Price 9 As. or 1s.

PUBLICATIONS OF THE DEPARTMENT OF COMMERCIAL INTELLIGENCE AND STATISTICS, INDIA.

[Publications noted below are obtainable from the Government of India Central Book Depôt, 8, Hastings Street, Calcutta, and all agents for the sale of Government publications. Remittances should be made by postal or money order and should include forwarding charges, as indicated in brackets after each price.]

WEEKLY.

1. Indian Trade Journal.—Annual subscription (including postage) : Indian R13 and Foreign R18.
Single copies (excluding postage) :—Current issue As. 4; Back numbers over 3 months' old R1 each.
[Orders may be placed, with prepayment, for particular issues of the *Journal*, e.g., issues containing Crop Forecasts or those having Special Supplements.]

FORTNIGHTLY.

2. Return showing the wholesale and Retail Prices of certain staple Cereals, Pulses, Oilseeds, Sugar (raw), Salt, etc., in India by districts. As. 6. (2a.) Yearly subscription R12. Post free.

MONTHLY.

3. Accounts relating to the Sea-borne Trade and Navigation of British India. R1-4. (4a.) Yearly subscription R18. Post free.
4. Accounts relating to the Trade by Land of British India with foreign countries. As. 18. (2a.) Yearly subscription R7-8. Post free.
5. Monthly Statistics of Cotton Spinning and Weaving in Indian Mills. As. 2 (1a.) Yearly subscription R2-4. Post free.
6. Indian Customs Revenue. Half anna. Yearly subscription As. 12. Post free.
7. Joint Stock Companies registered in British India and in the Indian States of Mysore, Baroda, Travancore and Hyderabad. As. 2. (1a.) Yearly subscription R2-4. Post free. (Supplement to the *Indian Trade Journal*.)

ANNUAL.

8. Review of the Trade of India. R1-10. (2a.)
9. Accounts relating to the Sea-borne Trade of British India for the Calendar year. R1-2. (2a.)
10. Annual Statement of the Foreign Sea-borne Trade of British India—
Vol. I.—Abstract and detailed tables of Imports and Exports. R8. (R1-7.)
Vol. II.—Abstract and detailed tables of trade and shipping with each country and at each port, and tables relating to the trade of Aden and of the French Possessions in India. R7-10. (R1-9.)
11. Prices and Wages in India. R2. (9a.)
12. Statistical Abstract for British India. R1-12. (10a.)
13. Agricultural Statistics of India—
Vol. I.—British India. R1-2. (4a.)
Vol. II.—Indian States. As. 15. (4a.)
14. Summary Tables of the Agricultural Statistics of British India. As. 2. (1a.) (Supplement to the *Indian Trade Journal*.)
15. Estimates of Area and Yield of Principal Crops in India. As. 12. (2a.)
16. Indian Tea Statistics. (Supplement to the *Indian Trade Journal*.)
17. Report on the production and consumption of Coal in India. (Supplement to the *Indian Trade Journal*.)
18. Statement relating to Area, Production, Stocks, Exports and Imports of Rubber in India. (Supplement to the *Indian Trade Journal*.)
19. Indian Coffee Statistics. (Supplement to the *Indian Trade Journal*.)
20. Joint Stock Companies in British India and in the Indian States of Mysore, Baroda, Gwalior, Hyderabad, Indore and Travancore. R6. (9a.)
21. Statistical Tables relating to Banks in India. As. 8. (1a. 6p.)
22. Statements showing progress of the Co-operative Movement in India. As. 10. (3a.)
23. Tariff Schedules—Reprint of Schedules II and III of the Indian Tariff Act, VIII of 1894 (as subsequently amended), showing the rates of Customs duties levied on goods imported into, and exported from, British India. As. 6. (1a.)

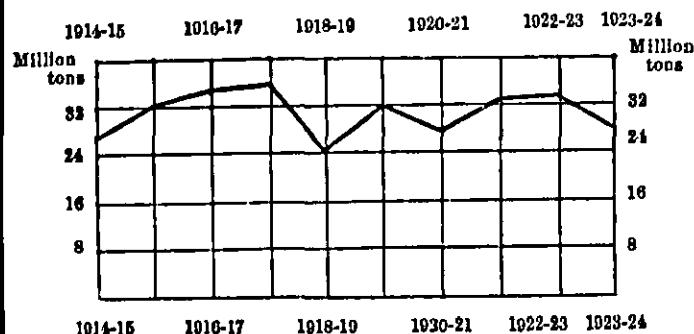

MISCELLANEOUS.

24. Index Numbers of Indian Prices from 1861—1918 with addenda for 1919, 1920, 1921, 1922 and 1923. As. 13. (3a.)
25. Crop Forecast. (Published in the *Indian Trade Journal*.) Per copy As. 4. (1a.)
Rice—1st (October), 2nd (December), Final (February).
Wheat—1st (January), 2nd (March), 3rd (April), 4th (May), Final (August).
Cotton—1st (August), 2nd (October), 3rd (December), Final (February), Supplementary (April).
Linseed, Rape and Mustard (*winter oilseeds*)—1st (January), 2nd (March), Final (June).
Sesamum (*til or jenjiri*)—1st (September), 2nd (October), Final (January), Supplementary (April).
Groundnut—1st (October), Final (February).
Indigo—1st (October), Final (December).
Sugarcane—1st (August), 2nd (October), Final (February).
26. Large Industrial Establishments in India. R4. (6a.)
27. Registration and Publication of Statistics relating to the Sea-borne Trade and Navigation of British India. R3-2. (10a.)
28. A Manual on the preparation of crop forecasts in India. As. 8. (2a.)
29. Cotton Map of India. No. 1—Showing the different varieties of cotton grown in the different districts and States in India. R1. (1a.)
30. Crop Atlas of India. R6-8. (10a.)
31. Quinquennial Report on the average yield per acre of principal crops in India for the period ending 1921-22. As. 8. (3a.)
32. Report on the first Census of live-stock, ploughs, and carts in India held between December 1919 and April 1920. As. 4. (2a.)
33. A classified list of the commodities that enter into the Land Frontier Trade of British India. R1-2. (6a.)

Estimates of Area and Yield of Principal Crops in India, 1923-24

INTRODUCTORY NOTE.

The present issue is the twenty-sixth of the series and relates to the area and yield of the principal crops for which estimates were framed in 1923-24. It is the eleventh of the new series that was started in 1913-14.

The periodical estimates or forecasts of certain crops are compiled from local returns and issued by this Department. The general practice is to issue a preliminary forecast, a second estimate, and a third or final estimate—fuller and more precise in data than the first two forecasts, as in the case of rice, oilseeds, and sugarcane. There are two additional forecasts for wheat and cotton, and one for sesamum. On the other hand, only two forecasts are made of the jute, groundnut, and indigo crops. The method of framing estimates is described in Appendix I and the dates prescribed for the issue of the different forecasts by this Department are given in Appendix III. The tables of this volume are compiled from the data given in the final forecasts.* The detailed tables show for the last ten years (whenever available) the area sown with, and the estimated yield of, rice, wheat, sugarcane, tea†, cotton, jute, linseed, rape and mustard, sesamum, groundnut, indigo, coffee† and rubber†. The rates of yield per acre of most of these crops in each of the ten years ending 1923-24 are shown in table No. 2, and the standard or normal yields per acre, as far as reported in the Quinquennial Report on the Average Yield of Principal Crops in India for the period ending 1921-22, are also given in table No. 3.

The estimates for these crops in the forecasts for earlier years did not relate to all the producing areas in India, but only to those tracts where the respective crops were grown on an extensive and commercial scale. Tracts of minor importance have been added gradually, as will be seen from the tables and the footnotes thereto. It should, therefore, be borne in mind that, owing to this gradual development, the estimates for earlier years are not strictly comparable with those for later years, as is the case with the agricultural statistics of India published in Volumes I and II of Agricultural Statistics of India. At present the estimates for cotton, wheat, and jute, as also those for tea, coffee, and rubber, relate to all the tracts in India where these crops are grown to any extent, excluding certain unimportant outlying tracts such as Baluchistan, Kashmir, Nepal, and Sikkim. For other crops, however, the estimates relate to all the British provinces where they are grown to any considerable extent, but exclude Indian States, except those in the Bombay Presidency and the States of Hyderabad, Mysore, and Baroda in certain cases. Further details regarding the reporting tracts are given in the paragraphs below, as also in footnotes to the tables, and in Appendices II and IV. It should be borne in mind that, owing chiefly to the reasons stated above, the figures given in this volume do not agree in some cases with those in the Agricultural Statistics of India.

Estimates so far as available from the provincial Season and Crop Reports or specially obtained from local authorities for certain other staple crops, namely, barley, jowar, bajra, maize, gram, and castor seed, are shown in a supplementary table (No. 17).

Figures showing the reported area and yield of certain crops (rice, wheat, maize, barley, cotton, linseed, rapeseed, tea, coffee, and sugarcane) in foreign countries are given in table No. 19, the data being collected from the publications of the International Institute of Agriculture, Rome.

In the hot weather months (i.e., March to May) of 1923, the weather was much drier than usual in the Gangetic plain and the central parts of the country. The monsoon arrived late but gave fairly well-distributed rain over the greater part of the country except Sind, Gujarat and parts of Madras, where the amount was decidedly in defect. On the other hand, Lower Burma and Malabar had very heavy rain. The monsoon retreated from northern India at about the normal date but was then less vigorous than usual in the Peninsula. The winter rains were unusually early and heavy in north-west India at the close of the year. Taking the year as a whole, the rainfall was fairly well-distributed except in Bihar, Sind, Gujarat and the Madras-Deccan where it was much below the normal. The season was, on the whole, fair to good. Conditions with regard to each crop are stated in the following paragraphs.

* In the case of Madras finally adjusted figures of the Season and Crop Report are entered. For the other provinces also the final forecast figures are subsequently revised when finally adjusted figures are available.

† For tea, coffee and rubber no forecast is prepared, the figures being taken from the annual statements of these products published by this Department.

Statistics of normal and actual rainfall are given in table No. 18, and the condition of weekly rainfall during the monsoon period (June to October) of 1923 is shown in the appended chart (page 5).

Rice Rice is generally regarded as a winter crop, being mainly harvested in December and January. It is sown in the months of May to August. There are two other varieties of comparatively small importance, namely, autumn rice and summer rice. Autumn rice is sown in May and June and harvested in September, and summer rice is sown in January and February and harvested in May and June. In Madras, the seasons vary greatly, the first crop being sown in April to October and harvested between September and March and the second crop sown in September to March and harvested between January and May. The provinces to which the estimates for rice now relate are Bengal, Bihar and Orissa, Madras, Burma, the United Provinces, the Central Provinces and Berar, Assam, Bombay (including Sind) and Coorg. These tracts comprise about 99 per cent of the total rice area of British India. The Indian States for which estimates for rice are prepared are Hyderabad, Mysore, and Baroda, and those in the Bombay Presidency (including Sind), the United Provinces, and the Central Provinces. The total area under rice in all these tracts in 1923-24 was reported as 78,241,000 acres, as compared with 82,402,000 acres in the preceding year. The condition of the crop was not so favourable as in the preceding year. The total yield was estimated at 28,130,000 tons, as against 33,703,000 tons in 1922-23. To this figure should be added some 335,000 tons in respect of other British provinces* (having an area of about 925,000 acres under rice), for which no forecasts are made.

Wheat Wheat, which is a *rabi* (spring) crop in India, is sown from October to December and is harvested from March to May. The provinces and States to which the estimates for this crop relate are the Punjab†, the North-West Frontier Province, the United Provinces†, Ajmer-Merwara, Delhi, the Central Provinces † and Berar, Bombay (including Sind) †, Bengal, Bihar and Orissa, Central India, Gwalior, Rajputana, Hyderabad, Baroda, and Mysore. These tracts contain practically the whole of the area under wheat in India. The total area under wheat in 1923-24 was reported to be 31,197,000 acres, which is greater than the area of the preceding year by 1 per cent. The condition of the crop was generally good. The total estimated yield was 9,747,000 tons, which is 2 per cent below the yield of 1922-23. An addition of some 150,000 tons should be made to this estimated yield in respect of some other tracts ‡ (having an area of about 478,000 acres under wheat), for which no reports are made.

Sugarcane The sugarcane crop is usually planted from February to May and is harvested from November to January. In Madras, the crop is harvested between December and May. The provinces to which the reports on this crop relate are the United Provinces, Bihar and Orissa, Bengal, Assam, the Punjab, the North-West Frontier Province, Bombay (including Sind), Madras, the Central Provinces and Berar, and Delhi. These tracts contain 99 per cent of the total area under sugarcane in British India. Reports are also received from the States in the Bombay Presidency and the United Provinces and from Baroda and Mysore. The total area reported under sugarcane in 1923-24 was 2,917,000 acres, as compared with 2,740,000 acres in the preceding year. The condition of the crop was reported to be generally good. The estimated yield amounted to 3,279,000 tons of raw sugar (gur), being 8 per cent above the final figure (3,015,000 tons) of the preceding year. To this figure should be added approximately 28,000 tons in respect of other British provinces§, for which no separate estimates are made.

Tea Tea seeds are sown between November and March, and the seedlings are transplanted when they are at least six months old. The crop is plucked from May to December in northern India, and from January to December in southern India. The provinces where tea is grown are Assam, Bengal, Madras, the United Provinces, the Punjab, Bihar and Orissa, and the States of Travancore and Tripura. In Burma tea is grown for consumption as pickles. The total area under tea in 1923 was reported to be 710,300 acres, as compared with 708,200 acres in the preceding year. The total production of manufactured tea (black and green) was reported to be 375,355,700 lbs, as against 311,638,900 lbs in the preceding year. For detailed accounts, a reference is invited to the Indian Tea Statistics, 1923, published as a Supplement to the Indian Trade Journal.

Cotton Cotton is grown in all the provinces. There are two crops, namely, the early and the late, of cotton grown in India. Early cotton grows mainly in central and

* Punjab, North-West Frontier Province, Delhi, Manipur Pargana, and Ajmer Merwara. † Including Indian States.
‡ Burma, Madras, and the Kashmir State. § Burma, Coorg, and Ajmer Merwara.

northern India, and late cotton in southern and western India. Taking both the crops together, the sowing season extends from March to August and the harvesting season from October to April. In parts of southern India sowings continue till December and harvesting till July. The estimates given below relate to all the cotton-growing provinces and states in India.

The total reported area under cotton was 23,074,000 acres in 1923-24, as against 21,804,000 acres in 1922-23, or an increase of 6 per cent. Conditions were not, on the whole, so favourable for the crop as in the preceding year.

	1922-23	1921-22	
	1,000 bales	1,000 bales	5,074,000 bales of 400 lbs each, which is practically the same as in 1922-23.
Exports	3,473	3,170	The marginal statement compares the estimates of yield for the years 1921-22 and 1922-23* with the sum of net exports and internal consumption (in thousands of bales). It will be noticed that the estimates of "carry-over" from one year to another are not taken into account for want of reliable data.
Mill consumption	2,109	2,159	
Extra-factory consumption (conjectural)	750	750	
Total	6,332	6,079	
Less imports	63	107	
Approximate crop	6,270	5,972	
Estimated in forecast	5,073	4,485	

	1923-24†	1922-23	descriptions of cotton grown in the years 1922-23 and 1923-24 are given in the marginal table. Of the total yield, Oomras represent 52 (53) per cent, Bengal-Sind 17 (14) per cent, Dholleras 6 (10) per cent, Americans 5 (2) per cent, Coompta-Dharwars 4 (1) per cent, Broach 4 (6) per cent, Tinnevellys 3 per cent, Cambodia and Westerns and Northerns 3 (3) percent each, Comillas, Burmas and other sorts 2 (2) per cent, and Cocanadas 1 (1) per cent. The percentages of the previous year are shown in brackets.
	1,000 bales	1,000 bales	
Oomras	2,629	2,708	
Dholleras	183	489	
Bengal-Sind	847	693	
Americans—			
Punjab	234	117	
Sind	3	4	
Broach	203	281	
Westerns and Northerns	173	167	
Cocanadas	60	55	
Tinnevellys	187	141	
Salems	26	23	
Cambodias	151	130	
Coompta-Dharwars	221	189	
Comillas, Burmas and other sorts	82	78	
Total	5,074	6,073	

Jute is an autumn crop, being sown from March to May and harvested in Jato August and September. The provinces where it is grown are Bengal (including the Cooch Bihar State), Bihar and Orissa, and Assam. It is also grown to a small extent in the Nepal State, but no reliable information is available from that State except the figures of export. The total area under jute in 1923 was 2,788,000 acres, being 55 per cent above that of the preceding year, and the estimated yield 8,401,000 bales (of 400 lbs each) also rising in the same ratio. The sum of exports and internal consumption, both in and outside the mills, is compared, in table No. 9, with the estimated yield for the nine years ending 1923. The area and yield of jute in 1924 are estimated to be 2,733,000 acres and 7,986,000 bales, showing a decrease of 2 per cent in area and 5 per cent in yield as compared with 1923.

Linseed is a *rabi* (spring) crop, being sown from August to October Linseed and harvested from January to April. The provinces to which the estimates for linseed relate are the United Provinces, the Central Provinces and Berar, Bengal, Bihar and Orissa, the Punjab, and Bombay. These tracts comprise 99 per cent of the total area under linseed in British India. Reports are also received from Hyderabad, the States in the Bombay Presidency, Kotah (in Rajputana), and certain Feudatory States in the Central Provinces. The total area under linseed in all the reporting tracts in 1923-24 was 3,730,000 acres, which is 10 per cent above the final figure of the preceding year. The condition of the crop was reported to be generally fair. The total estimated yield (162,000 tons) was less than that of the preceding year by 13 per cent. To this figure should be added some 3,000 tons for other British provinces, for which no reports are made.

Rape and mustard are also *rabi* (spring) oilseeds, being sown from August Rape and mustard to October and harvested from January to April. The provinces from which

* For earlier years, see table No. 8, page 16.

† Assam, Ajmer-Merwara, Madras, Berara, and Manipur Pargana.

‡ Figures are subject to revision.

reports are received are the Punjab, Bengal, Bihar and Orissa, Assam, the United Provinces, the North-West Frontier Province, Bombay (including Sind), and Delhi. These tracts contain about 99 per cent of the total area under rape and mustard in British India. Reports are also received from the States of Hyderabad, Baroda, and Alwar (Rajputana) and from the States in the Bombay Presidency. The total area under rape and mustard in all the reporting tracts in 1923-24 was 6,139,000 acres, as against 6,259,000 acres in the preceding year, a decrease of 2 per cent. The condition of the crops was reported to be generally fair. The total estimated yield (1,152,000 tons) was 5 per cent less than the final figure of the preceding year. To this figure should be added some 14,000 tons in respect of other British provinces,* for which no reports are made.

Sesamum

Sesamum is mainly a *kharif* (autumn) crop, being generally sown from May to July and harvested from October to December; but in parts of southern India sowings continue till September or October and harvesting till March or April. A *rabi* or summer variety is also grown in certain tracts; this is sown in January and February and is harvested in May to July. The provinces to which the estimates for sesamum relate are Burma, the Central Provinces and Berar, Bombay (including Sind), Madras, the United Provinces, Bengal, Bihar and Orissa, the Punjab, and Ajmer-Merwara. These tracts contain 99·6 per cent of the total area under sesamum in British India. Reports are also received from the States of Hyderabad, Baroda, Kotah (Rajputana), and those in the Bombay Presidency. The total area under sesamum reported in 1923-24 was 5,062,000 acres, as against 4,998,000 acres in the preceding year. The condition of the crop was generally fair. The total estimated yield was 436,000 tons, as against 482,000 tons in 1922-23. An addition of approximately 1,000 tons should be made to this figure in respect of other British provinces † (containing an area of about 17,000 acres under sesamum), for which no reports are made.

Groundnut

The groundnut crop is sown from May to August and is harvested from November to January. A summer variety is also grown in Madras, forming about 5 per cent of the total area under the crop; this variety is sown in February-March and harvested in July-August. The estimates for this crop relate to Madras, Bombay (including Indian States), and Burma, these being the provinces where groundnut is grown to a considerable extent. Report is also received from the Hyderabad State. The total area under groundnut in these tracts in 1923-24 was reported to be 2,742,000 acres, which is 4 per cent more than in the preceding year, the estimated yield (1,149,000 tons) being 7 per cent less than that of the preceding year.

Indigo

The indigo crop is sown from February to July and is harvested from August to November. In Madras, about 20 per cent of the area under the crop is irrigated, being grown as a second crop on wet land after paddy; this irrigated crop is sown in December-January and harvested in March-April. The provinces to which the estimates for indigo relate are Bihar and Orissa, Bengal, the United Provinces, the Punjab, Madras, and Bombay (including Sind). These tracts contain practically the whole area under indigo in British India. No report is received from any Indian State, except the State of Khairpur in Sind. The total reported area (180,600 acres) in 1923-24 was 36 per cent below that of the preceding year. The total estimated yield of dye was 35,100 cwts, which is 33 per cent below the yield of the preceding year.

Coffee

Coffee is sown and transplanted in the rainy season and is harvested from October to January. The crop is practically confined to southern India, comprising the Madras Presidency, Coorg, and the States of Mysore, Travancore, and Cochin. The total reported area under coffee in 1923-24 was 129,800 acres, the yield therefrom being estimated at 22,716,500 lbs. The figures are, however, defective inasmuch as plantations of less than 10 acres are not taken into account.

Rubber

The provinces where rubber is cultivated to an appreciable extent are, Burma, Bengal†, Assam†, Madras, Coorg, and the States of Mysore, Travancore, and Cochin. The total area under rubber in 1923 was 128,100 acres, as against 125,900 acres in the preceding year. The total yield of dry rubber was 14,162,500 lbs, as against 11,912,000 lbs in 1922.

Note.—The redder the statement, the scantier the rainfall. On the other hand, the thicker the black type in the statement, the more abundant the rainfall.

TABLES

Note.—The rates of yield per acre of the crops given in table No. 2 are worked out from the figures tabulated in tables Nos. 4 to 16.

ABSTRACT TABLE

8

No. 1—ABSTRACT TABLE—AREA AND YIELD OF EACH CROP.

Area (acres)

Crops	Average 1895-96 to 1899-1900	Average 1900-01 to 1904-05	Average 1905-06 to 1909-10	Average 1910-11 to 1914-15	Average 1915-16 to 1919-20	1919-20	1920-21	1921-22	1922-23	1923-24
Rice	50,855,000	50,067,000	56,051,000	70,252,000	79,519,000	79,422,000	78,952,000	81,667,000	82,402,000	78,241,000
Wheat	22,649,000	25,518,000	26,565,000	30,550,000	30,499,000	29,949,000	25,784,000	28,207,000	30,652,000	31,197,000

(a) The generally low output of sesamum in Ajmer-Merwara is due to the fact that the crop is grown on unirrigated land, which is not manured and on which no other valuable crop is expected to give a yield sufficiently remunerative.

(b) The question regarding the generally low output in Hyderabad is under investigation.

* Refers to Kutch State only.

(c) Includes Baroda.

(d) Not available.

† Refers to Alwar State only.

(a) Includes Indian States.

(c) Not available.

(b) Includes the State of Rampur.

(d) Not yet available.

(e) Includes Gwalior up to 1920-21.

(f) Included under Central India States. (g) 300 bales.

(h) Excluding Feudatory States, estimates for which for 1923-24 are 52,000 acres and 17,000 bales, as against 51,000 acres and 18,000 bales in 1922-23.

(i) The exports as well as the mill consumption are for the year ending August. The mill consumption is estimated from 1916-17 on the basis of returns furnished by mills to the Bombay Millowners' Association; prior to 1916-17 the estimates were based on return of yarn produced by mills. No reliable information is available as to the annual consumption outside the mills, but in 1911 it was settled in consultation with the Bombay Cotton Trade Association (now East India Cotton Association) to adopt the conventional estimate of 450,000 bales, at which figure it remained up to 1913-14. The consumption was estimated for 1914-15 at 1,000,000 bales, and that from 1915-16 to 1922-23 at 750,000 bales each year by the Association.

Note.—Figures for 1923-24 are subject to revision.

(a) Includes also the State of Baroda up to 1917-18.

(b) The figures in italics represent "mixed" crop, i.e., sown in the same fields with other crops. The estimates for the mixed crop of the United Provinces are highly conjectural; hence they have been kept separate.

(c) Not available.

(d) Less than 100 tons.

(e) 200 tons.

(f) Included under Bombay.

(g) As reported by the Director of Agriculture, Bombay.

(h) Excluding Feudatory States, estimates for which for 1922-23 are 313,000 acres and 23,000 tons, as against 290,000 acres and 21,000 tons in 1921-22.

(i) About 100 tons.
Note - Figures for 1923-24 are subject to revision.

APPENDIX I

METHOD OF FRAMING ESTIMATES OF CROPS

There are three factors necessary for framing an estimate of outturn, namely, the area, the standard normal outturn per acre, and the fraction representing the relation of the crop reported on to the normal crop per acre.

As regards area, there exists in the villages of most provinces an agency capable of reporting the acreage of crops with great accuracy, wherever the fields have been mapped and surveyed. The tracts, for which statistics are ordinarily not obtainable, are yearly diminishing in extent; but owing to the absence of maps or the non-existence of trained village establishments they still represent a considerable aggregate area. These tracts consist chiefly of permanently settled estates, lands held on privileged tenure, and unsurveyed areas. For these tracts, the acreage as well as the outturn cannot be more than a rough estimate. Such estimates of areas, once framed, are liable to become stereotyped and repeated year after year without regard to the influence of exceptional seasons or changes in the economic condition of the tracts. In order to prevent this, provision has been made for the annual revision of these estimates by careful comparison with the conditions prevailing in those adjoining areas of a similar character for which accurate information is available, and by means of such special enquiries as may be possible.

In dealing with the calculation of the areas under crops, two other matters demand consideration, namely, (1) whether the area returned should be the area sown or that successfully cropped, and (2) whether, when the forecast crop is sown mixed with other crops, it is preferable that the total area covered by the mixed crops should be exhibited, or that such area only should be shown as is estimated to represent the acreage covered by the forecast crop only. As regards (1), the general rule is that the returns should exhibit the areas actually sown whether the crop comes to maturity or not, the principle underlying this rule being that the failure of crop should affect not its area but its outturn. An exception to this rule is, however, made when fields, owing to the failure of the first sowings, have been devoted to other crops. In this case the area first sown with the forecast crop may be omitted. As to (2), the areas covered by the several crops in a mixed field are estimated in various ways in the different provinces, and the estimates are based on formulæ prescribed by the provincial authorities in individual cases, as it has not been found practicable to prescribe one uniform method of calculation. For purposes of the forecasts, the area to be returned must be the area covered by the forecast crop, exclusive of the area covered by the other crops with which it is mixed.

Next with regard to the standard normal outturn. A normal crop may be defined as "that crop which past experience has shown to be the most generally recurring crop in a series of years; the typical crop of the local area; the crop which the cultivator has a right (as it were) to expect, and with which he is (or should be) content, while if he gets more he has reason to rejoice, and if less he has reason to complain;" or in other words, it is the "figure which in existing circumstances might be expected to be attained in the year if the rainfall and seasons were of a character ordinary for the tract under consideration, that is, neither very favourable nor the reverse." Briefly, it is stated to be "the average yield on average soil in a year of average character." This normal or average yield will not necessarily correspond with the average of a series of years' figures, which is an arithmetical average. The Agricultural Department in each province maintains a statement of the normal or average yield per acre of land of average quality (under the two major heads of irrigated and unirrigated land) for the several crops in each district. In order to test the accuracy of these standards of normal or average yield and to revise them, if necessary, a system of crop-cutting experiments is in force in almost all the provinces. Under this system plots of land of average quality are selected and the crops grown on them are cut and weighed in the presence of responsible officers of the District staff or of the Provincial Agricultural Department. These experiments have to be carried out every year in respect of all the principal crops, and in accordance with rules specially framed by the several provincial authorities. The results of the experiments are reported to the head of the Provincial Agricultural Department, who, on a careful scrutiny of all the reports received by him and after such further investigations as he may deem necessary, revises or verifies the standards previously adopted for the districts or the province. This revision is ordinarily made once in five years.

The third factor—the fraction representing the relation of the crop reported on to the normal crop per acre—is what is known as the "anna estimate" or the "percentage estimate." In many parts of India the cultivators estimate the crop outturn in annas or sixteenths, as there are sixteen annas in a rupee. They take a certain number of annas to represent the normal outturn and estimate the outturn of the year of report as so many annas higher or lower than the normal. But in some tracts sixteen annas express a bumper crop, while in others the same term expresses a normal crop, and the number of annas taken to represent a normal outturn varies between 12 and 16. Consequently the anna estimate of one tract is not always amenable to comparison or combination with that of another tract. The percentage estimate is the American system under which 100 is taken to denote a normal crop and the estimated outturn of the year of report is stated as a percentage of that crop. In 1897 a question arose as to whether the anna notation or the American notation should be used in making crop estimates, and it was strongly urged upon the Government of India that as the cultivators and

village officers entrusted with the duty of collecting data for crop reports were mostly accustomed to the Indian system, *i.e.*, the anna notation, the adoption of any other system would tend to confuse the estimate. Local Governments and Administrations were, therefore, permitted to adopt such scale of notation as might be suited to local conditions, the object being to secure that the returns should be in terms of a normal crop. But since the anna standard thus adopted would not possess any fixed or uniform value, it was laid down that in published forecasts the anna notation should not be used, the American notation being used in its stead, *i.e.*, 100 being taken to represent a normal crop and the estimated outturn being stated as a percentage of that crop, and the conversion of the anna estimate into the percentage estimate being made either by the district officer or by the provincial authorities.

When these three factors have been determined, they are multiplied with each other to arrive at the required quantitative estimate of outturn. Thus, if the area be 60,000 acres, the standard of normal outturn 500 lbs per acre, and the percentage estimate 80, the required quantitative estimate would be $60,000 \times 500 \times \frac{80}{100} = 24,000,000$ lbs.

APPENDIX II

METHODS OF COLLECTING THE STATISTICS PROVINCE BY PROVINCE

In the Madras Presidency, the estimates relate to all the districts in which the respective crops are grown. Approximately two-thirds of the cultivated land in the Presidency are Government or *raiyatwari* land, and have been carefully surveyed. All the village officers therein are appointed and controlled by Government officials. In the ordinary course of his work the village accountant sends every month to the Revenue Inspector (the officer in charge of a group of villages varying in number) a detailed statement of the sowings in his village. For those crops for which forecasts are prepared, the Revenue Inspector, who is himself a touring officer, reports to his *Tahsildar** the area in his range under that crop, with his estimates of the average yield expressed in so many annas of the normal crop, when outturns are required. The *Tahsildar* consolidates all these figures and reports the total direct to the Director of Agriculture with, in the case of outturn, his estimated yield (also expressed in annas of the normal). The remaining third of the Presidency is *zamindari* (consisting of large proprietary estates), of which only a part has been accurately surveyed, and for which somewhat similar returns are prepared and dealt with accordingly. In other cases where some sort of account is maintained in *Zamindari* and *whole inam* villages, the *Tahsildar* or Deputy *Tahsildar* estimates the area and yield, as well as he can, from his own knowledge and from reports of the estate officials. The figures for these areas are included but shown separately under estimates in the reports sent by the *Tahsildar* to the Director of Agriculture. In the remaining cases, where estates have not been surveyed and where no sort of account is maintained at all, the estimating is done in the office of the Director of Agriculture with reference to previous year's final audited figures, the character of the season, and the figures of neighbouring Government areas. The States of Pudukkottai and Banganapalle send similar reports direct to the Director for cotton only. No other State in the Presidency prepares any crop forecast. Thus, for each forecast return, separate reports (242 for cotton and 240 for other crops) are received in the Director's office, where they are scrutinized and tabulated. More accurate figures of areas cultivated are obtainable at the end of the year after all the village accounts have been checked. These figures are published later in the provincial Season and Crop Report. The figures reported by *Tahsildars* in their final forecasts are checked by a comparison with the forecast reports and the Season and Crop Reports for previous years, and thus an attempt is made to rectify obviously inaccurate reporting. Standard rates of outturn have been determined for each crop on a consideration of the latest crop-cutting experiments, of the results on the Government farms, of the local knowledge of the Director of Agriculture and his staff in comparing the yields from adjoining districts, and of the results of a comparison of the figures of yield with the figures of net export and the estimate of consumption. The Director checks the rate of yield reported by *Tahsildars* by estimates received from his subordinate officers and from non-officials interested in a particular crop.

The estimates for the Bombay Presidency include all British districts and States where the respective crops are grown to any extent. In the British districts of the Presidency proper, the area under different crops is ascertained in the first instance by village officers and recorded in village returns, which are checked by circle inspectors and other revenue officers, and compiled by the former for their circles and then for the taluka.** The taluka figures are totalled up for each district in the office of the Director of Agriculture of the province. For Sind, this work is done by local officers, and the Director receives district-by-district figures. The information received is for villages for which regular statistics are available, the proportion of reporting area being 91·4 per cent in the Presidency proper and 99·6 per cent in Sind. From 1909-10, however, estimates for the non-reporting areas have been made so far as possible and included in the table. In the case of Indian States the acreage is estimated on the best local data available. The approximate numerical strength of the reporting agency is 188 in the Presidency proper, 60 in Sind, and 33 in the Indian States. No standard of yield has yet been fixed. Local estimates of crop condition are converted to quantitative figures on the basis of a formula showing the average yield of crops, which has been adopted provisionally. This formula is now being revised, the revision being based on the ascertainment of actual yield in different parts of the Presidency by careful local enquiry by officers of the Provincial Agricultural Department, who are tabulating the results and comparing them for the purpose. The unit of area in the formula is the district, and irrigated and unirrigated crops are separately dealt with. Each year's estimate of the condition of crops is prepared by the *mamlatdar* (or *mahakarist*, where the taluka is sub-divided) from notes which they make and from reports from village accountants and circle inspectors. The estimate is sent direct to the Director of Agriculture, who, in the light of the general prospects of the season, makes the quantitative calculations. For Sind there are no formulas, and all the necessary information is obtained from the district officers in the form of estimates on the basis of twelve annas for a normal crop, together with quantitative equivalents gathered from general experience. For Indian States condition estimates are obtained, and the formulas for adjoining British districts are applied.

The estimates for Bengal relate to all the districts of the Presidency where the respective Bengal crops are grown. In the absence of any revenue agency in the province, the figures are based mainly on rough approximate estimates made by District Officers, and are more or less conjectural. The district officers obtain information from the sub-divisional officers through the agency of the police or the Circle Officers where appointed as a permanent

Madras
(Total cultivated area
33,037,000 acres)

Bombay and Sind
(Total cultivated
area 30,000,000
acres)

NOTE.—The cultivated area shown in the margin represents the average net area actually sown with all crops in each province during the three years ending 1922-23.

* A sub-divisional officer. ** A sub-division of a district under the management of a *Tahsildar*.

† The chief revenue and police officer in charge of a taluk.

‡ A revenue or police officer in charge of a sub-division of a taluk.

§ Entire villages granted rent-free.

measure. The quantitative estimates of yield formerly given in the forecasts were based on standards provisionally adopted. The standards have now been revised on the basis of the results obtained from crop-cutting experiments conducted over a series of areas and seasons.

United Provinces
(Total cultivated area except Almora and Garhwal for which the required particulars are not available as no regular village papers are kept up by *patwaris* (village accountants) in these two districts. The area is taken from the crop statements based on field-to-field inspections, which are compiled by *patwaris* and checked by higher revenue officers. The estimates of the standard yield are based on the results ascertained from crop-cutting experiments conducted annually in selected districts. The standards, which are different for irrigated and unirrigated crops, are revised every five years on a consideration of the results of the crop-cutting experiments, and are applied to the condition of the crops reported by district officers and selected landholders whose number exceeds six hundred.)

Punjab
(Total cultivated area 201,000 acres)
The estimates for the Punjab relate to all the British districts in which the respective crops are grown. As regards Indian States of the province, reports on wheat and cotton are furnished by all the States in which these two crops are grown to any considerable extent. No estimates for any other crop are prepared by any State. The figures of area for all the British districts up to 1912-13 were based on actual measurements by the village revenue staff. Estimates of yield were recorded by district officers after personal enquiry from *tahsildars* and leading agriculturists. The total number of agriculturists consulted by the district officers and *tahsildars* amounts to several thousands. From 1913-14, however, this method is followed only in districts in which the respective crops are grown to a considerable extent. For other districts the Provincial Director of Agriculture prepares conventional forecasts based on the actual average area figures for the previous five years and an assumed average outturn as determined by him to meet the character of the harvest.

Burma
(Total cultivated area 15,770,000 acres)
The estimates for Burma relate to all the districts of the province in which the respective crops reported on are grown. The figures for the districts in which the crops are grown to a considerable extent are based on regular reports, furnished by District Officers, while those for the remaining districts are based on rough estimates prepared by the Commissioner of Settlements and Land Records. For the districts from which regular reports are received, the figures of area are obtained from the assessment rolls prepared by revenue surveyors. The original information about the yield is obtained from township officers, inspectors of Land Records, and from the more important of the Land Revenue subordinate officers. In this way the estimate of each district is based on the information furnished by some thirty or more persons. The figures of both area and yield are tabulated by the Superintendent of Land Records and checked by the District Officers. The Commissioner of Settlements and Land Records compares the estimated yield with a standard representing the normal yield, which was fixed after an extensive series of experimental crop-cuttings by Settlement Officers.

Bihar and Orissa
(Total cultivated area 25,263,000 acres)
The estimates for Bihar and Orissa relate to all the districts of the province where the respective crops are grown. Survey and Settlement operations have been completed in all the districts except two, and in these districts the settlement figures serve as a check on the estimates of acreage based on the information furnished by the police. In the absence of any revenue agency in the province, the figures are based mainly on rough approximate estimates made by district officers, and are more or less conjectural. The district officers obtain information from the sub-divisional officers through the agency of the police. In the district of Sambalpur, the acreages under crops are revised annually by the Land Records staff by field-to-field inspection. The system of making crop-cutting tests, as in other provinces, over a series of areas and seasons for the ascertainment of standards of yield has been in force in the districts of this province for some thirty-one years, but sufficiently trustworthy figures of yield have not yet been obtained from these tests to enable Government to accept them as standards. The estimates, therefore, of yield given in the forecasts are based on standards adopted provisionally by the Provincial Department of Agriculture on the basis of information obtained from other sources.

The estimates for the Central Provinces and Berar relate to all the British districts of the province in which the respective crops reported on are grown. As regards Indian States of the province, reports on wheat, rice, and linseed only are furnished by six to ten States. No information is available from the other States. The figures of acreage for cotton, sesamum, rice, and sugarcane are estimates based on reports furnished by the local officials of the Land Records staff. The figures for wheat and linseed represent the actual areas sown with these crops as disclosed by field-to-field inspection by *patwaris*.* The reporting agency consists of 392 revenue inspectors with, on an average, 17 *patwaris* working under each inspector. Each *tahsil* † has usually 4 revenue inspectors. Standards of outturn were framed for each crop from the results of crop-cutting experiments on selected fields under the supervision of responsible and selected officials during the years 1884-85 to 1887-88. These standards have been revised from time to time on the basis of the results of crop-cutting experiments since made. In the year 1920-21 the substitution of anna estimates for American notation was introduced in accordance with the wishes of the Board of Agriculture, who, in 1919, decided that it would be better to abandon all attempts to impress on the reporting agency what is meant by the expression "normal crop," and secondly, that the use of American notation in which 100 is meant to signify a normal crop should be discontinued. The Board considered that in the long run better statistics would be obtained if the reporting agency were allowed to follow its traditional method of reporting the crop in the anna notation. All deductions based on the standards are made by the provincial Director of Land Records from the year's figures furnished by the District Officers, who are supposed to bear in mind the standards when estimating the yield of the season.

* Village accountants.

† Sub-division of a district.

The estimates for Assam relate to all the districts in which the respective crops reported on are grown to any extent. For hill districts figures are obtained from the annual crop forecasts and the quinquennial crop statements. For plains districts the information is received from District Officers, who in their turn obtain figures from the district Land Records staffs in the case of the temporarily-settled areas, and from zamindars in the case of the permanently-settled portion of Goalpara, with the exception in the latter district of jute, the figures for which are compiled by the village *chaukidari panchayats*. In the permanently-settled part of Sylhet the figures for jute are those submitted after actual inspection by the village *chaukidari panchayats*, while for all other crops except tea, estimates have been framed by the District Officer from the actual areas in the surveyed parts being applied to the rest of the district. The figures for tea are obtained in all cases from the garden managers. The figures are checked only in the temporarily-settled tracts by the circle Sub-Deputy Collectors; in the permanently-settled districts of Sylhet and Goalpara there is no valid check at all. The estimates of outturn are based on the normal yield obtained from the results of crop-cutting experiments.

The estimates for the North-West Frontier Province relate to all the districts of the province in which the respective crops reported on are grown, including the Tochi agency in the case of wheat, cotton, and sugarcane, and the Kurram agency in the case of wheat and cotton. The figures of area are based on actual measurements made by the *patwari* in their field-to-field inspection at each harvest. They are further checked by higher revenue officers. The estimates of the standard yield are based principally on data derived from a large number of crop-cutting experiments made during the progress of settlement operations. They were framed for each assessment circle, which is the unit of area, and separately for lands irrigated by canals, by wells, for alluvial (*sailab*) lands, and for lands entirely dependent on rain. The standards are applied to the estimates of condition of crops received from the District Officers, who frame their estimates in consultation with local agriculturists. The exact number of agriculturists consulted by the district officers is not available, but it must necessarily be several hundreds.

The estimates for Ajmer-Merwara relate to the whole of the district. So far as *khalsa*,^{*} *jagir*,[†] and minor *istamrari*,[‡] villages are concerned, the *patwari* is responsible for making field-to-field inspections of every village in his circle at each harvest. These inspections commence on 1st September for the autumn harvest and on 1st February for the spring harvest. The *patwari* notes down the results of his local inquiries and inspections in his field book. A certain percentage of the entries made by the *patwari* is checked and corrected, when necessary, by the *girdawar* or *kanungo*,[§] who also inspects the crops at each harvest. The tahsil officers further test a certain number of entries, and the sub-divisional officer also makes a general inspection of crops at each harvest. As soon as the inspection of the harvest is complete, an abstract statement of area and outturn is compiled separately for each *girdawar*'s circle and tahsil, and these statements are then consolidated for the three sub-divisions in the district office. An assumed normal outturn per acre for each crop has been fixed at settlement. Crop estimates are annually made by the revenue officers and the results recorded. These sets of figures give a useful check on the outturn estimates made by the *patwaris*. The exact area sown in the sub-divisions is obtained from the abstract statements. In the large *istamrari* estates the preparation of the field books is done by the estate officials. These field books contain fairly accurate information in regard to wheat, the outturn of which in maunds is generally appraised for the purpose of payment of the cultivators' rent; but as regards cotton and sesamum the figures are conjectural, as no crop-cutting experiments are made, the rents being charged in cash. The Government agency does not supervise the collection of figures in large *istamrari* estates.

The estimates for rice furnished by Coorg are based on the results of annual crop inspections and experiments. Crop inspections are made by each *shankay*,[¶] for his circle under the supervision of the *parpattigar*,^{||} and the detailed particulars entered in the crop inspection registers and summarised in the crop abstracts, the totals of which are compiled in the office of the Deputy Director, Land Records and Agriculture. About 30 crop experiments are conducted annually by subordinates of the Revenue Department and *subedars*,^{**} (*tahsildars*) and also a few by the Deputy Director of Land Records and Agriculture, in whose office the estimates of yield, given in the forecast, are calculated on the basis of the average for the province.

The estimates for the Delhi province relate to all villages included within the province. The figures of area are based on actual measurements by the village revenue staff. Estimates of yield are recorded by the *tahsildar* after personal enquiry from the leading agriculturists. No crop-cutting experiments are conducted in the province.

The estimates for the Hyderabad State relate to all the districts of the State including non-Government area, such as *Jagirs*, etc. *Raiyatwari* tenure prevails in the State and with the exception of some parts of a few districts, the area is surveyed and settled. *Patwaris* or village accountants, who are hereditary office-bearers, furnish to the *taluk* office figures regarding area under principal crops. The *tahsildars* who are touring officers check these figures by a field-to-field inspection during their tours and send reports of their *talukas* to the District Collector or first *talukdar* as he is called in the State. The figures for each district after being consolidated in the District office are sent to the Director of Statistics of the State who finally checks and consolidates them. The estimates of standard yields of crops are based only on conjectures, which are generally misleading. As a result, the reported outturn is generally low. Instructions were issued by the authorities of the State for conducting crop-cutting experiments. But the experiments were not carried out so extensively as to furnish any reliable data for fixing normal yields per acre. Sixteen annas represent a normal crop.

* *Khalsa* villages are those which pay full revenue to Government.

† Land granted revenue-free on condition of military service or as a charitable endowment.

‡ A tenure which, though the revenue is assigned, is charged with a permanently fixed quit rent.

§ Circle Inspector.

¶ A revenue officer in charge of a sub-division of a taluk.

|| Village accountant.

** Revenue officer in charge of a taluk.

(Total cultivated area 5,765,000 acres)

(Total cultivated area 2,150,000 acres)

(Total cultivated area 815,000 acres)

(Total cultivated area 140,000 acres)

(Total cultivated area 212,000 acres)

(Total cultivated area 28,300,000 acres)

(Total cultivated area 28,300,000 acres)

Mysore
(Total cultivated area 6,011,000 acres) The estimates furnished by the Mysore State relate to all the districts of the State in which the respective crops are grown. As regards area the information is based on the entries made by the *shanbag* (village accountant) in his crop inspection book and checked by the higher revenue officers. The outturn is noted by the *shanbag* in terms of annas (16 annas being taken for a normal or 100 per cent crop) from which the total yield is determined by reference to the standard normal outturn per acre fixed for each taluk. The figures are finally scrutinized and consolidated in the Revenue Commissioner's office.

Baroda
(Total cultivated area 3,041,000 acres) The figures are furnished to the Director of Agriculture by the Revenue Heads of each taluka (*Vahivatdar*). These are prepared in villages by the village clerks (*Talatis*) from the form recording crops grown in every survey number. These entries are checked by the inspecting officers. The outturn is usually returned as so many annas in the rupee and also as so many lbs. of 40 tolas per bigha. The crop returns are finally consolidated and checked in the office of the Director of Agriculture. With regard to the standard yields per acre, these are not yet separately ascertained as pertaining to Baroda territories. Whenever a reference to these becomes necessary, those ascertained for the contiguous British territory, with which Baroda territory is closely interlaced, are utilised.

Central India. In the Central India States, estimates are framed for wheat and cotton. The methods differ with the different States. In most States the acreage returns are prepared by *tahsils* from the field measurements of the *patwaris* and then compiled for the whole State. In some cases the outturn estimates are similarly compiled after check on the spot by the higher revenue officials in consultation with the cultivators; in others they are merely an approximation from the acreage figures; in a few States fields are selected in the different circles as bearing an average yield, the crop is cut and weighed, the outturn for the circle is calculated from the result, and the totals of the circles form the return for the State.

Rajputana. The estimates for wheat and cotton furnished by the States in Rajputana are generally defective in consequence of the absence of figures for unsurveyed areas and privilege tenures in many cases.

APPENDIX III

DATES ON OR ABOUT WHICH THE ALL-INDIA FORECASTS OF CROPS
ARE ISSUED IN THE INDIAN TRADE JOURNAL BY THE DEPARTMENT
OF COMMERCIAL INTELLIGENCE AND STATISTICS, INDIA.

RICE—

1st forecast	October	20
2nd "	December	20

Preliminary forecast	July	7-15
Final "	September	21

APPENDIX IV

SEASONS OF SOWING AND HARVESTING OF THE CROPS AND THE TRACTS WHERE THEY ARE MAINLY GROWN

CROP	SEASON OF		WHERE MAINLY GROWN	
	Sowing	Harvesting	British Provinces	Indian States
Rice— Winter (a) . .	May to August	December and January	Bengal, Madras, Bombay including Sind, United Provinces, Bihar and Orissa, Punjab, Burma, Central Provinces and Berar, Assam, North-West Frontier Province and Coorg.	Mysore, Madras Central India Punjab States, Hyderabad, Baroda States, Central Provinces States and Provinces States.
Autumn . .	May and June	September		Punjab, Central Provinces, Hyderabad, Baroda States, Central Provinces States and Provinces States.
Summer . .	January and February	May and June		
Wheat— (Rabi or spring crop)	October to December	March to May	Bengal, Madras, Bombay including Sind, United Provinces, Bihar and Orissa, Punjab, Burma, Central Provinces and Berar, North-West Frontier Province, Ajmer-Merwara and Manpur Pargana and Delhi.	Mysore, Central States, Rajputana States, Punjab States, Central Provinces, Hyderabad, Baroda, Central Provinces, Bombay State, Gwalior.
Sugarcane (b) . .	February to May	November to January	Bengal, Madras, Bombay including Sind, United Provinces, Bihar and Orissa, Punjab, Burma, Central Provinces and Berar, Assam, North-West Frontier Province and Delhi.	Mysore, Madras Central India Rajputana States, States, Kashmir, Hyderabad, Central Provinces, Gwalior United Provinces Travancore (Madras), Tripura (Bengal).
Tea . .	Seeds sown between November and March and seedlings transplanted when at least 6 months old.	May to December in Northern India and January to December in South India.	Bengal, Madras, United Provinces, Bihar and Orissa, Punjab, Burma, and Assam.	
Cotton (c)— Early . .	March to August	October to April	Bengal, Madras, Bombay including Sind, United Provinces, Bihar and Orissa, Punjab, Burma, Central Provinces and Berar, Assam, North-West Frontier Province, Ajmer-Merwara and Delhi.	Mysore, Madras Central India Rajputana States, States, Kashmir, Hyderabad, Baroda, United Provinces State (Rajputana State), Bengal State (Travancore), Bombay States, Gwalior.
Late . .				
Jute— (Autumn crop)	March to May	August and September	Bengal, Bihar and Orissa and Assam.	Bengal State (Bihar).
Linseed— (Rabi or spring crop)	August to October	January to April	Bengal, Madras, Bombay, United Provinces, Bihar and Orissa, Punjab, Central Provinces and Berar, and Assam.	Central India States, Rajputana States, Punjab States, Kashmir, Hyderabad, Baroda, Central Provinces, Gwalior and United Provinces States.
Rape and Mustard— (Rabi or spring crop)	Ditto	Ditto	Bengal, Madras, Bombay including Sind, United Provinces, Bihar and Orissa, Punjab, Burma, Central Provinces and Berar, Assam, North-West Frontier Province and Delhi.	Mysore, Central States, Rajputana States, Punjab States, Kashmir, Hyderabad, Baroda, Central Provinces, Gwalior and United Provinces States.
Sesamum— Kharif or autumn crop (d) . .	May to July	October to December	Bengal, Madras, Bombay including Sind, United Provinces, Bihar and Orissa, Punjab, Burma, Central Provinces and Berar, Assam, and Ajmer-Merwara.	Mysore, Madras Central India States, Rajputana States, Punjab States, and Kash Baroda, Hyderabad, Central Provinces and Gwalior.
Rabi or summer . .	January and February	May to July		
Groundnut (e) . .	May to August	November to January	Madras, Bombay, United Provinces, Burma, Central Provinces and Berar.	Mysore, Madras (Bangalore), Central India States, Hyderabad, Central Provinces, Gwalior.
Indigo (f) . .	February to July	August to November	Bengal, Madras, Bombay including Sind, United Provinces, Bihar and Orissa, Punjab and Burma.	Rajputana, Punjab, Hyderabad and Baroda State (Kashmir), Madras States.
Coffee . .	Rainy season	October to January	Madras and Coorg . .	Mysore, Madras (Travancore and Coorg).
Rubber	Burma, Madras, Assam, Coorg and Bengal.	Mysore, Madras (Travancore and Coorg).

* Incomplete.

- (a) In Madras, the seasons vary greatly. The first crop is sown between April and October and the second crop between September and March. The first crop is harvested between September and March and the second crop between January and May.
- (b) In Madras, the harvest takes place between December and May.
- (c) In parts of Southern India, sowing continues till December and harvesting till July.
- (d) In parts of Southern India, sowing continues till September or October and harvesting till March or April.
- (e) A summer variety is also grown in Madras forming about 5 per cent of the total area under the crop; this variety is sown in February-March and harvested in July-August.
- (f) In Madras about 20 per cent of the area under the crop is irrigated being grown as a second crop on wet lands after paddy is sown in December-January and harvested in March-April.
