. Lord Cochrane entered on his new duties at Rio de Janeiro in March 1822. His services to Brazil were quite important, though scarcely marked by so many brilliant episodes, as those to Chile, and they were in the end equalled by his activities in the Pacific. His daring capture of Maranham with a single frigate, in July 1823, added a province to the newly-formed empire; and the value of the accession was acknowledged by the title of marquis of Maranham being conferred.
upon the captor, along with an estate, of which, however, Lord Cochrane never obtained possession. In fact, both by Chilt and Brazil he was unjustly deprived of all substantial rewards, and his connection with the new empire which he had done so much to aid in establishing was ignominiously terminated by his dismissal from her service in 1835. He had given some provocation to this by his obstinacy in refusing to appear at a court-martial, and account for his conduct in taking the frigate under his command to England without orders. The Brazilian Government itself, however, practically admitted the gross injustice with which it had treated him by awarding him twenty years afterwards the pension that had been agreed upon in the first engagement made with him.

On his return to England Lord Cochrane found himself the object of a popularity that had grown rather than abated during his absence. His great achievements had been spoken of in the warmest terms in the House of Commons by Sir James Mackintosh, who urged the Government to restore to him his place in the service of his native land. But the time for the redress of his wrongs was not yet, and, finding injustice impossible, he gladly gave his services to the cause of Greek independence. Appointed by the National Assembly admiral of the Greek fleet, he found himself for the first and only time in his career in a position where success was impossible even for him. The want of union and discipline among the Greek troops frustrated all his plans, and an attempt to relieve the Acropolis at Athens in 1827 ended from this cause in a disastrous failure, Lord Cochrane only escaping by jumping into the sea. In 1828, after the Great Powers had secured the recognition of the independence of Greece, he returned to England.

With the accession of King William and the formation of a Liberal ministry there came at last a tardy and imperfect reparation to Lord Cochrane for the injustice he had suffered. He was restored to his rank in the navy, but with this he had to remain content. It was with bitter and indignant feelings that he found himself compelled to accept a pension under the Great Seal instead of the new title he had long and vehemently demanded. And the restoration to his rank was robbed of much of its grace by the facts that the honour of the knighthood of the Bath, of which he had also been deprived, was not restored at the same time, and that the arrears of his pay were withheld. In 1831 he succeeded his father in the earldom of Dunonald. On the 23rd November 1841 he became vice-admiral of the blue.

During the Russian war he revived secret plans which he had detailed to the prince regent nearly fifty years before for the total destruction of an enemy's fleet, and he offered to conduct in person an attack upon Sebastopol and to destroy it in a few hours without loss to the attacking force. That his intellect remained clear and vigorous to the close of his life was shown by the publication in his eighty-fourth year of his Narrative of Service to the Liberation of Greece. An autobiography, in two volumes, the second of which appeared just before his death. The literary style of both works is admirably appropriate to the subject, simple, lucid, and dashing, and the story they tell bears the stamp of heroism and adventure that has scarcely its parallel even in romance. The author's burning sense of his wrongs, and his passionate desire for a thorough vindication, reveal themselves at every turn. If he is not unnaturally blind to the fact that his own impudence and want of self-command contributed in some degree to his misfortunes, no one will now deny that this "heroic soul branded with felon's doom" suffered more cruel and undeserved wrongs than ever fell to the lot of any warrior of his genius and achievements.

Lord Dunonald died at Kensington on the 30th October 1850, and was buried in Westminster Abbey (w. n. s).

DUNEDIN, a city in New Zealand, in 43° 52' 12" S lat. and 170° 52' 37" E long., at the head of Otago harbour, an arm of the sea on the east coast of the South Island. It is the capital of the late province and present provincial district of Otago, and was founded as the chief town of the Otago settlement by settlers sent out under the auspices of the Lay Association of the Free Church of Scotland in 1848. The discovery of large quantities of gold in Otago in 1861 and the following years, and the great increase in the production of wool, have made Dunedin a very flourishing place. The city is beautifully situated in an amphitheatre of hills. The streets, nearly all paved and level, have been made at considerable expense and trouble,—some being carried through swamps and others through cuttings and embankments. The cost of permanent improvements during the last fifteen years has been about £200,000. The town is supplied with pure water, and (since 1862) with gas from works belonging to the corporation. Dunedin is the seat of a judge of the supreme court, and of a resident minister, who is a member of the Colonial Executive, and it also has a Waste Lands Board, a body constituted for the purpose of administering the public estate of the provincial district. The city contains some fine buildings, especially two handsome Presbyterian churches, constructed of white stone from Oamaru. The so-called university of Otago, now affiliated with the university of New Zealand, which alone has the power to grant degrees, possesses halls of classes, mathematics, mental and moral philosophy, as well as lectureships on botany, mineralogy, law, and modern languages. A museum (well built of concrete) contains an excellent collection of New Zealand flora and fauna, including some fine skeletons of the Dacomes. There is called the Otago Institute, a body affiliated with the New Zealand Institute. There are three good libraries—one at the supreme court, a second at the university, and a larger one at the Athenaeum—six banks, and several large mercantile houses. The people are mostly of Scotch origin, with a considerable intermixed population of immigrants from England, Ireland, the British colonies, and Germany. All classes are prosperous except among the extremely limited criminal class, poverty rarely occurs, and absolute pauperism is quite unknown.

Otago harbour, by which the city is approached from the sea, is an inlet about 18 miles long. There is about 22 feet of water on the bar at low tide. Half way up to Dunedin is Port Chalmers, a fine anchorage for the largest vessels, where, owing to the presence of precipitous hills, the land was found too limited in area for a large city. From this point the water grows shallower as it approaches Dunedin. Until lately no vessels drawing more than 10 feet could pass up, but by two years dredging the channel has been made available for steamers drawing 13 or 14 feet, and this depth is gradually being increased. The Harbour Board, which has spent about £250,000 by bonds, of which £129,400 has been raised, but £65,000 is still unexpended. The revenue of the
board is £14,500, which is rapidly increasing, as it arises from a manifold landed endowment. A large part of this money is available for works at the terminus of a line of large mail steamers running monthly to San Francisco via Auckland and Honolulu, but it is now found more convenient to use smaller steamers for the coastal section. It is, however, still the terminus of a line of five vessels running at intervals of about ten days to Melbourne, and carrying the monthly mail for Suez and England. There is also direct steam communication with Sydney and Hobart Town, and communication via Auckland with Fiji. All the coasting steamers and many sailing vessels are owned in Dunedin. In 1875, besides the San Francisco boats, 69 vessels, varying from 250 to 1000 tons, entered the port from places beyond the seas other than Australasia. The greater number of these arrive in the early part of the summer, and load with wool for London. The customs revenue collected in 1876 amounted to £92,355. The municipal debt amounts to £292,000, and the revenue (raised by rates, rents, water, and gas works, &c.) to £47,500. The population of the city in the beginning of 1877 was about 22,500, and that of the suburbs about 9000, while other towns within a circuit of a few miles bring it up to 35,000.

DUNFERMLINE, a city and royal burgh of Scotland, situated in the western district of the county of Fife, about three miles from Limekilns, the nearest point on the Firth of Forth. It is connected with Glasgow by railway via Stirling, and with Edinburgh, from which it is distant 16 miles, via Thornton and by a direct line constructed in 1877 to North Queensferry. The town is situated about 300 feet above the sea, on the brow of a slope which ascends from the Forth, and it accordingly commands a very extensive view of the country towards the south. It is intersected from north to south by a deep ravine, at the bottom of which a small stream pours its tortuous course; and this ravine is crossed by an earthen mound, on which an excellent street is built. At the east end of the town, on the south side of the turnpike road, is a public road comprising about 36 acres, partly the gift of the late Mr Ker of Middlebank; and to the north of the road, at a little distance, are the jail, the workhouse, a hospital, and a cemetery, all in close proximity to each other. The county burgh, with its tall and graceful spire 132 feet high, is inserted above his resting-place within the abbey. The town is well supplied with means of education in all the ordinary branches, but there is no special provision for the higher departments of learning.

The staple industry of Dunfermline is the manufacture of table-linen, and in this department it has almost no rival. The weaving of damask was introduced into the town in 1718 by a Mr James Blake, who had succeeded in getting possession of the jealously guarded secret in workshops at Drumsheugh, near Edinburgh, to which he obtained access by feigning idiocy. Till about 1845 the bulk of the population were engaged on handlooms, but at present only a comparatively small number earn a scanty and precarious subsistence by the old method. The eleven power-loom factories in the town in 1877 give employment to about 5000 persons, of whom a large proportion are females. The annual value of the goods manufactured is about £500,000. Iron and brass foundries, soapworks, and dyeworks are among the minor industrial establishments, and in the vicinity there are about 22 collieries.

Dunfermline returns a member to Parliament in connexion with Stirling, Inverkeithing, and Culross. The population of the town was 14,963 in 1871, and is now (1877) 15,858, that of the parish, which, besides the strictly rural district around, includes Limekils and Charleston, with several colliery districts, was 23,123 in 1871, and is now 24,329. The town is governed by a council consisting of 22 members, including a provost, four bailies, and other officers. The revenue of the town, derived principally from coal-fields, was £7875 in 1876. The number of inhabited houses is 1638; the annual value of real property, £56,038. There are two newspapers published weekly, and four banks, besides the National Savings Bank.

In spite of the introduction in 1850 of an apparently abundant supply of spring water, a scarcity has since been felt in dry seasons; and accordingly at present (1877) new works are in progress to effect a communication with the River Devon. It is anticipated that the cost of these will be nearly £60,000. Drainage works are also being constructed, at an estimated cost of £5000, to convey the sewage of the city to the sea at Limekils. The situation of Dunfermline is very favorable, the birth rate is 40 per thousand, the rate of mortality 13 4, and the marriage rate 8 7.
DUNFERMLINE, Lord See Abercromby
DUNGANNO, a parliamentary borough and market-town of Ireland, in the county of Tyrone, standing on an activity 8 miles W of the south-western shore of Lough Neagh, and 94 miles N W of Dublin. It consists of a square with diverging streets, and is generally well built. The only public buildings of note are the parish church, with an octagonal spire, a court-house, a market hall, and a college founded by Charles I. Latins are manufactured and coarse earthenware. The town also contains a power-loom weaving factory and flour mills. It returns one member to Parliament. The early history of the place is identified with the once powerful family of the O'Neals, whose chief residence was there. In 1642 the independence of the Irish Parliament was proclaimed in 1782.

The population in 1871 was 3886, of whom 55 per cent were Roman Catholics, and 230 acres.

DUNGANRAN, a parliamentary borough, market-town, and seaport of Ireland, in the county of Westport, 125 miles S W of Dublin. It is situated on the Bay of Dunganran, at the mouth of the Colligan, which divides the town into two parts, connected by a bridge of a single arch. The eastern suburb is called Abbeyville, where the remains of an ancient keep, erected by the O'Gusheen, still exists. The town contains a town hall, a season's house, a union workhouse, a market house, and barracks. The town is carried on to a small extent, and there is a steam mill. The borough returns one member to Parliament (Area of town, 392 acres, of borough, 419 acres, Population of borough, 1745). In 1793, of whom 36 per cent were Roman Catholics.

DUNKELD, a borough of barony and market-town of Perthshire, Scotland, situated on the north bank of the Tay, 15 miles N W of Perth. The river is crossed there by a fine bridge of seven arches, begun in 1605 and completed in 1608, at a cost of £42,000. The town is remarkable for its large and well-preserved Quakers' meeting-house and adjoining buildings, the village consists of narrow and ill-built streets presenting an antiquated aspect. It is burned among the dark shades of luxuriant trees, and stands in the centre of a valley surrounded by mountains of considerable elevation, which are wooded to their summits. The river, the bridge, the surrounding mountains, and the remains of an ancient cathedral combine to give the town a very romantic appearance. As early as 729 the Caledions had a monastery at Dunkeld, which was converted into a cathedral by David I. in 1127. Its architecture is of a composite character, exhibiting features both of the Norman and pointed styles. The centre of the nave is about 120 feet by 60, the walls are 40 feet high, and the aisles 12 feet wide. The choir was founded by Bishop Simler in 1150, and completed by Bishop Farcher in 1,469, and by Bishop Brown in 1,501. It contains four bells. The cathedral was never roofed at the Reformation, but the choir has been rebuilt, and is now used as the parish church. Beneath the choir-house is the sepulchral vault of the Athole family. The porch of the church is the tomb of Alexander Stuart, earl of Buchan, better known as the Wolf of Badenoch, who died in 1394. The most famous of the bishops of Dunkeld was George Douglas, the translator of the _Ecclesiasticum_ immediately behind the cathedral stands Dunkeld House, the mansion of the dukes of Athole. The grounds of the ducal residence (which are extensive and picturesque) contain two of the earliest larch trees introduced into Britain, they were brought from Tyrol in 1728. A mile south of Dunkeld, on the other side of the Tay, is the modern village of Birnam, which has sprung up at the railway station. It lies at the foot of Birnam hill, and derives its name from the famous wood connected with the fate of Macbeth. The population of the burgh in 1871 was 783.

DUNKERS, or Dunkers, a sect of American Baptists originating in Germany. The name, as its second form indicates, is a nickname meaning _dippers_, from the German _tucken_, to dip. From the first the members recognized no other name than "Brethren." The founder of the sect was Alexander Mack of Schwartzeman, who, along with one or two companions, was led to adopt anti-pedobaptist views about the year 1708. It had scarcely assumed organized character in Germany when its members were compelled by persecution to take refuge in Holland, from which they emigrated to Pennsylvania in small companies in the years between 1720 and 1729. Their first community was established at Germantown, not far from Philadelphia, and other settlements were gradually formed in New England, Maryland, Virginia, Ohio, and Indiana. In the early history of the sect the sect dwelt apart, and marriage, while not forbidden, was discouraged. Similarly, while the holding of private property was not absolutely prohibited, a certain community of goods was established and maintained by the voluntary action of the members, and it was considered unlawful to take interest for money. These features have now disappeared, but in other respects the sect retains much of its original character. Every member has the right to exhort and take part in the religious services, and for a considerable period on special provision was made for the conduct of worship there is now, however, a recognized unpaid ministry of bishops and teachers. These are also deacons and deaconesses. In baptism, true immersion is used. The Lord's Supper is observed in the evening only, and connected with it are the _larges_ and other religious feasts, and the apostolic "_fastes_." Putting a literal interpretation on James v. 14, they provide the amounting with oil for the healing of the sick, and many of them will not adopt any other means of recovery. They exhale (except inQ the Quakers') and their refusal to take oaths or to serve in war. Their number, which at one time was estimated at 30,000, has very considerably declined, and the latest account states it at less than 8000. An early offshoot from the general body of Dunkers were the Seventh Day Dunkers, whose distinctive principle, as their name importes, was that the seventh day, and not the first day, of the week was the true Sabbath intended to be perpetually and universally observed. Their founder was Conrad Peyer, one of the first emigrants who established a settlement at Ephrata, about 20 miles from Philadelphia, in 1733. This branch of the sect has almost died out.

DUNKIRK, or Dunkirk, a strongly fortified seaport town of France, and capital of an arrondissement in the department of Nord, is situated on the Straits of Dover, 40 miles N W of Lille, and 194 N from Fins, in 51° 22' N lat. and 2° 22' 32" E. long. It is a well-built town, the streets being large, wide, and regular. It is divided into three parts: (1) the town proper, which is the centre of trade; (2) the low town, containing the principal industries, and (3) the town, including docks and granaries, and containing the houses of labourers and sailors. Dunkirk is both a naval port and...
one of the merchant ports of Paris, and has two harbours, its maritime trade employing about 5000 vessels with a tonnage of 270,000. The docks occupy about 100 acres.

It possesses sugar refineries, starch manufactories, distilleries, foundries, and large ship-building yards. The fisheries of the coast are valuable and extensive. The public buildings most worthy of notice are the church of St. Eleusis, constructed about 1650 in the Gothic style, with a Cornishian pediment. In 1783, the lighthouse, 170 feet high; the Beffroi, 300 feet high, surmounted with signals for vessels in distress, and containing a celebrated peal of bells; the exchange, the second story of which is a gallery for pictures, statuary, medals, and curiosities; and the theatre. The principal square contains the statue of Jean Bart by David of Angers.

Dunkirk is said to have originated in a chapel founded by St. Eleusis in the 7th century, round which a small village slowly sprung up. In the 13th century Baldwin III., count of Flanders, raised it to the rank of a town. In 1388 it was burned by the English, and in the 16th century Charles V. built a tower for its defence, of which no traces now remain. In 1552 the English, who had been in possession of the town, were expelled by the French, who, in the ensuing year surrendered it to the Spaniards. In 1646 it once more passed into the hands of the French, who, after a few years' occupation of it, again restored it to Spain in 1665. It was retaken by the French and made over to the English in 1674, Charles II., being in money difficulties, sold it to the French king Louis XIV., who fortified it. In 1759 it was attacked by the English under the duke of York, who, however, were compelled to retire from its walls with severe losses.

The population in 1872 was 34,342.

DUNKIRK, a lake-port town of the United States, in Chautauqua county, New York, situated on a small bay in Lake Erie, 40 miles south-west of Buffalo. It is an important station on the Lake railroad, and forms the western terminus of the Erie line; and by means of the Carrolton railroad it has connection with the Pennsylvania coal-fields. The town occupies an elevated and agreeable position on the lake, and its harbour is free of ice earlier in the spring than the neighbouring port of Buffalo. The industries of the place comprise oil-refining, and the manufacture of glue, flour, and iron-work. Population (1870), 5531.

DUNMOW, GREAT, a market-town of England, in Essex, situated on a sva militaris, some remains of which it consists. It consists of two good streets, built on an acclivity near the right bank of the Chelmer, 40 miles north-east of London by rail. Its public buildings include a town hall and a literary institute, besides the parish church of St. Mary the Virgin, recently restored. Population in 1871, 2986. Two miles to the east is the village of Little Dunmow (population, 359), formerly the seat of a priory remarkable for the custom of presenting a fish of bacon to any couple who could satisfy a jury of six bachelors and six maidens that they had spent the first year of married life in perfect harmony, and had never at any moment wished they had married. The institution of this strange matrimonial prize—which had its parallel at Whakonour (or Winchour) in Staffordshire, at St. Meleins in Brittany, and apparently also at Vaucouleurs—appears to date from the reign of John; and the only instances recorded of its occurrence are in 1445, 1467, 1701, 1751, and 1763. A revival of the custom was effected in 1655 by Mr. Harrison Ainsworth, but the scene of the ceremony was transferred to the town-hall of Great Dunmow. For details see Chamber's Book of Days, vol. ii. p. 745-751; and W. Andrews, History of the Dunmow Flitch of Bacon Customs, 1877.

DUNNING, JOHN, BARON ASHBURTON (1731-1783), an eminent English lawyer, the second son of John Dunning of Ashburnton, Devonshire, an attorney, was born at Ashburnton, October 18, 1731, and was educated at the free grammar school of his native place, where he distinguished himself in classics and mathematics. On leaving school he was taken into his father's office, where he remained until the age of nineteen, when he was sent to the Temple. Called to the bar in 1756, he came very slowly into practice. He went the Western Circuit for several years without receiving a single brief. In 1762 he was employed to draw up A Defence of the United Company of Merchants of England trading to the East Indies, and their Servants, particularly those at Bengal, against the Complainants of the Dutch East India Company to his Majesty on that subject; and the matter style which characterized the document procured him at once reputation and emolument. In 1763 he distinguished himself as counsel on the side of Wilkes, whose cause he conducted throughout. His powerful argument against the validity of general warrants (18th June, 1763) established his reputation, and his professional business from that period gradually increased to such an extent that in 1776 he is said to have been in the receipt of nearly £10,000 per annum. In 1766 he was chosen recorder of Bristol, and in December 1767 he was appointed solicitor-general. The latter year witnessed his marriage; and in 1770, when he retired, along with his friend Lord Shelburne, in 1771 he was presented with the freedom of the city of London. From this period he was considered as a regular member of the Opposition, and distinguished himself by many able speeches in Parliament. He was first chosen member for Calne in 1768, and continued to represent that borough until he was promoted to the peerage. In 1780 he brought forward a motion that the "influence of the crown had increased, was increasing, and ought to be diminished," which he carried by a majority of eighteen. He strongly opposed the system of sincere offices and pensions; but his probity was not strong enough to prevent his taking advantage of it for himself. In 1783, when the marquis of Rockingham became prime minister, Dunning was appointed chancellor of the duchy of Lancaster, a rich sinecure; and about the same time he was advanced to the peerage, by the title of Lord Ashburnton. Under Lord Shelburne's administration he accepted a pension of £4000 a year. He died while on a visit to Exmouth, August 18, 1783. Though possessed of an insignificant person, a awkward manner, and a provincial accent, Lord Ashburnton was one of the most fluent and persuasive orators of his time. Sir William Jones speaks in the highest terms of his eloquence and wit, and Bentham commended the closeness of his reasoning.

Besides the answer to the Dutch memorial, Lord Ashburnton is supposed to have satirized in writing a pamphlet on the law of libel, and to have been the author of A Letter to the Proprietors of John Stock, on the Subject of Lord Shelburne's Letter on that Subject, 1764, 8vo. He was at one time suspected of being the author of the celebrated Letters of Junius.

DUNOIS, JEAN (1402-1468), Count of Orleans and Longueville, commonly called the "Bastard of Orleans," a celebrated French warrior and grand-chamberlain of France, was the natural son of the duke of Orleans (brother of Charles VI.) and Mariette d' Enghein, Madame de Cergy, and was born at Paris the 23d November 1402. He was brought up in the house of the duke, and in the company of his legitimate sons. He was the surprise and rout in 1427 of the English, who were besieging Montargis,—the first successful blow against the English power in France following a long series of French defeats. In 1428 he threw himself into Orleans, and was the principal means of enabling the garrison to hold out until the arrival of Joan of Arc, with whom he shared with her the honour of defeating the enemy there in 1429. He then accompanied Joan to Rheims, and shared in the victory of Patay. After her death he raised the siege of Chartres and of Lagny, and drove the English from Paris, which he entered in triumph on the 13th April 1436. The English retreated gradually out of the limits of France, and thence into Normandy; and Dunois, having in 1449 been raised to the rank of lieutenant-general, soon conquered from them the whole
of that province. In 1451 he attacked them in Guinée, taking among other towns Bordeaux, which the English had held for 300 years. At the conclusion of those conquests Charles VII. legitimated him, and gave him the title of defender of his country, and there was a grand chamberlain, but on the death of Charles, Louis XI. deprived him of his titles and dignities. He then joined the league of revolted princes, but, assuming the function of negotiator, and thus securing the favour of the king, he was reinstated in his offices, and named president of the council for the reform of the state. He died 28th November 1465.

DUNNOON, a town in Argyllshire, Scotland, situated on the Firth of Clyde, about nine miles west from Greenock, and on the opposite shore. Of recent growth (having been about the beginning of this century a mere fishing hamlet), it is now one of the most extensive and populous watering-places on the shores of the Clyde, a condition for which it is much indebted to the late James Ewing of Strathearn, who first drew attention to its capabilities as an agreeable summer residence. On account of the mildness of the climate that prevails, and the amelity of the situation, it was selected as the site of a convalescent home, which has proved a boon to many of the hard-wrought in all brances of learning, but, as is usually given, the arguments of Duns Scotus. In 1387 it formally condemned the Thomist doctrine, and a century afterwards it required all who received the doctor's degree to bind themselves by an oath to defend the doctrine of the Immaculate Conception. In 1388 Duns Scotus was sent by the general of his order to Cologne with the twofold object of engaging in a controversy with the Reghards and of assisting in the foundation of a university. He was received with great ceremony by the magistrates and nobles of the city. After a very short residence, however, he died of apoplexy on the 8th November 1308. The story told by Paulus Jovius, that on his grave being opened some time after his death his body was found to have turned in the coffin, from which it was inferred that he had been burned alive, is generally regarded as fabulous.

Duns Scotus was one of the great leaders of scholastic thought, and, as a full account of his philosophical system must therefore necessarily be given in the general article on SCHOLASTICISM, a brief indication of its leading points will suffice here. It may be noted at the outset that the philosophical position of Duns Scotus was determined, or at least very greatly influenced, by the antagonism that existed between the Dominican and the Franciscan Thomas Aquinas was a Dominican, Duns Scotus was a Franciscan, and hence arose the schism between the Thomists and the Scotists. Aquinas ranks in philosophy with the realists as well as Duns Scotus, but his view in regard to the great philosophical controversy of the Middle Ages was a modified or eclectic one in comparison with that of Duns Scotus, who as the true representative and apostle of scholastic realism. Theologically, the doctrine of the Immaculate Conception was the great subject in dispute between the two parties. There were, however, differences of a wider and deeper kind. In opposition to Aquinas, who maintained that reason and revelation were two independent sources of knowledge, Duns Scotus held that there was no true knowledge of anything knowable apart from theology as based upon revelation. In conformity with this principle he denied that the existence of God was capable of being proved, or that the nature of God was capable of being comprehended. He therefore rejected as worthless the ontological proof offered by Aquinas. Another chief point of difference with Aquinas, which in regard to the freedom of the will, which Duns Scotus maintained absolutely. He held also in an unqualified form the doctrine of predestination, and he reconciled free-will and necessity by representing the divine decree as a temporally antecedent, but as immediately related to the action of the created will. He maintained, in opposition to Aquinas, that the will was independent of the understanding, and that only will could affect will. From this difference as to the nature of free-will followed by necessary consequence a difference with the Thomists as to the operation of divine grace. In ethics the distinction he drew between natural and theological virtue is common to him with the rest of the scholastics, among others with his great opponent. (See Aquinas, vol. ii p. 232-3) Duns Scotus strongly upheld the authority of the church, making it the ultimate authority on which that of Scripture depends.

VII. — 69
The works of Duns Scotus were very numerous, though in the collection edited by Luke Wadding, a Franciscan (12 vols., fol., Lyons, 1639), several are ascribed to him without sufficient ground. This edition contains a life full of legends, which was reprinted separately (Mons, 1644).

The most important of the works of Duns Scotus consisted of questions and commentaries on the writings of Aristotle, and on the Sentences of Lombard. For the theology of Etskus see the Summa Theologica en Societate, by Jerome de Fortin, a Franciscan, the Resolution doctrinaria Societatis, by F. E. Allegro, (Lyons, 1643), and the Contrarum theologiarum sermones de S. Thomae de Aquino, De Beato, a Spanish Franciscan (Venice, 1599). Of more recent authorities particular value attaches to Baumgarten-Crusius's De Theologia Scot., Jena, 1826; and an article by Erdmann in the Theologische Studien und Kritiken for 1863. On the philosophy of Duns Scotus see Ritter's Geschichte der Philosophie und Ueberweg's Geschichte der Philosophie.

DUNSTABLE, a market-town and, since 1864, a municipal borough of England, in the county of Bedfordshire, N.W. of London, and 18 miles S.S.W. of Bedford, with communication by both the North-Western and the Great Northern railways. Its parish church, a fine old building, formerly part of the Augustinian priory, was restored about 1865, the principal points of interest are the richly decorated choir, the ancient monuments of the Chichele family, and, among the interior adornments, Sir James Thornhill's painting of the Last Supper. The five dissenting churches, the temperance hall, several almshouses, and the Ashton charity and other schools complete the list of public buildings. Straw-plaiting and the making of straw hats and bonnets are the principal industries; and, as a consequence, the female considerably outnumbers the male population. The census of 1861 gave 2712 females out of a total of 4470 inhabitants; and that of 1871, 2702 out of 4658.

From its situation at the junction of the ancient Watling and Icknield Streets, it seems probable that Dunstable was a Roman station, but its identification, whether with Magnusinum or Durcombruma, is not certainly established. Matthew Paris mentions, in his Lives of the Abbots of St Albans, that about 1110 the play of St Catherine was acted in the town by direction of Geoffrey, afterwards abbott of St Albans, and thus the name of Dunstable is associated with the very earliest authenticated notice of theatrical representation in England. The Augustinian priory, to which it was afterwards indebted for its celebrity, was founded in 1131 by Henry I., and for a long period exercised lordship over the town. From 1247 to 1292 there was a violent dispute between the burgesses and the canons, but the claims of the latter were acknowledged by Henry III., the paterfamilias. It was at Dunstable that in 1244 the discontented barons met and ordered the papal legate, who was with the pope's legates, to leave the kingdom; and in 1258 the commissioners for the divorce of Queen Catherine sat in the town. The exchequer from 1210 to 1242 are due to Richard de Maris, the prior. The original is a parchment folio preserved among the Cotton MSS in the British Museum (Tiberius, A. 10). It was greatly damaged by the fire of 1731, and is consequently slightly imperfect, in spite of the care with which it has been stretched and mended. Hearne published an edition in 1733, from a copy secured temporarily by Humphrey Wanley (Harissian MSS, 4580); another by H. R. Luard, from the original MS., completes 420 pages of vol. ii. of the Antiquae Romanae, published by the Master of the Rolls.

DUNSTAN, Sr (924 or 925–988), was born at Glastonbury in 924 or 925. His father, Herstan, was brother of Elfhest the Bold, bishop of Winchester, and the tradition that he was connected with the royal house seems not improbable. As a child he was placed under the care of certain Irish teachers who had settled at Glastonbury; and he devoted his boyhood to study with a fervour so intense that he at length brought on himself a severe attack of brain fever, after the effects of which he was still apparent in the fantastic visions which troubled his after life. He was still a boy when he entered the house of Athelstan, and he was only fifteen or sixteen at the accession of Edmund; but he had not been long at court before his ambitious and lofty temper had made him the bitter enemies. In all the accomplishments of his time, except those of the warrior, he stood pre-eminent. His memory was stored with the ancient Irish ballads and legends, and he excelled in music, in painting, and even in the mechanical arts. But he soon found that his talents, while making him a favourite with the ladies, had inflamed the jealousy of his rough, ignorant soldier rivals. He was accused of dealing in witchcraft, was driven with rude force from the court, and, perhaps under the pretext of testing whether he was really wizard or no, was flung into a muddy pond, whence he was glad to escape to the protection of his uncle Elfric. The cause of this outrage was a second attack of fever, from which he rose to yield to his uncle's persuasions, and take the vows as a monk. It was with great reluctance that he took this step, for he was deeply in love with a lady at court; but the feeling, natural in that age, that his illness was a direct indication of the will of providence, was likely to impress itself with peculiar force upon an imagination such as his, and he was also, doubtless, conscious that the only protection for his physical weakness lay in the power of the church. After his recovery, he spent some time quietly studying and teaching, and practising the austerity which gained him the reputation of a saint; but it was not long before he returned to court. Again his enemies seemed likely to prove too powerful for him. He, however, gained the favour of King Edmund, who created him abbot of Glastonbury when he was about twenty-two years of age. He became principal treasurer of the kingdom, and we find him a few years later (953), on account of his tenure of that office, refusing an offer of the see of Crediton.

From 946 to 955 the throne was occupied by Edred, whose constant ill health threw the chief power into Dunstan's hands. In 955 Edwy came to the throne; and the party of Edgiva, to which Dunstan belonged, lost its influence. Of the details of the party struggles which ensued we have no trustworthy information; but one incident of the quarrel between the king and the minister has become famous. Edwy, though then probably a mere boy, was deeply in love with his kinswoman Elgiva, whose mother Ethelgiva, a lady of the highest rank, is accused, with what degree of truth cannot now be determined, of having used the most shameless means to gain power over the young king. What relationship really existed between Edwy and Elgiva is unknown, but it was such as to be considered by the churchmen as an insupportable to marriage. Edwy, however, defied their opposition. On the evening of his coronation he withdrew from the banquet to the society of Elgiva. Dunstan was sent by the Witun to recall him, and exhibited a violence which may be excused, when we consider that Edwy had both grievously insulted the Witun and openly sought, upon so solemn an occasion, the dangerous society of a girl whom the church forbade him to marry.

A year or so after Ethelgiva and her party triumphed, and Dunstan being outlawed, was obliged to flee to Ghent. In 957, however, a revolt placed Edwy's brother Edgar on the throne of Mercia and Northumbria, and at his court Dunstan resumed his old position of chief minister. He was created bishop (perhaps at first without a see); and, in defiance of strict ecclesiastical law, he obtained and held at once the sees of Worcester and London. By the death of Edwy in 955, Edgar gained the sovereignty of Wessex, and in the ears of which, a few months after Dunstan was appointed archbishop of Canterbury.1

1 In connection with the coronation of Edgar, Osbern of Canterbury tells a story intended to exalt the archbishop. The king having
Dunstan's influence secured the crown for Edward. But a fierce struggle ensued between Dunstan and his enemies. In 977 the Witan met three times, and the last meeting, that at Canterbury, was signalized by an accident, which inflicted a mortal wound. Dunstan's life was preserved, either by the timely intercession of St. Ethelred the Unready, or by the influence of Dunstan's enemies. The Witan was assembled again, when it was announced that the king had ordered Dunstan to withdraw from the court. Dunstan retired to the monastery of Eynsford, and remained there until the death of Ethelred. During the reign of Edgar, Dunstan was again called to the court, and continued to exercise his influence till his death. His influence was felt in the selection of bishops, and in the establishment of religious houses. He was a great patron of learning, and his influence was felt in the establishment of the first universities. Dunstan was a man of profound learning, and his works are a valuable source of information about the history of the Church in England.

Dunstan's influence is still felt in the Church. His influence was not confined to England, but extended to other countries. He was a great missionary, and his influence was felt in the establishment of new monasteries. Dunstan's influence is still felt in the Church, and his works are a valuable source of information about the history of the Church in England.
his vessel was wrecked at the Malouin Islands. In 1832 he attained the rank of lieutenant, and was entrusted with the command of the "Cochin," which during the next three years was engaged in scientific explorations in the South Pacific and along the coasts of South America. From this voyage he brought back not only great additions to cartography and important data in regard to the currents of the Pacific, but also numerous specimens of rare and interesting shells, so that he became the captain of the magnet's equator, and to prove the equality of the flattening of the two hemispheres. During the rest of his life he devoted himself mainly to the investigation of terrestrial magnetism; and the value of his labours was recognized by his admission into the Académie des Sciences in 1842. He died in August 1865.

The following are his principal works:—Les Voies historiques, the Hydrographie, and the Physique du Voyage autour du Monde sur la Cochinch, Paris 1838-1850, and extensive contributions to Bucquoy's Traité de l'Étoile.

DUPERRON, JACQUES DAVY (1556-1618), a celebrated French cardinal, was born at St Lo, in Normandy, November 15, 1556. His father was educated for a physician, but on embracing the doctrines of the Reformation became a Protestant minister, and to escape persecution settled at Bern, in Switzerland. Here Jacques Davy received his education, being taught Latin and mathematics by his father, and learning without the aid of any one Greek and Hebrew, and the philosophy which was then in vogue. At twenty years of age he came to Paris, and was presented to the king by the count of Matignon; and, after he had abjured Protestantism, being again presented by Philip Desportes, abbot of Tiron, as a young man without equal for knowledge and talent, he was appointed to the king. He was commanded to preach before the king at the convent of Vincennes, when the success of his sermon on the love of God, and of a funeral oration on the poet Ronsard, induced the king to appoint him his assistant in theology, which, though it contained an attack on Elizabeth of England that the king thought it prudent to disavow, tended to advance both the prosperity of God, and of a funeral oration on the poet Ronsard, induced the king to appoint him his assistant in theology, which, though it contained an attack on Elizabeth of England that the king thought it prudent to disavow, tended to advance both the prosperity of God, and the interests of the Church. At the end of 1832 he became president of the chamber, which office he held successively for eight years. On Louis Philippe's abdication in 1848 Dupin introduced the young count of Paris into the chamber, and proposed him as king with the duchess of Orleans as regent. This attempt failed, as Dupin submitted to circumstances, and, retaining the office of procureur-general, his first act was to decide that justice should henceforth be rendered to the "name of the French people." In 1849 he was elected a member of the Assembly, and became president of the principal committee—that on legislation. After the coup d'état of 2d December 1851 he still retained his office of procureur-général, and did not demit it till it was given to the decrees confiscating the property of the house of Orleans. In 1857 he was offered his old office by the emperor, and accepted it, explaining his acceptance in a discourse, a sentence of which may be employed to describe his whole political career. "I have always," he said, "belonged to France and never to parties." He died 8th November 1865. Among Dupin's works, which are numerous, may be mentioned Principes Juris Civilis, 5 vols. (1806); Mémoires et plaidoyers de 1806 au 1er Janvier 1850, in 20 vols.; and Mémoires ou souvenirs du barreau, in 4 vols. 1855-56.

DUPIN, LOUIS ELLIUS (1657-1719), a celebrated French ecclesiastical historian, belonged to a noble family in Normandy, and was born at Paris on the 17th June 1657. He received his early education from his father, and had scarcely reached his tenth year when he entered the college of Harcourt, where he graduated as A.M. in 1672. He was distinguished among the students by his genius for learning. He was passionately fond of the sciences, and was educated in immense energy, and of a ready and convincing eloquence, which he could make available for whatever opinions he thought it prudent to adopt; and, if he did not form his opinions solely with a view to his advancement, they certainly adapted themselves in each case with remarkable appropriateness to the different emergencies and turning points of his life. His works were collected after his death, and published in three volumes in 1622-23.

DUPIN, ANDRE MARIE JEAN JACQUES (1783-1860), commonly called Dupin the Elder, a celebrated French advocate, president of the Chamber of Deputies and of the Legislative Assembly, was born at Vassy, in Nièvre, on the 1st February 1783. He was educated by his father, who was a lawyer of eminence, and at an early age he became principal clerk of an attorney at Paris. On the establishment of the Académie de Législation he entered it as pupil from Nièvre. In 1800 he was made advocate, and in 1802, when the schools of law were opened, he received successively the degrees of licentiate and doctor from the new faculty. He was in 1810 an unsuccessful candidate for the chair of law at Paris, and in 1811 he also failed to obtain the office of advocate-general at the court of cassation. About this time he was added to the commission charged with the classification of the laws of the empire, and, after the interruption caused by the events of 1814 and 1815, was charged with the sole care of that great work. When he entered the Chamber of Deputies in 1815 he at once took an active part in the debates, and strenuously opposed the election of the son of Napoleon as emperor after his father's abdication. At the election after the second restoration Dupin was not re-elected. He defended with great intrepidity the principal political victims of the reaction, among others, in conjunction with Berryer, Marshal Ney; and in October 1815 boldly published a tract called Libre Défense des Accusés. In 1827 he was again elected a member of the Chamber of Deputies, and in 1830 took part in counselling the revolution, and in exhorting the citizens to resistance. In August of that year he became a member of Louis Philippe's cabinet, and more than any one else contributed to the formation of the new régime. At the end of 1832 he became president of the chamber, which office he held successively for eight years. On Louis Philippe's abdication in 1848 Dupin introduced the young count of Paris into the chamber, and proposed him as king with the duchess of Orleans as regent. This attempt failed, as Dupin submitted to circumstances, and, retaining the office of procureur-général, his first act was to decide that justice should henceforth be rendered to the "name of the French people." In 1849 he was elected a member of the Assembly, and became president of the principal committee—that on legislation. After the coup d'état of 2d December 1851 he still retained his office of procureur-général, and did not demit it till it was given to the decrees confiscating the property of the house of Orleans. In 1857 he was offered his old office by the emperor, and accepted it, explaining his acceptance in a discourse, a sentence of which may be employed to describe his whole political career. "I have always," he said, "belonged to France and never to parties." He died 8th November 1865. Among Dupin's works, which are numerous, may be mentioned Principes Juris Civilis, 5 vols. (1806); Mémoires et plaidoyers de 1806 au 1er Janvier 1850, in 20 vols.; and Mémoires ou souvenirs du barreau, in 4 vols. 1855-56.
DUPONT, PIERRE (1721-1751), a French song-writer of great popularity, the son of a workman of Tours, was born at Lyons, his mother's native city, but brought up from childhood under the care of an elderly cousin who occupied the position of priest of Roche-Tailleuse-sur-Scène. From the seminary of Largentière, where his education was completed, he passed to the general drudgery of a lawyer's and banker's office, in 1739 found his way to Paris and got some of his poems inserted in the Gazette de France and the Quotidienne, and two years later was saved from the conscription and enabled to publish his first volume—Les deux Anges—through the exertions of a Thomas kin-maman and M. Lebrun. The prize founded by M. de Mailly, La Tour-Landry was awarded to him in 1842, and he was employed for some time in connection with the Academy's great dictionary. The thought of trying his fortune as a writer for the stage was taking shape in his mind, when in 1847 the success of his pleasant song Jusqu'ont grande langue dans mon étable opened up another prospect of fame, and from that date to his death he confined himself mainly, though not exclusively, to the cultivation of his lyrical poetry. Accompanied, as they often were, by airs of his own invention, many of his songs became in the west so popular that they were equally welcome in the workshop and the drawing-room. His sympathies were much less, however, with the drawing-room than the workshop, and in 1851 he paid the penalty of having become the poet laureate of the socialist aspirations of the time by being condemned to seven years of exile from France. The sentence was cancelled, and the poet withdrew for a season from participation in politics. He died at Paris in 1871.

His lyrical poems may very fairly be arranged according to his own classification—rural and, as far as the writer is concerned, objective, legendary and subjective, patriotic and contemporaneous. They have appeared in various forms—Chants et Chansons, 3 vols., with music, 1852-54, Chants et Poèses, 7th edition, 1862, &c. Among the best known are Le braconnier, Le tourneur, Le vol de l'hirondelle, La chanson du bœuf, but many others might be mentioned of equal merit, natural, bold, delicate, and poignant. Dix événements, 1864, Fin de la Polycrace, 1847, La trahison du jofre avocat, 1862, written to accompany Dore's engravings, and Musée jules, 1850, are separate publications.

See Sainte-Beuve, Cours de légende, vol. iv, where an interesting description is given of the style in which the author sings his own songs in the clubs and political meetings, Ch. Baudelaire, Nanteau les Paris, 1849, Dognan, Dernier, 1851. Dupont de l'Eure Jacques-Charles (1757-1855), a French lawyer and statesman, was born at Neubourg, in Normandy, on the 27th February 1757. In 1789 he was an advocate at the Parliament of Normandy. During the republic and the empire he filled successively judicial offices at Lournes, Rouen, and Epernay. He had adopted the principles of the Revolution, and in 1793 he commenced his political life as a member of the Council of Five Hundred. In 1813 he became a member of the Corps Legislatif. During the Hundred Days he was vice-president of the Chamber of Deputies, and when the allied armies entered Paris he distinguished himself by the firmness with which he asserted the necessity of maintaining the principles of government that had been established at the Revolution. A resolution to that effect which he moved in the chamber was adopted, and he was chosen one of the commissioners to negotiate with the allied sovereigns. From 1817 till 1849 he was untrammelled a member of the Chamber of Deputies, and he acted consistently with the liberal opposition, of which at more than one crisis he was the virtual leader. For a few months in 1830 he held office as minister of justice, but, finding himself out of harmony with his colleagues, he resigned before the close of the year and
1814 Dupont became secretary to the Provisional Government, and on the restoration he was made a councillor of State. The return of the emperor in 1815 determined him to quit France, and he spent the close of his life with his two sons, who had established a powder manufactory in the state of Delaware. He died near Wilmington, Delaware, on the 6th August 1817.

DUPUIS's most important works, besides those mentioned above, were his De l'origine et des propriétés d'une science nouvelle (London and Paris, 1767), Phycologie, ou constitution naturelle du gouvernement le plus avantageux au genre humain (Paris, 1789), and his Observations sur les effets de la liberté du commerce des grains (1790). Dupont was a member of the Institute of France, to which he contributed many papers.

DUPUIS, CHARLES FRANÇOIS (1742-1809), an eminent French scientific writer, was born of poor parents at Tryé-Chateau, between Gisors and Chaumont, October 26, 1742. His father, who was a teacher, instructed him in mathematics and law-surveying. While he was engaged in measuring a tower by the geometric method the Due de Beauséjour, whom he employed in preparing his views on the subject of geometry, gave him a library in the college of Harcourt. Dupuis made such rapid progress in his studies that, at the age of twenty-four, he was appointed professor of rhetoric at the college of Luneux, where he had previously passed as a licentiate of theology. In his hours of leisure he applied himself to the study of the law, and in 1770 was admitted an advocate before Parliament. Two university discourses which he delivered, one on occasion of the distribution of prizes, and the other on the death of the empress Maria Theresa, having been printed, were admired on account of their elegant Latinism, and laid the foundation of the author's fame as a writer. His chief attention, however, was devoted to mathematics, the object of his early studies; and for some years he attended the astronomical lectures of Lalande, with whom he formed an intimate friendship. In 1778 he constructed a telegraph on the principle suggested by Amontons, and employed it in keeping up a correspondence with his friend M. Fortin in the neighbouring village of Bagneux, until the Revolution rendered it necessary that he should destroy his machine to avoid suspicion.

Much about the same time, Dupuis formed his ingenious theory with respect to the origin of the Greek months. In the course of his investigations upon this subject Dupuis composed a long memoir on the constellations, in which he endeavoured to account for the want of any resemblance between the groups of stars in the heavens and the names by which they are known, by supposing that the zodiac was, for the people who invented it, a sort of calendar at once astronomical and rural, and that the figures chosen for the constellations were such as would naturally suggest the agricultural operations of the season. It seemed only necessary, therefore, to discover the clime and the period in which the constellation of Capricorn must have arisen with the sun on the day of the summer solstice, and the vernal equinox must have occurred under Libra. It appeared to Dupuis that the clime was Upper Egypt, and that the perfect correspondence between the signs and their significations had existed in that country at a period of between fifteen and sixteen thousand years before the present time; that it had existed only there; and that this harmony had been disturbed by the effect of the precession of the equinoxes. He therefore ascribed the invention of the signs of the zodiac to the people who then inhabited Upper Egypt or Ethiopia. This was the basis on which Dupuis established his mythological system, and endeavoured to explain the subject of fabulous history, and the whole system of the theology and theology of the ancient world.

Persuaded of the importance of his discoveries, which, however, were by no means entirely original, Dupuis...
published several detached parts of his system in the Journal de Sciences for the months of June, October, and December 1777, and of February 1781. These he afterwards collected and published, first in Lalande's Astronomy, and then in a separate volume in 4to, 1781, under the title of Mémories sur l'Éryxwall des Considérations de l'Éryxwall. The theory propounded in this memoir was refuted by Baily, in the fifth volume of his History of Astronomy, but, at the same time, with a just acknowledgment of the erudition and ingenuity exhibited by the author. Conдорект proposed Dupuy to Frederick the Great of Prussia as a fit person to succeed Thebault in the professorship of literature at Berlin, and Dupuy had accepted the invitation, when the death of the king put an end to the engagement. The chair of humanity in the college of France having become vacant by the death of Bopin, it was conferred on Dupuy, and in 1788 he became a member of the Academy of Inscriptions. He now resigned his professorship at Lisseux, and was appointed by the administrators of the department of Parme one of the four commissioners of public instruction. At the commencement of the Revolutionary troubles Dupuy sought an asylum at Evreux, and, having been chosen a member of the National Convention by the department of Seine-et-Oise, he distinguished himself by the moderation of his speeches and public conduct. In the third year of the republic he was elected secretary to the Assembly, and in the fourth he was chosen a member of the Council of Five Hundred. After the memorable 18th Brumaire he was elected by the department of Seine-et-Oise a member of the legislative body, of which he became the president. He had been proposed as a candidate for the senate when he resolved to abandon politics, devoting himself during the rest of his life to his favourite studies. He died September 29, 1809.

In 1794 he published the work by which he is best known, entitled Du genre des Animaux, ou le Regnum Animal in 18 (1, or 12 vols 12mo). Though its circulation was small, it became the subject of much bitter controversy, and the theory propounded as to the origin of mythology in Upper Egypt led to the expedition organized by Napoleon for the exploration of that country. In 1799 Dupuy published an abridgment of his work in one volume 8vo, which met with no better success than the original. Another abridgment of the same work, executed upon a much more methodical plan, was published by M. de Tien, in two volumes 4to, inserted in the Memoirs of the Institute, a memoir "On the Zodiac of Tiberius (1637) published in the Revue Philosophique for May 1808, and a Mémorie Explicative du Zodiaque Chorologique et Mythologique published the same year, in one volume 4to. M. Dacier, secretary to the third class of the Institute, delivered his eulogy, and an historical account of his life and writings was published by his widow.

DUPUYTREN, Guillaume, Baron (1771-1825), one of the most distinguished French anatomists and surgeons, was born October 6, 1771, at Peure Butière, a small town of Normandy. He was sprung from poor parents, and was furnished with the means of receiving an ordinary education at the Collège de la Marche by some charitable persons to whom he had been introduced. At the newly established École de Médecine, under Fourcroy, he began the study of medicine with great diligence, and was appointed by competition prosecutor of the faculty when only eighteen years of age. His early studies were directed chiefly to morbid anatomy, which he did much to establish on a scientific basis, though many of his theories were ungrounded. In 1800 he was appointed assistant-surgeon at the Hotel-Dieu, and he was appointed professor of operative surgery in succession to Sabattier in 1811. In 1815 he was appointed to the chair of clerical surgery, and three years later he became head surgeon at the Hôtel-Dieu. Many other offices were conferred upon him; he became inspector of the university, a chevalier and afterwards an officer in the Legion of Honour, chevalier of St Michel, baron, member of the Institute, and first surgeon to the king. Dupuytren's energy and industry were admirable. He visited the Hotel-Dieu morning and evening, performing at each time several operations, lectured to vast throngs of students, gave advice to his out-door patients, and fulfilled the duties consequent upon one of the largest practices of modern times. By his indefatigable activity he amassed a fortune of £300,000, the bulk of which he bequeathed to his daughter, with the deduction of considerable sums for the endowment of the anatomical chair in the École de Médecine, and the establishment of a benevolent institution for distressed medical men. The most important of Dupuytren's writings is its Traitement des Articulations, in which the principles laid down by John Hunter are happily applied. In his operations he was remarkable for the skill and dexterity with which he overcame the numerous difficulties incidental to so extensive a practice as he enjoyed. He had complete control over his feelings, and great readiness of resource. Instead of attempting to introduce new methods of procedure, he commonly limited himself to modifying and adapting to his particular exigencies the established laws of surgery. He was thus led to invent several new surgical instruments. In private life Dupuytren was cold and reserved, and this was perhaps increased by his constant struggle against a consumptive tendency, which ultimately carried him off, 8th February 1835. In November 1853 he had suffered a slight shock of apoplexy, but he continued in practice almost until the day of his death.

DUQUESNE, Abraham, Marquis (1610-1688), one of the most distinguished naval officers in the history of France, was born at Dieppe in 1610. Born in a strong seaport, the son of a distinguished naval officer, he naturally adopted the profession of a sailor. He spent his youth in the merchant service, and obtained his first distinction in naval warfare by the capture of the Island of Lermia from the Spaniards in May 1637. About the same time his father was killed in an engagement with the Spaniards, and the news raised his hatred of the national enemy to the pitch of a personal and hotter animosity. For the next five years he sought every opportunity of inflicting further humiliation on the Spanish navy, and he distinguished himself by his bravery in the engagement at Gattari (1658), the expedition to Coruña (1630), and in battles at Tarragona (1641), Barcelona (1643), and the Cape of Good Hope. The French fleet, being left unoccupied during the minority of Louis XIV., Duquesne obtained leave to offer his services to the king of Sweden, who gave him a commission as vice-admiral in 1643. In this capacity he defeated the Danish fleet near Gottenburg and thus raised the siege of the city. The Danes returned to the struggle with increased forces under the command of King Christian in person, but they were again defeated,—their admiral being killed and his ship taken. Peace having been concluded between Sweden and Denmark in 1645, Duquesne returned to France. The revolt at Bordeaux, supported as it was by the naturalists from Spain, gave him the opportunity of once serving his country and gratifying his long cherished hatred of the Spaniards. In 1650 he fitted out at his own expense a squadron with which he blockaded the mouth of the Gironde, and compelled the city to surrender. For this service he was promoted in rank, and received a gift of the castle and isle of Indre, near Nantes. Peace with Spain was concluded in 1659, and for some years afterwards Duquesne was occupied in endeavours to suppress piracy in the Mediterranean. On the revolt of Messina from Holland, he was sent to support the insurgents, and had to encounter the united fleets of Spain and Holland under the command of the celebrated Admiral De Ruyter.
After several battles, in which the advantage was generally on the side of the French, a truce was arranged and took place near Cutania, on 20th April 1676, when the Dutch fleet was totally routed and De Ruyter mortally wounded.

The greater part of the defeated fleet was afterwards burned in the harbour of Palermo, where it had taken refuge, and the French thus secured the undisputed command of the Mediterranean. For this important service Duquesne received a letter of thanks from Louis XIV., together with the title of marquis and the estate of Bouchet. Owing to his being a Protestant, however, his professional rank was not advanced. His last achievements were the bombardment of Algiers (1822-3), in order to effect the delivery of the Christian captives and the bombardment of Genoa in 1824. On the revocation of the Edict of Nantes Duquesne lost his commission, but he was specially excepted from banishment. He died at Paris on 2d February 1688.

DURAN, Augustus (1759-1862), one of the leaders of the literary movement in Spain during the present century, was born at Madrid, where his father held the post of court physician. He lost his mother in childhood, and, instead of being educated in the capital, was sent to the seminary at Vergara, rather to gain strength and health than such mathematics and Latin as his clerical teachers could supply. Thence he returned a firm believer in ghosts, and erudite in the traditions of Spanish romance. In 1817 he joined the university of Seville for the study of philosophy and law, and in due course was admitted an advocate at Valladolid. From 1821 to 1823 he held a post in the dirección general de estudios at Madrid; but in the latter year he was discarded on account of his political opinions, and it was not till 1834 that he received a new appointment as secretary of the board for the censorship of the press, shortly afterwards supplemented by a post in the National Library at Madrid. The revolution of 1840 again led to his dismissal; but he recovered his position in 1843, and in 1854 attained the rank of director of the library. Next year, however, he retired, and the rest of his life was devoted to his literary work. He died in 1862. It was in 1829, shortly after his first discharge from office, that he published his discourse on the influence which modern criticism had exercised on the ancient Spanish theatre (Discurso sobre el inftajo que ha tenido la critica moderna en la decadencia del teatro antiguo); and, though the work was anonymous, it produced a marvellous effect on the tendencies of the national drama. He next endeavoured to make better known to his fellow-countrymen those half-forgotten treasures of their literature, in the collection of which he had spared neither money nor toil. Five volumes of a Romancero general appeared from 1828 to 1832 (republished, with considerable additions and improvements, in 2 vols. 1849-1851), and Talca española, or a collection of old Spanish comedies, in 3 vols, in 1834. As an original poet the author is best known by a poem in imitation of the style of the 15th century, entitled Las tres toronjas del verdol de amor, or "The Three Citron Trees of the Orchard of Love."

DURANDUS, Willelmus (1237-1296), otherwise Durante or Duranti, was born at Pulimin, sometimes written Pulmoisin, a small town in the diocese of Beziers, in Languedoc, whence he is sometimes described as a native of Provence. He studied law under Bernardus of Parma, in the university of Bologna, where he was promoted to the degree of doctor. He shortly afterwards migrated to the University of Modena, where he became so famous by his lectures on the canon law that he attracted the notice of Pope Clement IV., who appointed him auditor of the palace, and subsequently subdeacon and chancellor. In 1274 he accompanied Pope Gregory X. as his secretary to the Council of Lyons, which is reckoned as the fourteenth general council, and under the pontificates of several subsequent popes filled highly responsible offices. He was a work of 1278 spiritual and temporal legate of the patrimonis of St Peter under Pope Nicholas III., and in 1278 took possession, in the name of the same Pope, of the provinces of Bologna and Romagna. In 1281 Pope Martin IV. named him vicarapo spiritual, and in 1283 governor of the temporalities of the two provinces, in which office he had the direction of the war against the rebellious province of Romagna. The town of Castrum Riparum Urbanianum having been burnt down during the war, he rebuilt it, and renamed it Castrum Durantis. Pope Urban VIII. subsequently gave to this town the name of Urbania, which it bears in the present day. Pope Honorius IV. returned Durandus in the same offices until the end of 1286, when his election to the bishopric of Meude, in Languedoc, was the occasion of his retiring for a short time from the conduct of civil affairs.

Durandus, however, appears to have remained in Italy, and to have revised at this time several of his works. He refused in 1286 the archbishopric of Ravenna, which was offered to him by Pope Boniface VIII., and accepted in preference the more arduous office of governor of the province of Romagna and of the march of Ancona. The party of the Ghibellines, however, carried on hostilities against the Holy See with so much vigour that he found his strength unequal to the exigencies of government; and, having resigned his post, he retired to Rome, where he died on 1st November 1296.

Durandus was the author of several very learned works. The most famous of them is his Speculum Iudiciale. This work is entitled in the printed copies, the earliest of which was published at Rome in folio in 1474, as Speculum Juriae, but all the MSS. bear the title of Speculum Iudiciale, and Durandus himself, in his epistle dedicatory to Cardinal Ottobono Passo, afterwards Pope Adrian V., describes it under this latter title. It is a practical treatise on civil and canon law, and it earned for its author, when young, the surname of the Father of Practice. Durandus is said to have completed it in 1274, at the age of thirty-four, and he revised it some time between 1287 and 1291. It has since been such an acquisition of its time. As Durandus himself drew up the Decretals, which after his death were inserted in the Sextus. Durandus also wrote a commentary on the decretales of Pope Nicholas III., which is only known to us from the epitaph on his tomb, as preserved by Sarti, and which enumerates all his chief writings, amongst which may be mentioned his Speculum Legisaurum, inserted in the Speculum Judiciale, his Edizione Dissertationum Officiorum, which has passed through many editions, the earliest of which was printed at Brescia in 1490, and a copy of which is stated was in the library of Abbe Pascal Bataille, who have been scrawled from his Pontificale Patrum, being a treatise on the duties of bishops, preserved in the National Library of Paris. Durandus the Speculator is sometimes confounded with Durandus of Acre, who, under the name of Dominico, bishop of Meaux, who died in 1332, and was the author of two treatises, De Jurisdictionibus and De Legibus, and with William Durandus, his own nephew, who was living in 1308 and wrote De modo celebrandi Canonia, and who died in Cyprus in 1328.

DURANGO, a town of Spain, in the province of Biscay 16 miles south-east of Bilbao, at the confluence of the Durango and the Mafaria. As a military position of some importance it is often mentioned in history. The town of Pedro de Tavira is one of the earliest in the Biscayan district; and that of Santa Ana has some interesting altars constructed by Ventura Rodriguez in 1774. The inhabit-
DUR-DUR

...ants, who number about 2600, are partly engaged in the manufacture of iron and steel, and carry on a trade with Hamburg in chestnut. The foundation of the town is ascribed to the early kings of Navarre, and in 1158 it obtained the rank of a countyship. The decree by which Don Carlos in 1839 ordered all foreigners taken in arms against him to be shot was issued from Durango.

DURANGO, sometimes called Ciudad Victoria, or Guadalupe, a city of Mexico, the capital of the state of Durango, lies near the foot of the south eastern slope of the Sierra Madre, at a height of 6487 feet above the sea, in 24° 25' N lat and 102° 55' W long. It is the centre of a Roman Catholic bishopric, and possesses a cathedral, ten parish churches, a hospital, Government-buildings, a penitentiary, a state prison, a bull-ring, and a large cock-pit. Formerly the seat of a Jesuit college, it still maintains an episcopal seminary, and an institute with literary, legal, and scientific departments. It is well supplied with water by thermal and other springs, which not only satisfy the demands of nine public baths, but also fill considerable channels along the streets. Trade is carried on with the northern and north-western states, and, besides a mint, a gold refinery, and other offices connected with the mining operations, there are glass works, printing-presses, and factories for cotton and woollen goods, leather, and tobacco. Durango was founded in 1559 or 1560 by Alonso de Echeveria, an officer of the Viceroy Velasco, as a military post for the control of the Chichimecas. It was soon after made an episcopal see, but did not attain any great importance till the discovery of the rich deposits of Guarrasowe, and most of its public buildings were erected at the expense of Zambruno, the owner of the mines. In 1783 it had no more than 8000 inhabitants, about 1850 they were estimated at 30,000 or 40,000, in 1868 they were reduced to 12,449.

DURANTE, Francesco, a celebrated Italian composer, and one of the founders of the so-called Neapolitan school of music, was born at Frattamaggiore, in the kingdom of Naples, and not, as has been erroneously stated, in the city of that name. The date of his birth is generally given nine years too late. In reality he was born on March 15, 1684. At an early age he entered the Conservatorio dei poveri di Gesù Cristo, at Naples, where he received lessons from Gaetano Greco, but soon he attracted the attention of the celebrated Alessandro Scarlatti, at that time the head and ornaments of another great music school of Naples, the Conservatorio di St Ondoro. Under his guidance Durante studied for a considerable time, and left him only to go to Rome, where, during further five years, he completed his vocal studies under Fétis. On his return to Naples he obtained the position of chapel-master at the school of St Ondoro, which he occupied till 1742, when he succeeded Porpora as head of the Conservatorio Santa Maria di Loreto, also at Naples. This post he held for thirteen years, till his death in 1755. His fame as a teacher was all but unrivalled, and the most celebrated masters of the earlier school of Italian opera are amongst his pupils. Only Jamelli, Pasdelou, Perugio, Pecchi, and Vincenzo may be mentioned here. Under him the Neapolitan school of music reached its climax of celebrity, and it was in this school that the great traditions of Italian vocal art were established, the last remnants of which are rapidly disappearing. His manner of working, in writing all but exclusively of sacred compositions, was presented by Savorgnà, a Neapolitan lover of art, to the Pari library. A catalogue of it may be found in Fétis's Biographie Universelle. The imperial library of Vienna also preserves a valuable collection of Durante's manuscripts. Two requiems, several masses (one of which, a most original work, is the Pastoral Mass for four voices), and the Lamentations of the Prophet Jeremiah are amongst his most important settings.

DURÃO, José de Santa Bárbara, a Brazilian poet, was born at Mariana, in the province of Minas Gerais, in 1737, and died at Lisbon in 1784. He studied at Coimbra, in Portugal, graduated as a doctor of divinity, became a member of the Augustan order of friars, and obtained a great reputation as a preacher. Having irritated the minister Fombal by his defence of the Jesuits, he retired from Portugal, and, after being imprisoned in Spain as a spy, found his way to Italy, where he became acquainted with Alios, F品德monte, Casti, and other literary men of the time. On his return to Portugal he delivered the opening address at the university of Coimbra for the year 1782, but soon after retired to the clusters of a Grattan convent. At the time of his death he taught in the little college belonging to that order in Lisbon. His principal poems, entitled Carasia, or, poema eposo do descrevimento da Bahia, appeared at Lisbon in 1781, but proved at first a total failure. Its value has gradually been recognized, and it now ranks as one of the best poems in Brazilian literature—remarkable especially for its fine descriptions of scenery and native life in South America. The historic institute of Rio de Janeiro offered a prize to the author of the best essay on the legend of Caraimura, and the successful competitor published a new edition of Durão's poem. There are two French translations, one of which appeared in 1829 in 3 vols 8vo.

See Adolfo de Varnhagen, Epoca Beneficen, 1845, Pereira da Silva, Os Varios Lisadores do Brazil, 1858, Wolf, Le Brasil litteraire, Berlin, 1863.

DURAZZO, the ancient Dyrrachium, or Epidamnum, in Turkish Dratsh, and in Slavonian Drantze, was an old Ionian city of European Turkey, in Albania, about fifty miles south of Scutari, on the eastern shore of the Adriatic. It is the seat of a Roman Catholic bishop and a Greek archbishop, but in every respect has greatly declined from its former prosperity. The walls are dilapidated, plantain trees are growing on the gigantic ruins of its old Byzantine citadel, and its harbour, once equally commodious and safe, is gradually becoming silted up. The only features worthy of notice are the quay, with its rows of cannon, and the bridge, 750 feet long, which leads a colony of Turks across the mouth of the coast. Such trade as it still possesses is mainly carried on with Trewon, and consists in the export of grain, skins, wool, wood, and leeches. The population is estimated at 9600.

DURBAR, or more correctly DURBAN, a town of South Africa, in Natal, in the county of Durban, situated on a sandflats about a mile to the north of the bay of Port Natal, in 29° 52' S lat, and 31° 2' E long. It is well laid out with wide tree-shaded streets, carries on a considerable export and import trade, and possesses an Episcopal church, two Wesleyan chapels (one for natives and the other for Europeans), a Government school, a prison, a custom-house, a literary institution, and an agricultural and horticultural society. Durban was founded in 1834 as the capital of the republican colony of Victoria and Natal, its name was bestowed in honour of Sir Benjamin D'Urban, the governor of the Cape. The population, mostly English, was in 1866, 4991.

DUREN, a town of Prussia, at the head of a circle in the province of the Rhine, on the right bank of the Poer at a railway junction eighteen miles east of Aix-la-Chapelle. Besides two Roman Catholic and two Protestant churches, it possesses three nunneries, a gymnasium, a mining school, and a blind asylum—the Elizabeth Institution—which was
founded in 1845 and in 1863 was made a provincial establishment. Woollen goods, paper, and needles were manufactured on an extensive scale, and flax-spinning, felt-weaving, wire-weaving, macramé, and zino-rolling are also carried on.

Durer is probably to be identified with the Marodurum of the Ubi, where they were defeated by Cottius in 49 B.C. It was from Cottius, the rank of an provincial city, and its claims were confirmed by Rupert in 1407. Paused by Frederic 11. to Count William of Juliers as security for the payment of a debt, it was ultimately incorporated with the duchy of Juliers. Its name frequently occurs in the history of the Palatinate. Population in 1873, 14,512.

DURER, ALBRECHT (1471-1528), was born at Nuremberg on the 21st of May 1471; he was therefore six years older than Titian and twelve years older than Raphael. In the history of art, Albert Durer has a name equal to that of the greatest of the Italians. North of the Alps, his only peer was Holbein. But Holbein was not born till 1497, and lived after 1535, principally in England; hence in youth he came within the influence of the already matured arts of Italy, and in manhood his best powers were concentrated on the painting of portraits in a foreign country. Durer lived a German among Germans, and is the true representative artist of that nation. All the qualities of his art取决于 the combination of the warmth of the South, with a Reformation of the mind. He was, indeed, first of all a painter; and though in his methods he was too scrupulous and laborious to produce many great works, and though one of his greatest, the Assumption of the Virgin, has been destroyed by fire, and another, the Feast of Rose-Garlands, has suffered irreparable injury and repair, yet the paintings which remain by his hand are sufficient to place him among the great masters of the world. He has every gift in art except the Greek and the Italian gift of beauty or ideal grace. In religious painting, he has profound earnestness and humanity, and an inexhaustible dramatic invention; and the accessory landscape and scenery of his compositions are more richly conceived and better studied than any painter before him. In portrait, he is equally master of the soul and body, rendering every detail of the human superficies with a microscopic fidelity, which nevertheless does not encumber or overlay the essential and inner character of the person represented. Still more if we judge him by his drawings and studies, of which a vast number are preserved in private as well as public collections, shall we realize his power in grasping and delineating natural face and character, the combined gravity and minuteness of his style, the penetration of his eye, and the almost superhuman patience and accuracy of his line in drawing, whether from persons, animals, plants, or landscape, whether with pen, pencil, charcoal, or (which was his favourite method) in colour with the point of the brush. But neither his paintings nor his drawings could by themselves have won for him the immense popular fame and authority which have been his from his own time to ours; that fame and that authority are due to his pre-eminence in the most popular and democratic of the arts, that of which the works are accessible to the largest number, the art of engraving. In an age which drew a large part of its intellectual nourishment from engraving, Durer furnished the most masterly examples both of the refined and elaborate art of the metal engraver, as well as the most striking inventions for the robust and simple art of the wood engraver.

The town of Nuremberg in Franconia, in the age of Durer, was a home most favourable to the growth and development of its arts. Of the free imperial cities of central Germany, none had a greater historic fame, none a more settled and patriotic government, none was more the favourite of the emperors, none was the seat of a more active
and flourishing commerce. Nuremberg was the great mart for the merchandise that came to central Europe from the East through Venice and over the passes of the Tyrol. She held not only a close commercial intercourse, but also a close intellectual intercourse, with Italy. Without being so far forward as the neighbour city of Augsburg to embrace the intellectual fashions of the Italian Renaissance, yet, continuing to be profusely imbued with the old German burgher spirit, and to wear, with an evidence which is almost unimpaired to this day, the old German civic aspect, she had imported, before the close of the 15th century, much of the new learning of Italy, and numbered among her citizens a Willibald Pirckheimer, a Sebastian Schreyer, a Hartmann Schedel, and others fit to hold a place in the first rank of European humanists. The life into which Albert Durer was born was a grave, a devout, a law-loving, and a lettered life, in the midst of a community devoted to honourable commerce and honourable avocations, proud of its past, proud of its wealth, proud of its liberties, proud of its arts and ingenuities, and abounding in aspects of a quaint and picturesque dignity. His family was not of Nuremberg descent, but came from the vale of Eyta in Hungen. The name, however, was German, and the family bearing—an open door—points to an original form of Thürer, meaning a maker of doors, or carpenter. Albrecht Durer the elder was a goldsmith by trade, and settled soon after the middle of the 15th century in Nuremberg. He served as assistant under a master goldsmith of the city, Hieronymus Holper, and presently married his master's daughter, Barbara. This was in 1468, the bridegroom being forty and the bride fifteen years of age. They had eighteen children, of whom Albert was the second. The elder Durer was an esteemed citizen, and was possessed of an immense family, but living in virtue and honour to the end of his days. The accounts we have of him proceed from his illustrious son, who always speaks with the tenderest reverence and affection of both his parents, and has left a touching narrative of the deathbed of each. He painted the portrait of his father twice, once about 1490, the second time in 1497. The former of these two pictures is in the Uffiz at Florence, the latter, well known by Holbein's engraving, is in the possession of the Duke of Northumberland. A third "Portrait of his Father" by Durer, in the gallery at Frankfort, is probably so called in error. The young Albert was the second. He was the second of the Tyrolian family. In learning, he was at the age of fifteen and a half apprenticed for three years to the principal painter of the town, Michael Wolgemuth. Wolgemuth furnishes a complete type of the German painter of that age. At the head of a large shop, he had numerous assistants, his business was to turn out, generally for a small price, devotional pieces commissioned by mercantile corporations or private persons to decorate their chapels in the churches,—the preference being usually for scenes of our Lord's Passion, or for tortures and martyrdoms of the saints. In work of this class, the painters of upper Germany before the Renaissance show considerable technical knowledge, and a love of rich and quaint costumes and of landscape, but in the human part of their representations often a grim and debased exaggeration, transgressing all bounds in the grotesqueness of undignified caricature.

Wolgemuth and his assistants also produced woodcuts for book illustration, and probably—though this is a vexed question—engravings on copper. In this school Durer learnt much, by his own account, but suffered also not a little from the roughness of his companions. At the end of his term under Wolgemuth, he entered upon the usual course of travels—the Wunderjahre—of a German youth. The direction of these travels we cannot retrace with certainty. It had been at one time his father's intention to apprentice him to Martin Schongauer, of Colmar in Alsace, incomparably the most refined German painter and engraver of his time. To Colmar, among other places, Albert Durer went in the course of his travels; but Schongauer had already died there in 1488. We also hear of him at Strassburg. It is a moot point among biographers whether towards the end of his Wunderjahre—about the year 1494—the young Durer did or did not cross the Alps to Venice. On the one hand it is argued that he did, first, because, on the occasion of an undoubted visit to Venice in 1506, he speaks of admiring no longer that which he had vastly admired "eleven years before," secondly, because several careful drawings by his hand from the engravings of Mantegna and other Italian masters, bearing the date of 1494, show that in this year he was making a special study of Italian art, and thirdly, because he has left a number of coloured drawings of the scenery of Tyrol, such as he would have to traverse on the road between Bavaria and Venice, and these show a technical finish and minuteness of execution, characteristic of his studies at this early period but not later. Those who do not believe in this early visit to Venice reply, first, that the allusion interpreted as above in Durer's correspondence is too vague and uncertain, and that what Durer, in 1506, had really "admired eleven years ago" was probably not the work of Venetians seen at Venice, but of a Venetian artist known as Jacopo de' Barbari, or Jacob Waltz, who resided about that time in Nuremberg, and who, we know, had a very considerable influence on the art of Durer; secondly, that the prints of Mantegna and other Italians, undoubtedly copied by Durer in 1494, may very well have been brought to Germany with other wares on sale from Venice, or have been shown him by the same Jacopo de' Barbari, and thirdly, that other landscapes, bearing the date of 1506 or 1507, do in fact show the same technical characters as those which are assigned, by the other side in the argument, to 1494. The question will probably remain open to the end. With reference, however, to the third head of the argument, the character of Durer's early landscape work, it has not been sufficiently observed that his ideal of scenery shows itself fully formed and developed by the time of the publication of his Apocalypse woodcuts and his earliest engravings on copper, that is, about the year 1497, that this ideal background, of a lake with castled and wooded headlands sloping down from either side, and slopes afflato in distance, is taken not from the neighbourhood of Nuremberg but from the northern borders of Tyrol—it is the scenery, not of the banks of the Tegnitz nor even the Danube, but rather of the Wurmsee or the Tegernsee, that to the Alps and lakes, therefore, of the Northern Tyrol, whether on his way to Venice or otherwise, Durer must certainly have come during these travels of his youth.

At the end of May 1494, being twenty-three years old, Albert Durer returned, at his father's summons, to his native Nuremberg, and within two months was married to Agnes, the daughter of a well-to-do merchant of the town named Hans Frey. It is probable that the marriage had been arranged between Hans Frey and the elder Durer while Albert was on his travels, and possible that a portrait of the young painter very much habited, executed by himself
in the previous year 1493, and showing him in the first bloom of that admirable manly beauty for which he was afterwards renowned, may have given him the good graces of the lady. Their marriage was childless. Agnes survived her husband. The petulance of an old friend of her husband's has unjustly blackened her reputation. Her name has for centuries been used to point a moral, and among the unworthy names of great men the wife of Dürer was as notorious as the wife of Socrates.

The origin of this tradition must be sought in a letter written a few years after Dürer's death by his close friend and lifelong companion, Willibald Pirckheimer, in which Pirckheimer accuses Agnes of having plundered her husband to death with her wanton ways, of having made him over-work himself for money's sake, of having given his latter days no peace. But a closer study of facts and documents shows that there is not a jot of evidence to support these spleenetic charges. Pirckheimer, when he made them, was old, broken with grief, and disgusted with the world, and the immediate occasion of his outburst was nothing more than a vagary of pique on the part of the widow because she had not let him have a pair of antlers—a household ornament much prized in those days—to which he fancied himself entitled out of the property left by Dürer. On the other hand, there is abundant evidence of the close confidence and companionship that subsisted between Dürer and his wife; she accompanied him on his journey to the Low Countries in 1521; after his death she behaved with peculiar generosity to his brothers; it is perfectly probable that Dürer had in her a kind and beloved as well as a careful partner; the old legend of her sufferings at her hands must be regarded as completely discredited. So far from being forced to toil for money to the end, he died well off, though he had in his latter years occupied himself more and more with unremunerative pursuits—with the theoretical studies of perspective, geometry, fortification, proportion, for which he shared the passion of Leonardo, and on which, like Leonardo, he has left written treatises.

For more than eleven years after his marriage, Dürer lived at Nuremberg the settled and industrious life of his profession. Within this period his masterly powers unfolded and matured themselves. Two important devotional pictures are attributed to his early practice; one a large triptych painted in tempera on linen, now in the gallery at Dresden, the other also an altar-piece with wings, now in the small palace of the archbishop of Vienna at Ober St Veit; both probably painted for the Elector Frederick of Saxony. These pictures have been executed, like those of Wohlgemuth, hastily, and with the help of pupils. (Of painters trained in the school of Dürer, we know the names and characters of Schaufelein, Sprungkobbe, Haan Baldung Grun, and Hans of Culmbach.) A finer, and somewhat later, example of the master's work in this class is the altar-piece painted for the family of Baumgartner, having a Birth of Christ in the centre and the figure of a knight on either side; this is now at Munich. The best of Dürer's engravings, both of mind and hand, must have been given in these days to the large number of engravings and woodcuts for the Apocalypse. The first edition illustrated with this series appeared in 1498. The Northern mind had long dwelt with eagerness on these mysteries of things to come, and among the earliest block-books printed in Germany is an edition of the Apocalypse with rude figures. But Dürer not only transcended all efforts made before him in the representation of these strange promises, terrors, and transformations, these thunamaturge visions of doom and redemption; the passionate energy and undismayed simplicity of his imagination enable him, in this order of creation, to reach the highest point of human achievement. The four angels keeping back the winds that they blow not; the four riders; the loosing of the angels of the Euphrates to slay the third part of men; these and others are creations of such force, such grandeur or tempestuous grandeur in the midst of grotesque and unutterable horror, as the art of no other age or hand has produced. At the same time, Dürer was practising himself diligently in the laborious art of copper engraving. In the years immediately about or preceding 1500, he produced a number of plates of which the subjects are generally fanciful and allegorical, and the execution is more or less tentative and uncertain. Of several of these, other versions exist by contemporary masters, and it is disputed in most of such cases whether Dürer's version is the original, or whether, being as that time young and comparatively unknown, he did not rather begin by copying the work of older men; in which case, the originals of such engravings would have to be sought in versions bearing other signatures than Dürer's. One signature of frequent occurrence on German engravings of this time, and among them, on several subjects which are also repeated by Dürer's hand, is the letter W. To the identity of this W, criticism is much divided. He has been generally identified with one Wenzel of Olmuts, whom we know to have engraved copies after Martin Schongauer and other masters. Others, again, attribute some at least of the prints signed W to Dürer's teacher Wohlgemuth, and when the same composition is found engraved by each of the two masters, conclude that the younger has copied the work of the elder. Instances are the subjects of the Four Naked Women with Death and the Fiend, the Old Man's Dream of Love; the Virgin and Child with the Ape, &c. The question is difficult to decide. It seems certain that the work of several different hands is signed with this same initial W; and we are of those who hold, that, of the engravers so signing, one, whether Wohlgemuth or not, is a very accomplished master, whose work Dürer, until near the age of thirty, was in the habit of occasionally copying. From another master, again, whose name we have already mentioned, the half Venetian half German Jacopo de' Barbari, Dürer learned much. The Italians had already begun to work out a science of the human structure and of ideal proportions; and from Jacopo de' Barbari, as Dürer himself tells us, he received in youth the first hints of this science, which he subsequently investigated for himself with his usual persistent industry. These early notions received from Jacopo de' Barbari led to one immediate result of value, the famous engravings of Adam and Eve published in 1504. The figures here, as we can see by many preparatory sketches, are planned on geometrical principles, not drawn—as was the common German custom, and Dürer's own in a large majority of his works—direct from the model, with all the crudities of the original faithfully delineated. The background of foliage and animals is a miracle of rich invention and faithful and brilliant execution; the full powers of Dürer as an engraver on copper are here for the first time asserted. In another elaborate engraving which probably soon followed this—the Great Fortune or Nemesis—the opposite principle is observed; above a stem (nothing ideal, there is the most literal and graceless commonness. In his own journals Dürer calls this plate Nemesis; it has been conjectured that the piece was composed in allusion to the unfortunate expedition sent by the emperor Maximilian to Switzerland, in which a number of Nuremberg citizens took part, with Pirckheimer at their head. In the meantime Dürer had been variously exercising his inexhaustible power of dramatic invention on the subjects of Christian story. He had completed the set of drawings of the Passion
of Christ, in white on a green ground, which is known as the Green Passion, and forms one of the treasures of the Albertina at Vienna. He had followed up his great woodcut series of the Apocalypse with preparations for another series on a similar scale, and had finished seven out of twelve subjects for the second known as the Green Passion, and sixteen out of twenty for the Life of the Virgin, when his work was interrupted by a journey which is one of the principal episodes in his life. In the autumn of the year 1505 he went to Venice, and stayed there until the autumn of the following year.

The occasion of this journey has been erroneously stated by Vasari. Dürer's engravings, having by this time attained a great popularity both north and south of the Alps, had begun to be copied by various hands, and among others by the celebrated Marcantonio of Bologna, then in his youth. According to Vasari, Marcantonio, in copying Dürer's series of the Little Passion on Wood, had imitated the original monogram, and Dürer, indignant at this fraud, set out for Italy in order to protect his rights, and having lodged a complaint against Marcantonio before the signory of Venice, carried his point so far that Marcantonio was forbidden in future to add the monogram of Dürer to copies taken after his works. This account will not bear examination. Chronological and other proofs show that such a suit was fought at all, it must have been in connection with another set of Dürer's woodcuts, the first sixteen of the Great Passion on Wood. Dürer himself, a number of whose familiar letters written from Venice to his friend Pulkheimer at Nuremberg are preserved, makes no mention of anything of the kind. Nevertheless something of the kind may probably have been among the causes which determined his journey. Other causes, of which we have explicit record, were an outbreak of sickness at Nuremberg, Dürer's desire, which in fact was realized, of finding a good market for the proceeds of his art; and the prospect, also realized, of a commission for an important picture from the German community settled at Venice, who had lately caused an exchange and warehouse—the Fondaco dei Tedeschi—to be built on the Grand Canal, and who were now desirous to dedicate a picture in a church of St. Bartholomew. The picture painted by Dürer on this commission was the Adoration of the Virgin, better known as the Feast of Roé-Garlands, it was subsequently acquired by the emperor Rudolph II., and carried as a thing beyond price upon men's shoulders to Vienna, it now exists in a greatly injured state in the cloisters of St. Bartholomew near Prague. It is one of Dürer's best conceived and most multitudinous compositions, and one in which he aims at rivalling the richness and playfulness of Italian art. Other pictures probably painted by him at Venice are Christ disputing with the Doctors, now in the Palazzo Barbarini at Rome, Christ Crucified, in the gallery at Dresden, and a Madonna and Child in the possession of Lord Lothian. These works of the German master were not without influence upon the Italian painters resident at Venice, an influence which we can distinctly trace in some of the early works of Titian. Dürer's letters testify to the high position he held at Venice, and speak of the jealousy shown towards him by some of the more saucy sort of artists, the friendship and courtesy by the nobler sort, and especially by the noblest of all, the veteran Giovanni Bellini. He had come to Venice with wealth in which he might live if he would consent to abandon home for Italy, of the Northern winter, and how it will make him shiver. Yet he resisted the seductions of the South, and was in Nuremberg again before the close of 1506. First, it seems, he had made an excursion to Bologna having in mind to take Mantegna to the way, in order to do homage to the old age of that Italian master. Andrea Mantegna, from whom he had himself in youth learnt the most. But the death of Mantegna prevented this purpose.

From the winter of 1506 until the summer of 1520, Dürer was again a settled resident in his native town. During these years his genius and his fortunes were at their height, except the darling existence of Raphael at Rome, the annals of art present the spectacle of no more honourable or enviable career. Dürer's fame had spread all over Europe. From Antwerp to Rome his greatness was acknowledged, and artists of less invention, among them some of the foremost on both sides of the Alps, were not ashamed to borrow from his work this or that striking combination or expressive type. He was on terms of friendly or friendly communion with all the first masters of the age, and Raphael held himself honoured in exchanging drawings with Dürer. In his own country, all orders of men, from the emperor Maximilian down, delighted to honour him, he was the familiar companion of chosen spirits among statesmen, humanists, and reformers, and had the power to bend to himself with the links of a more than brotherly friendship the leading citizen of the leading city of Germany, Willibald Pulkheimer. His temper and his life were singularly free from all that was jarring, jealous, or fistful.

The burgher life of even thus, the noblest German city, seems narrow, quiet, and hurh besides the grace and elegance and poetry of Italian life in the same and the preceding generation, but among its native surroundings, the career of Dürer stands out with an aspect of ideal elevation and decorum which is its own. He is even distinguished from his fellow citizens by the stately beauty of his aspect and the rich elegance of his attire. Every reader will be familiar with the portrait in which he has represented himself at this middle period of life—the nobly formed oval countenance, with the short beard, and the long carefully divided locks curling and flowing over either shoulder, the upright brow, the steadfast penetrating gaze of the large perfectly cut eyes, the long nose somewhat aquiline, and full perfectly cloven mouth, the strong delicate fingers playing with the rich fur laped of his cloak.

These years of Dürer's life can best be divided according to the several classes of work with which, during their succession, he was principally occupied. Dürer had written to his brother the Archdeacon Hein, a merchant of Frankfort, in 1502—this was afterwards replaced, at Frankfort, by a copy, and the original transported to Munich, where it perished by fire in 1674; and lastly, the Adoration of the Trinity by all the Saints, a composition of many figures commissioned for a chapel dedicated to All Saints in an almshouse for decayed tradesmen at Nuremberg, and completed in 1511—this is now one of the glories of the Belvedere at Vienna. In this same year, 1511, Dürer brought out his three great woodcut books in folio form together—the Apocalypse in a second edition with the German text, the Life of the Virgin for the first time complete. In 1513, he painted two pictures for his native town, the historical portraits of Charlemagne and the emperor Sigia.
mood, which are now to be seen in the Germanic Museum of Nuremberg. The two or three years next following this are for Dürer years, above all things, of engraving on metal. Of the sixteen pieces composing the Little Passion on Copper, perhaps the best invented and certainly the most brilliantly executed of all his gospel histories, ten were executed in 1512 and the last six in 1513. Of the many Devotional figures of the Virgin and Child cut on copper by Dürer at various times of his career, several of the most pathetic and carefully finished date from about the same time. Now, also, he began to repeat with greater persistency the experiment, which he had first tried some years before, of working by the method, then newly invented, of the etcher; that is, of biting the lines of his drawing with acid upon metal instead of cutting them with the burn. And these, again, are the years of those three master-pieces of his mind and hand, the Melancholia, The Knight with Death and the Devil, and the St. Jerome reading in his Cell. These engravings are too well known to need description. The first two, by their earnest and eminently significant, have fascinated minds of every class, and given rise to an infinity of discussion. It is nearly certain that in these three plates, of almost the same size, date, and manner of equal technical perfection, we have three out of four projected illustrations of the Human Tempers, as they were divided by medieval science—the Melancholic, the Sanguine, the Phlegmatic, and the Choleric. Melancholy being intended to stand at the head of the series (although it is dated 1515, and the Knight 1512), has the numeral I. written after the name Melancholia; the winged genius, in whom the qualities of this temperament are incarnated, is seated darkly musing among symbolic instruments of science. She seems an incarnation of the new spirit of the age, the spirit of solemn and resolve search. The subject of the Knight, being intended to illustrate the opposite type of the personage, in the life of this rude world, has seemed a type of the righteous man whom fate and retribution are about to overtake. And the subject of St. Jerome, the Father of the church to whom Renaissance Christianity turned with the greatest devotion, and whom the labours of Erasmus had made familiar in especial to the humanists of the North, serves as the natural type of the phlegmatic or student temperament. No fourth subject seems to have been attempted to complete the set. The reason of this may have been the call which at this time began to be made on Dürer's industry by another kind of work. The five years between 1514 and 1519 are devoted above all things to woodcut work, on commission from the emperor Maximilian, who had resided for some time at Nuremberg in 1512, and whose personal favour and friendship Dürer from that time enjoyed. With the learned cooperation of Johannes Stabius, he presently commenced a scheme of design for wood engraving in honour of Maximilian more soldiers of the Reformation, Franz von Sickengen; others as designating one of the most insidious and laborious than those of the period just preceding. In 1518 the Diet of Augsburg brought Maximilian to that city, and there Dürer was in attendance on him. A new portrait drawn in charcoal, and subsequently used for an engraving in wood, carries a note in the artist's handwriting to the effect that it was done from the emperor at Augsburg "in his little room up at the top in the palace.

In 1519 Maximilian died. In the next year the desire of Dürer to secure from his successors a continuance of the patronage and privileges granted during his lifetime, together with an outbreak of sickness in Nuremberg, gave occasion to the master's third and last journey from his home. On the 15th of July 1520 he set out for the Netherlands, with his wife and her maid, in order to be present at the coronation of the young emperor Charles V., and if possible to conciliate the good graces of the all-powerful regent Margaret. In the latter part of his aim Dürer was but partially successful. His diary of his travels enables us to follow his movements almost day by day. He travelled by the Rhine to Cologne, and thence by road to Antwerp, where he was splendidly received and lived in whatever society was most distinguished, including that of Erasmus of Rotterdam. Many portrait drawings of persons who sat to him in these days are preserved. Besides going to Antwerp for the coronation, he made excursions down the Rhine to Cologne and thence back overland by Herzogenbusch; to Brussels, to Bruges and Ghent; and to Zealand with the object of seeing a natural curiosity, a whale reported ashore. The vivid account of this last expedition given in his diary contrasts with the usual dry entries of interviews and disembarkements. A still more striking contrast is the passionate outburst of sympathy and indignation with which, in the same diary, he comments on the supposed kidnapping of Luther by foul play on his return from the Diet of Worms. Without being one of those who in his city took an avowed part against the old ecclesiastical system, and probably without seeing clearly whether the religious ferment of the time was tending—without, that is, being properly speaking a Reformer—Dürer in his art and all his thoughts was the incarnation of those qualities of the Teutonic character and the Teutonic conscience which resulted in the Reformation; and personally, with the fathers of the Reformation he lived in the warmest sympathy.

On the 12th of July 1521 Dürer reached home again. The remaining seven years of his life were occupied chiefly with the preparation of the scientific writings of which we have already spoken; with engraving on copper, in a style of consummate care and power, several portraits of his friends, among them the elector Frederick, Frickeimer, Erasmus, and Melanchthon; and with the execution of those two paintings by which, perhaps, his powers in this highest branch of his art are best known, the figures of St. Paul with St. Mark and St. John with Peter. These are now in the Munich gallery, and exhibit at their greatest Dürer's earnest and pregnant conception of character, with a majesty in the types and a grandeur in the gesture and drapery which in his earlier career he had never yet attained. Each apostle or evangelist represents a "temperament"—John the melancholic, Peter the phlegmatic, Paul the sanguine,
DUR-DUR

and M uk the cholerick, and it is characteristic of Durer's thought that Peter is put in the background, studying off a book held open by John, the favourite evangelist of the Reformation and of Luther, in this representation of John some have recognized the features of Melanchthon, its history and all the poet Schiller's correspondence must be obvious. These various classes of work were carried on in the face of failing health. In the cottons of the Low Countries Durer had caught a fever of which he never shook off the effects. The evidence of this we have in his own written words, as well as in the sketch which, he drew to indicate to some doctor with whom he was in correspondence the seat of his suffering, and again, in the record of his physical aspect—the shoulders already somewhat bent, the features somewhat gaunt, the old pride of the abundant locks shaved away—which is preserved in a portrait engraved on wood just after his death, from a drawing made not doubt not long previously that death came suddenly, so suddenly that there was no time to call his dearest friends to his bedside, on the night of the 6th of April 1528. Durer was buried in the vault belonging to his wife's family, but since disturbed, in the burying-ground of St John at Nuremberg He left a name that will be honoured by the latest posterity, and a place that nothing could fill in the affection of his noblest contemporaries. This is the grave and feeling Recognition of Luther, in a letter written to their common friend, Eoban Howe—"As for Durer, assuredly admiration bids us mourn for one who was the best of men, yet you may well hold him happy that he has made so good an end, and that Carst has taken him from the midst of this time of troubles, and from yet greater troubles in store, lest he, that deserved to behold nothing but the best, should be compelled to behold the worst. Therefore may lie in peace with his fathers Amen." The principal extant paintings of Durer, with the places where they are to be found, have been mentioned above. Of his drawings, by far the richest collection is in the Albertina Palace at Vienna, where a large volume, forming part of Lord Arundel's collection, is preserved. By the acquisition of the Poncy-Haller collection, from the Berlin Museum has now (1877) taken certain the third place The Louvre also possesses some good examples, and many others are dispersed in various public collections, as at Munich, Hamburg, Vienna, Basel, Milhn, and Florence, as well as in private hands all over Europe. The principal editions of Durer's theoretical writings are these—

**Geometrie und Perspective**—Unterweisung der Messung mit dem Zirkel und Komass, in Liedern, Aachen und zu Nuremberg, 1525; a Latin translation of the same, with a long title, Paris, Wechel, 1532, and another ed in 1555 Again in Latin, with the title *Institutionum geometrarum libri quatuor*, Archon, 1665

**Fortification**—Eliche Unterweisung in das Seltenheit der Schlach, Stadt, und Platten, Nuremberg, 1527; and other editions in 1530 and 1538 A Latin translation of the same, with the title Der wunders, arcbeus, artificiel de l'architettura, Paris, Wechel, 1535.

**Human Proportion**—Herein begriffen von Buclier von menschlicher Proportion, Nuremberg, 1524 Latin translation De Similitudetaturs in rea humanae corporum libri in latine converten, de variis figuration, &c, libri II, Nuremberg, 1532.

The private literary remains of Durer, his diary, letters, &c, were first published, partly in Von Murr's *Journal zur Kunstgeschichte*, Nuremberg, 1756-1757; afterwards, in Capitana's *Reise*, of A. Durer, Nuremberg, 1827; and again, carefully edited by Profess Thunen, in the *Quellenarbeiten fur Kunst- und Geschichte* in Kunst- und Kunstdruck, Vienna, 1872.

DURFY, Thomas, more generally known by the familiar name of Tom d'Urfe, an English satirist and song writer, was descended from a family of French Huguenot refugees, and was born at Exeter. The year of his birth is unknown. He was originally bred to the law, which he forsok for the more congenial employment of writing plays and songs. His humour both in writing and in singing the latter procured him access to the highest circles, and made him a favourite even at court Addison in the *Guardian* (No. 67) relates that he remembered more than once to have seen Charles II leering on Tom d'Urfe's shoulder and humming over a song with him. He was a strong Tory and Protestant, and it is said that his songs had considerable influence in strengthening the cause of his party His dramatic pieces, numbering upwards of thirty, were well received, but were so licentious that none of them kept the stage during the absolute period for which they were written. D'Urfe, by impudence and extravagance, became poor as he grew old; and having prevailed on the managers of the playhouse to act his comedy of the *Flouting Satire* for his benefit, Addison wrote the above mentioned paper in the *Guardian*, with another (No 82) giving a humorous account of his eccentricities, in order to procure him a full house. He died at an advanced age in 1725. His songs, published in 6 vols, under the title of *Pleas to Forse Melodran*, were republished in 1875.

DURHAM, COUNTY PALATINE OF, one of the northern fertile shires of England. The country is triangular in form, its eastern limit or base being a coast-line exposed to the German Ocean. It is separated from Northumberland chiefly by the Tyne, and its tributary the Derwent; and from the Tees Towards its western extremity it joins Cumberland and Westmoreland. Its greatest length is 45 miles, and its greatest breadth 36 miles, and it contains an area of 1012 square miles, or 647,692 acres. It is divided into four wards—Chester and Eagleson in the north, and Darlington and Stockton in the south. There were formerly three outlying portions of the county, shown in old maps, and known as North Durham (including Northamshire and Inlandshire), Bedlingtonshire, and Crayke. These were attached to the county as having formed parishes of the ancient "parish of St Cuthbert," of which the land between the Tyne and the Tees was the chief portion.

Physical Features—The western angle of the country is occupied by spur of the Pennine chain, and hence is mountainous, with black, naked, and barren regions, from which issue numerous streams flowing to the sea. The elevations vary from 1000 to 2196 feet. There are some beautiful and fertile valleys in the eastern and central parts, pleasantly varied with hill and dale, and alternately appropriated to corn and pasture. Extensive tracts of heather, and meadows, in the western part of the country, are waste, but rich in minerals. In the southern districts the area of cultivation..."
DURHAM

has been considerably increased within the last few years. The ancient common fields belonging to the townships are now mostly inclosed. Draining having been carried on to a great extent; there is very little marshy ground left. Near the river Tees, and in some places bordering on the other rivers, the soil is loam or a rich clay. At a farther distance from these rivers it is of an inferior quality, with patches of gravel interspersed. The hills between the sea and an imaginary line from Brotton Castle on the Tees to Alnwick on the Derwent, are covered with a dry loam, the fertility of which varies with its depth. From this line westward the summits as well as the sides of the hills are in great part moorish wastes.

At the distance of about three miles from Darlington, at Oakenhall, are cavities in the earth, called "Hell Kettles." There are similar natural pits in the neighbourhood of Ripon, and elsewhere. The diameter of the largest is not less than 114 feet, and that of the least 75. About five miles from Hartlepool is one of the most singular clusters of rocks in the north of England, called "Black Halls," formed by the force and constant action of the waves, which have separated enormous masses of the magnesian limestone, washing some entirely away, but leaving others standing, like vast towers. In some places the rock is perforated so as to form curious arches.

The only considerable river, besides those just mentioned, is the Wear, which rises in the western hills and flows past Durham to join the sea at Bishop-Wearmouth and Monk-Wearmouth, which places unite with Sunderland to form one great town. The Team, which gives its name to the Team Valley Railway, is a mere rivulet.

Trees are chiefly confined to the banks and seats of the nooks, which rise in the western hills and flows past Durham to join the sea at Bishop-Wearmouth and Monk-Wearmouth, which places unite with Sunderland to form one great town. The Team, which gives its name to the Team Valley Railway, is a mere rivulet.

Minerals.—The western hills are composed of carboniferous limestone, succeeded eastward by millstone grit, coal-measures, magnesian limestone, and new red sandstone. The southern portion of the limestone is covered with sand, resulting from disintegration of the coal-measures and often showing black beds of coal-detritus. The mountain limestone contains productive veins of lead ore, which are extensively worked, also zine ore. The beds of coal in the coal-measures are from 5 to 6 feet thick, and have long been source of enormous wealth. The mines are among the most extensive and productive in the kingdom. At Sunderland the coal trade furnishes employment for hundreds of vessels, independently of the "keels" or lighters which convey the coal from the termini of the railways and tramways to the ships. The seams now worked extend horizontally for many miles, and are from 20 to 100 fathoms beneath the surface. Under almost every seam of coal is a bed of fire-clay, full of roots of pruneful forest trees. The basaltic formation known as the "Great Whin Sill" appears in Teesdale, and is also remarkable at Cockfield. A beautiful variety of the mountain limestone, known as Prestonian marbles, has for many centuries been quarried near Stanhope for decorative purposes, in Durham Cathedral and elsewhere taking the place of Purbeck marble, while in modern houses it is used chiefly for chimney-pieces. Ironstone is extensively worked in the neighbourhood of Swallett and Wilsington. Some excellent quarries of slate for buildings have been opened in different parts of the county. The neighbourhood of Wolsingham abounds in fine millstones. The Newcastle grindstones are procured at Gateshead Fell; and firestone of high estimation, for building ovens, furnaces, and the like, is obtained in various parts of Durham, and exported in considerable quantity.

Towns.—Besides the city of Durham, the county includes seven ancient boroughs, viz., Hartlepool, Barnard Castle, Bishop Auckland, Darlington, Sunderland, Stockton, and Gateshead. The large villages of Stanhope, Wolsingham, Stanhope, and Sedgefield near Stockton are market towns. The port of Stockton-upon-Tees is well situated for commerce Hartlepool, being on a promontory, nearly encompassed by the German Ocean, which forms a capacious bay to the south of the town is advantageously placed for maritime traffic, Sunderland and South Shields are also well placed at the mouths of the Wear and Tyne.

No county in England presents a closer network of railways than Durham. The York, Newcastle, and Berwick trunk line enters the county south of Darlington, and continues due north until at Gateshead it crosses the Tyne and enters Northumberland. From this a great many smaller lines diverge to the ports and mineral fields.

Agriculture.—Improvements in agriculture have been pursued with considerable spirit and success. On some spots of gravelly soil, turnips and barley are grown in almost perpetual succession, a crop of clover being sometimes interposed. The summers are chiefly limey and the produce of the fold-yard; and though abundance of sea-weed might be collected on the coast, as it was in mediaval times, the farmers now make but little use of it. The farms are of moderate size, few of them exceeding 200 acres. The largest portion of each is arable, except towards the western extremity of the county, where the whole is pasture. The farm houses are well situated and commodious; and improvements in farming and farming machinery keep pace with the age. The cattle of Durham have long been in great repute—except towards the western extremity of the county, where the whole is pasture. The farm houses are well situated and commodious; and improvements in farming and farming machinery keep pace with the age. The cattle of Durham have long been in great repute; and firestone of high estimation, for building ovens, furnaces, and the like, is obtained in various parts of Durham, and exported in considerable quantity.

The following figures, taken from the Agricultural Returns for 1873 and 1876, show the acreage of the principal crops and the numbers of the live stock in the county in those years:

According to the Owners of Land Return, Durham was divided in 1873 among 34,317 separate proprietors, of whom the large proportion of 91 cent. owned less than 1 acre—the average of England and Wales being 71 per cent. The gross rental of the land amounted to £2,589,170, or an average of £5.14.2d. per acre—as compared with £3.0s. 2d., the average of England and Wales. This unusual value per acre is to be ascribed to the presence of minerals. The proprietors possessing more than 8000 acres were as follows:—duke of Cleveland, 55,837 acres; Ecclesiastical Commissioners, 26,068 acres; Viscount Boyne, 15,310; earl of Durham, 14,664; marquis of Londonderry, 12,823; earl of Eldon, 11,848; John Bowes, 8,313; dean and chapter of Durham, 8,089.

Natural History.—Except in the moorlands of the west only a few scraps of the county have been left in their natural state; but these portions are of great interest to the student of natural history. Some excellent quadrupeds have been observed in different parts of the country. The neighbourhood of Wolsingham abounds in fine millstones. The Newcastle
of masonry, and at Billchester the most perfect hypocaust in the north of England has been found. Castles are to be referred to portions of the churches of Chester-le-Street, Whitsome, and in the centre, surrounded by a trench, and encircled by a row of stones, which has been removed and broken to repair the sacred body of St Cuthbert, where they are referred to as marking the limits of the Bishop's estate.

The county is divided for parliamentary purposes into two divisions (North and South Durham), each of which returns two members. The northern division includes 29 polling-places, and the southern 33. The population has greatly increased within the last three years. Durham was inhabited in the year 1851 by 399,597, in 1861, 508,666, and in 1871, 685,089—353,117 males and 331,972 females. The increase between 1851 and 1871 amounts to 724 per cent. The population is estimated at upwards of 850,000 in 1877.

In the county may be traced down to the middle of the 1st century, the remains of a castle, where they are referred to as marking the limits of the Bishop's estate.

Durham

which in Norman times was softened to "Duressa," whence "Durham." The castle was erected by William the Conqueror in 1072, across the neck of the peninsula, so as to guard the church and monastery. In 1093 Ealdhune's church was rebuilt by Bishop Carileph, who changed the Anglo-Saxon establishment of married priests into a Benedictine abbey.

The Cathedral.—Carileph's grand Norman church still forms the main part of the cathedral buildings; but numerous additions have been made from time to time, the chief of which are—the Galilee or western chapel, of the Transitional period, the eastern transept or "Nine Altars" and the western towers (Early English), and the central tower (Perpendicular). Decorated and Perpendicular windows have, as is usual in old churches, been freely inserted. The interior presents the appearance, as Dr. Johnson remarked, of "rocky solidity and of indeterminate duration," and combines, we may add, absolutely perfect proportion in all its original parts with a harmonious magnificence of detail in its massive columns, arches, and stone groining. It has recently been thoroughly cleaned, and supplied with much painted glass and very costly modern fittings, including a new organ built on the largest scale and of fine tone. Durham Cathedral, or "The Abbey," as old-fashioned residents still call it, has long been celebrated and still maintains its reputation for its choral services, as being at least equal to any in England in point of musical execution. This glorious building has been admirably illustrated in Carter's Plates, and in Billing's "Architecture of Durham Cathedral." It is 507 feet in length, by 200 in extreme breadth, with a central tower 214 feet in height, and two smaller ones 138 feet high at the west end. The Galilee or western chapel was built by Bishop Pudsey between 1153 and 1186, and contains the supposed remains of the Venerable Bede. In the chapel of the Nine Altars are the remains of St. Cuthbert, brought to light in 1827. The cathedral library, formerly the dormitory and refectories of the abbey, contains a number of curious and interesting printed books, and MSS., and the portable altar, vestments, and other relics found in St. Cuthbert's grave.

The see of Durham was long the richest bishopric in England. The total revenue of the dean and chapter during the seven years ending 1834 amounted to £36,937 a year. On the death of the incumbent in 1836, at the recommendation of the Ecclesiastical Commissioners, the income of the bishop was fixed at £5000 per annum—the surplus revenues of the see being reserved to form a fund for augmenting the incomes of the poorer bishops.

Castle, &c.—The castle of Durham consists of a polygonal keep, now reconstructed to form a very inconvenient set of college rooms; the great hall built by Bishop Hatfield, which in some respects exceeds any hall in the older universities; the Norman hall, now cut up into rooms; the old Norman crypt chapel; Bishop Tunstall's chapel, at present in use; the Black Staircase, built by Bishop Cope; and the kitchen, the gate-house, and other offices. These are grouped round a court very irregular in plan, and not less picturesque in general effect. Durham Castle was the chief residence of the bishops of the Palatinate, but is now appropriated to the uses of the university, with the exception of the state apartments, which are partly reserved for the bishop and for Her Majesty's judges of assize. The university was opened in 1833; an account of it will be found under Universities. Besides the cathedral, Durham has seven parish churches. There are also places of worship for Roman Catholics, and for various denominations of Protestants. The grammar school attached to the cathedral was founded by Henry VIII. in 1541, and possesses eighteen "king's scholarships," of the annual value of nearly £40 each. There are also several scholarships and exhibitions tenable at the universities. The original school-room is now used by the university of Durham; the new buildings are beautifully situated to the west of the city, and are very handsome and commodious, including residences for the head and second masters, and a school infirmary. Durham possesses flourishing diocesan training colleges for schoolmasters and schoolmistresses; and about four miles to the west of the city is the great Roman Catholic College called St. Cuthbert's College, Ushaw, the present representative of the old college at Douai.

The civil corporation of Durham and Framwellgate consists of the mayor, six aldermen, and eighteen councillors, with a recorder, a chaplain, and town clerk, two elective auditors, and two elective assessors. On the passing of the Corporation Act, 5 and 6 Will. IV. c. 76, the election of the eighteen councillors was vested in the citizens occupying houses and paying poor rates. The councillors so elected have to choose the six aldermen, and the aldermen and councillors have the election of the mayor. Four charters (all, except the third, preserved in the "Hutch" at the Guild Hall) have been granted to the city by different bishops of Durham:—the first by Hugh Pudsey, confirmed by Pope Alexander III., 1175 or 1180; the second by Tobias...
Matthew, confirmed by James I; the third by Nathaniel Lord Crew, 1684 (afterwards delivered to the bishop, the corporation acting under the second charter), and the fourth by John Egerton, 1750.

Durham can scarcely be said to have any staple trade or manufacture, though it possesses one carpet factory and one large mill for the preparation of "Durham mustard." It is now a very different place, socially, from what it was when there were twelve prebendaries with much larger incomes than the canons now have, and when "The College" was a noted centre for dignity and liberal hospitality. At that time, canonical residence was kept with much more strictness than it is at present, and the prebendaries in residence entertained guests of all classes. Noblemen and gentlemen then resided in houses in Framwellgate and Elvet, now let out into tenements and serving as the squatted homes of the very poorest class. The Bailey and Old Elvet are, however, still chiefly occupied by the upper classes, and Western Hill is a new and rapidly increasing suburb. The Palace Green is an open space having the cathedral on the south side, the castle, now University College; on the north, the Exchequer Buildings, now the university library, together with Bishop Cosin's library, on the west, the museum, alms-houses, and other offices on the east. The museum contains an almost complete collection of British birds. Six out of the seven parish churches are ancient, and possess features of interest. The high banks of the river on which the cathedral and castle stand are richly wooded, and traversed in all directions by well-kept paths, which afford ever-changing views of wood, water, rocks, bridges, the cathedral, the castle, picturesque old houses, and terraced gardens.

In 1861 the municipal borough of Durham had within its area of 880 acres 2,007 inhabited houses, with a population of 14,088. In 1871, the number of inhabited houses was 2349, and the population comprised 6956 males and 7450 females, or 14,406 in all. The parliamentary borough, which with an area of 967 acres had 14,833 inhabitants in 1871, returns two members to Parliament. (J. T. F.)

DURHAM, JOHN GEORGE LAMBERT, FIRST EARL OF (1792-1840), born at Lambton Castle, Durham, on the 12th April 1792, was the eldest son of William Henry Lambton, M.P. for the city of Durham. It is noteworthy that the family to which he belonged had held the Lambton estate in uninterrupted male succession from the 12th century. Educated at Eton, he held for a short time a commission in a regiment of hussars. In 1813, soon after attaining his majority, he was returned to Parliament as the representative of the University. In 1817, he was a member of the committee of the House of Commons and at numerous public meetings, of the coercive measures proposed by the Government. His political position was strengthened by his marriage in 1816 to the eldest daughter of Earl Grey. In 1819 he championed the rights of the people by his denunciation, in the House of Commons and at numerous public meetings, of the coercive measures proposed by the Government against the Chartists. In April 1821 he proposed in the House a scheme of parliamentary reform which was pointedly rejected by the Government in 1827, and of that of Lord Goderich by which it was succeeded. When the latter fell to pieces owing to its inherent weakness in January 1829, Lambton's services were acknowledged by his elevation to the peerage as Baron Durham. On the accession of Lord Grey to power in 1830 Lord Durham obtained the office of lord privy seal. He was one of a Cabinet committee of four who were intrusted with the preparation of the Reform Bill, the others being Sir James Graham, Lord John Russell, and Lord Duncannon. It was understood at the time that his influence was exerted to make the measure as liberal as possible, and in particular that he wished to introduce the ballot as one of its provisions. In the debates on the bill in the Lords he did not take the leading part that might naturally have been expected from the only peer who had been on the Cabinet committee for its preparation. This was owing partly to his own indifferent health and partly to grief at the death of his eldest son, the Master Lambton of one of Lawrence's most admired portraits. Continued ill-health led him to resign office in March 1833, when he was raised to the dignity of Viscount Lambton and earl of Durham. In the summer of the same year, however, he was able to undertake a special embassy to the court of St Petersburg, the chief object of which was to secure lenient treatment for the insurgent Poles. In this he was unsuccessful. When the party that had carried reform began to be divided, Lord Durham was generally regarded as a likely leader of the more advanced section, and a strongly radical speech which he delivered at the celebrated Grey banquet at Edinburgh in 1834 helped to strengthen his claim to the postion. It took the form of a reply to a previous speech of Lord Brougham, whose enmity Lord Durham had provoked. In 1837 he accepted the post of ambassador at St Petersburg, which he occupied for about a year. Meanwhile a very serious insurrection had broken out in Canada, and early in 1838 the Government found it necessary to suspend the constitutional constitution and send out a new governor with special powers. Lord Durham was selected to undertake the difficult task, for which his extensive experience and his well-known advanced liberalism were supposed specially to qualify him. Some what hasty and irascible in his temperament, he unfortunately adopted measures which were beyond the powers conferred upon him by the special Act of Parliament under which he had been appointed. These measures were disapproved of by a vote of the House of Lords on the motion of Lord Brougham, who imported the bitterness of his earlier quarrel with Lord Durham into the debate, and the Government were compelled to disallow the ordinances in which they were embodied. Lord Durham was so deeply incensed at this that he took the extraordinary step of returning home without waiting for his recall, and the Government marked its disapproval of his conduct by directing that he should not receive a salutation on landing in England. He defended his plan of administration in an able and elaborate report addressed to the queen, and his policy was practically justified by being adopted by his successor. He had returned to England in shattered health, and he died at Cowes, in the Isle of Wight, on the 28th July 1840.

DURIÁN (Malay, dur, a thorn), the fruit of Durio zibethinus, a tree of the natural order Sterculiaceae, which attains a height of 70 or 80 feet, has oblong, tapering leaves, rounded at the base, and yellowish-green flowers, and bears a general resemblance to the elm. The durian is cultivated in Sumatra, Java, Celebes, and the Moluccas, and northwards as far as Mindanao in the Philippines; also in the Malay Peninsula, in Tenasserim, on the Bay of Bengal, to 14° N. lat., and in Siam to the 13th and 4th parallels. The fruit is spherical, and 6 to 8 inches in diameter, approaching the size of a large cocoa-nut, it has a hard external husk or shell, and is completely armed with strong pyramidal tubercles, meeting another at the base, and terminating in sharp thorny points; these sometimes inflict severe injuries on persons upon whom the fruit may chance to fall when ripe. On dividing the fruit at the
sutures of the carpels, where the spines arch a little, it is found to contain five oval cells, each filled with a cream-colored, almost smooth pulp, in which are imbedded from one to five seeds about the size of chestnuts. The pulp and the seeds, which latter are eaten roasted, are the edible parts of the fruit. With regard to the taste of the pulp Mr. Wallace remarks, "A rich butter-like custard, highly flavoured with almonds, gives the best idea of it, but intermixed with it are bits of flavour that call to mind cream-cheese, ouzo-sauce, brown sherry, and other incongruities, . . . . . . it is neither acid, nor sweet, nor juicy, yet one feels the want of none of these qualities, for it is perfect as it is." The fruit, especially when not fresh from the tree, has, notwithstanding, a most offensive smell, and the seeds, which latter are eaten roasted, are the best relish for cattle; and the grain, of which the yield in favourable situations is upwards of a hundredfold, is used for the same purposes as maize, rice, corn, and other cereals. Allied species are S. bicolor, much valued in India as a forage-plant, and S. esculentum, commonly called sorghum or Chinese sugar cane, which is extensively cultivated in China, North India, and Africa. The latter species is grown in America chiefly for the manufacture of molasses from its juice, and in France as a source of alcohol. The total quantity of sorghum molasses made in the United States in 1800 has been estimated at 15,050,080 gallons.

DURRA, or INDIAN MILLET, Sorghum vulgare, is a species of grass of the tribe Andropogoneae. The terms durra and curru are applied to the plant in Arabia; in India it is known as jowari (Hindustani), jowar (Bengali), chotum (Tamil), and jonna (Telugu), and in the West Indies as Negro or Guinea Corn. It is a strong grass, growing to a height of from 4 to 8 or even 16 feet; the leaves are shining, solitary, and about 2 inches broad and 2 feet in length; the panicles are conical or club-shaped, hermaphrodite; and the seeds, which are inclosed in husks, and protected by awns, are round, hard, smooth, shining, brownish-red, and somewhat larger than mustard seeds. The plant is cultivated in various parts of India and other countries of Asia, in the United States, and in the south of Europe. Its culms and leaves afford excellent fodder for cattle; and the grain, of which the yield in favourable situations is upwards of a hundredfold, is used for the same purposes as maize, rice, corn, and other cereals. Allied species are S. bicolor, much valued in India as a forage-plant, and S. esculentum, commonly called sorghum or Chinese sugar cane, which is extensively cultivated in China, North India, and Africa. The latter species is grown in America chiefly for the manufacture of molasses from its juice, and in France as a source of alcohol. The total quantity of sorghum molasses made in the United States in 1800 has been estimated at 15,050,080 gallons.

DURSEK, JOHANN LUDWIG (1761-1812), pianist and composer, was born at Czsalu, in Ebohemia, on the 9th February 1761. His father, Johann Joseph Dussek, a musician of high reputation, was organist and choir-master in the collegiate church of Czsalu, and several other members of the family were distinguished as organists. He had thus the most favourable opportunity for the development of the musical talent which he displayed almost from infancy. Under the careful instruction of his father he made such rapid progress that he appeared in public as a pianist at the age of six. A year or two later he was placed as a choir boy at the convent of Tglau, and he obtained his first instruction in counterpoint from Spenar, the choir-master. When his voice broke he entered on a course of general study, first at the Jesuits' college, and then at the university of Prague, where he took his bachelor's degree in philosophy. During his curriculum of two and a half years he had paid unremitting attention to the practice and study of his art, and had received further instruction in composition from a Benedictine monk. In 1779 he was for a short time organist in the church of St Rombaut at Mechlin. At the close of this engagement he proceeded to Holland, where he attained great distinction as a pianist, and was employed by the stadtholder as musical instructor to his family. While at the Hague he published his first works in the form of several sonatas and concertos for the piano. He had already composed at the age of thirteen a solemn mass and several small oratorios, which still exist in manuscript. In 1783 he visited Hamburg, and placed himself under the instruction of Emmanuel Bach. Though he believed himself to have derived great benefit from this, it may be questioned whether his genius was not fitter rather than stimulated by the enthusiastic veneration with which he regarded his model. From Hamburg he proceeded to Berlin, where his powers as a pianist met with their accustomed recognition. After spending two years in Lithuania in the service of Prince Radziwill, he went in 1786 to Paris, where he remained, with the exception of a short period spent at Milan, until the outbreak of the Revolution, enjoying the special patronage of Marie Antoinette and great popularity among artists. At the close of 1789 he removed to London, where three years later he married a daughter of Dominico Corri, who was...
herself a clever harpist and pianist. In London he obtained her greatest success alike as composer, performer, and teacher. Unfortunately, however, he was tempted by the large sale of his numerous compositions to open a music-publishing warehouse in partnership with Montague Corri, a relative of his wife. The result was injurious to his fame and disastrous to his fortune. Writing solely for the sake of sale, he composed many pieces that were quite unworthy of his genius, and, as he was entirely destitute of business capacity, bankruptcy was inevitable. In 1800 he was obliged to flee to Hamburg to escape the claims of his creditors. Some years later he was attached in the capacity of musician to the household of Prince Louis Ferdinand of Prussia, with whom he formed an intimate friendship. On the death of his patron in 1806 he passed into the service of Prince Yusenburg as court musician. In 1809 he went to Paris to fill a similar situation in the household of Prince Talleyrand, which he held until his death in March 1812. Dussek had an important influence on the development of pianoforte music. As a performer he was distinguished by the purity of his tone, the combined power and delicacy of his touch, and the facility of his execution. As a composer he possessed a distinct individuality of style, and, while much that he wrote had little value, his best works rank high among pianoforte classics. His sonatas known as The Invention, The Farewell, and The Harmonic Elegy, though not equally sustained throughout, contain movements that have scarcely been surpassed for solemnity and beauty of idiom. Two operas, which he composed during his residence in London, were failures.

DUSSELDORF, a town of Prussia, at the head of a government in the province of the Rhine, on the right bank of the river, 25 miles below Cologne. It is divided into four portions—the Old Town, the Karlstadt, which dates from 1787 and is called after the electoral prince Charles Theodore, the New Town, which was in process of formation from 1690 to 1716, and the Friedensstadt, laid out within recent years. New streets are rapidly stretching out in all directions, and the villages of Pempelhortex, Bilk, and Dernendorf are already almost incorporated. Within the area of the town proper there are numerous open grounds and public squares, which prevent the regularity of its plan degenerating into monotony: the market-place, with the colossal bronze statue of the electoral prince Johann Wilhelm, the parade, the Allee Straße, the King's Alley, and the King's Platz may be specially mentioned. Of the ten churches the most noticeable are—St Andrew's, formerly the Jesuit or court church, with frescoes by Hubner, Deger, and Macke; the embalmed bodies of several of the electors, St Lambert's, with a tower 180 feet high, and containing monuments in honour of Duke William IV and Voetius, and Maximilian's, with frescoes by Setzgast and others. Besides the old ducal palace, laid in ruins by the French in 1794, but restored in 1846, the secular buildings comprise the former Jesuit college, now occupied by the administrative offices, a town-house dating from 1567, a penitentary, a lunatic asylum, several hospitals and infirmaries, a theatre completed in 1856, a music hall, a gymnasmum, and a polytechnical school. The town also possesses a library of 50,000 volumes, and is the seat of a great number of commercial and intellectual associations, but to nothing is it more indebted for its celebrity than to the Academy of Painting This famous institution, originally founded by the electoral prince Charles Theodore in 1767, was reorganized by King Frederick William in 1821, and has since attained a high degree of prosperity as a centre of artistic culture. From 1822 till 1826 it was under the direction of Cornelius, a native of the town, from 1826 to 1859 under Schadow, and from 1859 to 1864 under Benda. Benda's resignation it continued in the hands of a body of curators till 1874, when Wischmann of Weimar was chosen director. The noble collection of paintings which formerly adorned the Dusseldorf gallery was removed to Munich in 1805, and has not since been restored, but there is no lack of artistic treasures in the town. The academy possesses 11,000 original drawings and sketches by the great masters, 24,000 engravings, and 248 water-colour copies of Italian originals, the municipal gallery contains valuable specimens of the local school, and the same is the case with the Schueller collection. The principal names are Cornelius, Lessing, Achenbach, Daur, Tiedemann, and Kraus. An annual exhibition is held under the auspices of the Art Union, and the members of the Artist's Society, or Malkasten, as they are called, annually celebrate festivities and masquerades of a remarkable description. Not only is Dusseldorf situated in the greatest manufacturing province of Prussia, but it is itself the seat of various important industries—cotton and carpet weaving, iron-founders, wire-drawing, sugar-refining, brewing, distillation, and the making of pianos and carriages. The surrounding country is largely devoted to market-gardening, and the Dusseldorf mustard is in special repute. A very extensive trade is carried on both by river and by rail, the port was declared free in 1839, and is consequently one of the most frequented on the Rhine. The Dusseldorf Steam-boat Company maintains regular communication with Mayence on the one hand and Rotterdam on the other. A little to the north of the town lies the village of Dusselshof, with Count de Beek-Volmanstein's establishment for homeless children in a former Trappist monastery, and in the suburban village of Pempelhortex is the Jagerhof, the residence at one time of
Prince Frederick of Prussia, and afterwards of the prince of Hohenzollern-Sigmaringen. In 1780 the number of inhabitants was about 8000; by 1831 it was over 25,000. The year 1821 gave 41,350 (of which 3566 were military); that of 1871, 69,348.

Dusseldorf, as the form of the name—the village on the Dussel—clearly unchanges, was long a place of small consideration. In 1794, when the town was captured for a time by Count Adolfo di Bavaria from his successors it obtained various privileges, and in 1838 was chosen as their residence. After it had suffered greatly in the Thirty Years’ War and in the war of 1744, the town was violently bombarded by the French, and after the peace of Lunville it was deprived of its fortifications. In 1865 it became the capital of the Rhineland county of Berg; and in 1815 it passed with the duchy into Frankfort palace.

Among its celebrities are George and Friedrich Heinrich Jacobi, Schenk, Heine, Varnhagen, Cornelius, Camphassen, and H. von Sybel.

DUTENS, LOUIS (1730–1812), a French writer of some celebrity, was born at Tours, of Protestant parents, January 15, 1730. In his youth he devoted himself to poetry; and in 1748 he composed a tragedy, entitled The Return of Ulysses to Ithaca, which failed in Paris, but was republished with great success in London. The author, however, soon became sensible of the faults of his work, and abandoned a species of composition in which he found he was not destined to excel. He soon afterwards went to England with an introduction to Pitt, which he had received from a sister of the statesman. His first residence in London was brief, but he soon returned and obtained an situation as tutor in a private family. The father of the pupil was a man of considerable literary and scientific attainments, who instructed him in those branches of science which he was destined to pursue. He soon afterwards was appointed chaplain and secretary to Lord MacKenzie, the English minister at the court of Turin, and left England in October 1758. In 1760, when Lord MacKenzie returned to England, the secretary remained at Turin as charged d’affaires, until 1762, when he returned to England and attached himself to the family of Lord Bute, who, before retiring from office in 1763, procured him a pension. He again went to Turin as charged d’affaires; and during this second mission he undertook the task of collecting and publishing a complete edition of the works of Leibnitz (Geneva, 6 vols. 1769) and wrote his celebrated Discours sur la découverte du Siècle des Lumières. On his return to England he attached himself to the duke of Northumberland, who procured him the living of Elsdon, in Northumberland. He accompanied the duke’s son, Lord Algernon Percy, in his travels through France, Italy, Germany, and Holland; and while at Paris he was chosen a member of the Academy of Inscriptions, in 1775. In the same year he was made a fellow of the Royal Society. In 1776 he returned to England, and soon afterwards accompanied Mr MacKenzie and his wife on a tour to Naples. On his return Dutens was invited by Lord Mount-stuart, who had been appointed envoy extraordinary, to accompany him to Turin, and found himself for the third time charged d’affaires at that court, during a short absence of the envoy. From Turin he went to Florence, and thence to Rome. He was in Paris in 1783, and returned to London the following year. The revenue he derived from his living amounted to £600 per annum, together with a considerable legacy left him by Mr MacKenzie, and estimated at £15,000, enabled him to pass the remainder of his life in affluence. He died at London, May 23, 1812.

The principal works of Dutens were his Recherches sur l’origine des Découvertes attribuées aux Modernes (1766, 2 vols. 8vo); Appel au bon Sens (London, 1777, 8vo), directed in defence of Christians
DUVERGIER DE HAURANNE, Jean (1581-1643),
abbe of St Cyran, a celebrated French theologian, was born
at Bayonne in 1581. He studied theology at the university
of Louvain, where he formed an intimate friendship with
Jansen, who was his fellow student. After quitting
Louvain in 1605, he went to Paris, where his intimacy
with Jansen continued, and with him he pursued with great ardour
the study of the fathers. Leaving Paris in 1611, they
continued the same studies at Bayonne, where Duvergier
received the canonry of the cathedral. When Jansen left
Bayonne, Duvergier returned again to Paris, and shortly
after his arrival there his indefatigable and asetic character
secured for him the esteem of the bishop of Potten, who
gave him a canonry, and in 1620 made him abbe of St
Cyran. He established in the monastery the order of St
Benoit in all its rigour; but his zeal for reform was so great
that it awakened opposition, and he found it expedient to
quit his diocese and return to Paris. Here he formed a
connection with the influential Arnauld family, and along
with Angélique Arnauld, director of the convent of Port
Royal, he completely reformed that institution. His rigor-
ous asceticism acquiring for him great ascendency over
female minds, his fame and influence increased with great
rapidity, and he soon began to number among his disciples
members of the highest classes of society, and to have as
his personal friends some of the chief dignitaries of church
and state. Soon, however, his enemies came to be as
numerous as his friends. His rigid and domineering dis-
position began to alienate from him many of his disciples,
and, taking a leading part in the Jansenist controversy, he
excited against himself the peculiar animosity of the Jesuits.
At last his views came to be suspected by Richelieu,
and he was arrested and thrown into prison at Vincennes, 11th
March 1638. No evidence could be obtained from his
papers sufficient to criminate him, but to limit his influence
he was retained in durance at Vincennes—where, however,
his was to keep up intercourse with his patrons and
disciples. On the death of Richelieu he regained his liberty,
and resumed his religious duties and his war with the
Jesuits with the same energy as before; but he enjoyed
only six months of freedom, dying from a stroke of apoplexy,
10th October 1645.

DWARF (Saxon dwerg, deerc, German, Zwerg), a term
applied to men, animals, and plants that fail to reach even
the mediocrity of growth natural to their respective classes.
It is also otherwise applied. In France, for instance, a
yolkless egg is termed "un cuf nam," or dwarf egg; and
an imitation of fine English cloth is called "un nom Londins,"
technically "London dwarf." The norm or rumpu of the Romans might be a dwarf
by nature or a person dwarfed by cruel art. In the former
case, his lack of height found compensation in increased
strenth, as exemplified in the line by Propertius, "Nanus et
eipse suos breviter concretus in artus," etc., in the latter,
where growth had been early suppressed by the dealers
who manufactured monstrosities for fashionable people in
Rome, weakness bred contempt. The norm, or, if he were
more than unusually diminutive, the miniunm, was exposed to
application of the proverb, "nama cum sia, cede,"
equivalent to "little people must not be in our way."  

Various have been the recipes for dwarfing children from
birth. The most effective, according to report, was anoint-
ing the back bone with the grease of moles, bats, and
dormice. It is also said that pups were dwarfed by
frequently washing their feet and backbone, the consequent
drying and hardening of those parts hindered, it was alleged,
their extension. In England, the growth of boys intended
for riders in horse-races is kept down to some extent by
the weakening process of "sweating." There is a familiar story of a partnership entered into
between a dwarf and a giant. The dwarf had the intellect,
the giant had the strength; the result of this limited
liability was that the giant received all the blows, and the
dwarf all the profits. The partnership was consequently
brokeu up. A fact of which we are reminded by this
fiction, occurred in Austria in the 17th century—To please
the caprice of an empress, all the giants and dwarfs in the
empire were brought together to Vienna, and were lodged
in one building. The dwarfs were told they had nothing
to fear from the giants, but the latter were soon seen in
bodily fear of the dwarfs, who made the life of their
stupendous companions unbearable by tearing them,
molesting them, tripping them up, and unscrupulously
robbing them. The giants, with tears as big as pears in
their eyes, prayed the authorities to relieve them from
the persecution of their tiny enemies, and the prayer was
granted. At a later period, another German princess
promoted marriages among dwarfs, but without succeeding
in the object she had in view. When Lady Mary Wortley
Montague was in Germany, in the last century, she found
that a dwarf was a necessary appendage to every noble
family. At that time English ladies kept monkeys. The
imperial dwarfs at the Viennese court were described by
Lady Mary as "as ugly as devils" and "bedaubed with
diamonds." They had succeeded the court fools, and exer-
cised some part of the more ancient office. Absolute princes
could not stoop to familiar discourse with mankind of less
degree. Therefore did they hold dwarfs to be outside
humanity, made intimate associates of them, and allowed
them an unrestrained freedom of speech, by the exercise of
which the dwarfs imparted to their masters strange and
strange truths which on the lips of ordinary men would have been
treason. One of the kings of Denmark is said to have
made a prime-minister of his dwarf, in order to get at rough
truths which a minister of ordinary stature would have
been afraid to utter. It could not have been for this reason that Stanislas, ex-
king of Poland and duke of Lorraine, was so attached to
his dwarf, Nicholas Ferry, otherwise known as "Belé,"
for this dwarf was weak in mind and body. Belé was one of
dwarf children of peasant parents in the Vosges. He
was 3 feet in height, and his fame has not died out at
Nancy and the department of the Meurthe. At his death
in 1764 he was in his twenty-third year, and, among the
five phrases of which his epitaph is composed, the world
still assured that Belé was "chien du mourel Antonin.

But Belé was not so remarkable a dwarf as Richebourg,
who died in Paris in 1558, at the age of ninety. He was
only 25 inches in height. In his childhood he was a servant
(without especial duty) in the Orleans family. In later
years, Richebourg was their pen-carrier. He is said to have
been put to use in the Revolutionarry period,—
passing in and out of Paris as an infant in a nurse's arms,
but with despatches, dangerous to carry, in the little man's
baby wrappings. At present, on the Continent, Russia
and Turkey alone have a common sympathy for dwarfs.
At the court of the sultan, should the dwarf, besides being
of efilh height, be deaf, dumb, and qualified to hold a place
among the official eunuchs, the poor creature is accounted as a priceless treasure.

The early history of British dwarfs is less saddled with wonders than the record of dwarfs of the classical times. Britain has nothing to compare with Philetas of Cos, the little tutor of Ptolemy Philadelphus. Philetas would have us believe that Philetas was so light as to be able to stand upon his head in his pockets to prevent his being blown away. Nor does any British chronicle register such minute marvels as the couple of dwarfs possessed by Julius, the niece of Augustus, namely, Coropas and Julia, little handmaid Andromeda. The height of both was 2 feet 4 inches. This, however, was little less than the stature of the Aztec dwarfs who were exhibited (and were publicly married) in London some twenty years ago. It is not that British annals or tradition can be said to be known by the now generic Dame of the Royal College of Surgeons, London.

In the year in which Boruwiaski died, 1837, the line of publicly exhibited dwarfs was continued by the birth of the existing American pigmy, Charles Stratton, better known as "General Tom Thumb." In 1844 he appeared in England, where his grace, vivacity, and good humor made him popular, from the royal family to the general public, before whom he stood on the Lyon's Theater. He also made his appearance on the stage in Paris. After extensive travel in both hemispheres, he again visited England in 1857, but the dwarf man, despite many personal and intellectual qualities, was less attractive than the dwarf boy. In the year 1863 the "General" married the very minute American lady, Lavinia Warren (born in 1842), with whom he has seen many lands, and they are now enjoying honourable retirement in their own. (u. no.)

Dwight, Timothy (1755-1817), an eminent American divine, was born at Northampton, Massachusetts, 14th May 1755. His father, though educated at Yale College, was a merchant, and his mother the third daughter of Jonathan Edwards. His mother began to instruct him almost as soon as he was able to speak, and it is said that he learned the alphabet at a single lesson, and before he was four years old was able to read the Bible. In 1765 he entered Yale College, and received his B.A. degree in 1769, shortly after which he went to take charge of a grammar school at New Haven, where he remained two years. In September 1771 he was appointed tutor in Yale College, where he distinguished himself by the skill with which he taught the higher mathematics. In the same year he began an epic poem entitled the Conquest of Canaan, which was published in 1785. He received his degree of M.A. in 1772, and afterwards pursued his studies with the view of adopting law as his profession, but, changing his intention, was licensed as a preacher of the gospel in 1777, and accepted the office of chaplain to the forces, which post he held for some time. In 1783 he was ordained minister of Greenfield in Connecticut, when he opened an academy which speedily acquired a very high reputation, and attracted scholars from all parts of the Union. He received the degree of D.D. from Princeton College in 1785, and that of L.L.D. from New Jersey in 1810. In 1799 he was elected president of Yale College, and by his judicious management restored that institution to the high place, from which it had fallen before his appointment. He died at Philadelphia on the 11th January 1817. Dr Dwight was the author of a considerable number of essays and sermons; and his Theology Explained and Defended in a series of Sermons was published in 5 vols., with a life of the author, in 1818. Two additional volumes of sermons were published in 1827, and had an extensive circulation both in the United States and in England.

DWINA, a name common to two important rivers of European Russia. (1.) The Northern Dwina, or Drina Siverskaya, belongs to the basin of the White Sea, and is formed by the junction of the Sukhona and the Yak, which, being the former in the south-east and the latter in the south-west of the government of Vologda, meet in the neighbourhood.
of Veliki Ustjug, at a height of 300 feet above the sea, in 60° 46' N. lat. and 46° 20' E. long. From its mouth, in the Gulf of Archangel, the distance to the confluence of the co tributary streams is about 400 miles, and to the source of the Sukhona 750 miles. The drainage area is estimated at from 140,000 to 145,000 square miles. Except at the rapids the current of the Dvina is comparatively slow, as the average fall per mile is only 9 inches. Till its union with the Vychegda, a river which exceeds it in volume, it flows for the most part in a single, well-defined, and permanent channel; but below that point it often breaks up into several branches, and not unfrequently alters its course. In the neighbourhood of Archangel it divides into three distinct arms, which form a regular delta, but of these that of Berezoff alone is navigable for seawater vessels, and even it is crossed by a bar at the mouth with not more than 14 1/2 or 15 1/2 feet of water at full tide. Above the confluence of the Vychegda the breadth is about 1750 feet, below that point it widens out to 3500, and near Archangel it attains to three times that measure. The river affords a valuable means of inland navigation. From Vologda to Archangel the ordinary passage requires from 10 to 12 days, and the return journey from 6 to 8 weeks. The channel is free from ice for about 174 days in the year.

II. The Southern Dwina, or Dwina Zapadnaya, in German Duemn, belongs to the Baltic sea, and takes its rise in a small lake about 800 feet above the level of the sea, in the government of Tver, not far from the sources of the Volga and the Dnepro. In its whole course of about 600 miles it waters the seven governments of Tver, Pskoff, Vitebsk, Mogilieff, Vlina, Curland, and Livonia; and it is calculated that it drains an area of about 65,000 square miles. From Dunamburg to Riga, a distance of 204 miles, there is altogether a fall of 295 feet, of which 105 are in the 463 miles from Jakobstadt to Friedrichstadt. In the lower part of its course the river attains an ordinary depth of 30 feet, and an average breadth of 1400 feet, but during the spring flood it sometimes rises 14 feet above its usual level, and extends its waters for about a mile. The inundation lasts at Riga from two to ten days. Near the mouth the river is usually free from ice 243 days in the year, and in the government of Vitebsk for 255. It is navigable from the confluence of the Mezha downwards, but the number of rapids and shallows greatly diminishes its value. No fewer than 63 of the former are counted below Jakobstadt, and among these are some of the most dangerous of all. The passage to Riga from Velich usually takes thirteen days, from Dama seven, from Dunamburg four, from Friedrichstadt one. Navigation can also be carried on by the following tributaries of the Dvina—the Torona, the Uszt, the Mecha, and Oshbes, the Kasplia, the Ulla, and the Bolderens. By Polemy and Marcian of Heraclea the river is mentioned as the Rubon or Rhodon; at a later date it is called the Khenzu or Tarunt, and till the present day has the name of Polot among the White Russians. The modern designation is said to be due to the Schlenwi and Bremen sailors, who were struck by the sandstone hills at the mouth of the river.

DYCE, ALEXANDER, (1798-1869), a distinguished dramatic editor and literary historian, was born at Edin- burgh on the 30th June 1798, and, after receiving his early education at the High School of his native city, became a student at Exeter College, Oxford, where he graduated as B.A. Having adopted the clerical profession, he officiated as curate at Lentegloss, in Cornwall, and subsequently at Nuyland, in Suffolk, and, in 1827, he settled in London. His first books were Select Translations from Quintus Smyrnius, an edition of Collis, and Specimens of British Poets. He issued annotated editions of George Peele, Robert Greene, John Webster, Thomas Middleton, and Beaumont and Fletcher, with lives of the authors and much illustrative matter. He completed an edition of Shirley left unfinished by Gifford, and contributed biographies of Shakespeare, Pope, Akenside, and Beattie to Pickering's Almane Poets. He has also edited several of Bentley's works, and Specimens of British Poets, and his carefully revised edition of John Skelton, which appeared in 1843, did much to revive interest in that trenchant satirist. In 1857 his edition of Shakespeare was published by Moxon; and the second edition, a great improvement on the old one, was issued by Chapman and Hall in 1865. Dyce's interest in Shakespeare manifested itself further in such works as Remarks on Collin's and Knight's Editions of Shakespeare, A Few Notes on Shakespeare, and Structures on Shakespeare's New Edition of Shakespeare. He was intimately connected with several literary societies, and undertook the publication of Kempe's Nine Days' Wonder for the Camden Society; and the old plays of Timon and Sir Thomas More were published by him for the Shakespeare Society. He was associated with Halliwell, Collier, and Wright as one of the founders of the Percy Society, which aims at publishing old English poetry. Dyce also issued Recollections of the Table-Talk of Samuel Rogers, which has been several times reprinted both in Britain and in the United States.

The editions of the dramatists already mentioned were re-issued with many improvements. Dyce died on the 15th May 1869. His reputation rests on his contributions to English literary biography, and on the untiring industry, abundant learning, and admirable critical acumen displayed in his editions of the old English poets. His wide reading in Elizabethan literature enabled him to explain much that was formerly obscure in Shakespeare, while his sound judgment was a sure check to anything like extravagance in emendation. His labours resulted in the best text of Shakespeare we possess. While preserving all that is valuable in former editions, Dyce has added much fresh matter. The Glossary, which consists of a large volume of 500 pages, is the most exhaustive that has appeared. Not only rare words are explained, but common words when employed with an unusual meaning, phrases, proverbs, old customs, and difficult allusions. The book is, therefore, an important contribution to philology and to the history of the English language, as well as to the elucidation of the text. The mere number of words in Dyce's Glossary shows a great advance in comprehensiveness. It is calculated that the Globe Glossary has about 2500 entries, and Staunton's 2500, while Dyce's has upwards of 5000. The meanings of the words, as used by the poet, are accurately given, and are illustrated by literary quotation and linguistic comment. Altogether Dyce's Shakespeare is likely long to remain the standard edition of our English dramatists.

DYCE, WILLIAM (1806-1864), a distinguished painter, was born in Aberdeen, where his father, a fellow of the Royal Society, was a physician of some repute. He attended Marischal College, took the degree of M.A. at sixteen years of age, and was destined for one of the learned professions. Shewing a turn for design instead, he studied in the school of the Royal Scottish Academy in Edinburgh, then as a probationer (not a full student) in the Royal Academy of London, and thence, in 1825, proceeded to Rome, where he spent nine months. He returned to Aberdeen in 1826, and painted several pictures, one of these, Bacchus nursed by the Nymphs of Nysa, was exhibited in 1827. In the autumn of that year he went back to Italy, showing from the first a strong sympathy with the earlier masters of the Florentine and sienese Schools. "Venus and Child" which he painted in Rome in 1828 was much noticed by Overbeck and other foreign artists. In 1829 Dyce settled in
DYE—DYE

Edinburgh, taking at once a good rank in his profession, and showing considerable versatility in subject-matter. Portrait-painting for some years his main occupation of his time; and he was particularly prized for likenesses of ladies and children. In February 1837 he was appointed master of the school of design of the Board of Manufactures, Edinburgh. In the same year he published a pamphlet on the management of schools of this description, which led to his transfer from Edinburgh, after eighteen months' service there, to London, as superintendent and secretary of the then recently established school of design at Somerset House. Mr J. R. Herbert was head-master about the same time. Dyce was sent by the Board of Trade to the Continent to examine the organization of foreign schools; and a report which he eventually printed, 1840, led to a remodelling of the London establishment. In 1842 he was made a member of the council and inspector of provincial schools, a post which he resigned in 1844. In this latter year, being appointed professor of fine art in King's College, London, he delivered a noticeable lecture, The Theory of the Fine Arts. In 1835 he had been elected an associate of the Royal Scottish Academy; this honour he relinquished upon settling in London, and he was then made an honorary R. A. In 1844 he became an associate, in 1848 a full member, of the London Royal Academy, he also was elected a member of the Academy of Arts in Philadelphia. He was active in the deliberations of the Royal Academy, and it is said that his tongue was the dread of the urbane President, Sir Charles Eastlake, for Dyce was keen in speech as in visage; it was on his proposal that the class of retired Academicians was established. In January 1850 Dyce married Jane, daughter of Mr James Brand, of Bedford Hill, Surrey. He died of a cancerous disease in his house at Streatham on 14th February 1864, leaving two sons and two daughters.

Such is a brief outline of the honourable and prosperous career of one of the most learned and accomplished of British painters—one of the highest in aim, and most consistently self-respecting in workmanship. His finest productions, the frescoes in the Queen's Robing-room in the Houses of Parliament, may rightly be called great, and an honour to the country and time which produced them; these frescoes, and the water-glass paintings of Maclise in the same building, would find few rivals in contemporaneous Continental labour. Generally, however, there is in Dyce's work more of earnestness, right conception, and grave, sensitive, but rather restricted powers of realization, than of authentic greatness. He has elevation, draughtsmanship, sympathy, on occasion fine colour, along with some, a certain leaning on precedent, and castigated semi-conventionalized type of form and treatment, which bespeak rather the scholarly than the originating mind in art. The following are among his principal or most interesting works (oil pictures, unless otherwise stated). 1829: The Daughters of Jethro defeated by Moses, Puck. 1830: The Golden Ages; the Infant Hercules strangling the Serpents (now in the National Gallery, Edinburgh), Christ crowned with Thorns. 1835: A Dead Christ (large lunette altarpiece). 1836: The Descent of Venus, from Ben Jonson's 'Triumph of Love'; 'The Judgment of Solomon, prize canvas in tempera for tapestry (National Gallery, Edinburgh). 1837: Francesca da Rimini (National Gallery, Edinburgh). 1838, and again 1846: The Madonna and Child. 1839: Dunstan separating Edwin and Elgiva. 1844: Josiah sitting on the Deliverance (the finest perhaps of the oil-paintings). 1850: The Mowing of Jacob and Rachel. 1851: King Lear and the Fool in the Storm. 1855: Christabel. 1857: Titian's first Essay in Colouring. 1859: The Good Shepherd. 1860: St John bringing Home his Adopted Mother, Pegwell Bay (a coast scene of remarkably minute detail, showing the painter's partial adhesion to the so-called "pre-Raphaelite" movement of that time). Dyce executed some excellent cartoons for stained glass—that for the choirmen's window, Ely Cathedral, and that for a vast window at Alnwick in memory of a duke of Northumberland; the design of Paul rejected by the Jury, now at South Kensington, belongs to the latter. In fresco-painting his first work appears to have been the Consecration of Archbishop Parker, painted in Lambeth Palace. In one of the Westminster Hall competitions for the decoration of the Houses of Parliament, he displayed two heads from this composition; and it is related that the great German fresco-painter Corot, who had come over to England to give advice, with a prospect of himself taking the chief direction of the pictorial scheme, told the Prince Consort frankly that the English ought not to be asking for him, when they had such a painter of their own as Mr Dyce. The cartoon by Dyce of the Baptism of Edithbert was approved and commissioned for the House of Lords, and is the first of the works done there, 1845, in fresco. In 1848 he began his great frescoes in the Robing-room—subjects from the legend of King Arthur, exhibiting chivalric virtue. The whole room was to have been finished in eight years; but ill-health and other vexations thralled the artist, and the series remains unfinished. The largest picture figures Hospitality, the admission of Sir Tristram into the fellowship of the Round Table. Then follow—Religion, the Vision of Sir Galahad and his Companions; Generosity, Arthur unhorsed, and spared by the Victor; Courtesy, Sir Tristram harping to La Belle Yeux; Mercy, Sir Gawain's Tournament. The fame of the Circle sacred subjects in All Saints' Church, Margaret Street, London; of Comus, in the summer-house of Buckingham Palace, and of Neptune and Britannia, at Osborne House, are also by this painter.

Dyce was an elegant scholar in more ways than one. In 1838 he obtained the Blackwell prize at Aberdeen for an essay on animal magnetism. In 1843-4 he published an edition of the Book of Common Prayer, with a dissertation on Gregorian music, and its adaptation to English words. He founded the Motett Society, for revival of ancient church-music, was a fine organist, and composed a "nouveau poème" which has appropriately been sung at Royal Academy banquets. His last considerable writing relating to his own art was published in 1853, The National Gallery: its Formation and Management. (w. m. e.)

DYEING is the art of colouring in a permanent manner porous or absorbent substances by impregnating them with colouring bodies. Most vegetable and animal bodies are porous or absorbent, and can be dyed; some minerals also, such as marble, can absorb liquid colouring matters; but the term dyeing is usually confined to the colouring of textile fibrous materials by penetration. The superficial application of pigments to tissues by means of adhesive vehicles, such as oil or albumen, as in painting or in some kinds of calco-printing, is not considered as a case of dyeing, because the colouring bodies so applied do not penetrate the fibre, and are not intimately incorporated with it. The mere saturation of textile fibre with a solution of some coloured body and subsequent drying do not constitute a case of dyeing, unless the colour becomes in so far permanently attached to the fibre that it cannot be washed out again by the solvent employed or by common water.

In the present article dyeing will be considered only with relation to the vegetable and animal fibrous substances which are commonly used in clothing or furnishing—the less important arts of dyeing feathers, skins, ivory, wood, marble, &c., being left over for treatment under other headings.
DYING

HISTORICAL SKETCH.

That dyeing was practised in the most ancient times is abundantly proved by the frequent mention of dyed colours in the oldest extant writings, that it was not a common art seems apparent from the use to which coloured garments were devoted, and the distinction which they conferred upon the wearers. It is probable that such definite and bright colours as the "blue, and purple, and scarlet" mentioned several times in the book of Exodus, as well as the Tyrian purple so often referred to by Roman writers of the Augustan age, were so costly as not to be available for general and common use. Pliny is the only one of the older writers from whom we might have expected an account of the processes of dyeing employed at his time; but, except a reference to two or three tintorial substances, and a description of a process of obtaining several colours by one dyeing operation, which he saw practised in Egypt (see Calico-printing, vol. iv. p. 684), there is nothing detailed in his writings:—he in fact formally excuses himself from entering upon the subject as one not worthy of his attention.

The Tyrian purple is the only dye treated of at some length in Pliny and contemporary authors; its discovery and employment gave wealth and prosperity to Tyre and Sidon more than 1000 years B.C. In the days of the Roman conquests in the East it was reserved under penal statutes for imperial use, its production then declined, and eventually both the material and the art of using it were lost. From Pliny's description, modern investigators were enabled to rediscover the shell-fish which yielded the dye, but the colours furnished by it were neither so bright nor so permanent as those obtainable from much less costly dyeing materials; and there is reason to conclude that the most brilliantly tinted garments of an Egyptian priest of Isis or Osiris, or the mantle of a Roman emperor, were poor and dull in hue compared with those within reach of a domestic servant of the present time.

From many independent sources—Homer, Strabo, Herodotus, &c,—it is clearly shown that the manufacture of coloured tissues was carried on by the Oriental nations. A knowledge of the art spread slowly westward, but there are few records of its existence to be found from the time of Pliny to about the 15th century. It would appear that the Jews held the secret or the monopoly of the dyeing art during this long period. According to Mrs Merrifield, Benjamin of Tudela relates that when he visited Jerusalem between 1160 and 1173 he found only 200 Jews resident in that city, and these were engaged in wool-dyeing, which trade was entirely in their hand. Beckmann shows that at the same epoch the art of dyeing in Italy was principally carried on by the Jews. It is in Sicily that we can first distinctly discern the practice of dyeing in Europe; afterwards the Italians generally practised it; and in the 15th century dyers formed important guilds in Florence, Venice, and other cities. It is not to be supposed that the art of dyeing was ever completely lost, the records of particular seats of the art only indicate that at such places some special excellence had been acquired which gave them a further reputation than was enjoyed by others. The domestic records of all modern nations speak of dyers and dyed cloths. Among the ancient laws of Ireland are some which lay down the number of colours that may be employed in the dress of various classes of society, the monarch alone being permitted to wear seven colours; from which it may be inferred that if the Irish at a very early period were not dyers, they at least had variously dyed garments. Similar facts can be adduced of all countries that possess an early literature.

From the perishable nature of textile substances and their comparatively small intrinsic value, very few ancient examples of the dyer's art have been preserved. We have, however, one account of a cloth containing dyed yarn which may have been in the dyer's hands in Egypt 1000 years before the Christian era, and we have still in good preservation ecclesiastical vestments containing dyed silks which are certainly 600 to 700 years old. The late Mr Thomson of Clitheroe examined numerous manuscripts of which some of which had a border of blue and fawn-colour made by coloured threads introduced into the loom. The blue, upon examination, was proved to have been dyed with indigo; other specimens of mummy cloth of a reddish colour appeared to have been dyed with safflower, though this colouring matter could not be recognised with the same certainty as indigo. Dr Rock, in his catalogue of the textile fabrics in the South Kensington Museum, attributes many of the church vestments there preserved to the 12th and 13th centuries, and in these can be seen silks of all the colours known to dyers up to the middle of the present century, which, though in most cases changed and faded, still present sufficient evidence that dyeing, upon this material at least, was successfully practised in the Middle Ages. It is interesting further to note that in inventories of vestments of the 13th century the silks in the dyers' stores are often designated by their colours, as in a chasuble at St Paul's, London, 1295, which is set down as "purpureo alburnum sacramentum," of a purple inclining to blood red. This, as Dr Rock says, is intelligible, but other definitions are not, as "famous Taroci colors," a Tarucco-coloured cloth, it can only be conjectured that it was a purple dyed at Tuscan, and something like the Tyrian purple, sky-blue silk is named "indicus," probably because it was dyed with indigo.

The earliest account of the processes and materials used by dyers is to be found in a collection of manuscripts in the French National Library, No. 6741, known as the manuscripts of Jehan le Béguin. These mostly refer to the art of painting and the making of artists' colours and the modes of applying them, but some describe the preparation and use of dyes. The most interesting of these manuscripts is that by Jehan Alcherus (Le Béguin was only the copier or compiler), which from internal evidence cannot be dated later than the year 1410, and some parts of which refer to a period at least thirty years earlier. Among the colouring matters and mordants there mentioned we find iron (the dust or mud from grindstones on which knives are ground) dissolved in vinegar and mixed with alum, green copperas, and gall nuts presciibed as a black colour, and methods are given for the use of Brazil woods, madder, indigo, in conjunction with lime and honey, verdigris, alkalies, oxide of tin, kermes, &c., much in the same way as those employed four centuries later by dyers and calico-printers. There are also eleven receipts for preparing colours, for painting on cloth to imitate tapestry,—examples of which (tailes pentez) of the 15th century were exhibited in Paris in 1876. Curiously enough, a certain Fleming named Theodore in 1410 brought these receipts to Alcherus from London, where they were in regular use. They are all chemical dyes, and seem to be the prototypes of the same class of colours employed long subsequently by calico-printers in England and other countries.

The first printed account of dyeing processes was an Italian work. It is referred to under the title Marmorinis dell' arte des Tinctor, published at Venice in 1425. The printer has never seen a copy of this work, nor does it appear that any exists in the chief libraries of Europe; an enlarged edition was published in 1510. In 1548 Rosetti wrote an account of dyeing, which was also published at Venice. Copies of this are not very scarce; it is the only one of these early works which is actually known. The so-called Bolognese manuscript translated in Merrifield's
Ancient Practice of Painting, is preserved in the convent of St. Salvatore at Bologna, and is said not to be of later date than the middle of the 15th century—that is, about 100 years anterior to the date of Rosetti’s work. In this manuscript, in addition to the materials enumerated by Alchemists, mention is made of wood and methods of making indigo from it; of indigo imported from India, called bayodon and beograd, of sumac, gal nuts, and lac; of the berries of buckthorn, similar to the Avignon or Persian berries, to be used for yellow; and of Brazil wood or seruano, sandal wood, and madder for red, and archil for purple. The use of nitric acid to give a yellow colour to silk, and of alum for preparing and mordanting that material, and the subsequent dying of it by Brazil wood, are also clearly pointed out. The receipt No. 362 of this manuscript is of interest as showing that the Italian dyers early possessed the method of dissolving indigo by means of the action of honey and quicklime upon it, and used the solution for the blue required in dyeing silk green.

It is very clear, then, from these accounts, and from numerous existing samples of coloured stuffs, that dyeing was well understood in Europe in the 15th century, and that the materials at the command of the dyer were sufficiently numerous and varied to enable him to produce all desired shades of colour. The improvements which took place in the dyeing art from this time until the commencement of the present era of artificial colouring matters were no doubt important in detail, but not very striking in principle.

The discovery of America was soon followed by the introduction of cochineal (see vol. vi. p. 97), but this did not enable the dyer to produce any new colours, since it differed from the ancient kermes, frequently called granum or grains, only in being ten or twelve times as rich in colouring matter. Logwood or Campeachy was also an introduction from the New World, and greatly enlarged the power of the dyer, though, from the looseness of the colour it yielded, it brought his art into some disrepute; it was in many respects a new colouring matter, but eventually settled down as the principal ingredient in the common black dye. In mordants, the discovery in Holland in the 17th century of the use of solutions of tin in acid, especially for the scarlet dye with rhododendron, was one of the greatest utility. The gradual introduction of the acetates of aluminium and iron to replace the respective sulphates was of more importance to calico-printing than dyeing proper. At the close of the last century Dr Bancroft discovered and introduced quercitron back from America for dyeing yellows, and this, from its superior richness and less cost, displaced other materials used for that purpose. Of the natural dyes introduced in the present century probably the most important is catechu. The discovery of the use of bichromate of potash as a mordant for woolen goods belongs to the latter half of this century, and has been of the highest benefit to the dyer. We shall not speak in detail of a number of dye-stuffs used by dyers of the present day, which were probably unknown to their predecessors, because most of them are only varieties of what have been long employed. Such, for example, are valonia, divi-divi, and myrobalans, which have no properties different from gums or sumach, and the different red woods, which are merely varieties of the anciently known Brazil woods.

Artificial Colouring Matters.—In the year 1858 commenced the discovery and application of a series of artificial colouring matters, which have created a distinct era in the history of dyeing. Up to that date the colouring matters used in dyeing were either the spontaneous productions of nature or simple preparations of the same. An exception, however, must be made to this statement in respect of Prussian blue and the so-called sulphate of indigo, which have been largely used as colours in dyeing since the middle of the last century, and are as truly products of art as any of the modern creations of chemistry. The purple of murexelte had only a brief existence as a dye. Mr Perkin was the first to practically produce a dyeing material from aniline, the well-known murex or purple shade so much in vogue for several years; a history of which see vol. ii. p. 100 of the present work. Other discoveries rapidly followed, and in the course of a few years it may be said that a hundred patents were taken out for methods of making artificial colouring matters from aniline and its homologues; these alkaloid bases, under the transforming hands of chemists, supplied the dyer with every shade and hue which could be desired. Up to 1869 the artificial colours were of one general family, and had many characters in common; they were very brilliant, very easily applied on fibre of animal origin (silk and wool), required no mordant, and for the most part were very loose and unstable. Imitating more or less closely the colours obtained on tissues from natural colouring matters, they had no similarity of chemical composition, and were in every other respect fundamentally different from them. In 1868 two German chemists, Graebe and Liebermann, by means of a severe synthetic investigation, succeeded in transforming anthracene into alizarin, the latter being identical in chemical composition as well as tintorial properties with the colouring matter of madder, one of the most anciently known and most valuable of all natural dye-stuffs (see vol. i. p. 577). This was the first instance in which chemistry had produced one of the old and well-known colours of the dyer; in a short time after its discovery it was made practically available for the trade, and has at this date (1877) almost entirely driven from the market the native product,—accomplishing a revolution which has no parallel in the history of colouring matters, and which is one of the most signal triumphs of modern chemistry. Other natural colouring matters have since then been put by artists such as indigo and archil, but from some difficulties in their manufacture they have not yet become commercially available.

Mechanical Improvements.—In the art of dyeing, steam power has proved no less serviceable than in other important industries. Its applications are not for-
DYEING 573

...lakes can be applied, but that as is only in conjunction with acid salts and at a high temperature, by means of which a sort of solution is obtained while in contact with the fibre itself. The art of the dyer consists in so arranging these three elements — fibre, metallic salts, and colouring matter — that he may obtain the formation of the insoluble colouredlake in the body of the fibre itself, whereby either by the lake being mechanically retained or chemically combined the fibre is permanently coloured.

Application of Mordants — There are three principal ways in which the mordant and colouring matter can be brought into contact with the fibre, the developments and modifications of which constitute the whole art of dyeing.

1. By the first method, which is by far the most common, the fibrous matter is separately impregnated with the mordant, which is by various means decomposed, so as to deposit its base in an insoluble state upon or within the fibre, and afterwards the colouring matter is applied. Take, for example, the case of dyeing a common black from logwood upon calico, which has an affinity for the colouring matter of the logwood dye. To prepare the calico through a hot aqueous solution of sulphate of iron, sometimes mixed with acetate of iron, and to remove the excess by passing the cloth through cold water, is to pass it not, as is usually done, through a mixture of lime and water which has the effect of decomposing the iron salts and liberating oxide of iron; but in washing in water to remove the excess of lime or of any other attached oxide of iron the calico is washed into contact with the logwood. The calico, which has now a buff colour, owing to the attached mordant of oxide of iron, when placed in a hot decoction of logwood speedily acquires a dark hue and in about half an hour has become dyed of a dense black colour, and, when thoroughly washed and finally finished, forms the common black calico of the shops. A variety of other cases might be adduced, woollen cloth boiled for some time in a bath of potash solution acquires a certain amount of a salt of chromium, which enables it to take a black colour from logwood, and other colours from other dyestuffs. Woolen, boiled with salts of tin, is enabled to dye up a brilliant scarlet in decoction of cochineal; boiled with alum, it will take a great variety of colours in various dye stuffs. The practice of calico-printing illustrates in a very forcible manner the action of mordants, by the aid of apparatus described in the article upon that subject, portions of a piece of calico are impregnated with mordants, and these portions alone acquire colour from the dyeing solution, and these designs or patterns are produced upon a white ground. The most usual method of impregnating the fibrous matter with mordant, consists in boiling it with the required metallic salts, and it will be seen hereafter that easily decomposed salts are those generally used, or substances such as chalk, alkali, or tannin are added, such as alum, to induce the formation of comparatively unstable compounds, which, under the influence of a high temperature and contact with fibrous matter undergo decomposition, — the metallic oxide or some base insoluble compound of it becoming intimately combined with the fibre, which is then said to be mordanted.

2. A second method, less general than that above described, is to apply the colouring matter before the mordant. It is resorted to only with heavy goods which absorb a large quantity of liquid, or with light colours upon other fibres, dyes produced in this way are superficial in their character, and not so permanent as those produced by the first method. In dyeing by that method it is in many cases customary to add a small quantity of mordant to the dye-bath through which the process is quite or nearly finished, or to pass the dyed goods, as a final operation, through a diluted mordant.

3. A third method is to apply the mordant and the colouring matter together to the fibrous substance. In common piece-dyeing in weak liquids this plan is seldom followed, on account of the tendency to form insoluble lakes in the solution, which, depositing only on the external part of the fibres, give inferior results, alike as to stability of colour, depth of shade, and evenness of the dyeing. The process consists in passing a calico-printing or in padding, the method is of extended application and the inconveniences experienced in common dyeing are not perceptible, owing to the greater concentration of the colouring matters and the use of thickening matter. Lakes are very probably formed to some extent during the preparation of the mordant, but, the combination taking place in the presence of a fixed medium, such as starch or gum, the insoluble lake is in an extremely fine state of division, in such a mixture there is always present an acid or carbonate of acid, such as acetic acid or carbonate of ammonia, or chloric acid of lime, cream of tartar, or benzoate of potash. These three, in the first instance, to restrain the formation of a lake, and afterwards, when the fibre and the mordant and colouring matter are submitted to heat, as in the process of steaming or stoving, facilitate the solution of any lakes formed, which thus find entrance into the fibrous matter, and there undergo combination with it,
owing to decomposition of the mordanting salts, a true dyeing taking place.

**PRACTICAL DYEING PROCESSES.**

By the foregoing preliminary observations the reader will have been prepared to comprehend the rationale of the practical processes of dyeing. In order to give a fairly comprehensive account of these, it has been found convenient to take the colours in the old arrangement of simple and compound colours. Red, blue, and yellow are supposed to be simple or primitive colours; the methods of obtaining these being given, then follow the colours from mixtures of two of the elementary colours, as green from yellow and blue, orange from red and yellow, and purple from red and blue. The colours not included in the above, and in the dyer's philosophy made by mixing the three elementary colours, red, blue, and yellow, in different proportions—namely, the browns, greys, and chocolates, and black—will be conveniently treated of after those supposed to result from the mixture of two of the primary colours.

This arrangement, though perfectly arbitrary, is both convenient and consistent as far as regards dyeing; for though modern discoveries in optics may show that pure blue and yellow do not make green, and may in other respects disturb the older ideas concerning primitive and secondary colours, yet the dyer has sufficient justification for retaining the old system, because he can show that his blue and yellow always make green, and that the proper mixture of the so-called simple colours produces a compound shade which can be calculated beforehand from the proportion of the respective colours employed.

**Red Colours.**

The most important of the red colours produced by dyeing are obtained from cochineal and from madder, the former being used for woollen and the latter for cotton goods. They are both old colours, and have arrived at their present excellence by slow degrees; they are deep and brilliant, and, as far as regards permanency, hold the highest position among all dyed colours. The processes employed are inductive as illustrating the diversity of treatment required by different fibres and colouring matters.

Red upon wool from cochineal.—Let it be assumed that the shade of red required is fine scarlet, such as is worn by officers of the British army, and that the woolen cloth is of finest quality. The cloth first requires purifying from all the extraneous substances which it has acquired in the process of manufacture, in order to prevent irregularity and unevenness in the shade of colour; this is done by methods described in the article BLEACHING. The only materials required to produce a fast scarlet upon wool are oxides of tin and the colouring matter of cochineal, but it requires much practical skill to bring them into contact properly. After the cloth is cleaned, and while it is still wet from its last washing, it is mordanted by boiling it in a solution of a salt of tin with or without cream of tartar. The parts of the colours not in actual contact with the fire are frequently constructed of pure black tin, or at least all parts out of water should be of this metal, or else protected by wood. The dyeing vessel should be made entirely of wood and heated by steam pipes; for if the cloth containing the acid solution of tin comes in contact with a copper or brass surface it acquires a stain which afterwards dyes up an unproportionable colour. What takes place in the course of boiling is that eventually a certain portion of tin, probably in the state of stannic oxide, becomes fixed upon or within the fibres of the wool, and thus a perfectly uniform manner. The tin not in intimate combination with the wool, or held merely by capillary attraction, is washed off by water before the cloth is brought into contact with the colouring matter.

The mordanted cloth is now brought into a boiler containing finely ground cochineal diffused through a sufficient quantity of water, and such is the usual manner of adding the dye and tartar; the cloth is turned continually to prevent folds or creases from interfering with the free access of the dye to all parts of it. The boiler is heated in the boiling point, and in half an hour or so the liquid becomes nearly colourless, and the cloth is found dyed of a bright red.

**THE TARTAR OF THE DYEING BOILER.**

The above may suffice to furnish a general view of the procedure usually followed, and to illustrate the principles involved with regard to numerous other dyes here the general reader a further insight into some of the operations practised in the use of that colour (and the description applies more or less to other dyes, the following particulars may be noted).

The tin mordant used for scarlet on wool.—It is now 200 years since the discovery was made of the use of tin with cochineal for dyeing scarlet; it might be thought that by this time the exact kind and quantity of tin solution to be used would have been settled; there exists, however, the greatest diversity upon this point among the practical dyers. The two salts of tin used in commerce, designated by chemists stannous and stannic chlorides, have received various names from dyers. Crystallized stannous chloride is generally known as "tin red," and the solution of the same as "murett of tin. A simple murett and a double murett of tin are also distinguished, the difference being in the degree of concentration; and in some dyers' philosophy, the murett of tin is said to be the same given to a solution of stannic chloride, elsewhere called "blackst" of tin, and a good deal of confusion is sometimes caused by the terms. The dyer, however, is in a position to judge for himself whether the shade which can be calculated beforehand from the so-called "tin red" and "blackst" of tin, and a good deal of confusion is sometimes caused by the terms. The dyer, however, is in a position to judge for himself whether the shade which can be calculated beforehand from the presence of these names from dyers. Crystallized stannous chloride is generally known as "tin red," and the solution of the same as "murett of tin. A simple murett and a double murett of tin are also distinguished, the difference being in the degree of concentration; and in some dyers' philosophy, the murett of tin is said to be the same given to a solution of stannic chloride, elsewhere called "blackst" of tin, and a good deal of confusion is sometimes caused by the terms. The dyer, however, is in a position to judge for himself whether the shade which can be calculated beforehand from the presence of these
as follows—20 lb. of tin solution, containing about 20 ounces of metallic tin dissolved in nitric acid, with the addition of a little common salt, are used to 100 lb. of the wool. The already mordanted wool, 13 lb. are taken and mixed with a solution in water of 8 lb. of crude tartar, and about 8 ounces of cochmeal are added to enable the wool to take a deep shade by reason of the progressive action of the mordant on the tin. The ingredients having been boiled for a couple of hours, the cloth is raised in clean water and placed in another boiler, containing the remaining 7 lb. of tartar and 6 lb. around cochmeal, which is sufficient to dye up a full scarlet colour, but if the scarlet is required to be very bright, or what is called "fery" coloured, a further quantity of tartar is added, this has the effect of "blowing" the depth of colour, and at the same time giving it a yellowish or orange hue, which for certain purposes is much desired.

Use of yellow scarlet—It appears that Florence, who wrote about the end of the last century, was the first to suggest that the bright fiery scarlet, which the dyes found they could best obtain by using a large quantity of tartar might be produced more cheaply by adding some yellow colouring matter to the cochmeal, or by first dyeing the cloth a yellow light yellow, he treated the yellow from quercetin bark, and succeeded as far as perhaps was possible with that material. At any rate from his time it has been customary for dyers to use the highest degree of excellence in the scarlet colour to use a purified preparation of quercetin bark, commercially known as flavine, in conjunction with cochmeal, other yellow colouring matters, such as fuste and turmeric, are also used. An admixture of these substances cheapens the cost of the colour, which can be made nearly equal in appearance to that obtained with the original "fery" red, and which is sold in its stand as scarlet, and is more readily stained by various influences. The best scarlets are still dyed exclusively with cochmeal.

Orange red on wool—This colour is also dyed with cochmeal, but with a mordant of alum instead of tartar. It is a far more certain colour than the scarlet, and compared with it is dull and flat, it is, however, rich and durable, and combines excellently with other colours.

The mordanting of cloth by means of alum, an operation of capital importance for a large series of colours derived from all varieties of dye-stuffs, must now be noticed.

Mordanting of wool—The method of mordanting with alum, generally adopted for one or two simple processes, but the chemical principles involved have given rise to much debate amongst experimenters. The alum is usually performed by boiling wool for one or two hours with a solution of common alum mixed with tartar; a certain portion of alum, or, it may be, of some compound of alumnum, becomes thus intimately combined with the wool, and forms a basis upon which a coloured lake may be produced with solutions of colouring matters. The chemical conditions are somewhat different here from those which obtain in the ease of mordanting with tin; for the disposition of tin salts in dilute solutions to decompose even spontaneously is so manifest that it may really be supposed that some action on the part of the wool takes place which induces the formation of a compound of tin. The great apparent stability of alum caused the explanation of its action given by Thennard and Roard to be for a long time accepted.

Some of the colours of mordanting solved, the brownish reds which returned it by some undefined power, so that it could not be removed by cold water, and required to be heated twenty times in an alkali solution, must now be noticed.

Artificial alizarin on wool—By employing artificial alizarin, somewhat better shades of colour can be obtained, and even pink or rose colour upon wool. A process for obtaining a fast red on woolen yarn, from alizarin, is as follows—boil 10 lb. of wool for an hour and a half with 1 lb. of common alum; boil 1 lb. of tartar; rinse in water, and then dye with 6 to 7 ounces of the tin solution being taken for 10 lb. of cloth, after boiling, the cloth is rinsed in water to remove uncombined mordant, and then dyed with madder, or preferably its derivative garum, with addition of a portion of tartar; the dyeing may be accomplished in an hour, the depth of colour varying with the amount of colouring matter used.

The shade of red between scarlet and crimson rods proper, or cherry reds, are also dyed with aluminium and cochmeal, and the same way as the scarlet, but in order to avoid a yellowish tone, the natural cochmeal may be mixed with the manufactured or modified material known as artificial cochmeal.

Ammonical cochmeal—This is made by treating ground cochmeal with concentrated aqueous ammonia for several days, the colouring matter undergoing a chemical change, and changing with the colourant, the fine ammmonial cochmeal, or alminum ammonic, is produced. The wool is then ammmonialised, and according to the proportion in which it is added to ordinary cochmeal, the natural scarlet shade is gradually brought over to the red and even to the scarlet.
DYEING

576

on only, for the colour fades rapidly in sunlight, and is easily washed out by soap and water. Substances similar to cowpea, which have even still more recently appeared in trade, are called cocoon and acacine, they yield beautiful but perishable red colours on wool and silk.

Red colours on cotton.—Turkey red.—Cochineal, which is so suitable a colouring matter for woollen and worsted fabrics but from very remote times the Hindus have possessed a process for dyeing a brilliant and extremely permanent red upon cotton fabrics by means of madder. This process travelled westward through the Levant into Turkey and Greece, the date of its introduction into Western Europe going no further back than the middle of the 18th century, at which period Greek dyers were induced to settle in France and make known the methods in use for the production of this much desired colour. The name Turkey red, or Adana red, was applied to cotton dyed with it at the time that such goods could be obtained only from the East, and it still retains the name. So much was the colour esteemed that in 1765 the British Government paid a sum of money to a Frenchman named Angermair in order to obtain a sample describ-}

ing the best known methods of dyeing it on yarn, and some years afterwards, the British Government paid a sum of money to a Frenchman named Bautain, to procure cotton same methods.

The dyeing of Turkey red upon cloth and yarn is now extensively carried on in Great Britain, and with great success. Turkey red, essentially a madder red with an aluminous bloom, though it differs from a common madder red by containing oil, and it is the fixing and combining of the oil with the fibre and the colour which produces its peculiarity. Divested of details the process of producing Turkey red may be divided into four stages:—(1) the oiling of the cloth, (2) mordanting with a salt of aluminium; (3) dying with madder; or its equivalents garamun or alunna; and (4) the brightening of the dyed colour. The preparation of the cloth with oil is a process used in no other kind of dyeing of; of its utility there can be no doubt, but the attempt to explain the rationale of its action has failed. There are many modifications of the method of applying the oil, but the older and more commonly used process is to mix the oil with a dilute solution of potash or soda ash, so as to diffuse it uniformly through the liquid, forming an emulsion; the oil is not dissolved by the alkalies, nor is it a solvent for them, but it is held by the state of excessively fine mechanical division. A low quality of oil or olive oil is usually employed in Europe, that from Mogador, in the coast of Africa, being very suitable. Certain kinds of oil do not answer for Turkey red, only those being suitable which, probably from containing free fatty acids or albuminous matters, readily form a milky emulsion with weak alkaline solutions, other kinds are, in use in some places. The cloth to be dyed is steeped in the oil emulsion, wrung out, and dried in a warm stove; this process is repeated six or eight times, and the cloth is finally washed in weak alkali to remove from it all the oil not intimately united to the fibre. The result of this treatment, which is the most delicate and important in the Turkey red process, is that the cloth becomes impregnated with a fatty matter, which by contact of alkalies and heated air has undergone some change from its original state, which is usually called an oxidant, but the nature of which is really unknown. The oily matter now possesses a power of attraction for mordants and colouring matters greatly superior to untreated cloth, and further, its physical condition is changed so that colour upon it is more transparent and more vivid than upon ordinary cotton.

The cloth in this state is ready for mordanting, which is done by passing it through a bath of alum, partly neutralized with carbonates of soda or by chalk, or in a bath of acetate of alumina, the object being to obtain a regular deposition of the albuminous base upon the fibre; the excess of mordant is carefully washed away from the cloth, which is now ready for dyehng.

The dyehng is accomplished in the ordinary way, by keeping the cloth in continuous motion in a vessel containing heated water, the dye staff, which may be madder, garamun, or artificial alunna. It is a very general practice to add a quantity of ox-blood to the water used in mordanting the cloth, and to introduce a mixture of salt of tin with the soap used as the last process of brightening—occasionally under a pressure greater than that of the atmospheric pressure or in order to obtain a temperature some degrees higher than 212° F.

In many processes of Turkey red dyeing, the cloth is treated with a pickle, or with a dilute solution of mordant with oil and before the mordanting; this enables it more easily to absorb and fix the allumnos mordant, but it is not essential, and is most generally omitted.

No allusion has been made to a number of extraordinary and other animal matters, which the dyer may be induced to use in the dyeing process, such as sheep-dung, cow-dung, oz-bile, &c., they can be dispensed with, and were employed probably from caprice and ignorance.

Barkwood red.—An imitation of Turkey red is obtained from barkwood; it is much inferior both in beauty and stability to the real colour, but the ease with which it can be dyed, and the costly nature of the materials employed, enable it to be sold at a much lower price, and for some purposes it is largely used. Barkwood is one of the red dyes of which the colouring matter is very slightly soluble in water; it is used in a state of fine powder. The cotton to be dyed is impregnated with a tiff mordant by any of the means known to dyers, and then boiled with the dye-stuff, the colouring matter as it dissolves is fixed by the mordant, and the process is continued until the required shade is obtained. This wood, and a similar material called canwood, are also employed in woolen dyeing to give brownsish red, and to dye a "bottom" or foundation for indigo blue colours, by which some economy in indigo is effected, and a peculiar bloom on the blue is produced.

The class of woods represented by Brazil wood, do not yield good reds upon cotton.

Blue Colours.

The most important of the blue colouring matters is indigo. This may be said indeed to be the most important of all colouring matters, both as regards the large quantity and monetary value of what is produced and sold, and the permanence and solidity of the dyed colours which it yields. The indigo dye is a manufactured article, prepared in the place of growth of the plant which produces it. The indigo plant could itself be used for dyeing, but from 300 to 250 lb. of it would be required to produce the effect of a single pound of the prepared indigo. In England, and many other countries possessing a temperate climate, the species indigofera, from which it has been cultivated, and has been used from time immemorial for dyeing blue. Its comparative poverty in colouring matter has caused it long since to be disused by dyers as a source of colour; it is, however, employed by them in the preparation of their indigo vats, but rather as a convenient material to induce fermentation than as a dye.

Indigo is distinguished from nearly all other colouring matters by its complete insolubility per se in water and other ordinary solvents. It dissolves to a very slight extent in heated aniline, petroleum, and acetic acid, upon which cooling redeposits it; the only real solvent for it is anhydrous acetic acid mixed with a little sulphuric acid, from which water precipitates it unchanged, but this solvent is inapplicable in dyeing. But solubility is an essential condition for dyeing, and means have been found to obtain satisfactory solutions of indigo by circuitous methods which involve the temporary destruction of its blue colour and a change in its chemical composition. By various decolorizing agents, indigo blue can be changed into a white substance, indigo white, which dissolves with facility in all alkaline liquids, forming a colourless or slightly yellow solution. On exposure to the air or other sources of oxygen, the solution yields the insoluble blue indigo, and permanently dyes any fibre which has been saturated with it.

This is the only case in which such a method of dyeing is applicable, and on that account it possesses much interest. We shall now proceed to describe some of the practical methods in use for indigo dyeing.

Fermentation process.—The oldest of these, and one naturally suggested by the method employed in preparing the dye-stuff, is the process of fermentation in contact with lime, or sometimes soda or potash. During this process, gaseous or liquid substances are formed, which have the power of reducing indigo from the blue to the white state, and fitting it for dyeing. This ancient method has not been superseded in England at least, being employed at the present day for dyeing the indigo blue, and dyes to the colouring matter of which is greater for woollen than for all other kinds of cloth.
The wood vat.—To a course of lectures upon dyeing, recently delivered by Mr. Jarman before the Society of Arts, we are indebted for the following account of the use of the wood vat by the Yorkshire dyers. The materials employed are indigo, wood, madder, bran, and lime. For the first, the sheets of the lignum indigo are employed, in which case the indigo must be reduced to the finest possible powder. It is generally ground mixed with water, in closed revolving cast-iron cylinders containing iron-cored balls, for several days, or until the alime or pulp formed contains no visible particles of the dye-stuff. The proportions of materials employed are:

<table>

The wood vat is first placed in the dyeing vat nearly filled with water, which is heated to between 100° and 105° F., after some hours (required to soften the wood), the bran, madder, and indigo are added, and half of the whole quantity of lime. In a few hours, if all is right, a clear blue dye is formed. If this process is proceeding well, a little more lime is added, but at intervals, so as not to check the progress of fermentation; and, if necessary, the vat is heated by steam to its original temperature, on the third day the vat should be ready for dyeing. The vat contains a clear blue dye and the process of fermentation is then repeated until the required depth of colour is obtained. By proper management of the temperature and proportion of materials required, standard results may be obtained.

Dyeing the vat nearly filled with water, the colours employed are

- 200 gallons of water
- 20 lb. ground indigo
- 40 lb. ground madder
- 1 lb. ground lime

The vat is added of 20 lb. of water, and a sufficient quantity of bran, madder, and indigo to give the desired colour. The vat is then covered with a network bag, and left to stand for 24 hours. During this time, the colour should be checked, and more water or indigo added if necessary. The vat is then ready for dyeing.

The vat is prepared as follows:

1. Prepare the indigo vat by boiling the indigo in water, and adding the necessary amount of lime and bran.
2. Add the madder and water to the indigo vat, and boil for an hour.
3. Add the bran to the vat, and boil for another hour.
4. Add the lime to the vat, and boil for another hour.
5. Add the wood to the vat, and boil for another hour.
6. Add the remaining bran and lime to the vat, and boil for another hour.
7. Add the dyestuff to the vat, and boil for another hour.
8. Add the remaining water to the vat, and boil for another hour.

The vat is then ready for dyeing.

The vat is prepared as follows:

1. Prepare the indigo vat by boiling the indigo in water, and adding the necessary amount of lime and bran.
2. Add the madder and water to the indigo vat, and boil for an hour.
3. Add the bran to the vat, and boil for another hour.
4. Add the lime to the vat, and boil for another hour.
5. Add the wood to the vat, and boil for another hour.
6. Add the remaining bran and lime to the vat, and boil for another hour.
7. Add the dyestuff to the vat, and boil for another hour.
8. Add the remaining water to the vat, and boil for another hour.

The vat is then ready for dyeing.

The vat is prepared as follows:

1. Prepare the indigo vat by boiling the indigo in water, and adding the necessary amount of lime and bran.
2. Add the madder and water to the indigo vat, and boil for an hour.
3. Add the bran to the vat, and boil for another hour.
4. Add the lime to the vat, and boil for another hour.
5. Add the wood to the vat, and boil for another hour.
6. Add the remaining bran and lime to the vat, and boil for another hour.
7. Add the dyestuff to the vat, and boil for another hour.
8. Add the remaining water to the vat, and boil for another hour.

The vat is then ready for dyeing.

The vat is prepared as follows:

1. Prepare the indigo vat by boiling the indigo in water, and adding the necessary amount of lime and bran.
2. Add the madder and water to the indigo vat, and boil for an hour.
3. Add the bran to the vat, and boil for another hour.
4. Add the lime to the vat, and boil for another hour.
5. Add the wood to the vat, and boil for another hour.
6. Add the remaining bran and lime to the vat, and boil for another hour.
7. Add the dyestuff to the vat, and boil for another hour.
8. Add the remaining water to the vat, and boil for another hour.

The vat is then ready for dyeing.

The vat is prepared as follows:

1. Prepare the indigo vat by boiling the indigo in water, and adding the necessary amount of lime and bran.
2. Add the madder and water to the indigo vat, and boil for an hour.
3. Add the bran to the vat, and boil for another hour.
4. Add the lime to the vat, and boil for another hour.
5. Add the wood to the vat, and boil for another hour.
6. Add the remaining bran and lime to the vat, and boil for another hour.
7. Add the dyestuff to the vat, and boil for another hour.
8. Add the remaining water to the vat, and boil for another hour.

The vat is then ready for dyeing.

The vat is prepared as follows:

1. Prepare the indigo vat by boiling the indigo in water, and adding the necessary amount of lime and bran.
2. Add the madder and water to the indigo vat, and boil for an hour.
3. Add the bran to the vat, and boil for another hour.
4. Add the lime to the vat, and boil for another hour.
5. Add the wood to the vat, and boil for another hour.
6. Add the remaining bran and lime to the vat, and boil for another hour.
7. Add the dyestuff to the vat, and boil for another hour.
8. Add the remaining water to the vat, and boil for another hour.

The vat is then ready for dyeing.

The vat is prepared as follows:

1. Prepare the indigo vat by boiling the indigo in water, and adding the necessary amount of lime and bran.
2. Add the madder and water to the indigo vat, and boil for an hour.
3. Add the bran to the vat, and boil for another hour.
4. Add the lime to the vat, and boil for another hour.
5. Add the wood to the vat, and boil for another hour.
6. Add the remaining bran and lime to the vat, and boil for another hour.
7. Add the dyestuff to the vat, and boil for another hour.
8. Add the remaining water to the vat, and boil for another hour.

The vat is then ready for dyeing.

The vat is prepared as follows:

1. Prepare the indigo vat by boiling the indigo in water, and adding the necessary amount of lime and bran.
2. Add the madder and water to the indigo vat, and boil for an hour.
3. Add the bran to the vat, and boil for another hour.
4. Add the lime to the vat, and boil for another hour.
5. Add the wood to the vat, and boil for another hour.
6. Add the remaining bran and lime to the vat, and boil for another hour.
7. Add the dyestuff to the vat, and boil for another hour.
8. Add the remaining water to the vat, and boil for another hour.

The vat is then ready for dyeing.

The vat is prepared as follows:

1. Prepare the indigo vat by boiling the indigo in water, and adding the necessary amount of lime and bran.
2. Add the madder and water to the indigo vat, and boil for an hour.
3. Add the bran to the vat, and boil for another hour.
4. Add the lime to the vat, and boil for another hour.
5. Add the wood to the vat, and boil for another hour.
6. Add the remaining bran and lime to the vat, and boil for another hour.
7. Add the dyestuff to the vat, and boil for another hour.
8. Add the remaining water to the vat, and boil for another hour.

The vat is then ready for dyeing.

The vat is prepared as follows:

1. Prepare the indigo vat by boiling the indigo in water, and adding the necessary amount of lime and bran.
2. Add the madder and water to the indigo vat, and boil for an hour.
3. Add the bran to the vat, and boil for another hour.
4. Add the lime to the vat, and boil for another hour.
5. Add the wood to the vat, and boil for another hour.
6. Add the remaining bran and lime to the vat, and boil for another hour.
7. Add the dyestuff to the vat, and boil for another hour.
8. Add the remaining water to the vat, and boil for another hour.

The vat is then ready for dyeing.
DYEING

be used. Dissolve 9 lb of yellow prussiate of potash in hot water, and add the solution to the required quantity of water, then add 14 lb of 50% sal-ammoniac, and about 6 oz. of crystals of protochloride of tin, the mixture being placed in the mixture, and the temperature of the dye-bath gradually raised to the boiling point and kept there for two hours. The blue gradually formed on the cloth requires

bleaching and brightening in a fresh bath containing an alum, potash of tin, and cream of tartar, heated to nearly the boiling point. Red prussian blues upon wool, but as it is more easily decomposed than the yellow, it is a matter of acid-alkali success. These blues are often finished off with logwood to give them a deeper tone.

Prussian blues can also be obtained on such woolen goods as manners, by a process of padding, and the use of a colour nearly identical with the so-called French or royal blue used by calico printers. A mixture is prepared as follows: Half a pound of wheel-starch is boiled with about half a gallon of water, in the thin paste thus made 13 oz. of powdered yellow prussiate are dissolved, and afterwards 6 oz. of tartaric acid, when the mixture is quite cold 1 lb. of prussiate of tin in paste is added, 13 oz. oxalic acid, and 3 oz. sulphuric acid; the whole is well mixed and strained. The woollens to be treated are first "prepared," as it is called, by impregnating them with a solution of alum, and then the above thickened mixture is applied by means of rollers, so that it shall be evenly and smoothly spread over the whole stuff, the cloth is then dried and properly pressed, which causes the acids to rise upon the prussiate, and from a nearly colourless mixture develops an intense blue, which is found to be permanently fixed in the fibre.

Aniline blues—There are several artificial blue dyes made from aniline and similar bodies, which yield very brilliant colours on wool and silk, and with a little care can be used with advantage. The process requires to be worked in a squerous solution until they have acquired a sufficiently dark tone. An artificial dye called Nicholson’s dye is very extensively used, it is prepared from the alkali in the liquor, and forms then a colourless or nearly colourless solution, with which the goods to be dyed are impregnated, they are then passed into dilute acids, which develop the blue colour.

Litmus and logwood blues—The other substances which have been used for blue colours, such, for example, as litmus, are of little importance, and are now nearly unknown to the practical dyer. A blue can be obtained from logwood which has some resemblance to indigo blue upon wool, but it is of a very low character both as to stability and shade, and is hardly ever employed by respectable dyers.

Yellow Colours.

Yellow textiles, being less pleasing to the eye, and more readily soiled, are not nearly so much in use as those dyed with the two simple colours blue and red. The chief yellow dyes, besides fustic, are quercitrin bark or its concentrated extract flavin, Avignon or Persian berries, and the most almost disused indigenous product, weld. The general mordant for these is tin, sometimes with addition of alum. One or two illustrations will suffice to show the methods employed for such goods as are obtained by the use of salts of lead and bichromate of potash.

Fustic yellow—Fustic is probably the most generally employed yellow dye-stuff for wool, it gives yellows inclined to orange. For light yellow it is not necessary to mount the wool; it is simply well cleaned, and then heated with fustic decoction and some cream of tartar. For darker shades the wool is boiled with solution of tin and tartar, washed, and then worked in the decoction of fustic.

Persie and yellow—Persie, a dye, one of the artificial colouring matters, gives pure though not deep yellow shades upon silk and wool without the aid of a mordant. The cleaned material being dyed by working it in a warm solution of the acid.

Chromate of lead yellow—The yellow most commonly employed for such goods as are obtained by the use of salts of lead and bichromate of potash. The method of obtaining this colour differs somewhat from any previously described. The cotton, having been prepared to receive the dye, is impregnated with a salt of lead, usually by employing a solution of the acetate or sub-acetate of lead. The goods are next passed into a mill of lime solution, to which it is prudent to add some acetate of lead, in order to prevent the lime from dissolving the oxide of lead at first precipitated; the result of this lime treatment is that oxide of lead is evenly fixed upon the cotton, the yellow red lead is then washed away, and the goods are passed into a solution of bichromate of potash, where they quickly acquire a bright and deep yellow colour, owing to the formation of the well-known intermittent chrome yellow calcium. To facilitate the combination, the bichromate of potash is mixed with as much sulphuric and as much as to liberate the whole of its chromic acid. The yellow-dyed goods require no further treatment than a good washing, the colour being quite fast.

This yellow is, however, in very little demand, and is mostly

cases out of a hundred it is immediately converted into an orange, so that when passing through built chimneys, the yellow-dyed goods used as chrome known as chrome orange, which has always been in demand for many articles of wear.

Compound Colours.

The so-called simple colours—red, blue, and yellow—having now been dealt with, it remains to treat of their combinations, and this may be done briefly, the processes employed being for the most part similar to those already described. The compound shades in Chevreul’s chromatic nomenclature amount to nearly 15,000, and it is very probable that fully that number are produced by the dyers of the present day. For practical treatment, however, the compound colours can be reduced to comparatively few classes. Mixing the simple colours one and one we obtain a compound colour called Lo-kao, until then known in Europe. It was a costly dye-stuff, selling in China for 12 weight of silver. Some quantity of it was imported and used in silk-dyeing, but by the French, it was not, however, applied to wool, and has at length been quite abandoned for the aniline greens, which are in every respect preferable.

Aniline green—There are two or three kinds of artificial green dye in use, of which that known as methyl-aniline green, applied in silk dyeing, is most in request. The so-called indigo green has also been somewhat extensively employed for all class of articles. These artificial and unstable materials are the only dye-stuffs for green possessed by the dyer, who is compelled to produce the colour by means of blue and yellow, but are not composed of the two separate colours blue and yellow. About that time some green-dyed cottons, imported into France from China, attracted the attention of chemists, who were surprised that they could not separate the green into blue and yellow constituents. Inquiries showed that the Chinese employed a green-colouring matter called Lo-kao, until then unknown in Europe. It was a costly dye-stuff, selling in China for 12 weight of silver. Some quantity of it was imported and used in silk-dyeing, but by the French, it was not, however, applied to wool, and has at length been quite abandoned for the aniline greens, which are in every respect preferable.

Green Colours.

Lo-kao or Chinese green—Until about the middle of the present century there was not an instance known of any green or yellow which was not composed of the two separate colours blue and yellow. About that time some green-dyed cottons, imported into France from China, attracted the attention of chemists, who were surprised that they could not separate the green into blue and yellow constituents. Inquiries showed that the Chinese employed a green-colouring matter called Lo-kao, until then unknown in Europe. It was a costly dye-stuff, selling in China for 12 weight of silver. are nearly always composed of some of the red and yellow dyes mentioned in the preceding pages, such, for instance, as cochineal and fustic, and are supplied in one bath, the same mordant serving for both.

Arran orange.—A warm solution of arran in weak alkalies is used without mordant to impart an agreeable orange shade. In early times it was generally considered too yellow, but may be made redder by treatment with weak acids, or by previously giving the silk a yellow foundation.

Purpure and orange.—Another orange on silk can be dyed by superimposing on a light pink a yellow obtained from purpure and cochineal. Purple and orange—Silk can also be permanently stained of a yellowish orange by means of moderately strong nitric acid, and must, however, be applied with care, since a more than momentary contact would be very injurious to the strength of the fibre. This method of dying silk was formerly much used for handkerchiefs, by protecting certain parts from the acid with melted wax or similar resists, white designs being produced upon an orange ground.

Purple Colours.

The purple colours may be held to include all shades produced by an admixture of red and blue, such as for example blue, violet, mauve, &c., and are of immense variety.

Antique purples.—Since their discovery aniline dyes have been almost exclusively employed for dying silk and wool purple, yielding as they do shades which for lustre and purity surpass any obtainable from the older colouring matters, and possessing also a far greater stability. An application of the dye without mordant is all that is required, and the goods when dyed need very little subsequent treatment. The aniline purples, violets, and mordants used for dyeing on cotton without previous mordanting, and even then are so loose and unstable that they are only fitted for use where great fastness is not demanded, as for instance of clothing.

Madder purple.—But the purple colour par excellence upon cotton is obtained from madder or alizarin, the mordant being oxalate of iron, and the commercial pyroglucine of iron, commonly called iron liquor. This purple is remarkable for great permanence. It is very largely used in combination with black and white in the best kind of printed calicoes.

Arran purple.—Arran and indigo are sources of purple colours on wool and silk. The shades produced are rich and beautiful; they are not, however, very permanent, and have been nearly superceded by the aniline colours. Of the few instances that can be given of the mordant purple by the direct union of red and blue colouring matters, the violet or purple woolen cloth used for ecclesiastical purposes is an example. The indigo colour is first fixed, and then the cloth is dyed with cochineal and mordant in the way already described for dying scarlet. The purple thus obtained is a fast colour, but is very costly, and on that account is not much worked.

The common shades of purple, violet, blue, &c., upon wool are obtained from logwood with a mordant of alun and tannin, the red woods are sometimes employed in conjunction with logwood for these colours, which are “tipped” with archil to give them more brilliancy.

The extensive range of colours, comprising all the shades of brown, bronze, chocolate, nut, wood, drab, and grey, which may be considered as compounded of the three elementary colours, some of one of these predominating, can be only briefly treated of in this article. Most of them are actually produced by the use of dye-stuffs yielding the three simple colours, but there are colouring matters like catechu, which yield brown colours, and others, like logwood, which may be held to contain two or more of the simple colours, the blue predominating. A few illustrations will show how these tully compounded colours are produced by the dyer.

Brown Colours.

Brown on wood.—The wool is mordanted with alun and tannin in the usual way, and is then dyed in a mixture of fustic and logwood, or other equivalent dyes, for fast colours a blue part can be communicated to it by the indigo vat. For a lower class of colours no indigo is used, but instead, a mixture of fustic or other equivalent dyes, and with madder for the red, and logwood for the blue part, or again, the sulphate of indigo may be employed for the blue.

Brown.—According to Mr. Jarvis, the wool is mordanted by boiling it for an hour with one per cent. of its weight of sulphate of potash, it is then washed, and transferred to the dyers vessel, with the following percentages of its weight of materials—madder, 3 lb., 2½, 3½, &c., (for 44 lb.); indigo, 1 lb., 1½, 2 lb., &c., (for 44 lb.); logwood, 5 lb., 10 lb., &c. (for 44 lb.). With these materials it is boiled for two hours.

Black Colours.

Black, from a dyer’s point of view, is composed of the three simple colours, red, yellow, and blue, in a state of concentration, but in reality the blue predominates in all good black colours, and gives them their density and at the same time their lustre. What is called a dead black, a brassy black, or a jet black, is the nearest approach to a neutral black, but even this would be brownish if the blue did not predominate. It is often extremely difficult to obtain a black dye to suit a particular market. Of ten pieces appearing equally black to the untutored, an expert would, perhaps, pronounce one to be sooty, another purple, another red, another brown, another green, and so on.

We should have to go back several years in the history of dyeing, to find a time when black was actually dyed with anhrome or madder dyes. In some processes blue from indigo was first applied, and then, upon an alum mordant, red and yellow from madder and weld, and then the goods were washed and dried. For a long time there was a demand for aniline black, on account of its fastness to light, and at present there is no synthetic product that will take the place of the mordanted indigo, black or brown. Several shades of black are obtainable by the use of different mordants. The use of a mordant is not always necessary for the production of a black, as a mixture of iron and madder gives a good black, and many modern black silk dyes, with a mordant, will produce an excellent black, provided the mordant is not too strong, for it has the effect of giving the goods a certain amount of hardness and stiffness, and also of giving them fastness to light.

Black dye upon silk.—Silk easily takes a black by treatment first with decoction of gall-nuts, and subsequently with a salt of iron. For blue blacks the silk is usually first dyed with Prussian blue, and then with gall-nut black. Extract of indigo with an iron mordant gives a good yellow. In modern black silk dyes, either natural or artificial, the dye is most frequently obtained from the indigo plant; it is a blue salt, which is not only to its colour, but which increases its weight, in an extraordinary manner, so as not only to compensate for the loss of 25 per cent. of natural indigo in the silk, but even, in some cases, to double or treble the original weight. The silk is, of course, much injured by the accumulation of foreign matters upon it, the fibre becoming harsh and brittle, and soon showing the effects of wear. The chief substances used for weighting are lead salts, calcium, iron, and gall, with soap or fatty matter, to soften in some degree the hardness of the silk.

Common black.—Common blacks upon wool have no indigo in their composition, but are dyed clearly with logwood and iron salts, the wood and logwood are heated together for some time, and then sulphate of iron is added to the dye-bath. In other blacks of somewhat better quality, the wool is boiled for some time with solutions of iron, copper, and aluminium salts, together with tartar, and when the mordanting oxides have been fixed, the colour is dyed up in logwood. The logwood of mordant purple can also be used for the black dye, and the cloth can be “tipped” with camwood or barwood, it is then dyed up with logwood, to which fusling or madder may be added.

Black upon cotton.—Almost the only ordinary black in cotton dyeing is obtained from logwood with iron mordant; sometimes used, and very rarely the blacks are dyed upon an indigo blue basis by means of sumach and galls and iron. As before stated, aniline black has not yet been practically applied, but a common method is to first heat the goods for some hours with decoction of sumach, wash mordant in sulphate of iron, and then dye in logwood, another method consists of heating the cotton by the method given above (page 757), and dyeing in logwood, along with a portion of sumach or flax, according to the shade required.
applications of madder, sulphate or acetate of iron, sulphate of copper; and, finally, the end chiefly aimed at being the production of a black with blue or violet bloom. The Manchester dyers formerly held a monopoly of this blue-black upon velvet, as is called, but of late years the German dyers have shown themselves very formidable competitors in dying this class of goods.

**Theory of Dying.**

When the great variety of processes employed in dying is taken into consideration, it is apparent that there must be some difficulty in constructing a general theory which shall be applicable to every case.

The earlier writers who endeavoured to generalize the principles of the art considered that the particles of colour were mechanically deposited in the pores of the fibre. The use of chemical substances in dying was held necessary only to dilate the pores for the admission of the particles, to prepare the particles for entrance into the pores, or to close up the pores after the colouring particles had entered. Mordants were held to be necessary because they formed cavities in the fibre adapted by their axe and shape to receive and retain different kinds of coloured particles.

About the middle of the last century Bergmann, observing the dying of wool by sulphate of indigo, considered that what took place was a purely chemical action, and that the matter of the wool entered into chemical combination with the dye-stuff, changing it from a soluble into an insoluble substance, and showing therein the power of chemical affinity. From this time the mechanical or physical theory of dying was supplanted by a chemical theory, in which all the observed facts were explained by the assumption that chemical forces operated between the fibre and the mordant, or the fibre and the colouring matter. A closer consideration by a later generation of chemists of all the phenomena of dying and of the nature of the materials employed did not tend to support this theory. About 1840 Dumas, the celebrated French chemist, and Crum of Thornleibank, a skilful and a practical dyer, formally disputed the chemists' theories of dyeing and of the nature of the materials employed.

A closer consideration by a later generation of chemists of all the phenomena of dying and of the nature of the materials employed did not tend to support this theory. About 1840 Dumas, the celebrated French chemist, and Crum of Thornleibank, a skilful and a practical dyer, formally disputed the evidence of a chemical action in dying, and referred the phenomena to physical causes of attraction on the part of the fibre. Crum confined himself to the single case of the dying of cotton, and expressed himself convinced that it was owing either to surface contact of the dye stuff with the cotton or to its entrance into the hollow tubes of the same, the colours produced in the first case not being so stable as in the other, as far as resisting friction went. The power which cotton fibre evidently possesses of appropriating oxides from solutions, as well as colouring matters, such as indigo, was viewed by Crum as a case of surface attraction, similar to the power residing in charcoal of abstracting oxides and colouring matters from solutions, and he declared there was no such thing as a chemical combination between the cellulose of the cotton fibre and any of the chemical substances or dye materials. To controvert this statement is difficult, for, though the forces at work seem to be chemical forces, the products cannot be proved to be definite chemical compounds. On the other hand, the forces of catalysis, surface attraction, and powers of porous substances which Crum substitutes for the chemical forces of the older theories of dying, may be said to be merely names, without definite meaning, for indicating the existence of a class of phenomena not at all understood even at the present day. Dumas views the questions more broadly, and simply declines to accept as chemical phenomena actions which do not produce real chemical compounds. He considers that dying is more probably owing to a physical property of fibres by which they are enabled to attract and retain coloured bodies, much in the same way that a piece of charcoal does, and simply because the nature of the power by which charcoal are not accepted as chemical, and no one knows what they are, dying cannot be considered as an effect of chemical attraction or affinity. He admits, however, that there are some powers at work different from that possessed by charcoal. How is it, he asks, that wool takes up the scarlet dye so well under conditions where silk and cotton are barely tinged with colour? How is it that wool unites with the black precipitate formed with tannin and iron salts, while silk under the same circumstances is so difficult to dye? He asks, finally, how it is that certain colours can be fixed better on some fibres than others; and whether it is not by some special action, not correctly called affinity, but which at any rate is an important force, or the resultant of several forces, that this is affected. But, he continues, to confound chemical affinity, properly so called, with the phenomena of dying is to confuse two essentially different things. When silk unites with Prussian blue, or wool with indigo, the action is quite distinct from what takes place when sulphur combines with lead. But, on the other hand, again, fibres are not to be looked upon as acting simply the part of a filter in retaining colours.

Chevreuil, at a later date, insists that in the present state of our knowledge the phenomena of dyeing can be explained only upon chemical principles. He admits that colour may be and in practice is frequently deposited upon the external parts of fibres, but there are numerous cases in which a soluble salt is decomposed by fibrous matters, as when silk is steeped in persulphate of iron; and he cannot consider as anything else than chemical affinity that power which enables a solid body to decompose a solution of elements, themselves united by chemical affinity, and which without the contact of the solid body would have remained in perfect union. Many other chemists, physicists, and microscopists have occupied themselves upon this vexed question, but without evoking any generally acceptable theory of dyeing. The balance of opinion may be said to be in favour of the supposition that as far as regards the animal fibres, wool and silk, there are many cases of dying which can only be regarded as effects of mechanical forces; with respect to the vegetable materials cotton and linen, the evidence is less certain, and we must wait for further research and investigation to settle the disputed question.

**Books of Reference.**—Of the numerous works upon dyeing it may be sufficient to mention Bancroft's *Philosophy of Permanent Colours* (2d ed. 1813), Berthelot's *Eléments de la Teinture,* and Ure's translation of the same into English (1841); *Pére's Traité de l'Imprimerie par Dye* (1846),—a most complete and accurate work for its date; O'Nell's *Chemistry of Calico Printing and Dyeing* (1860), and *Dictionary of Dyeing* (1862); *Napier's Manual of Dyeing* (1860), *Dyer's Magazine* (1841); *Schützgenberger's Praktik der Farben- und Lackmischungen* (1807); *Crockett's Dyeing and Calico Printing* (1874); and *Craze-Calvert's Dyeing and Calico Printing* (1875). Of periodicals specially devoted to the application of colouring matters to textiles there is only one in Great Britain, the *Textile Colourist;* Germany has the *Färber-Zeitung* and the *Muster-Zeitung,* in France there are the *Moniteur de la Teinture* and *Le Teinturier Pratique,* occasional articles upon the subject occasionally appear in the chemical journals, and especially in the Bulletins of the Industrial Societies of Mulhouse and Bonn. C.O.W.

**DYER, John,** English poet, was born in 1699 or 1706 at Aberglassney, in Carmarthenshire, where his father, Robert Dyer, successfully practised as a solicitor. He was sent to Westminster school to be educated under Dr Friend, and was destined to succeed to his father's business. He showed, however, an inveterate dislike to the study of the law, and, having a taste for design, he induced his parents to allow him to adopt the profession of an artist. He wandered about South Wales, sketching landscapes and occasionally painting portraits. In 1726 his first poem, *Grongar Hill,* appeared in a miscellany published by Richard Savage, the poet. It was an irregular ode in the so-called Findian style, but Dyer wrote many such pieces at all ages and printed it separately in 1727. It had no immediate and brilliant success. *Grongar Hill,* as it now stands, is a short poem of only 150 lines,
D Y N — D Y N
581

describing in language of much freshness and picturesque
charm the view from a hill overlooking the poet's native
cave of Towy. Artificial in an affected age, the natural
images which crowd upon one another in this charming
little poem are as admirable now as when they were
written, and hold an assured place in English literature.
Dyer's ambition to succeed as a painter impelled him to
visit Italy, and about ten years after the publication of
Grongar Hill he seems to have attained this great desire,
and to have spent some time in the south of Europe. It
was in consequence of this tour that he wrote his next poem,
The Ruins of Rome, a descriptive piece in about 600 lines
of Miltonic blank verse. In this work the phraseology is
pompous and conventional, but there is considerable know-
ledge displayed, and the ardour of a true lover of antiquity
The Ruins of Rome appeared in 1740, and increased its
author's reputation. Having fallen into bad health while
painting in the Campagna, and finding that he was not
destined to excel in the practice of art, he determined to
enter into holy orders. In 1741 he was ordained by the
bishop of Lincoln, and presented with the living of Caldey
in Pembrokeshire. He was married about this time to a lady descended from the brother of
Calthorpe, in Leicestershire. He
published The Poems of Amwell, who
his genius was
In 1751 he was translated to the
bishop of
rural Kirby-on-Bane.

Caius, in Lincolnshire, to which was added

In 1756 he exchanged Belchford for the
weathered incumbency of Kirby-on-Lane. In 1757 he
published his longest work, the didactic epic of The Fleece,
in four books, of which the first described of the tending
of sheep, the second of the shearing and preparation of the
wool, the third of weaving, and the fourth of trade in
woollen manufactures. The subject was prophy, and the
stately blank verse in which it was discussed gave the poem
a ridiculous air. The town took no interest in it, and the
wits facetiously prophesied that "Mr Dyer would be buried
in flannel." He did, in fact, very shortly afterwards follow
his poem to the grave, for he died of consumption on the 24th
of July 1763, leaving a wife and four children. After his
death his genius was defended and his writings analyzed by
Scott of Anwell, who published a commentary on Dyer's
poems. The latter were collected by Dodsley in 1770, but
they only form one small volume. Grongar Hill has been
compared with Sir John Denham's Cooper's Hill, which
may in some measure have suggested it. These two pieces
remain the most important topographical poems in English
literature, if we exclude Ben Jonson's Persia.

DYNAMICS properly means that science which treats
of the action of forces. Defining forces as that which affects
the motion of matter, it appears that the study of dynamics
will lead to the consideration of the motion of material
systems, and the laws in accordance with which this motion
is changed by the mutual actions of the bodies forming
such systems. But there is a sense in which we may con-
template the geometrical results of the motion of bodies
without studying the forces under which, or the time
during which, it takes place; and hence there are many
problems which at first sight we might be disposed to include
under the term of dynamics, but which also belong to
the domain of pure mathematics, and may therefore more pro-
perly be considered as a branch of geometry. On the
other hand, there is a branch of dynamics which treats
of pure motion without taking any account of its subject
or the means by which it is produced or changed. In this
branch, to which the term kinematics, though first employed
by Ampère in a wider sense, may with propriety be confined,
it may seem that no consideration of matter or of force is
involved; but, unlike the class just alluded to, the
problems which come under this head involve explicitly the
element of time, and it is only after studying the laws of
dynamics that we are able to furnish a theoretical measure
of time satisfying the demands of the human mind. Thus
any subject in which the measurement of time is involved
enters on this account into the domain of dynamics.

Measurement of Time.—For ordinary purposes the rota-
tion of the earth furnishes a sufficiently exact means of
measuring time, and the observation of the transit of
a known star is the best method we possess of determining
the error of a clock, but that the fundamental conception
of the measurement of intervals of time is based upon other
foundation than the diurnal rotation of our planet at once
appears from the fact that we see no inconsistency in asking
whether the length of the day is the same now as it was
2000 years ago. If our primary conceptions of the measure-
ment of time were derived from the earth's rotation, the
absolute constancy of the length of the day would be a matter
of definition. But it is not to the motion of the earth or
to any other single body that we are indebted for our
highest conception of the measurement of time—it is rather
to the dynamical principle expressed in the first law of
motion, and hence it is that the theoretical measurement
of time, and of other physical quantities which explicitly
involve time, must find a place under the head of dynamics.
Kinetematics may therefore properly be treated as a branch
of dynamics, and for its discussion, as well as for the
enunciation and explanation of the laws of motion, the
reader is referred to the article on Mechanics.

Perhaps there is nothing which appears to present a
subject for study simpler than that afforded by the properties
of space, and hence it is that geometry attained so high a
reputation and made such rapid advances among the
ancients. It was easy to construct material standards of
length and by their means to measure approximately the
linear dimensions of limited portions of space, the human
mind being only too ready to believe in the constancy of
the dimensions of the standards constructed; and thus the
properties of space presented a subject which, at the very
outset, afforded a facility for investigation which was want-
ing in the study of other physical quantities. The great
simplification introduced by this belief in the permanence
of the dimensions of material standards will be apparent if
we consider the position in which we should be placed by
the adoption of a different hypothesis. Once admit the
supposition that the properties of a figure, as regards
dimensions or form, depend explicitly on its position in
space, or upon time, either by a process of growth in them-
sew or because space is changing its character, and the
whole subject of geometry will require reconsideration.

Displacement.—A number of points or figures may be
connected in accordance with such geometrical conditions
that if one or more be displaced in a given manner the
displacements of all the others may be determined. The
determination of the displacement of each in terms of the
given displacements as a problem in pure mathematics, and
the branch of geometry which treats of such questions may
be called the science of displacement. If we suppose the
figures here contemplated to be material bodies, and the
geometrical conditions to be determined by means of
material constraints such as links, pulleys, teeth, and the
like, the science of displacement thus applied becomes that
of mechanism, and it is only necessary here to call attention
to the following statements. First, in the study of dis-
placements, or of pure mechanism, no account is taken of
any but the geometrical properties of the bodies displaced,
while the forces engendering the displacement are entirely
neglected: the consideration of the mechanical
properties of the materials of which the parts of a machine
are constructed, the forces acting between those parts, and
the best means of fitting them, belong to the science of
mechanics and machine construction. Secondly, the ele-
ment of time is altogether left out of consideration; for,
although it may be argued that the displacement of each part of the system takes place in the same interval of time, and that the geometrical condition of the displacement experienced by different parts during the same time, and thus lead us to a comparison of velocities, yet it must be observed that this is only a comparison amounting simply to a relation between corresponding displacements, and does not imply that the whole displacement may take place in a time as long or as short as we please, for we do not consider it. Moreover, the actual motion of any part may be made uniform or varying in any arbitrary manner without any account being taken of it. In fact it is simply two or more configurations of the material system which are compared together, and, though for the sake of distinction we call one the initial and another the final configuration, we might as well distinguish them in any other manner and without stating which follows the other. Indeed we contemplate them as co-existing during the act of comparison. Hence we may complete the science of displacement or pure mechanism without ever considering forces, or being able to measure time or even to define equal intervals.

Kinematics.—If to our conceptions of space and of displacement we couple that of time as a measurable quantity, we are led to believe that the rates of non-simultaneous as well as of simultaneous displacements, and are consequently obliged to measure the rate at which displacement occurs by the change of position experienced in a definite interval of time by the body, figure, or point we are regarding. Hence the association of our conception of space with that of time as a measurable quantity opens up to us that branch of dynamics which we call kinematics.

Matter.—Having considered displacement in connection with the laws during which it occurs, the next step leads us to take account of the thing displaced, and here we are obliged to contemplate matter directly. Matter, like time and space, we do not attempt to define, but treat it as a primary concept, its more obvious properties making themselves known to all through daily experience. The next step in the same direction is the consideration of the rate at which velocity changes, or acceleration, and thus the association of our conception of space with that of time as a measurable quantity opens up to us that branch of dynamics which we call kinematics.

The sciences of dynamics in its restricted sense is that which treats of the consequences arising from the relations of matter to force, and before we can proceed in this science beyond the first step we must become acquainted with the second law of motion, which is the first law of motion, its range being thereby sharply defined and separated from that of the rest of dynamics. The laws of motion, like other natural laws, must be understood to express merely the properties of natural bodies as we find them, and within the degree of accuracy to which our experiments can be relied on. We might, of course, have started with any hypotheses we liked respecting the relations of force to matter, and upon these hypotheses and our conceptions of time and space have constructed a purely theoretical system of dynamics which would have been perfectly self-consistent; but our conclusions might, or might not, have agreed with observations of natural phenomena. If we found an agreement between the results of the application of our theory to special problems and the solutions of the corresponding problems as worked out objectively in nature, we should have reason to believe that our hypotheses agreed with the facts, or, in other words, that they were true, and we should then raise them to the dignity of natural laws. It is on evidence of this kind that our acceptance of all natural laws is based. If our conclusions were inconsistent with natural phenomena our system of dynamics would be an abstract, instead of a natural, science—if, indeed, it might be called a science at all—and would be valuable merely as an intellectual exercise. In the case of such an abstract science we are not even bound to adopt the axioms respecting the properties of space which are usually accepted, but may confine upon our "space" any number of dimensions and any properties we please.

Stress.—Though the conception of a single force is convenient, it nevertheless results from a mere process of mental abstraction. We never meet with a single isolated force in nature, but each is accompanied by an equal and opposite force acting in the same straight line, and when we speak of one without the other we do so merely for the sake of brevity. The third law of motion implies this statement, though it has also a wider signification. The action and reaction which are thus always inseparably linked together may be conveniently called a stress, of which the two forces are opposite aspects. Thus it appears that there is nothing in nature corresponding to what we are accustomed to call a single force; stresses, indeed, abound, and may be produced whenever we please, but we are completely ignorant of their existence except when they change the relative velocities of different portions of matter. Then, and then only, do they appeal to our senses.

Statics.—The investigation of the conditions under which a system of stresses produces no displacement of the bodies between which they act constitutes the science of statics, and will be discussed under the head of mechanics.

Measurement of Force.—Since force can be defined in terms of space, time, and matter, it follow that the measurement of a force ought to involve measurements of these three quantities and of them only. Now it is plain that any force whatever may be chosen as the unit in terms of which other forces should be expressed, provided it is capable of being reproduced at all times and in all places with precision. We all now believe that the region of space which we inhabit is sufficiently homoloidal to allow us to compare distances in different directions, at different places, and at different times. Moreover, the first law of motion, as has been stated above, provides, when proper precautions are taken, a method of measuring time which satisfies the requirements of the mind, while the rotation of the earth affords a practical measure of time sufficiently exact for the most refined experiments we can execute. Therefore a unit of force which depends only on the units of length, mass, and time will be the same at all places, and, so far as our experience allows us to judge, at all times. Such a unit is termed an absolute unit. Not only force but every other quantity dealt with in dynamical science, as well as every physical quantity whose relations to space, mass, and time are known, can be measured in terms of a unit of its own kind which depends only on the fundamental units of length, mass, and time, and is then said to be expressed in absolute measure. The three primary units must be chosen in an arbitrary manner, and their permanence must be considered a matter of definition; but when these have been once fixed, all the absolute units derived from them are perfectly determinate and invariable. If a foot, a pound, and a second be chosen as units, the corresponding absolute unit of force is called a pound; while if the primary units be a centimetre, a gramme, and a second, the unit of force is called a dyne,
For the definitions of the derived dynamical units and the investigation of their dependence on the fundamental units, the reader may refer to the article on Mechanics.

From what has been said it will appear that the whole difficulty in fixing upon a system of dynamical units lies in the determination of the fundamental units of mass, time, and space; and time in such a manner that their constancy can be relied upon. The unit of mass offers very little difficulty in this respect. Long experience has taught us which are the most permanent of the varieties of matter we have at command. We have good reason to believe that a piece of platinum or an alloy of platinum and iridium may be exposed to pure air at ordinary temperatures for an indefinite time without any increase or diminution of its mass whatever. Such a piece of metal may therefore with propriety be chosen as a national standard of mass, the absolute constancy of the quantity of matter constituting it being accepted on definition, as we are unable to test it by any standard in which we have more confidence than we have in itself. The British and French national standards of mass are of platinum, but the new standards recently constructed in Paris consist of an alloy of platinum and iridium.

The determination of a unit of length is not so simple as that of the unit of mass. In this case, as in the preceding, we avail ourselves of the properties of a material standard, but we know that however indestructible the standard itself may be its dimensions depend upon the pressure to which it is exposed, its temperature, and in some cases upon other accidents, such as the magnetic force in the neighbourhood, &c. Hence the only course open to us is to determine as far as possible all the causes of variation in the length of our standard, and carefully to define its condition with respect to these variables, so that it shall be a standard only under the circumstances thus defined. Having thus defined the condition of the material standard with respect to all the variables upon which the unit is dependent, we must consider the absolute constancy of its length at all times and places to be a matter of definition until we have discovered other causes which affect it. It has been proposed that the wave length of a few of a particular kind of light, as for instance that corresponding to one of the sodium lines, should be taken as the unit of length, and its period as the unit of time. These units are probably more constant than those afforded by any material standards or vibrating springs which we can construct; but a belief in their absolute constancy implies complete confidence in the constancy of the properties of the interstellar medium, and of the sodium molecule.

The determination of a satisfactory means of measuring time seems to offer greater difficulties than the measurement of mass or of space, though the difficulties are of the same character as those we have just considered. The great difficulty consists in defining what is meant by the equality of two intervals of time which do not commence simultaneously. Remembering that it is upon the properties of matter alone that we can rely for assistance, we might construct a spring and define as equal lapses of time those intervals during which this spring executes the same number of vibrations, the temperature, &c., being kept constant. But if we were to construct a number of such springs, though a perfect agreement might obtain between them at first, we should find after a considerable period that the measurements of time derived from different springs did not agree, while our knowledge is insufficient to enable us to apply to each the corrections necessary to lead us to a common result. Now these corrections may be no reason why we should prefer one spring above all the others, and thus it appears that a definition of equal intervals of time based upon the behaviour of any single spring is too arbitrary to be satisfactory. If, however, we found a large number of springs, constructed of different materials and differently affected by temperature and other known causes of variation, continue to give perfectly consistent results, the theory of probability would lead us to place a high value upon the measure of time thus afforded. Now, we have stated that our highest conception of the measurement of time is derived from the dynamical principle expressed in the first law of motion, but when we come to apply this it is impossible to determine a priori whether in the case of two given bodies there is no stress acting between them or between one of them and some third object. Consequently, the only course open to us is to examine the motion of a large number of material systems, making such corrections for the action of stresses which we know to be in operation as our theoretical dynamics will enable us to determine; and, if after this we find that several independent systems afford the same measurement of time, while those systems which lead to a different result disagree also among themselves, we must accept the measurement of time afforded by the first set as the true measure, and attribute the discrepancies manifested by the other systems to some unknown stresses, which it should be our subsequent business to discover.

Work—The contemplation of a stress, together with a relative displacement of the portions of matter between which it acts, introduces us to the conception of work. If we consider a stress, together with the distance through which the solicited bodies are capable of moving relative to one another in obedience to the stress, the object of our contemplation is the work which may be done under the given conditions of the system, and thus we call energy. The subject of which natural philosophy treats is the transformation of energy, which in all its phases takes place in accordance with two great principles, known respectively as the principles of the conservation and the dissipation of energy. Of these two principles the former rests upon a much higher scientific basis than the latter. In order to lose our faith in the principle of the conservation of energy we must give up our belief in the fundamental principles of dynamics expressed in the laws of motion, but as regards the dissipation of energy we can say little more than that all the operations of nature with which we are acquainted take place in accordance with this principle. Clerk Maxwell has, however, shown that it is possible to subvert the principles of the dissipation of energy under the case of a sufficiently high order of intelligence. For the statement and discussion of these two principles see ENERGY.

It is the work of the natural philosopher to explain the operations of nature in accordance with the principles of dynamics, and we consider that we understand any phenomenon when we have shown it to consist of a motion of matter and determined the character of this motion. Thus it is that dynamics forms the foundation of every branch of natural philosophy, and a thorough appreciation of the principles of conservation and dissipation of energy is the only safe guide in physical investigations. (W. O.)

DYNAMITE (δυνάμως, strength), the name applied to various explosive preparations containing nitroglycerin. The first practical application of nitroglycerin, discovered by Sobrero in 1847, was employed by Alfred Nobel, who in 1863 used gunpowder soaked with it for blasting. In 1864 he found that it could be exploded by the intiative detonation of fulminating materials; and in 1867, owing to the uncertainty and danger attending its employment, he conceived the idea of mixing it with some solid and adhesive substance. The silexaceous infusorial earth called in Germany Kieselgur proved to be well adapted for this purpose, since it took up as much as three times its weight of nitroglycerin without becoming more than damp to the
The mixture of earth and nitroglycerin, to which was added a little alkaline material to neutralize any acid that might be set free by the latter, was termed by Nobel dynamite. Ignited in the open air, dynamite burns slowly, but it is as readily exploded as nitroglycerin itself by means of a detonating fuse; and, though not equal in bursting or breaking power to uncombined nitroglycerin, on account of the absorption by its port constituents of part of the force developed in the exploding shock, it is greatly superior to gunpowder, instead of which or gun-cotton it is employed in blasting coal and stone, removing piles, felling trees, and clearing stumps from forest-land. It may also be used with advantage for the destruction of cannon and for breaking up large iron casings (see Comp. rend., lxxi. 770). For filling holes in the pasty consistency renders it a very convenient material.

In continuous masses dynamite transmits detonation at the rate of from 15,500 to 21,600 feet a second. Concentration is not requisite for its explosion, and it can be used in damp situations without to any great extent impairing its action. It explodes if heated in a closed brass case, also on sharp percussion when placed between two metallic surfaces; it should not, therefore, be kept in hermetically sealed receptacles of metal or other very solid material. A low temperature detonates loses its tendency to spontaneous detonation. The best absorbing agents are kaolin, tenement is not requisite for index, and to the other a small lever, which acting on the what analogous to that which was a desert, applied to a cave on the sea-shore which was occupied about 449 by St Berf or Sanctus Servanu, to whom at a later date the church was dedicated. From James V the town received the rights of a royal burgh. In the 16th and 17th centuries it was the seat of a great manufacture of salt, and besides dealing in coal and stone, removing piles, felling trees, and dynamite, the result of the earl of Rosslyn. As a parliamentary borough Dysart is a member of the Kirkcaldy district. The population of the town in 1871 was 2476.

Dysart is mentioned as early as 874 at the time of a Danish invasion. Its name is said to be a corroboration of the Latin desertum, a desert, applied to a cave on the sea-shore which was occupied about 449 by St Berf or Sanctus Servanu, to whom at a later date the church was dedicated. From James V the town received the rights of a royal burgh. In the 16th and 17th centuries it was the seat of a great manufacture of salt, and besides dealing in coal and stone, removing piles, felling trees, and dynamite, the result of the earl of Rosslyn. As a parliamentary borough Dysart is a member of the Kirkcaldy district. The population of the town in 1871 was 2476.

DYSART, a seaport town and royal and parliamentary burgh of Scotland, in the county of Fife, nine miles north-east of Burntisland, with a station on the North British Railway. It consists mainly of three narrow streets with a square in the centre, and on the whole has rather a dull and deserted appearance. In the High Street there are a number of antique houses with inscriptions and dates; and towards the south side of the town there are remains of an ancient chapel. Besides the old parish church with its tower, there are six places of worship, an old town-house, a mechanics' institute, and a combination poorhouse. The harbour is tolerably good, and there is a wet dock attached. The staple industry is the manufacture of linens and ticks; but flax-spinning and ship-building are also carried on, and there is a large export of coal. To the west of the town is Dysart House, the residence of the earl of Rosslyn. As a parliamentary borough Dysart is a member of the Kirkcaldy district. The population of the town in 1871 was 2476.

In the 16th and 17th centuries it was the seat of a great manufacture of salt, and besides dealing in coal and stone, removing piles, felling trees, and dynamite, the result of the earl of Rosslyn. As a parliamentary borough Dysart is a member of the Kirkcaldy district. The population of the town in 1871 was 2476.

DYRRACHIUM. See DURASSO.

DYRENTY (from the prefix δυρχή and δυρχω, the intestine), also called Bloody Flux, an infectious disease with a local lesion in the form of inflammation and ulceration of the lower portion of the bowels.

Although at one time a common disease in Great Britain, dysentery is now very rarely met with there, and is for the most part confined to warm countries, where it is the cause of a large amount of mortality.

Dysentery in a sporadic form may occur anywhere, but the variety of the disease is believed to depend on a different cause from that to which it is due where it prevails endemically or spreads as an epidemic; for, while isolated cases appear capable of being excited by irritating causes which act locally on the alimentary canal, and may thus be developed out of an ordinary intestinal catarrh, the dysentery of tropical climates is generally regarded as owing its origin to a specific poison of the nature of a minor or germ, somewhat analogous to that which is believed to be the cause of malignant cholera. How, and under what circumstances, the dysentery poison is generated is still a matter of uncertainty. The frequent association of dysentery with intermittent fever has long been remarked, and has led to the belief on the part of many in a malarial origin for the disease. It is, however, doubtful whether a causal relationship can be established between them (although a malarial form of dysentery is a well-marked variety of the disease), since dysentery may be found prevailing where no evidence of malaria can be detected. At the same time
certain characters of climate and soil are known to favour the increase and propagation of dysentery. Long continued high temperature of the air and ground, such as exists in the tropics, together with a soil of swampy character, are the conditions generally present where dysentery prevails endemically, and where it is propagated as an epidemic; these factors are seldom absent. Among other causes well recognized as favouring the spread of epidemic dysentery are impure air and water, improper and insufficient food, unripe fruit, excessive indulgence in alcoholic liquors, and exposure to chills in warm weather, all or many of which have been often found connected with the propagation of dysentery among large bodies of people, as in the case of armies, where also the disease has been frequently associated with outbreaks of scurvy.

The contagiousness of epidemic dysentery is generally admitted, and it is probable that in this disease as in cholera the vehicle of its transmission is contained in the matter discharged from the bowels of those affected.

Dysentery manifests itself with varying degrees of intensity, but in well-marked cases the following are the chief symptoms. The attack is commonly preceded by certain premonitory indications in the form of general ill-health, loss of appetite, and some amount of diarrhoea, which gradually increases in severity, and is accompanied with griping pains in the bowels (formaem), the discharges from the bowels succeed each other with great frequency, and the painful feeling of pressure downwards (tenesmus) becomes so intense that the patient is constantly desiring to defecate. The matters passed from the bowels, which at first resemble those of ordinary diarrhoea, soon change their character, becoming scanty, mucous or alimy, and subsequently mixed with, or consisting wholly of, blood, along with shreds of exudation thrown off from the mucous membrane of the intestines. The evacuations possess a particularly offensive odour characteristic of the disease. Although the constitutional disturbance is at first comparatively slight, it increases with the advance of the disease, and febrile symptoms come on attended with urgent thirst and scanty and painful flow of urine. Along with this the nervous depression is very marked, and the state of prostration to which the patient is reduced can scarcely be exceeded.

Should no improvement occur death may take place in from one to three weeks, either from repeated losses of blood, or from gradual exhaustion consequent on the continuance of the symptoms, in which case the discharges from the bowels become more offensive and are passed involuntarily.

When, on the other hand, the disease is checked, the signs of improvement are shown in the cessation of the pain, in the evacuations being less frequent and more natural, and in relief from the state of extreme depression. Convalescence is, however, generally slow, and recovery may be imperfect—the disease continuing in a chronic form, which may exist for a variable length of time, giving rise to much suffering, and not unfrequently leading to an ultimately fatal result.

Several varieties of dysentery are described in which the symptoms are modified by the association of the disease with other morbid conditions. Thus the form known as Malarial Dysentery is complicated with febrile attacks of an intermittent character, and is frequently attended with hepatic, renal, and resultant affections; while it is most successfully treated by remedies which are of value in malarial diseases, such as quinine. Again, in Scorbutic Dysentery the attack is accompanied with the great prostration characteristic of scorbutus, and also with dangerous hemorrhage. Malignant Dysentery is the term applied to those cases where all the symptoms are present in great intensity, and progress rapidly to a fatal termination. Such cases are often attended with gangrene and sloughing of the mucous membrane of the affected portion of the bowel.

The dysentery poison appears to exert its effects upon the glandular structures of the large intestine, particularly in its lower part. In the milder forms of the disease there is simply a congested or inflamed condition of the mucous membrane, with perhaps some inflammatory exudation on its surface, which is passed off by the discharges from the bowels. But in the more severe forms ulceration of the mucous membrane takes place. Commencing in and around the solitary glands of the large intestine in the form of exudations, these ulcers, small at first, enlarge and run into each other, till a large portion of the bowel may be implicated in the ulcerative process. Should the disease be arrested these ulcers may heal entirely, but occasionally they remain, causing more or less disorganization of the coats of the intestines, as is often found in chronic dysentery.

Sometimes, though rarely, the ulcers perforate the intestines, causing rapidly fatal inflammation of the peritoneum, or they may erode a blood vessel and produce violent hemorrhage. Even where they undergo healing they may cause such a structure of the calibre of the intestinal canal as to give rise to the symptoms of obstruction which ultimately prove fatal.

The occurrence of abscess of the liver in connection with attacks of dysentery is frequently observed. It has been ascribed to the passage of malarial material from the diseased intestine into the liver, but by many high authorities is regarded more as a coincidence, depending upon the same climatic causes as those which predispose to the dysentery.

Treatment.—Where the disease is endemic or is prevailing epidemically, it is of great importance to use all preventive measures, and for this purpose the avoidance of all causes likely to precipitate an attack as to be enjoined. Exposure to cold at night, the use of unripe fruit, and intemperance in eating and drinking should be forbidden; and the utmost care taken as to the quality of the food and drinking water. In houses or hospitals where cases of the disease are under treatment, disinfectants should be freely employed, and the evacuations of the patients removed as speedily as possible. In the milder varieties of this complaint it is as well to avoid those occurring sporadically, and where the symptoms are probably due to matters in the bowels setting up the dysenteric irritation, the employment of diaphoretic medicines is to be recommended, and the administration of such a laxative as castor-oil, to which a small quantity of laudanum has been added, will often, by removing the source of the mischief, arrest the attack. In the severer forms of the disease, those, namely, occurring in warm climates, the remedy most to be relied on is ipecacuana. This drug, which has long known as possessing special efficacy in dysentery (and was originally introduced into this country from Peru as the radix anto-dysenterica), has proved of signal value in the treatment of the disease in India, and, as shown by Dr Maclean, has diminished the mortality to a remarkable extent. It is administered in full doses of 25-30 grains, which are repeated in from six to ten hours, gradually lessening the quantity; the effect observable is a diminution in the pain, and in the frequency and offensive character of the stools, along with the accession of prouse perspiration and quiet sleep. Hot fomentations applied to the abdomen are of use in relieving the tenesmus. Ice may be freely taken to allay thirst. The diet should be light, consisting of soups and farinaceous food. In malarial dysentery quinine is the most successful remedy, ipecacuana being generally found to be inapplicable, while in a scorbutic dysentery the treatment must bear reference to the deprived condition of the general health characteristic of scorbutus. In this form
of the disease the fresh bael or bael fruit (Eugle Marmelo-
la) is largely used in India. In chronic dysentery the
administration of astringents such as Dover's powder may
be of service, but the chief points to be attended to are
the nourishing of the patient and the observance of judicious
hygienic measures, such as the due clothing of the body,
the use of tonics, baths, &c. A change to a cooler climate
often proves of great value.

DYSPEPSIA (from dys, and 
epa, to digest), or In-
digestion, is one of the most common of all complaints,
but, from its intimate connection with various other morbid
conditions, the term is somewhat vaguely employed.
There are comparatively few diseases of any moment where
some of the phenomena of dyspepsia are not present as
associated symptoms, and not unfrequently these exist to
such a degree as to mask the real disease of which they are
only complications. This is especially the case in many
organic diseases of the alimentary canal, in which the
symptoms of dyspepsia are often the most prominent. In
its restricted meaning, however (and it is to thus that the
present brief notice applies), the term is used to describe a
functional derangement of the natural process of digestion,
apart from any structural change in the organs concerned
in the act. The causes of this ailment are very numerous,
but are generally regarded as bearing reference either to
the quantity of the gastric juice, or the move-
ments of the stomach during the process of digestion.
Among the causes connected with the food are not only
the indulgence in indigestible articles of diet, but the too
common practice of eating too much of what may be other-
wise wholesome and digestible, irregular or too fre-
quent meals, and imperfect mastication of the food. Sub-
stances which are badly cooked, or too hot or too cold, the
excessive use of condiments, the partaking of too much
liquid with a meal, and over indulge in tea, tobacco, and
alcoholic liquors are likewise fruitful sources of dyspepsia.
Morbid states of the gastric juice readily give rise to
dyspepsia. This fluid may be changed in quality or be altered in character by the presence of too much acid,
or by deficiency in its active digestive principle, pepsine.
These conditions are often connected with actual disease
of the mucous membrane of the stomach, but they may also
exist in advanced life, in depraved states of the general
health (as in rheumatism, gout, Bright's disease, anemia,
&c.), or in constitutions weakened by fatigue, over-anxiety,
or debauchery. It must, however, be borne in mind that
not only the gastric juice but the other digestive fluids,
such as the saliva, bile, pancreatic and intestinal juices,
may by defects in their amount or quality materially hinder
the process of digestion. Further, dyspepsia may be the
result of a perverted condition of the natural movements
of the stomach during digestion,—whereby, on the one hand,
owing to increased activity of its propulsive power, the
food may be carried into the intestines in a half dissolved
state, and give rise to many of the symptoms of indiges-
tion, or, on the other hand, from a weakened or atonic
state of the muscular coats of the stomach digestion may
be retarded, and the food retained and excite discomfort and
pain consequent on its undergoing fermentive and puta-
factive changes.

The symptoms of dyspepsia, even when due to a like
cause, are so numerous and diversified in different indi-
viduals that probably no description could exactly
represent them as they occur in any given case. All that
can be here attempted is to mention some of the more
prominent morbid phenomena usually present in greater or
less degree.

When the attack is dependent on some error in diet,
and the dyspepsia consequently more of an acute character,
there is often pain followed with sickness and vomiting of
the offensive matters, after which the patient soon regains
his former healthy state. What are commonly known as
"bolic attacks" are frequently of this character. In
the more chronic cases of dyspepsia the symptoms are
somewhat different. A sensation of discomfort comes on
shortly after a meal, and is more of the nature of weight
and distension in the stomach than of actual pain, although
this too may be present. These feelings may come on after
each meal, or only after certain meals, and they may arise
irrespective of the kind of food taken, or only after certain
articles of diet. As in most of such cases the food is long
retained in the stomach, it is apt to undergo fermentative
changes, one of the results of which is the accumulation of
gases which cause flatulence and eructations of an acid or
foul character. Occasionally quantities of hot, sour, taste-
less, or bitter fluid, or mouthfuls of half-digested food,
regurgitate from the stomach. Temporary relief may be
obtained when another meal is taken, but soon the uncom-
fortable sensations return as before. The appetite is
often diminished, but may be little impaired; the tongue
is in general large and flabby, and more or less furred.
In some forms of this complaint, however, particularly
where there is great irritability of the stomach, the tongue
is abnormally red. There is generally obtinate constipa-

Numerous disagreeable and painful sensations in other
parts are experienced, and are indeed often more dis-
tressing than the merely gastric symptoms. Pains in
the chest, shortness of breathing, palpitation, headache,
giddiness, affections of vision, coldness of the extremities,
and general languor are common accompaniments of
dyspepsia; while the nervous phenomena are specially
troublesome in the form of sleeplessness, irritability, despondency, and hypochondria.

A disease of this nature, interfering as it does with
the assimilative and nutritive processes, must necessarily
exert an evil influence on the general health, and there is
reason to believe that many serious ailments owe their
origin to persistent dyspepsia. This is notably the case
as regards phthisis; for although dyspeptic symptoms
often present themselves as complications induced by the
disease, yet it cannot be doubted that long-continued indigestion, particularly in youth, must have the effect of
favouring the occurrence of consumption in persons at all
predisposed to it.

Dyspepsia appears to be in some cases hereditary. In
its chronic form, this disease may long resist treatment, but
it is always in some measure influenced by the diet and
regimen and by the occupation of the patient. As a rule
persons of sedentary pursuits and brain-workers suffer more
from dyspepsia than those leading active lives.

As regards treatment only a few general observations can
be made. The careful arrangement of the diet is a matter
of first importance. Quantity must be regulated by the
digestive capabilities of the individual, his age, and the
demands made upon his strength by work. There is little
doubt that the danger is in most instances on the side of
excess, and the rule which enjoins the cessation from eating
before the appetite is satisfied is a safe one for dyspeptics.
Due time, too, must be given for the digestion of a meal,
and from four to six hours are in general required for this
purpose. Long fasts, however, are nearly as hurtful as too
frequent meals. Of no less importance is the kind of food
taken, and on this point those who suffer from indigestion
must ever exercise the greatest care. Every article of diet
which past experience has proved to disagree should be
shunned, since what may appear trifling indiscretions to
this respect are often productive of great and prolonged
suffering. The tables which have been framed to show the
relative digestibility of various kinds of food, and which
have been founded largely on the observations of Dr Beaumont in the celebrated case of Alexis St Martin, are only valuable within certain limits when applied to the treatment of dyspepsia. It must be borne in mind that idiosyncrasy often plays an important part in digestion, and some persons being unable to partake without injury of substances which are generally regarded as wholesome and digestible. Difficulty, too, is often experienced in dealing with dyspeptics from their aversion to, or want of appetite for, those forms of diet which appear most suitable for them. Experience has shown that in this complaint no particular kind of food is absolutely to be relied on, but that in general the best diet is one of a mixed animal and vegetable kind simply but well cooked. The partaking of many dainties, of highly seasoned or salted meats, raw vegetables, newly baked bread, pastry, and confectionery, are all well known common causes of dyspepsia, and should be avoided. When even the simple diet usually taken is found to disagree, it may be necessary to change it temporarily for a still lighter form, such as a milk diet, and that even in very moderate quantity.

General hygienic measures are highly important, since whatever improves the state of the health will have a favourable influence on digestion. Hence regular exercise in the open air, early rising, and the cold bath to be strongly recommended.

The medicinal remedies for dyspepsia are exceedingly numerous, and a few only of them can be mentioned. Attacks brought on by errors in diet are generally relieved by small doses of rhubarb and bismuth, and by the use of small quantities of light and bland food. In chronic dyspepsia the treatment must depend on the cause of the disorder, as far as that can be ascertained. When the dyspepsia is of the atomic form without much irritability of stomach, bitter tonics such as nux vomica, calumba, gentian, or quassia, along with some of the mineral acids taken before, with, or immediately after a meal will be found highly serviceable, while on the other hand, when there is gastric irritation with acid eruptions, sickness, and pain, the medicinal hydrocyanic acid along with bismuth, and antacids taken after food will often afford relief. Pepsin is a remedy of undoubted value in many cases of dyspepsia, and appears to supply the place of that ingredient of the gastric juice when it is deficient in amount. It may be given along with a meal, alone, or in conjunction with diluted hydrochloric acid, which also is a remedy of great efficacy in indigestion. Strict attention must ever be paid to the regular action of the bowels, and where laxatives are required an aloetic dinner pill, or, what is often better, one of the mineral bitter waters (such as that of Frederickshall) which are now so commonly used, should be had recourse to.

The employment of alcoholic stimulants to assist digestion is largely resorted to both with and without medical advice. While it seems probable that in certain cases of atomic dyspepsia, particularly in the feeble and aged, the moderate administration of alcohol has the effect of stimulating the secretion of gastric juice, and is an important adjuvant to other remedies, the advantages of its habitual use as an aid to digestion by the young and otherwise healthy is more than questionable, and it will generally be found that among them those are least troubled with indigestion who abstain from it. See PHYSIOLOGY and DIETETICS (q.v.).

DYVEKE, in German often Diewerke, and in the Latin chronicles Columbella, the "Little Dove," the name by which the mistress of Christian II. of Denmark is invariably designated. Her father was a certain Sigbrit Villams, who had been obliged for political reasons to leave his native country of Holland. Settling at Bergen, he opened an inn, which soon became known for something more than the hospitality of the host or the excellence of his cheer. His daughter's beauty was bush enough for his weakest wine. Valkendorp, the chancellor, did not think it unbecoming of his princely character to sound her praise in the ears of the young crown-prince, and accordingly, when he visited Bergen in 1507, the prince made a point of seeing the "Little Dove" for himself. In matters of this sort there is unquestionably a royal road, and so having danced with her at a ball or two, he had little difficulty in getting her to leave the inn for a house of her own at Oslo. She followed him to Copenhagen on his accession in 1513, and both her father and mother obtained unusual influence at court. In 1515 the young king, indeed, was constrained from reasons of state to marry Isabella, the sister of Charles V., but in spite of the emperor's remonstrance, his relations with Dyveke and her parents underwent no real alteration till her sudden death in 1517. That she had been poisoned was the natural verdict of the popular feeling; and the royal suspicion fell on Torben Ox, warden of the castle of Copenhagen, who was known to have made love to the girl before she was carried off by the prince; and was it not true that two days before her death he had sent her a present of cherries? It mattered not that the culprit was declared innocent by the royal council. "Though his neck were as thick as the neck of a bull it should not save his head," raged the king, and he kept his word. Such is the story, not altogether authenticated, which has furnished a favourite theme to dramatist and novelist Samsoe the Danish poet, published his well-known tragedy "Dyveke" in the close of the 18th century, and it was translated by Manthey into German in 1798. Munch treated the subject in a semi-historical manner in his Biograph-historie Studien, Hermann Marggraf's tragedy of Dua Tausenden von Amsterdams appeared in 1835, Rokhoff's Dieweke in 1842, Hauch's Waldemar Zabern in 1834, Ede Frenck's Sybrich Williams in 1843, and Moseenthal's Dyveke in 1860.

DZUNGARIA, Dzongaria, or Songaria, a former Mongolian kingdom of Central Asia, raised to its highest pitch by Kaldan or Bushtu Khan in the latter half of the 17th century, but completely destroyed by Chinese invasion about 1757-59. It derived its name from the Dongsars, or Songars, who were so called because they formed the left wing (dun, left, parr, hand) of the Mongolian army. Its widest limits included Kashgar, Yarkand, Khotan, the whole region of the Thun Shan Mountains, and in short the greater proportion of that part of Central Asia which extends from 35° to 50° N. lat. and from 72° to 97° E. long. The name, however, is more properly applied only to the present Chinese province of Thun-Shan-pelu and the country watered by the Il. As a political or geographical term it has practically disappeared from the map; but the range of mountains stretching north-east along the southern frontier of the Land of the Seven Streams—as the district to the south-east of the Balkhash Lake is called—preserves the name of the Dzungarian Ranges.
E

E is the second vowel-symbol and the fifth letter in our alphabet. In its original form among the Phoenicians it represented the rough breathing—our k; we have seen that A represented the smooth breathing. As the Greeks had the sound Α at a very early period, it might have been expected that this symbol would have been taken by them with its original value. But the want of symbols to denote the vowels was apparently felt to be more imperative, therefore all the Phoenician symbols (corresponding to the Hebrew aleph, he, ayin) were taken to denote the vowel-sounds a, e, o respectively. The form of the symbol E has varied little from the earliest Greek times to our own. In old Latin it is sometimes, but rarely, found in the form Æ. The typical sound of E in almost all languages is one of those which we denote generally by a in English, e.g., in the word fate—that is, one of the simple sounds between A (English a) and I (English e), which are produced by raising the tongue gradually from its lowest position (at A) to its highest position (at I); in this scale of sounds the lips are not employed. The most clearly distinguished of these sounds are (1) that in men, (2) that in fair, (3) that in fate. It will be observed that these sounds have here different symbols; and if these were consistently employed in English we should not have much reason to complain of our spelling; but e also has the long sound in here and see; as in well has the same sound as a in fate, and it has many sounds. Other languages employ diacritical marks to distinguish these sounds; thus in Italian we have é and à called "open" and "close" e respectively; these correspond very nearly to (2) and (3) mentioned above. It is probable that the same distinction of sound was given in Latin by employing ae to express the open e, and a to express the close e. E was commonly found in Italian words which were written in Latin with ae, or with e short. It is possible that in Greece a similar distinction of close open e was expressed in early times by the symbols ε (epsilon) and η (eta); but in Attica, at least after 403 B.C., the distinction seems to have been rather quantitative than qualitative. For the history of eta see article Η. It is clear that in a perfect alphabet we ought to have at least three distinct symbols between A and I: we ought not to be compelled to distinguish the simple sounds by diphthongs or other modifications. Indeed yet more symbols would be desirable, for there are other sounds in this scale, which, however, are not easily distinguished from the above except by a practised ear.

It is probable that ae in English of the 16th and 17th centuries had the sound still heard in Scotland in words like stil, i.e., the simple e in our men pronounced long: this is not the only open e, but the back of the tongue is lower. But ae had acquired its present I sound in the last century.

EACHARD, JOHN (1636–1697), an English divine, was born in Suffolk in 1636, and was educated at Catherine Hall, Cambridge, of which he became master in 1675 in succession to Lightfoot. He was created a doctor of divinity in 1676 by royal mandate, and was twice (in 1679 and 1685) vice-chancellor of the university. He died on the 7th July 1697. In 1670 he had published anonymously a humorous satire entitled The Ground and Occasions of the Contempt of the Clergy enquired into in a letter to R. L., which excited much attention and provoked several replies, one of them being from John Owen. These were met by Some Observations, etc., in a second letter to R. L. (1671), written in the same bantering tone as the original work. Eachard attributed the contempt into which the clergy had fallen to their imperfect education, their insufficient incomes, and the want of a true vocation. He gave amusing illustrations of the absurdity and poverty of the current pulpiter oratory of his day, some of them being taken from the sermons of his own father. He attacked the philosophy of Hobbes in his Mr Hobbs's State of Nature considered; or a dialogue between Philantus and Timothy (1672), and in his Some Opinions of Mr Hobbs considered in a second dialogue (1673). They were written in their author's chosen vein of light satire, and Dryden praised them as highly effective within their own range. It is noteworthy that Eachard's own sermons were not superior to those he satirized. Swift alludes to him as a signal instance of a successful humorist who entirely failed as a serious writer. A collected edition of his works in three volumes, with a notice of his life, was published in 1774.

EADIE, JOHN (1810–1876), theologian and biblical critic, was born at Alva, in Stirlingshire, on the 9th May 1810. Having manifested unusual ability at school, he was sent to the university of Glasgow, where he passed through the usual curriculum in arts. Immediately afterwards he commenced to study for the ministry at the Divinity Hall of the Secession Church, a dissenting body which, on its union a few years later with the Relief Church, adopted the denomination United Presbyterian. In 1835 he was ordained to the pastoral charge of the Cambridge Street Secession church in Glasgow. Here he speedily attained a position of great eminence and usefulness, and for many years before the close of his life he was generally regarded as the leading representative of his denomination in the city which has always been its stronghold. Though he had little claim to be called eloquent, and his style was often slovenly, he had many of the other qualities that secure the most useful and enduring kind of popularity. As a preacher he was distinguished by invariable good sense, frequent flashes of happy illustration, masculine piety, deep spiritual earnestness, breadth of sympathy both intellectual and emotional, and—most specifically of all—by the power he had in his expository discourses of conveying the best results of biblical criticism in an intelligible form to a general audience. Behind the carelessness and apparent indifference of his manner, it was not difficult to detect the quick sensibility and tender feeling which were eminently characteristic of the man. Though more than once invited to an important charge elsewhere, Dr Eadie refused to leave Glasgow, in which he found a sphere more exactly suited to his pastoral gifts than he could expect in any other place. In 1863 he removed with a portion of his congregation to a new and beautiful church at Laurieston Crescent, where his influence continued unabated until his death.

From his student days Eadie bore a reputation for extensive, if not profound and accurate, scholarship, which he justified and increased during the earlier years of his ministry to such an extent that in 1843 the church to which he belonged appointed him professor of biblical literature and hermeneutics in its Divinity Hall. He held this appointment along with his ministerial charge till the close of his life, and discharged its duties with an efficiency that was universally acknowledged. While his scholarship was not minute or thorough, it was sure and sound, and was surmounted by few but notable commentators of his day in range of learning, and by still fewer in the soundness of judgment with which his learning was applied. As a critic he was acute and painstaking;
EAD—EAG 589

as an interpreter he was eminently fair-minded. In the professor's chair, as in the pulpit, his strength lay in the tact with which he selected the soundest results of biblical criticism, whether his own or that of others, and presented them in a clear and connected form, with a constant view to their practical bearing. If his works were not of an academic aspect to some portions of his lectures, he rendered them not less interesting and probably not less useful to his auditors. Eadie's merits as a scholar were early acknowledged by the usual honorary university distinctions. He received the degree of L.L.D. from Glasgow in 1844, and that of D.D. from St Andrews in 1850.

Busily engaged as he was in two distinct offices, either of which might well of itself have employed all his energies, Eadie nevertheless found time for an amount of work in a third sphere, of which the same thing might be said. His labours as an author would have been more than credible to one who had no other occupation. Most of his works were connected with biblical criticism and interpretation, some of them being designed for popular use and others being more strictly scientific. To the former class belong the Biblical Cyclopaedia, his edition of Gravett's Concurrence, his Early Oriental History, and his discourses on The Divine Law and on Paul the Preacher, to the latter belong his commentaries on the Greek text of St Paul's epistles to the Ephesians, Colossians, Philippians, and Galatians, published at intervals in four volumes, which take a high rank among exegetical works. His Life of Dr Kito obtained a deserved popularity. His last work, the History of the English Bible (2 vols. 1876), will probably be the most enduring memorial of his ability as an author. Though not unimportant in point of arrangement and style, it contains a fuller and more accurate account of the subject than is to be found anywhere else, and almost every page bears marks of the life-long interest and loving research of the author. His most unrivalled knowledge of the various English versions, as well as his ability as a critic and interpreter of the original, led to his being selected as one of the company for the revision of the authorized version of the New Testament, and in this capacity it is understood that he rendered excellent service. Dr Eadie died at Glasgow on the 3d June 1876.

EADMER, or EDEMER (in Latin Eadmerus, and by mistake Edinurus and Edinurus), an English ecclesiastic and historian of the Norman period, probably, as his name suggests, of English as opposed to Norman parentage. At an early age he was sent to the Benedictine monastery at Canterbury; and there he became acquainted with Anselm, at the time of the latter's first visit to England as abbot of Bec. The intimacy was renewed when Anselm was raised to the episcopal see; and thenceforward Eadmer was not so much the archbishop's disciple and follower as his friend and director, and that at last not only by Anselm's private recognition, but by the formal appointment of Pope Urban II. So complete, indeed, was the obedience shown by the great scholastic philosopher and head of the English Church to his self-elected tutor, that—according to William of Malmesbury, De gestis pontificum Anglorum, lib. I.—he is said to have waited for his express permission before he rose from his bed, or even turned from one side to the other. After Anselm's death Eadmer accompanied Radulph, the new archbishop, to Rome in 1119; and on their return in 1120 he was nominated to the see of St Andrews in Scotland. Owing, however, to the refusal of Anselm to recognise the claims put forward by Eadmer and his patron in support of the episcopal authority of the see of Canterbury, he was never formally inducted into the office. He was at Canterbury in 1121, and he spent the latter part of his life as prior of the monastery there. His death is variously assigned to the year 1128 and 1137.

Eadmer has left a large number of works, of which a list is given in Wharton's Anglo-Saxon, part II. Most important is his Historia Novembarum, in six books treating of his own time down to the death of Ralph in 1122, and his Pan De Portale in 1124, and both have since been several times reprinted. Of less mark are his lives of Odo, Bregewin, and Dunstan, and of Oswald and Wilfred of York, and his treatises—formerly ascribed to Anselm—De quattuor veritatis et quatuor de beata Maria Virgine, and De Simultudiinbus S. Anselmi. Nearly all his works are to be found in an early MS in the library of Corpus Christi College, Cambridge (C C C C, No. 371), and most of them have been reprinted as an appendix to Anselm's Opera by Gerberon, fol. 1674, and by the Benedictine monks of St Maur, ed. Paris, 1721. A number of his letters are preserved in MSS Cotton, Otho. A. 14.

EAGLE (French Aigle; from the Latin Aquila), the name generally given to the larger Diurnal Birds of prey which are not Vultures, but the limits of the subfamily Aquilinae have been very variously assigned by different writers on systematic ornithology, and, as before observed (Buckland, vol. iv. p. 603), there are Eagles smaller than some Buzzards. By some authorities the femmeres and buzzards, which the common English name (Bearded Vulture) shows. There are also other forms, such as the genera Aquila, Circus, Selenis, and allies, which though generally called Eagles have been ranked as Buzzards. In the absence of any truly scientific definition of the family Aquilinae it is best to leave this and many other more or less questionable members of the group—such as the genera Spilornis, Ciconius, Scelogus, Heterurus, and so forth—and, so far as space will allow, to treat here of those whose position cannot be gainsaid.

True Eagles inhabit all the regions of the world, and some seven or eight species at least are found in Europe, of which two are resident in the British Islands. In England and in the Lowlands of Scotland Eagles only exist as stragglers; but in the Hebrides and some parts of the Highlands a good many may yet be found, and their numbers appear to have rather increased of late years than diminished, for the foresters and shepherds, finding that a high price can be got for their eggs, take care to protect the owners of the eyries, which are nearly all well known, and to keep up the stock by allowing them to rear their young. There are also now not a few occupiers of Scottish forests who interfere so far as they can to protect the king of birds. But his mountainous country is not to young, poisoning, and other destructive devices were resorted to without stint, and there was then every probability that before long not an Eagle would be left to add the wild majesty of its appearance to the associations of the mountain or the lake. In Ireland the extermination of Eagles seems to have been carried on almost unashamedly by the prudent considerations which in the northern kingdom have operated so favourably for the race, and except in the wildest parts of Donegal, Mayo, and Kerry, Eagles in the sister-island are said to be almost birds of the past.

Of the two British species the Erne (Hali, Erna) or Sea-
Eagle (by some called also the White-tailed and Chineyous Eagle)—*Haliaetus albullla*—affects chiefly the coast and neighbourhood of inland waters, living in great part on the fish and refuse that is thrown up on the shore, though it not unfrequently takes living prey, such as lambs, hares, and rabbits. On these last, indeed, young examples mostly feed when they wander southward in autumn, as they yearly do, and appear in England. The adults (fig. 1) are distinguished by their prevalent greyish-brown colour, their pale head, yellow neck, and white tail—characters, however, wanting in the immature, which do not assume the perfect plumage for some three or four years. The eyry is commonly placed in a high cliff or on an island in a lake—sometimes on the ground, at others in a tree—and consists of a vast mass of sticks, in the midst of which is formed a hollow lined with *Lasiula sphyraena* (as first observed by the late Mr John Wolley) or some similar grass, and here are laid the two or three white eggs. In former days the Sea-Eagle seems to have bred in several parts of England—as the Lake district, and possibly even in the Isle of Wight and on Dartmoor. This species inhabits all the northern part of the Old World from Iceland to Kamchatka, and breeds in Europe so far to the southward as Albania. In the New World, however, it is only found in Greenland, being elsewhere replaced by the White-headed or Bald Eagle, *H. leucocephalus*, a bird of similar habits, and the chosen emblem of the United States of America. In the far east of Asia occurs a still larger and finer Sea-Eagle, *H. pelagius*, remarkable for its white thighs and upper wing-ovets. South-eastern Europe and India furnish a much smaller species, *H. leucoryphus*, which has its representative, *H. leucogaster*, in the Malay Archipelago and Australia, and, as allies in South Africa and Madagascar, *H. vocifer* and *H. vociferoides* respectively. All these Eagles may be distinguished by their soapy tarsi, while the group next to be treated of have the tars feathered to the toes.

The Golden or Mountain-Eagle, *Aquila chrysaetos*, is the second British species. This also formerly inhabited England, and a nest, found in 1568 in the Peak of Derbyshire, is well described by Willoughby, in whose time it was said to breed also in the Snowdon range. It seldom if ever frequents the coast, and is more active on the wing than the Sea-Eagle, being able to take some birds as they fly, but a large part of its sustenance is the flesh of animals that dis a natural death. Its eyry is generally placed and built like that of the other British species, but the neighbourhood of water is not requisite. The eggs, from two to four in number, vary from a pure white to a mottled, and often highly-coloured, surface, on which appear different shades of red and purple. The adult bird (fig. 2) is of a rich, dark brown, with the elongated feathers of the neck, especially on the nape, light tawny, in which imagination sees a "golden" hue, and the tail marbled with brown and ashy-grey. In the young the tail is white at the base, and the neck has scarcely any tawny tint. The Golden Eagle does not occur in Iceland, but occupies suitable situations over the rest of the Palaearctic Region and a considerable portion of the Neotropical—though the American bird has been, by some, considered a distinct species. Domesticated, it has many times been trained to take prey for its master in Europe, and to this species is thought to belong an Eagle habitually used by the Kurgis Tartars, who call it *Bergut* or *Bearroot*, for the capture of antelopes, foxes, and wolves. It is carried hooded on horseback or on a perch between two men, and released when the quarry is in sight. Such a bird, when well trained, is valued, says Pallas, at the price of two camels. It is quite possible, however, that more than one kind of Eagle is thus used, and the services of *A. lathaca* (which is the Imperial Eagle of some writers) and of *A. mogulina*—

1 As already stated, the site chosen varies greatly. Occasionally placed in a niche in what passes for a perpendicular cliff to which ascent could only be gained by a skillful eagarman with a rope, the writer has known a nest to within ten or fifteen yards of which he rode on a pony. Two beautiful views of as many Golden Eagle's nests, drawn on the spot by Mr Wolf, are given in the Oudbera Hallets, and a fine series of eggs is also figured in the same work.

2 Which species may have been the traditional emblem of Roman power, and the Aes Socala, is very uncertain.
both of which are found in Central Asia, as well as in South-eastern Europe—may also be employed.

Of the other more or less nearly allied species or races want of room forbids the consideration, but there is a smaller form on which a few words may be said. This has usually gone under the name of A. semipalmata, but is now thought by the best authorities to include three local races, or, in the eyes of some, species. They inhabit Europe, North Africa, and Western Asia to India, and two examples of one of them—A. bangs, the form which is somewhat plentiful in North-eastern Germany—have occurred in Cornwall. The smallest true Eagle is A. pennata, which inhabits Southern Europe, Africa, and India. Differing from other Eagles of their genus by its wedge-shaped tail, though otherwise greatly resembling them, is the A. audax of Australia. Lastly may be noticed here a small group of Eagles, characterized by their long legs, forming the genus Accipiter, of which one species, N. fasciatus, is found in Europe. The Osprey (Pandion), though placed by many among the Aquilina, certainly does not belong to that subfamily (A. N.).

The simplest form of the organ of hearing is a small sac containing fluid, with the auditory nerve expanded upon it. Sonorous vibrations are communicated to this sac either directly through the hard parts of the head, or at the same time by a membrane exposed to the surrounding medium. Such is the form of ear found in many of the Crustacea and in the Cephalopoda. In the Vertebrata, there is a progressive development and increasing complexity from the fishes up to Mammalia. For details as to the structure of the ear in the different subdivisions of the Vertebrata, reference is made to the articles treating of these, such as Amphibia, Birds, &c., and the structure of the human ear will be found fully described in the article Anatomy, vol. i. p. 891. It is the object of this article to describe the phenomena of auditory sensation from the physiological point of view.

The sense of hearing is a special sensation the cause of which is an excitation of the auditory nerves by the vibrations of sonorous bodies. A description of sonorous vibrations and of their transmission is given in the article Acoustics; here we shall consider, first, the transmission of such vibrations from the external ear to the auditory nerve, and secondly, the physiological characters of auditory sensation.

1. Transmission in External Ear.—The external ear consists of the pinna, or auricle, and the external auditory meatus, or canal, at the bottom of which we find the membrana tympani, or drum head. In many animals the auricle is trumpet-shaped, and, being freely movable by muscles, serves to collect sonorous waves coming from various directions. The auricle of the human ear presents many irregularities of surface. If these irregularities are abolished by filling them up with a soft material such as wax or oil, leaving the entrance to the canal free, experiment shows that the intensity of sounds is weakened, and that there is more difficulty in judging of their direction. When waves of sound strike the auricle, they are partly reflected outward, while the remainder, impinging at various angles, undergo a number of reflections so as to be directed into the auditory canal. Vibrations are transmitted along the auditory canal, partly by the air it contains and partly by its walls, to the membrana tympani. The absence of the auricle, as the result of accident or injury, has not caused diminution of hearing. In the auditory canal, waves of sound are reflected from side to side until they reach the membrana tympani. From the obliquity in position and peculiar curvature of this membrane, most of the waves must strike it nearly perpendicularly, and in the most advantageous direction.

2. Transmission in Middle Ear.—The middle ear is a small cavity, the walls of which are rigid with the exception of the portions consisting of the membrana tympani, and the membrane of the round window and of the apparatus filling the oval window. This cavity communicates with the pharynx by the Eustachian tube, which forms a kind of air-tube between the pharynx and the tympanum for the purpose of regulating pressure on the membrana tympani. It is generally supposed that during rest the tube is open, and that it is closed during the act of deglutition. As this action is frequently taking place, not only when food or drink is introduced, but when saliva is swallowed, it is evident that the pressure of the air in the tympanum will be kept in a state of equilibrium with that of the external air on the outer surface of the membrana tympani, and that thus the membrana tympani will be rendered independent of variations of atmospheric pressure such as may occur within certain limits, as when we descend in a diving bell or ascend in a balloon. By a forcible expiration, the oral and nasal cavities being closed, air may be driven into the tympanum, while a forcible inspiration (Valsalva's experiment) will draw air from that cavity. In the first case, the membrana tympani will bulge outwards, in the second case inwards, and in both, from excessive stretching of the membrane, there will be partial deafness, especially for sounds of high pitch. Permanent occlusion of the tube is one of the most common causes of deafness.

The membrana tympani is capable of being set into vibration by a sound of any pitch included in the range of perceptible sounds. It responds exactly as to number of vibrations (pitch), intensity of vibrations (intensity), and complexity of vibration (quality or timbre). Consequently we can hear a sound of any given pitch, of a certain intensity, and in its own specific timbre or quality. Generally speaking, very high tones are heard more easily than low tones of the same intensity. As the membrana tympani is not only fixed by its margin to a ring or tube of bone, but is also adherent to the handle of the malleus, which follows its movements, its vibrations meet with considerable resistance. This diminishes the intensity of its vibrations, and prevents also the continued vibration of the membrane after an external vibration has ceased, so that a sound is not heard much longer than it lasts. The tension of the membrane may be affected (1) by differences of pressure on the two surfaces of the membrana tympani, as may occur during forcible expiration or inspiration, or in a pathological condition, ant(2) by muscular action through the contraction of the tensor tympani muscle. This small muscle arises from the apex of the petrous temporal and the cartilage of the Eustachian tube, enters the tympanum at its anterior wall, and is inserted into the malleus near its root. The handle of the malleus is inserted between the layers of the membrana tympani, and, as the malleus and incus move round an axis passing through the neck of the malleus from before backwards, the action of the muscle is to pull the membrana tympani inwards towards the tympanic cavity in the form of a cone, the meridians of which, according to Helmholz, are not straight but curved, with convexity outwards. When the muscle contracts, the handle of the malleus is drawn still further inwards, and thus a greater tension of the tympanic membrane is produced. On relaxation of the muscle, the membrane returns to its position of equilibrium by its own elasticity and by the elasticity of the chain of bones. This power of varying the tension of the membrane is a kind of accommodating mechanism for receiving and transmitting sounds of different pitch. With different degrees of tension, it will respond more readily to sounds of different pitch. When the membrane is tense, it will readily respond to high sounds, while relaxation will be the condition most
adapted for low sounds. In addition, increased tension of the membrane, by increasing the resistance, will diminish the intensity of vibrations. This is especially the case for sounds of low pitch.

Heimholtz has also pointed out that the peculiar form of the membrana tympani in man has the effect of increasing the force of its vibrations at the expense of their amplitude. The vibrations of the membrana tympani are transmitted to the internal ear partly by the air which the middle ear or tympanic cavity contains, and partly by the chain of bones, consisting of the malleus, incus, and stapes. Of these, transmission by the chain of bones is by far the most important. In birds and in the scaly amphibians, this chain is represented by a single rod-like ossicle, the columella, but in man the two membranes—the membrana tympani and the membrane filling the fenestra ovalis—are connected by a compound lever consisting of three bones, namely, the malleus, or hammer, inserted into the membrana tympani, the incus, or anvil, and the stapes, or stirrup, the base of which fits into the oval window. The lever thus formed has its fulcrum near the short process of the incus, which abuts against the tympanic wall; the power is applied at the handle of the malleus, and the resistance is at the base of the stirrup. Both by direct experimental observation and by calculation from data supplied by measurement of the lengths of the arms of the lever, Heimholtz has shown that by this arrangement vibrations are diminished in extent in the ratio of 3 to 2, but are inversely increased in force. Considering the great resistance offered to excursions of the stapes, such an arrangement must be advantageous. It must also be noted that in the transmission of vibrations of the membrana tympani to the fluid in the labyrinth it contains, and partly through the chain of bones, the chain of ossicles vibrates as a whole and acts efficiently, the fluid of the labyrinth may receive vibrations of the fluid in the labyrinth by three different ways: (1) From the osseous walls of the labyrinth, (2) by the air in the tympanum and the round window, and (3) by the base of the stapes inserted into the oval window.

When the head is plunged into water, or brought into direct contact with any vibrating body, vibrations must be transmitted directly. Vibrations of the air in the mouth and in the nasal passages are also communicated directly to the walls of the cranium, and thus pass to the labyrinth. In like manner, we may experience peculiar auditory sensations, such as blowing, rubbing, and hissing sounds, due to muscular contraction or to the passage of blood in vessels close to the auditory organ. It has not been satisfactorily made out to what extent, if any, vibrations may be communicated to the fluid in the labyrinth by the round window. There can be no doubt, however, that in ordinary hearing vibrations are communicated chiefly by the chain of bones. When the base of the stirrup is pushed into the oval window, the pressure in the labyrinth increases, the impulse passes along the scala vestibuli to the scala tympani, and, as the only mobile part of the wall of the labyrinth is the membrane covering the round window, this membrane is forced outwards; when the base of the stirrup is pulled outwards, the pressure in the labyrinth decreases, the impulse passes along the scala tympani to the scala vestibuli. Thus the fluid of the labyrinth may receive a series of pulses or vibrations isochronous with the movements of the base of the stirrup, and these pulses affect the terminal apparatus in connection with the auditory nerve.

Since the size of the membranous labyrinth is so small, measuring, in man, not more than ½ inch in length by ¼ inch in diameter at its widest part, and since it is a chamber consisting partly of conduits of very irregular form, it is impossible to state accurately the course of vibrations transmitted to it by impulses communicated from the base of the stirrup. In the cochlea, vibrations must pass from the scala vestibuli along the scala vestibuli to the scala tympani and, in certain parts of which we find the terminal apparatus in connection with the auditory nerve, immersed in another fluid called the endolymph. The membranous labyrinth consists of a vestibular portion formed by two small sac-like dilatations, the scala vestibuli and the scala tympani, the latter of which communicates with the semicircular canals by five openings. Each canal consists of a tube, bulging out at each extremity so as to form the so-called ampulla, in which, on a projecting ridge, called the crista acustica, there are cells bearing or developed into long auditory hairs, which are to be regarded as the peripheral end-organs of the vestibular branches of the auditory nerve. The cochlear division of the membranous labyrinth consists of the ductus cochlearis, a tube of triangular form fitting in between the two cavities in the cochlea, called the scala vestibuli; because it commences in the vestibule, and the scala tympani, because it ends in the tympanum, at the round window. These two scala communicate at the apex of the cochlea. The roof of the ductus cochlearis is formed by a thin membrane called the membrane of Reissner, while its floor consists of the basilar membrane, on which we find the remarkable organ of Corti, which constitutes the terminal organ of the cochlear division of the auditory nerve, and which is fully described in vol. i. p. 894. It is sufficient to state here that this organ consists essentially of an arrangement of epithelial cells bearing hairs which are in communication with the terminal filaments of the spiral of the auditory nerve, and that groups of these hairs pass through holes in a closely investing membrane, the organ of Corti, which is supposed to act as a dampening apparatus, so as quickly to stop their movements. The ductus cochlearis and the two scalae are filled with fluid. Sonorous vibrations may reach the fluid in the labyrinth by three different ways: (1) From the osseous walls of the labyrinth, (2) by the air in the tympanum and the round window, and (3) by the base of the stapes inserted into the oval window.

The intensity of the vibrations of the air is determined by the elasticity of the middle ear, and by calculation from data supplied by measurement of the lengths of the arms of the lever, Heimholtz has shown that by this arrangement vibrations are diminished in extent in the ratio of 3 to 2, but are inversely increased in force. Considering the great resistance offered to excursions of the stapes, such an arrangement must be advantageous. It must also be noted that in the transmission of vibrations of the membrana tympani to the fluid in the labyrinth it contains, and partly through the chain of bones, the chain of ossicles vibrates as a whole and acts efficiently, although its length may be only a small fraction of the wave length of the sound transmitted.

3. Transmission in the Internal Ear.—The internal ear is composed of the labyrinth, formed of the vestibule or central part, the semicircular canals, and the cochlea, each of which consists of an osseous and a membranous portion (see vol. i. p. 893). The osseous labyrinth may be regarded as an osseous mould in the petrous portion of the temporal bone, lined by tasselled endothelium, and containing a small quantity of fluid called the perilymph. In this mould, partially surrounded by, and to some extent floating in, this fluid, there is the membranous labyrinth, consisting of parts of which we find the terminal apparatus in connection with the auditory nerve, immersed in another fluid called the endolymph. The membranous labyrinth consists of a vestibular portion formed by two small sac-like dilatations, the scala vestibuli and the scala tympani, the latter of which communicates with the semicircular canals by five openings. Each canal consists of a tube, bulging out at each extremity so as to form the so-called ampulla, in which, on a projecting ridge, called the crista acustica, there are cells bearing or developed into long auditory hairs, which are to be regarded as the peripheral end-organs of the vestibular branches of the auditory nerve. The cochlear division of the membranous labyrinth consists of the ductus cochlearis, a tube of triangular form fitting in between the two cavities in the cochlea, called the scala vestibuli; because it commences in the vestibule, and the scala tympani, because it ends in the tympanum, at the round window. These two scala communicate at the apex of the cochlea. The roof of the ductus cochlearis is formed by a thin membrane called the membrane of Reissner, while its floor consists of the basilar membrane, on which we find the remarkable organ of Corti, which constitutes the terminal organ of the cochlear division of the auditory nerve.
In the next place, vibrations must have a certain duration to be perceived; and lastly, to excite a sensation of a continuous musical sound, a certain number of vibrations must occur in a given interval of time. The lower limit is about 30, and the upper about 30,000 vibrations per second. Below 30, the individual impulses may be observed, and above 30,000 few ears can detect any sound at all. The extreme upper limit is not more than 35,000 vibrations per second. Auditory sensations are of two kinds—noises and musical sounds. Noises are caused by impulses which are not regular in intensity or duration, and are not periodic, or they may be caused by a series of musical sounds occurring instantly as so as to produce discord, as when we place our hand at random on the key-board of a piano. Musical tones are produced by periodic and regular vibrations. In musical sounds three characters are prominent—intensity, pitch, and quality. Intensity depends on the amplitude of the vibration, and a greater or lesser amplitude of the vibration will cause a corresponding movement of the transmitting apparatus, and a corresponding intensity of excitation of the terminal apparatus. Pitch, as a sensation, depends on the length of time in which a single vibration is executed, or, in other words, the number of vibrations in a given interval of time. The ear is capable of appreciating the relative pitch or height of a sound as compared with another, although it may not ascertain precisely the absolute height of a sound. What we call an acute or high tone is produced by a large number of vibrations, while a grave or low tone is caused by few. The musical tones which can be used with advantage range between 40 and 4000 vibrations per second, extending them from 6 to 7 octaves. According to E. H. Weber, practiced musicians can perceive a difference of pitch amounting even to only the 1/10 of a semitone, but this is far beyond average attainment. Quality or timbre (or Klang) is that peculiary characteristic of a musical sound by which we may identify it as proceeding from a particular instrument or from a particular human voice. It depends on the fact that many waves of sound that reach the ear are really compound wave systems, built up of constituent waves, each of which is capable of exciting a sensation of a simple tone if it be unsangled out and reinforced by a resonator (see Acoustics), and which may sometimes be heard without a resonator, after special practice and tuition. Thus it appears that the ear must have some arrangement by which it receives every wave system, however complex, into simple periodic vibrations. When we listen to a sound of any quality we recognize that it is of a certain pitch. This depends on the number of vibrations of one tone, predominant in intensity over the others, called the fundamental or ground tone, or first partial tone. The quality, or timbre, depends on the number and intensity of other tones added to it. These are termed harmonics or partial tones, and they are related to the first partial or fundamental tone in a very simple manner, being multiples of the fundamental tone. Thus—

</table>

When a simple tone, or one free from partials, is heard, it is given rise to a simple, soft, somewhat insipid sensation, as may be obtained by blowing across the mouth of an open bottle or by a tuning fork. The lower partials added to the fundamental tone give softness combined with richness, while the higher, especially if they be very high, produce a brilliant and thrilling effect, and caused by the brass instruments of an orchestra. Such being the facts, how may they be explained physiologically?

Little is yet known regarding the mode of action of the vibrations of the fluid in the labyrinth upon the terminal apparatus connected with the auditory nerve. There can be no doubt that it is a mechanical action, a true communication of impulses to delicate hair-like processes, by the movements of which the nervous filaments are irritated. In the human ear it has been established that there are about 3000 small arches formed by the rods of Corti (see Anatomy). Each arch rests on the basilar membrane, and supports rows of scales having minute hair-like processes somewhat resembling cilia. It would appear also that the filaments of the auditory nerves terminate in the basilar membrane, and possibly they may be connected with the hair-cells. At one time it was supposed by Helmholtz that these fibres of Corti were elastic and that they were tuned for particular sounds, so as to form a regular series corresponding to all the tones audible to the human ear. Thus 2800 fibres distributed over the tones of seven octaves would give 400 fibres for each octave, or nearly 33 for a semitone. Helmholtz has put forward the ingenious hypothesis that, when a pendular vibration reaches the ear, it excites by sympathetic vibration the fibre of Corti which is tuned for its proper number of vibrations. If, then, different fibres are tuned to tones of different pitch, it is evident that we have here a mechanism which, by exciting different nerves, gives rise to sensations of pitch. When the vibration is not simple but compound, in consequence of the blending of vibrations corresponding to various harmonics or partial tones, the ear has the power of resolving this compound vibration into its elements. It can only do so by different fibres responding to the constituent vibrations of the sound, one for the fundamental tone being stronger, and giving the sensation of a particular pitch or height to the sound, and the others, corresponding to the upper partial tones, being weaker, and causing special though undefined sensations, which are so blended together in consciousness as to terminate in a complex sensation of a tone of a certain quality or timbre. It would appear at first sight that 33 fibres of Corti for a semitone are not sufficient to enable us to detect all the gradations of pitch in that interval, since, as has been shown above, trained musicians may distinguish a difference of 1/10 of a semitone. To meet this difficulty, Helmholtz states that if a sound is produced, the pitch of which may be supposed to come between two adjacent fibres of Corti, both of these will be set into sympathetic vibration, but the one which comes nearest to the pitch of the sound will vibrate with greater intensity than the other, and that consequently the pitch of that sound would be thus appreciated. These theoretical views of Helmholtz have derived much support from remarkable experiments of Hensen, who observed that certain hairs on the antenna of Myia, a Crucifer, when observed with a low microscope power, vibrated with certain tones produced by a key. It was seen that certain tones of the horn set some hairs into strong vibration, and other tones other hairs. Each hair responded also to several tones of the horn. Thus one hair responded strongly to do and do², more weakly to g, and very weakly to a. It was probably tuned to some pitch between do² and do³. (Studien über das Gehörorgan der Decapoden, Leipzig, 1863.)

Recent histological researches have led to a modification of this hypothesis. It has been found that the rods or arches of Corti are stiff structures, not adapted for vibrating, but apparently consisting of a kind of support for the hair cells. It is also known that there are no rods of Corti in the cochlea of birds, which are capable of producing pitch. Hensen and Helmholtz have now suggested the view that not only may the segments of the membrana basilaris be stretched more in the radial than
in the longitudinal direction, but different segments may be stretched radially with different degrees of tension so as to resemble a series of tense strings of gradually increasing length. Each string would then respond to a vibration of a particular pitch communicated to it by the hair-cells. The exact mechanism of the hair-cells and of the membrana reticulata, which looks like a damping apparatus, is unknown.

II. Physiological Characters of Auditory Sensation. — 1. Under ordinary circumstances auditory sensations are referred to the outer world. When we hear a sound, we associate it with some external cause, and it appears to originate in a particular place, or to come in a particular direction. This feeling of exteriority of sound seems to require transmission through the membranes tympani. Sounds which are sent through the walls of the cranium, as when the head is immersed in water, appear to originate in the body itself. It is probable, however, that the external character of ordinary auditory sensations may be more the result of habit than due to any anatomical peculiarity of the ear itself.

2. An auditory sensation lasts a short time after the cessation of the exciting cause, so that a number of separate vibrations, each capable of exciting a distinct sensation when heard alone, may succeed each other so rapidly that they are fused into a single sensation. If we listen to the puffs of a syren, or to vibrating tongues of low pitch, the single sensation is usually produced by about 30 or 32 vibrations per second; but there can be no doubt, as was first pointed out by Helmholtz, that when we listen to beats of considerable intensity, produced by two adjacent tones of sufficiently high pitch, the ear may follow as many as 132 intermissions per second.

3. The sensibility of the ear for sounds of different pitch is not the same. It is more sensitive for acute than for grave sounds, and it is probable that the maximum degree of acuteness is for sounds produced by about 3000 vibrations per second, that is near 425. Sensibility as to pitch varies much with the individual and with the training to which he has subjected himself. Thus some musicians may detect a difference of \( \frac{1}{1000} \) of the total number of vibrations, whereas other persons may have difficulty in appreciating a semitone. This power of appreciating differences of pitch is termed a correct or just ear, and there can be no doubt of its improvement by cultivation.

4. Hearing with two ears does not appear materially to influence auditory sensation, but probably the two organs are enabled, not only to correct each other’s errors, but also to aid us in determining the locality from whence a sound originates. It is asserted by Fechner that one ear may perceive the same tone at a slightly higher pitch than the other, but this may probably be due to some slight pathological condition in one ear. If two tones, produced by two tuning forks of equal pitch, are produced one near each ear, there is a uniform single sensation; if one of the tuning forks be made to revolve round its axis in such a way that its tone increases and diminishes in intensity, neither fork is heard continuously, but both sound alternately, the fixed one being only audible when the revolving one is not. It is difficult to decide whether exactitude of corresponding elements in the two ears can be distinguished from each other. It is probable that the resulting sensations may be distinguished, provided one of the generating elements differs from the other in intensity or quality, although it may be the same in pitch.

5. Hitherto we have considered only the audition of a single sound, but it is possible also to have simultaneous auditive sensations, as in musical harmony. It is difficult to ascertain what is the limit beyond which distinct auditory sensations may be perceived. We have in listening to an orchestra a multiplicity of sensations which produces a total effect, while, at the same time, we can with ease single out and notice attentively the tones of one or two special instruments. Thus the pleasure of music may arise partly from listening to simultaneous, and partly from the effect of contrast or suggestion in passing through successive, auditory sensations.

The principles of harmony belong to the subject of music, but it is necessary here briefly to refer to them from the physiological point of view. If two musical sounds reach the ear at the same moment, an agreeable or disagreeable sensation is experienced, which may be termed a concord or a discord, and it can be shown by experiment with the syren (see Acoustics) that this depends upon the vibratory numbers of the two tones. The octave (1 2), the twelfth (1 3), and double octave (1 4), are absolutely consonant sounds; the fifth (2 3) is said to be perfectly consonant; and then follow, in the direction of dissonance, the fourth (3 4), major sixth (3 5), major third (4 5), minor sixth (5 8), and the minor third (9 5). Helmholtz has attempted to account for this by the application of his theory of beats.

Beats are observed when two sounds of nearly the same pitch are produced together, and the number of beats per second is equal to the difference of the number of vibrations of the two sounds. Beats give rise to a peculiarly disagreeable intermittent sensation, comparable to what is experienced on watching a flickering light, and a painful sensation may arise from intermittent vibrations of the auditory nerve filaments. The maximum roughness of beats, according to Helmholtz, is attained by 33 per second; beyond 132 per second, the individual impulses become indistinguishable as auditory sensation. When two notes are sounded, say on a piano, not only may the first, fundamental, or prime tones beat, but partial tones of each of the pmures may beat also, and the difference of pitch of two simultaneous sounds augments, the number of beats, both of prime tones and of harmonics, augments also. The physiological effect of beats, though they may not be immediately appreciable, is to give roughness to the ear. If harmonics or partial tones of prime tones coincide, there are no beats; if they do not coincide, the beats produced will give a character of roughness to the interval. Thus in the octave and twelfth, all the partial tones of the acute sound coincide with the partial tones of the grave sound, and the fourth, major sixth, and major third, only two pairs of the partial tones coincide, while in the minor sixth, minor third, and minor seventh, only one pair of the harmonics coincide. For details, see Helmholtz, On Sensations of Tone as a Physiological Basis for the Theory of Music, translated by Alexander J. Ellis, London, 1875.

DISEASES OF THE EAR. — Deafness may arise from obstruction of the external ear occasioned by disease of various kinds, from ulceration, thickening, or perforation of the membranes tympani; from inflammatory affections, both acute and chronic, of the middle and internal ear; from obstruction of the Eustachian tube caused by inflammation of its lining membrane, leading to thickening and accumulation of pus or mucus; from diseases of the tympanum itself; and, lastly, from disease of the auditory nerve or of the terminal apparatus connected with it in the membraneous labyrinth. Otitis, or ear-ache, is an inflammation, usually of a rheumatic nature, of some portion of the external auditory canal. Most frequently occurring in weakly individuals, it causes intense pain, which shoots over the head on the affected side. It may lead to the formation of a small abscess in one of the wax glands found in the passage. Hot applications by fomentations or warm poultices give relief, and if an abscess forms, it ought to be carefully lanced. Otorrhoea is a muco-purulent discharge, often of a fetid odour, from the ears of scrofulous children. It frequently occurs during teething, and it may be one of the sequela of scarlet fever, or measles, or small-pox. When pus flows from the ear, it may come from the membrane lining the deeper portion of the external meatus, or from the middle ear. A hole in the membrane tympani, or portions of bone near the middle, or internal ear. The treatment, of course, varies according to the cause, but generally the discharge may be lessened in quantity, and at all events rendered less offensive, by the use of weak in-
Note: The text appears to be partially transcribed and contains inconsistencies. The context seems to be historical, discussing the earldom of a specific earl and the subsequent titles and honors associated with it.

**EARL (Latin, comes; French, comte)**, a title and rank of nobility now the third in the order of the British peerage, and, accordingly, intervening between marquis and viscount. Earl, however, was the highest title and rank of the English nobles post conquestum until the year 1337, when by Edward III, the Black Prince was created duke of Cornwall. The “earl” of England was identical with comte or comte of France; and, so long as Norman-French continued to be spoken in this country, the English “earl” were styled “counts” as well in England as on the Continent. These powerful barons represented and succeeded the Saxon thanes who were ealdormen, their own title evidently having been derived from the *rāi* of Scandinavia.

The nature of a modern earldom is readily understood, since it is a rank and dignity of nobility which, while it confers no official power or authority, is inalienable, indivisible, and descends in regular succession to all the male heirs of the body of the grantee until, on their failure, it merges in the Crown. Not so was it with either the nature or the descent of the ancient earldoms of England. The early feudal times titles independent of office did not exist. The earls, or comtes, of those days, therefore, were actual officers, each having supreme authority in his own earldom, or “county,” under the Crown, each one of them also deriving from his earldom a certain fixed revenue, the possession of which was at times an anagnorisis of his official dignity as earl, and the evidence of his lawful and recognized title to it. But an earldom has long ceased to be endowed with any official association whatever, and has become merely a title by which its owners in male succession intestate and hold the dignitv, third in rank, of a peerage. In like manner, the descent and tenure of the ancient earldoms differed in many highly important particulars from the simple succession of the modern dignity. In the course of their chequered history, we find ancient earldoms, instead of passing by a quiet and clearly defined succession from father to son, constantly depending on the rights of female inheritance; they are seen to have been obtained by many a husband *jure uxoris*; they appear to have been transferred in an arbitrary manner, or actually to have been divided between coparcenors, or to have been retained for a while by the Crown and let out to farm. At the same time, under such strange conditions as these, and amidst conflicting vicissitudes, until they finally merged in the Crown, the ancient earldoms retained their vitality. They might descend very irregularly, and become vested in successive families, but still they did not become extinct, nor were they the claims of legal inheritance wholly forgotten or superseded, and, even if for a time they had been latent, or had actually been superseded, they emerged under more favourable circumstances, and under fresh arrangements or modifications they were again recognized by the Crown. An earl is “Right Honourable,” and is styled “My Lord.” His eldest son bears his father’s “second title,” and therefore, that second title being in most cases a viscountcy, he generally is styled “Viscount,” under all circumstances, however, the eldest son of an earl takes precedence immediately after the viscounts. The younger sons of earls are “Honourable,” but all their daughters are “Ladies.” In formal documents and instruments, the sovereign, when addressing or making mention of any peer of the degree of an earl, usually designates him “trusty and well-beloved counsels,” a form of appellation first used by Henry IV, who, after his betrothal or alliance was actually related to every earl and duke in the realm. The wife of an earl is a countess, she is “Right Honourable,” and is styled “My Lady.”

The coronet of an earl has, rising from a golden circlet, eight lofty rays of gold, each of which upon its point supports a large pearl, also, between each pair of rays, at their bases, there is a golden conventional leaf, the stalks of all these leaves being connected with the rays and with each other so as to form a continuous wreath. In representations, five of the elevated rays with their pearls and four of the leaves are shown. The cap and lining of the coronet, if worn or represented, are the same as those of the ducal coronet. An earl’s coronet without cap or lining is represented in the annexed figure.

In the monumental effigies of noble personages, which yet remain from the Middle Ages, there are many highly interesting representations of the variances of coronets worn by the earls of those days and by their contemporaries, before this coronet had assumed its present fixed and definite character. Thus, early in the 15th century, effigies of an earl and countess of Arundel, at Arundel, have very rich coronets. The earl’s has a series of leaves and of clusters of rays, the latter being encircled, all of them being raised to a considerable height above the circlet, the clusters rising rather higher than the leaves. The coronet of the countess differs in having the raised clusters set alternately with single balls or pearls that are less elevated. The coronet of a countess now in all respects is the same as that of an earl. The scarlet parliamentary robe of an earl has three doublings of ermine. The duke of Norfolk, who is premier duke, as earl of Arundel, Surrey, and Norfolk, is premier earl of England, also he holds his earldom of Arundel, a feudal dignity (as it was adjudged by Lord Hardwicke) a*.

1 In his essay at Warwick, 1499, the earl of Warwick, from a place of birth that is accompanied by a series of pearls slightly raised, but without any leaves. Still later in the century, 1483, Isabel Plantagenet, countess of Essex, in her bust at Little Easton in Essex, has a series of leaves, so less than thirteen in number, that rise to a uniform slight elevation above the front of an ample coronet; and about the same time, 1487, the coronets of another earl and countess of Arundel have been heightened with an uninterrupted series of architectural conventional leaves, and once more, at Here, in Kent, the brass to Sir T. Boleyn, G., earl of Wiltshire and Ormonde, represents the maternal grandfather of Queen Elizabeth, with the insignia of the Garter, and wearing a rich coronet, the circlet of which is set with small pearls in contact, not raised, and so numerous that upwards of twenty are designated.
PARLIAMENT, the 11th of Henry VI. 1433), by the fact of its hereditary possession of Arundel Castle only. As hereditary Earl-Marshall, his Grace of Norfolk is the head of the College of Arms.

EARLE, John (1601-1665), bishop of Worcester and afterwards of Salisbury, was born at York about 1601. He completed his education at Oxford, first entering Christ Church, and taking his degree of B.A. in 1619. He afterwards passed to Merton College, and graduated M.A. in 1624. He was appointed in 1631 proctor of the university, and in 1635 he joined the committee of the House of Commons on the matter of the closet and the house of Izaak Walton's friend Dr Morley, who became afterwards Bishop of Winchester. But his sympathies with the king and the Church of England were so strong that he declined the offer. Early in 1643 he was chosen chancellor of the cathedral of Salisbury, but of this preferment he was soon after deprived. After Cromwell's great victory at Worcester, Earl went abroad, and was named clerk of the closet and chaplain to Charles II. He spent a year at Antwerp in the house of Isaac Walton's friend Dr Morley, who became afterwards bishop of Winchester. He next joined the duke of York (James II.) at Paris, returning to England at the Restoration. He was at once appointed dean of Westminster, and in 1661 was one of the commissioners for revising the liturgy. At the end of November 1662 he was consecrated bishop of Worcester, and was translated, ten months later, to the see of Salisbury. During the plague of London Bishop Earle attended the king and queen at Oxford, and there he died, November 17, 1665. Earl's chief title to remembrance is his witty and humorous work entitled Microcomography, or a Piece of the World discovered, in Essays and Characters, which throws light on the manners of the time. First printed in 1630, it became very popular, and ran through eight editions in the lifetime of the author. A new edition with notes and appendix, containing much interesting matter, by Philip Bliss, was published in 1811. The style is quaint and epigrammatic; and the reader is frequently reminded of Thomas Fuller by such passages as this: "A university donner is a gentleman follower cheaply purchased, for his own money has hyed him, and so he is. Several reprints of the book have been issued since the author's death; and in 1671 a French translation by J. Dymock appeared with the title of Le monde ridicule. Earl was employed by Charles II. to make the Latin translation of the Eikon Basilike, published in 1649.

"Dr Earl," says Lord Clarendon in his Life, "was a man of great gaiety and devotion, a most eloquent and powerful preacher, and of a conversation so pleasant and delightful, so very innocent, and so very judicious, that no one in his society was more desired and loved. No man was more obliging in his dress and habits and manners, more wayward and cultivated in his behaviour and discourse. He was very dear to the Lord Falkland, with whom he spent as much time as he could make his own."

EARLON, Richard (1742-1822), English mezzotint engraver, was born in London in 1742. His natural faculty for art appears to have been first called into exercise by admiration for the lord mayor's state coach, just decorated by Cipriani. He tried to copy the paintings, and was sent to study under Cipriani. He displayed great skill as a draughtsman, and at the same time acquired without assistance the art of engraving in mezzotint. In 1765 he was employed by Alderman Boydell, then one of the most liberal promoters of the fine arts, to make a series of drawings from the pictures at Houghton Hall; and these he afterwards engraved in mezzotint. His most perfect works as engraver are perhaps the fruit and flower pieces after the Dutch artists Van Os and Van Huyssum. Amongst his historical and allegorical subjects are—Agrippina, after Rubens; West; Love in Bondage, after Guido Reni; the Royal Academy, the Embassy of Hydebeck to meet Lord Cornwallis, and a Tiger Hunt, the last three after Zoffany; and Lord Heathfield, after Sir Joshua Reynolds. Earlom also executed a series of 260 facsimiles of the drawings and sketches of Claude Lorrain, which were published from 6 vols. folio, under the title of Liber Veritatis (1777-1819). Earlom died in London, October 9, 1822.

EAR-RING, an ornament worn pendent from the ear, and generally suspended by means of a ring or hook passing through the pendulous lobe of the ear. The general usage appears to have been to have ear-rings worn in pairs, the two ornaments in all respects resembling each other; in ancient times, or sometimes more recently among Oriental races, a single ear-ring has sometimes been worn. The use of this kind of ornament, which constantly was of great value and sometimes was made of large size, dates from the remotest historical antiquity, the earliest mention of ear-rings occurring in the book of Genesis. It appears probable that the ear-rings of Jacob's family, which he buried with his strange idols at Bethel, were regarded as amulets or talismans, such unquestionably being the estimation in which some ornaments of this class have been held from a very early period, as they still are held in the East. Among all the Oriental races of whom we have any accurate knowledge, the Hebrews and Egyptians excepted, ear-rings always have been in general use by both sexes; while in the West, as well as by the Hebrews and Egyptians, as a matter of fashion, as they were prevalent among the Saxons, the Anglo-Saxon predecessors of the nations of modern Europe, they never have been worn only by women; and the prevalence of this fashion among the races of classic antiquity is illustrated in a singular manner by the ears of the famous statue of the Venus de' Medici being bored, evidently for the reception of pendant jewels. Ear-rings invariably having held an important position among the various remains of ancient and mediaeval goldsmiths' work that from time to time have rewarded the researches of archaeological inquirers. And these early relics, with rare exceptions objects of great beauty and delicacy, never fail to exemplify the artistic styles of their periods, as they were prevalent among the races by whom each individual jewel was produced. Ear-rings of costly materials and elaborate workmanship have been brought to light in considerable numbers in the Troad and in Peloponnese by Dr Schliemann, jewels of the same class, of exquisite beauty, and of workmanship that is truly wonderful, have been rescued from the sepulchres of ancient Etruria and Greece by Signor Castellani; other ear-rings of gold of characteristic forms have come down to our own times from the ancient Egyptians; we know well what styles of ear-rings were worn by the Romans of the empire and by the early Scandinavians; and recent researches among the burial places of our Anglo-Saxon predecessors in the occupancy of this island have led to the discovery of jewels in considerable numbers, which among their varieties include ear-rings executed in a style that proves the Anglo-Saxons to have made no inconsiderable advances in the arts of civilization. These same ornaments, which never have fallen into disuse, enjoy at the present day a very high degree of favour; like all other modern jewels, however, the ear-rings of our own times as works of arts can claim no historical attributes, because they consist as well of reproductions from all past ages and of every race as of fanciful productions that certainly can be assigned to no style of art whatever.
EARTH, FIGURE OF THE. The determination of the figure of the earth is a problem of the highest importance in astronomy, inasmuch as the diameter of the earth is the unit to which all celestial distances must be referred. Reasoning, doubtless, from the uniform level appearance of the horizon in any situation in which a spectator can be placed—the variations in altitude of the circumpolar stars as one travels towards the north or south, the disappearance of a ship standing out to sea, and perhaps other phenomena—the earliest astronomers universally regarded the earth as a sphere, and they endeavoured to ascertain its dimensions. Aristotle relates that the mathematicians had found the circumference to be 400,000 stadia. But Eratosthenes appears to have been the first who entertained an accurate idea of the principles on which the determination of the figure of the earth really depends, and attempted to reduce them to practice. His results were very inaccurate, but his method is the same as that which is followed at the present day—depending, in fact, on the comparison of a line measured on the earth's surface with the corresponding arc of the heavens. He observed that at Syene in Upper Egypt, on the day of the summer solstice, the sun was exactly vertical, whilst at Alexandria at the same season of the year its zenith distance was 7° 12', or one-fiftieth of the circumference of a circle. He assumed that these places were on the same meridian; and, reckoning their distance apart as 5000 stadia, he inferred that the circumference of the earth was 250,000 stadia. A similar attempt was made by Posidonius, who adopted a method which differed from that of Eratosthenes only in using a star instead of the sun. He obtained 240,000 stadia for the circumference. But it is impossible to form any correct opinions as to the degree of accuracy attained in these measures, as the length of the stadium is unknown. Polenoy in his Geography assigns the length of the degree as 500 stadia.

The Arabs, who were not at all prepossessing to astronomy, did not overlook the question of the earth's magnitude. The caliph Almanu'm, 814 A.D., having fixed on a spot in the plains of Mesopotamia, despatched one company of astronomers northwards and another southwards, measuring the journey by rods, until each found the altitude of the pole to have changed one degree. But the result of this measurement does not appear to have been very satisfactory. From this time the subject seems to have attracted no attention until about 1500, when Fernel, a Frenchman, measured a distance in the direction of the meridian near Paris by counting the number of revolutions of the wheel of his carriage as he travelled. His astronomical observations were made with a triangle used as a quadrant, and his resulting length of a degree was by a happy chance very near the truth.

The next geodist, Willemard Snell, took an immense step in the right direction by substituting a chain of triangles for actual linear measurement. The account of this operation was published at Leyden in 1617. He measured his base line on the frozen surface of the meadows near Leyden, and measured the angles of his triangles, which lay between Alkmaar and Bergen-op-Zoom, with a quadrant and semicircles. He took the precaution of comparing his standard with that of the French, so that his result was expressed in toises (the length of the toise is about 6.39 English feet). The work was recomputed and reconsidered by Muschenbroek in 1729. In 1637 an Englishman, Richard Norwood, published his own determination of the figure of the earth in a volume entitled The Seaman's Practice, containing a Fundamental Problem in Navigation experimentally verified, namely, touching the Compass of the Earth and Sea and the Longitude of a Degree in our English Mowtines. It appears that he observed on the 11th June 1633 the sun's meridian altitude in London as 62° 1', and on June 6, 1635, his meridian altitude in York as 59° 33'. He measured the distance between these places along the public road partly with a chain and partly by pacing. By this means, through compensation of errors, he arrived at 367,176 feet for the degree—which is very far removed from the truth.

The application of the telescope to circular instruments was the next important step in the science of measurement. Picard was the first who in 1669, with the telescope, using such precautions as the nature of the operation requires, measured an arc of meridian. He measured with wooden rods a base line of 5663 toises, and a second or base of verification of 3902 toises, his triangulation extending from Malvissane, near Paris, to Sourdun, near Amiens. The angles of the triangles were measured with a quadrant furnished with a telescope having cross-wires in its focus. The difference of latitude of the terminal stations was determined by observations made with a sector on a star in Cassiopea, giving 1° 22' 55'' for the amplitude. The terrestrial measurement gave 78,650 toises, whence he inferred for the length of the degree 57,600 toises.

Huygens' geodetic observations had been confined to the determination of the magnitude of the earth considered as a sphere, but a discovery made by Richer turned the attention of mathematicians to its deviation from a spherical form. This astronomer, having been sent by the Academy of Sciences of Paris to the island of Cayenne, in South America, for the purpose of determining the amount of terrestrial refraction and other astronomical objects, observed that his clock, which had been regulated at Paris to beat seconds, lost about two minutes and a half daily at Cayenne, and that in order to bring it to measure mean solar time it was necessary to shorten the pendulum by more than a line. This fact, which appeared exceedingly curious, and was scarcely credited till it had been confirmed by the subsequent observations of Varin and Deshayes on the coasts of Africa and America, was first explained in the third book of Newton's Principia, who showed that it could only be referred to a diminution of gravity arising either from a protuberance of the equatorial parts of the earth and consequent increase of the distance from the centre or from the counteracting effect of the centrifugal force. About the same time, 1673, appeared the work of Huygens entitled De Horologio Oscillatorio, in which for the first time were found correct notions on the subject of centrifugal force. It does not, however, appear that they were applied to the theoretical investigation of the figure of the earth before the publication of Newton's Principia. In 1699 Huygens, following up the subject, published his treatise entitled De Causa Gravitationis, which contains an investigation of the figure of the earth on the supposition that the attraction of every particle is towards the centre.

Between 1684 and 1718 J. and D. Cassini, starting from Picard's base, carried a triangulation northwards from Paris to Dunkirk and southwards from Paris to Collioure. They measured a base of 7416 toises near Perpignan, and a somewhat shorter base near Dunkirk, and from the northern portion of the arc, which had an amplitude of 2° 12' 9", obtained for the length of a degree 56,960 toises, while from the southern portion, of which the amplitude was 6° 18' 57", they obtained 57,097 toises. The immediate inference from this was that, the degree diminishing with increasing latitude, the earth must be a prolate spheroid. This conclusion was totally opposed to the theoretical investigations of Newton and Huygens, and created a great sensation among the scientific men of the day. The question was far too important to be allowed to remain unsettled, and accorded to the Academy of Sciences of Paris determined to apply a decisive test by the measurement of area at a great distance from each other. For this purpose some of the most distinguished
members of their body undertook the measurement of two meridian arcs—one in the neighbourhood of the equator, the other in a high latitude; and so arose the celebrated expeditions of the French Academicians. In May 1735, M.M. Godin, Bouguer, and De la Condamine, under the auspices of Louis XV., proceeded to Peru, where, assisted by two Spanish officers, after ten years of laborious exertion they measured an arc of $\text{arc}^\circ 7'$ intersected by the equator. The second party consisted of Maupertuis, Clairaut, Cassini, Lemonnier, and Outhier, who reached the Gulf of Bothnia in July 1736; they were in some respects more fortunate than the first party, inasmuch as they completed the measurement of an arc near the polar circle of $57'$ amplitude and returned to Europe within sixteen months from the date of their departure.

The measurement of Bouguer and De la Condamine was executed with great care, and on account of the locality, as well as the manner in which all the details were conducted, it has always been regarded as a most valuable determination. The southern limit was at a place called Tarquis, the northern at Cotehequi. A base of 62,722 toises was measured in the vicinity of Quito, near the northern extremity of the arc, and a second base of 53,610 toises near the southern extremity. The mountainous nature of the country made the work very laborious, in some instances the difference of heights of two neighbouring stations exceeding a mile. The difficulties with which the observers had to contend were increased by the opposition of the more ignorant of the inhabitants, and they were at times in danger of losing their lives. They had also much trouble with their instruments, those with which they were to determine the latitudes proving untrustworthy. But their energy and ingenuity were equal to the occasion, and they succeeded by simultaneous observations of the same star at the two extremities of the arc in obtaining very fair results. The whole length of the arc amounted to 176,945 toises, while the difference of latitudes was $3^\circ 7'3''$. In consequence of a misunderstanding that arose between De la Condamine and Bouguer, their operations were conducted separately, and each wrote a full and interesting account of the operation. Bouguer's book was published in 1749; that of De la Condamine in 1751. The toise used in this measure was ever after regarded as the standard toise, and is always referred to as the Toise of Peru.

The party of Maupertuis, though their work was quickly despatched, had also to contend with great difficulties. They were disappointed in not being able to make use of the small islands in the Gulf of Bothnia for the trigonometrical stations, and were forced to penetrate into the forests of Lapland. They commenced operations at Torna, a city situated on the mainland near the extremity of the gulf. From this, the southern extremity of their arc, they carried a chain of triangles northward to the mountain Kittis, which they selected as the northern terminus. In the prosecution of this work they suffered greatly from cold and the bites of flies and gnats. The latitudes were determined by observations with a sector (made by Graham) of the zenith distance of $\alpha$ and $\delta$ Draconis. The base line was measured on the frozen surface of the river Torna about the middle of the arc, two parties measured it separately, and they differed by about 4 toises. The result of the whole was that the difference of latitudes of the terminal stations was $57^\circ 29'6''$, and the length of the arc 55,023 toises. In this expedition, as well as in that to Peru, observations were made with a pendulum to determine the force of gravity; and these observations coincided with the geodetical results in proving that the earth was an ellipsoid and not prolate.

In 1740 was published in the Paris Mémoires an account, by Cassini de Thury, of a remeasurement of himself and Lacaille of the meridian of Paris. With a view to determine more accurately the variation of the degree along the meridian, they divided the same from the Cape of Good Hope to Collioure into four partial arcs of about two degrees each, by observing the latitude at five stations. The anomalous results previously obtained by J. and D. Cassini were not confirmed, but on the contrary the length of the degree derived from these partial arcs showed on the contrary an increase with increasing latitude. In continuation of their labours, Cassini and Lacaille further measured an arc of parallel across the mouth of the Rhone. The difference of time of the extremities was determined by the observers at either end noting the instant of a signal given by flashing gunpowder at a point near the middle of the arc.

While at the Cape of Good Hope in 1752, engaged in various astronomical observations, Lacaille measured an arc of meridian of $1^\circ 13'17''$, which gave him for the length of the degree 57,037 toises—an unexpected result, which has led to the modern remeasurement of the arc by Sir Thomas Maclear.

Passing over the measurements made between Rome and Rimini and on the plains of Piedmont by the Jesuit Boscovich and Beccaria, and also the arc measured with deal rods in North America by Messrs. Mason and Dixon, we come to the commencement of the English triangulation. In 1735, in consequence of a representation from Cassini de Thury on the advantages that would accrue to science from the geodetic connection of Paris and Greenwich, General Roy was with the king's approval appointed by the Royal Society to conduct the operations on the part of this country,—Count Cassini, Mechain, and Delambre being appointed on the French side. And now a precision previously unknown was brought into geodesy by the use of Ramsden's splendid theodolite, which was the first to make the spherical excess of triangles measurable. The wooden rods with which the first base was measured were speedily replaced by brass rods, which again were rejected for the steel chain of Ramsden. The details of this operation are fully given in the Account of the Trigonometrical Survey of England and Wales. Shortly after this, the National Convention of France, having agreed to remodel their system of weights and measures, chose, as applicable to all countries, for their unit of length the ten-millionth part of the meridian quadrant. In order to obtain this length precisely, the remeasurement of the French meridian was resolved on, and deputed to Delambre and Mechain. The details of this great operation will be found in the Base du Systeme Métrique Décimal. The arc was subsequently extended by M.M. Biot and Arago to the island of Iwia.

The appearance in 1838 of Bessel's classical work entitled Gradmessung in Ostpreussen marks an era in the science of geodesy. Here we find the method of least squares, a branch of the theory of probabilities, applied to the calculation of a network of triangles and the reduction of the observations generally. This work has been looked on as a model ever since, and probably it will not soon be surpassed as such. The systematic manner in which all the observations were taken with the view of securing final results of extreme accuracy is admirable. The triangulation, which is a small one, extends about a degree and a half along the shores of the Baltic in a N.N.W. direction. The compound bars with which he measured his base line may be understood by the following brief description. On the surface of an iron bar two toises in length is laid a zinc bar, both being perfectly planed and in free contact—the zinc bar being slightly shorter than the iron bar. They are united at one end into a spherical cap, the difference of length of the bars as seen at the other end varies; this difference of length is a thermometrical indica-
tion whereby a correction for temperature can be applied to the bars so as to reduce their length to that at the standard temperature. The bars in measuring were not allowed to come into contact, but the intervals left were measured by the interpolation of a glass wedge. The results of all the comparisons of the four measuring rods with one another, and with the standards, are elaborately worked out by least squares. The angles were observed with theodolites of 12 and 15 inches diameter, and the latitudes determined by means of the transit instrument in the prime vertical—a method much used in Germany. The formulæ employed in the reduction of the astronomical observations are very elegant. The reduction of the triangulation was carried out in the most thorough manner,—the sum of the squares of all the actual theodolite observations being made a minimum. As it is usual now to follow this method (sometimes only approximately) in all triangulations where great precision is required, we here give a brief description of the method. The equations of condition of a triangulation are those which exist between the supernumerary observed quantities and their calculated values, for, after there are just sufficient observations to fix all the points, then any angle that may be subsequently observed can be compared with its calculated value. If a triangulation consist of $n + 2$ points, two of which are the ends of a base line, then to fix the $n$ points $2n$ angles suffice, so that if $m$ be the actual number of angles really observed, the triangulation must afford $m - 2n$ equations of condition. To show how these arise, suppose that from a number $m$ of fixed points $A, B, C, \ldots$ a new point $P$ is observed, which $m$ points are again observed from $P$, then there will be formed $m - 1$ triangles, in each of which the sum of the observed angles is $180^\circ +$ the spherical excess, thus gives at once $m - 1$ equations of condition. The $m - 2$ distances will each afford an equation of the form

$$
PQ \times PB = PA \times PC \times 1,
$$

not, however, limited to three factors. Should $P$ observe the $m$ points and not be observed back, there will be $m - 3$ equations of the above form (they are called side equations). In a similar manner other cases can be treated. In practice the ratios of sides are replaced by the ratios of the sines of the corresponding opposite angles. To each observed angle a symbolical correction is applied, so that if $a$ be an observed angle and $a + x$ the true or most probable angle, $\sin a + x = \sin a(1 + \text{cot} a)$, $a$ being a small angle whose square is neglected. Thus the side equation takes the form

$$
\beta + \beta_1 + \beta_2 + \ldots + \beta_m = 0
$$

In the case of equations formed by adding together the three observed angles of a triangle the co-efficients are of course unity. The problem then is this. Given $n$ equations

$$
\beta + \beta_1 + \beta_2 + \ldots + \beta_m = 0
$$

between $m(m > n)$ unknown quantities $x_1, x_2, \ldots, x_n$, which are the corrections (expressed in seconds of arc) to the observed angles, we have to determine these quantities so as to render the function

$$
\sum \beta x_1^2 + \sum \beta_1 x_1^2 + \sum \beta_2 x_2^2 + \ldots + \sum \beta_m x_n^2
$$

a minimum, where $\sum \beta, \sum \beta_1, \sum \beta_2, \ldots, \sum \beta_m$ are the weights of the determinations of the angles to which the corresponding corrections belong. The equations $x_1, x_2, \ldots, x_n$ raffling this condition of minimum have, according to the theory of least squares, a higher probability than any other system of corrections that merely satisfy the equations of condition. Multiply the $n$ equations by multipliers $\lambda_1, \lambda_2, \ldots, \lambda_n$, and we obtain the theory of maxima and minima of $m$ equations

$$
\lambda_1 \beta_1 + \lambda_2 \beta_2 + \ldots + \lambda_n \beta_n = 0
$$

The values of $x_1, x_2, \ldots, x_n$ obtained from these equations are to be substituted in the original equations of condition, and then there will be $m$ equations between the $n$ multipliers $\lambda_1, \lambda_2, \ldots, \lambda_n$. These being solved, the numerical values of $\lambda_1, \lambda_2, \ldots, \lambda_n$ are obtained, and are substituting these in the last equations written down, the values of $x_1, x_2, \ldots, x_n$ will follow. The process is a long and tedious one, but it is inevitable if we wish very good results.

The great meridian arch in India was commenced by Colonel Lambton at Punnace in latitude $8^\circ 9'$. Following generally the methods of the English survey, he carried his triangulation as far north as $20^\circ 30'$. The work then passed into the able hands of Sir George (then Captain) Everest, who continued it to the latitude of $29^\circ 30'$. Two admirably written volumes by Sir George Everest, published in 1830 and in 1847, give all the details of the vast undertaking. The great trigonometrical survey of India is now being prosecuted with great scientific skill by Colonel Walker, R.E., and it may be expected that we shall have some valuable contributions to the great problem of geodesy. The working out of the Indian chains of triangles by the method of least squares presents peculiar difficulties, but enormous in extent as the work is, it is being thoroughly carried out. The ten base lines on which the survey depends were measured with Colby's compensation bars. These compensation bars were also used by Sir Thomas Macdowall in the measurement of the base line in his extension of Lacalle's arc at the Cape. The account of this operation will be found in a volume entitled Verification and Extension of Lacalle's Arc of Meridian at the Cape of Good Hope, by Sir Thomas Macdowall, published in 1866. Lacalle's amplitude is verified, but not his terrestrial measurement.

The number of stations in the principal triangulation of Great Britain and Ireland is about 250. At 32 of these the latitudes were determined with Ramsden's and Airy's zenith sectors. The theodolites used for this work were, in addition to the two great theodolites of Ramsden which were used by General Roy and Captain Kater (and which are now in as good condition as when they came from the hands of the maker), a smaller theodolite of 18 inches diameter by the same mechanism, and another of 24 inches diameter by Mears Troughton and Simms. The compensation bars for determination of absolute azimuths were made with these instruments at a large number of stations, the stars $\alpha$, $\delta$, and $\eta$ Ursae Minoris and 51 Cephei being those observed, always at the greatest azimuths. At six of these stations the probable error of the result is under $0^\circ 4$, at twelve under $0^\circ 5$, at thirty-four under $0^\circ 7$ so that the absolute azimuth of the whole network is determined with extreme accuracy. Of the seven base lines which have been measured, five were by means of steel chains and two with Colby's compensation bars. This is a system of six compound bars self-correcting for temperature. The compound bar may be thus described. Two bars, one of brass and the other of iron, are laid side by side, parallel, and firmly united at their centres, from which they are free to expand or contract, at the standard temperature they are of the same length. Let $AB$ be one bar, $AB'$ the other, draw a line through the corresponding extremities $A$, $A'$ to $P$, and a line through the other extremities $B$, $B'$ to $Q$, make $AP = EQ$, $AA'$ being $BB'$. Now if $AB$ is to $AP$ as the rate of expansion of the bar $AB'$ to the rate of expansion of the bar $AB$, then clearly the distance $PQ$ will be invariable, or very nearly so. In
the actual instrument P and Q are finely engraved dots at the distance of 10 feet apart. In the measurement the bars when aligned do not come into contact; an interval of six inches is left between each bar and its neighbour. This small space is measured by an ingenious micrometrical arrangement constructed on exactly the same principle as the bars themselves. The triangulation was computed by least squares. The total number of equations of condition for the triangulation is 920; if therefore the whole had been reduced in one mass, so as it should have been, the solution of an equation of 920 unknown quantities would have occurred as a part of the work. To avoid this an approximation was resorted to; the triangulation was divided into twenty-one parts or figures; four of these, not adjacent, were first adjusted by the method explained, and the corrections thus determined in these figures carried into the equations of condition of the adjacent figures. The average number of equations in a figure is 44; the largest equation is one of 77 unknown quantities.1

Aby’s Zenith Sector is too well known to need description. The vertical limb is read by four microscopes; altogether, in the complete observation of a star there are 10 micrometer readings and 12 level readings. In some recent observations in Scotland for latitude the Zenith Telescope has been used with very great success; it is very yet used; and a complete determination of latitude, affected with the mean of the declination errors of two stars, is effected by two micrometer readings and four level readings. The observation consists in measuring with the telescope micrometer the difference of zenith distances of two stars which cross the meridian, one to the north and the other to the south of the observer; at zenith distances which differ by not much more than 10° or 15°, the interval of the times of transit being not less than one nor more than twenty minutes. The advantages are that, with simplicity in the construction of the instrument and facility in the manipulation, reduction is eliminated (or nearly so), as the stars are generally selected within 2° of the zenith, and there is no large divided circle. The telescope, which is counterposed on one side of the vertical axis, has a small circle for finding, and there is also a small horizontal circle. This instrument is universally used in American geodesy.

The United States Coast Survey has a principal triangulation extending for about 9° 30′ along the coast, but the final results are not yet published. In 1850 was published F. G. Struve’s Arc du Méridien de 20° 30′ entre le Danube et la Mer Glaciale mesuré depuis 1816 jusqu’en 1848. This work is the record of a vast amount of scientific labour and is the greatest contribution yet made to the question of the figure of the Earth. The latitudes of the thirteen astronomical stations of this arc were determined partly with vertical circles and partly by means of the transit instrument in the prizm vertical. The triangulation, a great part of which, however, is a simple chain of triangles, is reduced by the method of least squares, and the probable errors of the resulting distances of parallels is given; the probable error of the whole arc in length is 6 2/10; less than the average length of a base line is 13,100 feet. The azimuths were observed at fourteen stations. In high latitudes the determination of the meridian is a matter of great difficulty; nevertheless the azimuths at all the northern stations were successfully determined,—the probable error of the result at Fuglenes being 0° 33′.

1 See the volume of the Ordnance Survey, entitled Account of the Principal Triangulation of Great Britain and Ireland, by Captain A. R. Clarke, B.E., F.R.S., 1856.

The problem of the figure of the earth treated as a question of mechanics or hydrostatics is one of great difficulty, and it would be quite impracticable but for the circumstance that the surface differs but little from a sphere. In order to express the forces at any point of the body arising from the attraction of its particles, the form of the surface is required, but this form is the very one which it is the object of the investigation to discover; hence the complexity of the subject, and even with all the present resources of mathematicians only a partial and imperfect solution can be obtained, and that not without some labour. We may, however, here briefly indicate the line of reasoning by which some of the most important of the results we
have alluded to above may be obtained. The principles of hydrostatics show us that if \( X, Y, Z \) be the components parallel to three rectangular axes of the forces acting on a particle of a fluid mass at the point \( x, y, z \), then, \( \rho \) being the pressure there, and \( \rho \) the density,

\[
dp = \rho \, (dx + dy + dz) \frac{dV}{dx + dy + dz},
\]

and for equilibrium the necessary conditions are, that \( \rho (dx + dy + dz) \) be a complete differential, and at the free surface \( Xdx + Ydy + Zdz = 0 \). This equation implies that the resultant of the forces is normal to the surface at every point, and in a homogeneous fluid it is evidently the differential equation of all surfaces of equal pressure. If the fluid be heterogeneous then it is to be remarked that for forces of attraction according to the ordinary law of gravitation, if \( X, Y, Z \) be the components of the attraction of a mass whose potential is \( V \), then

\[
Xdx + Ydy + Zdz = \frac{\partial V}{\partial x} \, dx + \frac{\partial V}{\partial y} \, dy + \frac{\partial V}{\partial z} \, dz,
\]

which is a complete differential. And in the case of a fluid rotating with uniform velocity, in which the so-called centrifugal force enters as a force acting on each particle proportional to its distance from the axis of rotation, the corresponding part of \( Xdx + Ydy + Zdz \) is obviously a complete differential. Therefore for the forces with which we are now concerned \( Xdx + Ydy + Zdz = dU \), where \( U \) is some function of \( x, y, z \), and it is necessary for equilibrium that \( dp = \rho dU \) be a complete differential, that is, \( \rho \) must be a function of \( U \) or a function of \( p \), and so also \( p \) a function of \( U \). So that \( dU = 0 \) is the differential equation of surfaces of equal pressure and density.

We may now show that a homogeneous fluid mass in the form of an oblate ellipsoid of revolution having a uniform velocity of rotation can be in equilibrium. It may be proved that the attraction of the ellipsoid \( x^2 + y^2 + z^2(1+\varepsilon) = c^2(1+\varepsilon) \) upon a particle \( P \) of its mass at \( x, y, z \) has for components

\[
X = Ax, \quad Y = Ay, \quad Z = Cz,
\]

where

\[
A = 2\pi \left( \frac{1 + \varepsilon}{2} \tan^{-1} \varepsilon - \frac{1}{2} \right),
\]

\[
C = 4\pi \left( \frac{1 + \varepsilon}{2} - \frac{1 + \varepsilon}{2} \tan^{-1} \varepsilon \right).
\]

Besides the attraction of the mass of the ellipsoid, the centrifugal force at \( P \) has for components \( -xw^2, -yw^2, 0 \), then the condition of fluid equilibrium is

\[
(A - w^2)dx + (A - w^2)ydy + Cdz = 0,
\]

which by integrating gives

\[
(A - w^2)(x^2 + y^2) + Cz = \text{constant},
\]

This is the equation of an ellipsoid of rotation, and therefore the equilibrium is possible. The equation concides with that of the surface of the fluid mass if we make

\[
A - w^2 = \frac{C}{1 + \varepsilon},
\]

which gives

\[
w^2 = \frac{3 + \varepsilon}{1 + \varepsilon} \tan^{-1} \varepsilon - \frac{3}{1 + \varepsilon}.
\]

If we would determine the maximum value of \( w \) from this equation, we find that it corresponds to the value of \( \varepsilon \) determined by the condition

\[
\tan^{-1} \varepsilon = \frac{9\varepsilon + 7\varepsilon^3}{(1 + \varepsilon^2)(\varepsilon^2 + 4)}\]

hence it may be shown that if the angular velocity exceed that calculated from \( \omega = 0.2497 \), equilibrium is impossible for the form of an ellipsoid of revolution. If \( \omega \) fall short of this limit, there are two ellipsoids which satisfy the condition of equilibrium; in one of these the eccentricity is greater and in the other less than 0.93. In the case of the earth, which is nearly spherical, we get by expanding the expression for \( w^2 \) in powers of \( \varepsilon^2 \), rejecting the higher powers, and remarking that the ellipticity \( e = \frac{1}{2} \varepsilon^2 \),

\[
2w^2 = 4\pi e^2.
\]

Now, if \( m \) be the ratio of the centrifugal force at the equator to gravity there,

\[
m = \frac{c^2}{\frac{3}{2} \rho m - c^2}, \quad \frac{m}{2w^2} = \frac{3}{5} \left( 1 - \frac{c}{m} \right).
\]

In the case of the earth it is a matter of observation that \( m = \frac{3}{5} \), hence the ellipticity

\[
e = \frac{5}{3} \frac{c}{m} = \frac{1}{231},
\]

so that the ratio of the axes on the supposition of a homogeneous fluid earth is 230. 231, as announced by Newton.

Now, to come to the case of a heterogeneous fluid, we shall assume that its surfaces of equal density are spheroids, concentric and having a common axis of rotation, and that the ellipticity of these surfaces varies from the centre to the outer surface, the density also varying. In other words, the body is composed of homogeneous spheroidal shells of variable density and ellipticity. On this supposition we shall express the attraction of the mass upon a particle in its interior, and then, taking into account the centrifugal force, form the equation expressing the condition of fluid equilibrium. The attraction of the homogeneous spheroid

\[
x^2 + y^2 + z^2(1+2\varepsilon) = c^2(1 + 2\varepsilon),
\]

where \( e \) is the ellipticity of which the square is neglected, on an internal particle, whose co-ordinates are \( x = f, y = 0, z = h \), has for its \( x \) and \( z \) components

\[
X = \frac{4}{3} \rho f \frac{c^2}{1 + 2\varepsilon}, \quad Z = \frac{4}{3} \rho h \frac{c^2}{1 + 2\varepsilon},
\]

the \( Y \) component being of course zero. Hence we infer that the attraction of a shell whose inner surface has an ellipticity \( c_1 \) and its outer surface an ellipticity \( e + de \), the density being \( \rho \), is expressed by

\[
