# AREA AND YIELD

#### OF CERTAIN

# PRINCIPAL CROPS IN INDIA

#### GENERAL NOTES

In the course of each year periodical estimates of the area and yield of certain crops are compiled from local returns and issued by the Commercial Intelligence Department.

The general practice is to issue a preliminary forecast, a second estimate, and a third (and final) estimate, fuller and more precise than the first two. The figures in these tables are abstracted from those appended to the final estimates and they show the area sown and the estimated yield of the crops.

The estimates state the area actually sown, whether the crop comes to maturity or not, but fields which have been sown with other crops, owing to the failure of the first sowings, are not entered.

The areas covered by the several crops in a mixed field are estimated in various ways in the different provinces, and the estimates are based on formulæ prescribed by the proyincial authorities.

The estimates are not generally made for the whole of India, and they are necessarily, in the most favourable circumstances, only approximations to the truth. The very complete agricultural records in most of the provinces in connection with the assessment of the land revenue render it possible in many cases to state with great exactness the area sown with each crop; but an equally important factor in determining the outturn, namely, the average yield per acre, has to be estimated, and exactness can be obtained only by the most careful consideration of the classes of soil, the methods of cultivation, and the climatic conditions which depend mainly on the quantity and timeliness of the rainfall in every part of the reporting arcas. The quantitative estimates are thus often imperfect and they have generally been too low. The attention recently paid to the estimates of the cotton and wheat crops showed that some of the estimates relating to past years were extremely defective, but measures have been taken, which appear already to have effected a substantial improvement. The revision of the estimates which was attempted has not, however, been entirely successful, for the reason that there are large unregistered movements of cotton across provincial boundaries by road, while the information from some of the Native States is defective and the internal consumption other than that in mills defies accurate computation. A conventional estimate of consumption outside mills has, however, been made in consultation with the Bombay Cotton Trade Association and included in the figures of the carrying over of stocks from one year to another, it is interesting to calculate the averages on these figures. Estimates of area and production are now received from various areas which were formerly unreported; but the fact that the total estimated outturn has as a rule, failen short of the total of net exports and consumption shows that there is still much room for improvement in the estimates of production. The years 1912-13 and 19

Attention has also been paid to the improvement of the jute forecast, and the yield for past years, from 1898 to 1904, has been corrected by the statistics of exports and consumption, but the estimates of the area cultivated are based on data, which are still uncertain, although they have recently been improved. Next to those for cotton and jute, the estimates of area are most complete in respect of wheat. For the other crops, however, the estimates of area apply only to the specified regions where those crops are largely grown, and not to the whole of India. Thus the rice estimates relate only to Bengal, Bihar and Orissa, Assam, Lower Barma, Madras, and the United Provinces, and those for groundnut to Madras, Bombay, and Burma. Again, for the reporting territories the estimates are sometimes imperfect, for, with some exceptions, those tracts have been excluded, which have not been accurately surveyed or are held under privileged tenures, and hence do not possess the regular establishments maintained elsewhere for reporting the area placed under each crop. The most serious defect from this cause is in the figures for Madras, which is a large producer of rice, cottons, sesamun, and indigo, but which up to 1906-07 made forecasts only for the raiyatwari villages or about twothirds of the area of the British districts. The Feudatory States within provincial boundaries are also generally omitted from the forecasts of all the provinces except Bombay and Sind. But for these omissions and a certain element of uncertainty in regard to crops which are grown conjointly or interspersed in the same field, the estimates of area relating to the Punjab, the United Provinces, the Central Provinces and Berar, and Madras may be regarded as fairly exact. The statistics for the British districts of Bombay are also very correct, but in this publication they are combined with the more conjectural figures of the provincial Feudatory States in which a large proportion of the cotton, oileceds, and wheat is grown.

The statistics of area for Bengal and Bihar and Orissa which relate to nearly the whole of the cultivated portion of the province, omitting unimportant Feudatory States, are also conjectural since they consist of estimates which are founded on information of varying degrees of accuracy and which have been verified by cadastral survey in respect of only about 20 per cent for Bengal and 78 per cent for Bihar and Orissa.

The statistics for the States of Hyderabad and Mysore and the numerous States in the Central India and Rajputana Agencies rest on data similar to those of British India, and like them mostly refer to tracts in which there exists a reporting agency not equal in efficiency to that of the neighbouring British Provinces. Estimates are also included for some of the revenue-free lands held on privileged tenures.

#### PROVINCIAL NOTES

urma

#### Estimates are made for rice, cotton, and groundnut. The figures for area are obtained from the assessment rolls prepared by revenue

surveyors.

The original information about the yield is obtained from township officers, inspectors of land records, and from the more important of the Land Revenue subordinate officers. In this way the estimate of each district is based on the information furnished by some thirty or more persons.

The figures for both area and yield are tabulated by the Superintendent of Land Records and checked by the Deputy Commissioner. The Commissioner of Settlements and Land Records compares the estimated yield with a standard representing the normal yield which was fixed after an extensive series of experimental crop cuttings hy settlement officers.

Estimates are made for the sixteen chief rice-producing districts of Lower Burma, namely, Akyab, Kyaukpyu, Insein, Hanthawaddy (Syriam), Pegu, Tharrawaddy, Prome, Maubin, Pyapôn, Bassein, Henzada, Myaungmya, Amherst, Tavoy, Toungoo, and Thatôn. The standard is 32 baskets (of 48lb each) = 1,536lb of unhusked rice to the acre. Until 1902-03 the estimates for cotton related to the five principal cotton-growing districts, pemela, Soming, Lower Chiedrin, Meiletile, Meingron and Thatôn.

districts, namely, Sagaing, Lower Chindwin, Meiktila, Myingyan, and Thayetmyo. Since that year all the cotton-producing districts have been reported on. From 1909-10, however, regular reports have been furnished by the eleven districts in which more than a thousand acres are under cotton, while a rough estimate of the production in other districts has been made and included. Except in districts where a settlement officer has conducted experiments

in crop cutting, it is not possible to estimate accurately the average yield per acre. Estimates were made for the first time in 1908-09. Reports are furnished only by the six principal groundnut growing districts, and a rough estimate is made of the outturn in other districts.

Estimates are framed for rice, cotton, oilseeds, jute, and sugarcane. The information is received from district officers, who in their turn obtain figures from mandals in the case of the temporarily-settled areas and from zamindars in the case of the permanently-settled portion of Goalpara. These figures are said to be checked by sub-divisional and district officers, but, except where the district or the sub-divisional officer is himself able to do it, there is no valid check at all, and sometimes figures returned by district officers are more or less inaccurate and inconsistent.

The estimates for rice relate to all districts (except the Naga Hills). The crop includes the *bhadoi*, *aus*, or autumn rice, and the *dman*, *bao*, or winter rice. The yield of a normal

the bhados, ais, or autumn rice, and the dman, bao, or winter rice. The yield of a normal crop is taken to be 6 cwts per acre for autumn rice and 9 cwts per acre for winter rice. Cotton is grown in the Garo, the Khasi and Jaintiá and the Lushai Hills, in Cachar, Sylhet, Goalpara, Nowgong, and Sibsagar. It is also believed to be grown in the Naga Hills, but it is not possible to make any estimate of the crop there. The crop is sown in March and April. The normal rate of outturn is taken to be 1531b of cleaned cotton per acre. The oilseeds are linseed, rape and mustard, and sesamum. They are generally grown in all the plains districts of Assam. Sesamum is grown also in the Garo, Khasi and Jaintiá and the Lushai Hills. The average yield of rape and mustard has been taken to be 4½ cwt per acre and that of linseed and sesamum to be 4 cwt per acre. The estimates for jute relate to all the districts of the province except the Naga Hills,

The estimates for jute relate to all the districts of the province except the Naga Hills, the Khasi and Jaintiá Hills, and the Lushai Hills. A general rate of 1,2001b (= 3 bales) per acre for a normal crop is taken to estimate the yield of the crop. The estimates for sugarcane relate to all the plains districts. The average yield of raw

sugar (ger) is taken to be 17 cwts per acre.

Estimates are made for rice, wheat, cotton, oilseeds, jute, indigo, and sugarcane. In the absence of any Revenue Agency the figures are based mainly on rough approximate estimates made by district officers, and are more or less conjectural. The district officers obtain information from the sub-divisional officers through the agency of the police. The system of making over atting and are more or price of areas, and account for system of making crop cuttings, as in other provinces, over a series of areas and seasons for the ascer imment of standards of yield has been in force in Bengal for the last eighteen years, but sufficiently to the standards of yield has been in force in Bengal for the last eighteen years, but sufficiently trustworthy figures of yield have not yet been obtained from these cuttings to enable Government to accept them as standards.

(Jute)

(Sugarcane)

Bengal

The rice crop includes the *bhadoi*, aus or autumn rice (sown in May and mostly reaped by the middle of September), the *aman* or winter rice (sown in May and June, transplanted in August and September, and reaped in November and December), and the boro or summer rice (sown towards the close of the cold weather and reaped in April to June). The yield of a normal or 100 per cent crop is taken to be 12 maunds per acre for winter rice and 10 maunds per acre for autumn and 134 maunds for summer rice (the maund in each case being equal to 8231b). These rates have been assumed to represent the average yield of cleaned rice.

Wheat is grown in all the districts of the Rajshahi, Burdwan, and Presidency Divisions (excepting the districts of Bogra, Howrah, 24-Parganas and Khulna) and in the district

(excepting the districts of Dogra, Howran, Erranganes and Rindina, and in the district of Faridpur. The average yield of the crop has been determined to be 10½ maunds per acro. Two varieties of cotton are grown in the province—early and late. The early crop is grown in the State of Hill Tippera and in the districts of Chittagong Hill Tracts, Bankura and Midnapore. The late crop is grown only in the last two districts. The early crop is generally sown before the rains and the late crop partly before and partly after the rains. Separate rate of outturn for the early and the late crops have been adopted for each district. The oilseeds are linseed, rape and mustard, and sesamum. The first three are grown in

all districts (excepting Darjeeling, Jalpaiguri, Rangpur, and Chittagong Hill Tracts, in the case of linseed), and are sown generally in October and reaped early in winter. The average yield is assumed to be 6 maunds (4941b) per acre.

Sesamum is grown in all districts except Darjeeling; it is sown generally in July-September and reaped early in winter. An early variety is sown in the cold weather and reaped in June-July. The average yield is assumed to be 44 maunds (3501b) per acre. Jute is grown in all the districts, excepting Birbhum, Bankura, and Chittagong Hill Tracts. A general rate of 1,2711b, or 31 bales, is assumed to represent the average production per acre for every jute-growing district in the province. The only district in which indigo is still cultivated is Nadia. The average yield is

The only district in] which indigo is still cultivated is Nadia. The average yield is assumed to be 1215 per acre.

The report on sugarcane relates to all the districts of the province; it is sown during the winter season and harvested after a year. The average yield of raw sugar (gur) is estimated at 351 maunds (2,9211b) per acre.

Estimates are made for rice, wheat, cotton, oilseed, jute, indigo, and sugarcane. In the absence of any Revenue Agency the figures are based mainly on rough approximate estimates made by district officers, and are more or less conjectural. The district officers obtain information from the sub-divisional officers through the agency of the police. The system of making crop cuttings, as in other provinces, over a series of areas and seasons for the ascertainment of standards of yield has been in force in the districts of this province for the last eighteen years, but sufficiently trustworthy figures of yield have not yet been obtained from these cuttings to enable Government to accept them as standards.

The rice crop includes the bhadoi, and or autumn rice (sown in May and mostly reaped by the middle of September), the *dman* or winter rice (sown in May and June, transplanted in August and September, and reaped in November and December), and the *boro* or summer rice (sown towards the close of the cold weather and reaped in April to June). The yield of a normal or 100 per cent crop is taken to be 15 maunds per acre for winter rice, and 10 maunds per acre for autumn and summer rice (the maund in each case being equal to 824 1b). These rates have been assumed to represent the average yield of cleaned rice.

Wheat is grown in all the districts, excepting Balasore and Puri. The crop is chiefly cultivated in Bihar, where it covers about 96 per cent of the total area under the crop in Bihar and Orissa. The average yield has been fixed provisionally at 12 maunds or 984 lb per acre for the Bihar districts, 104 maunds or 861 lb per acre for the Orissa districts, and 451 lb per acre for the districts of the Chota Nagpur Division. Two varieties of cotton are grown in the province—early and late. The early crop, which

is sown before the monsoon rains commence and harvested in winter, is grown in the districts of Saran, Monghyr, Bhágalpur, the Sonthal Parganas, and in the Chota Nagpur and Orissa Divisions, and also to a limited extent in Shahabad, Champaran, and Darbhænga. The late crop, which is usually sown at the close of the rainy season and harvested in May and June, is grown in the districts of Manbhum, Singhbhum, and in the Patna, Tirhut, Bhágalpur, and Orissa Divisions, excepting the districts of Gaya, Purnea, the Sonthal Parganas and Sambalpur. Parganas, and Sambalpur. Separate rates of standard outturn for the early and the late crops have been adopted for each district; the rates vary from 70 to 280 lb per acre.

The oilseeds are linseed, rape and mustard, and sesamum. The first three are grown in all districts (excepting Angul, in the case of linseed), and are sown generally in October and reaped early in winter. The average yield is assumed to be 6 maunds (494lb) per acre.

Sesamum is grown in all districts; it is sown generally in October and reaped carly in winter. An early variety is sown in the cold weather and reaped in May-August. The average yield is assumed to be 41 maunds (350 lb) per acre.

The estimate of the jute crop covers seven districts in which jute is grown, namely, Champaran, Muzaffarpur, Bhágalpur, Purnes, the Sonthal Parganas, Cuttack, and Balasore. A general rate of 1,2001b, or three bales, is assumed to represent the average production per acre for every jute-growing district in the province.

The report on indigo relates to eight districts in which the crop is still grown, namely, four districts of the Tirhut Division and Shahabad, Monghyr, Bhagálpur and Purnea. The average yield is assumed to be 20 15 per acre.

(Oilseed)

(Jute)

(Indigo)

(Sugarcane)

The report on sugarcane relates to all the districts of the province; it is sown during the winter season and harvested after a year. The average yield of raw sugar (gur) is estimated at 22 cwts per acre.

United Provinces	Estimates are made for wheat, cotton, linseed, rapeseed, sesamum, indigo, sugarcane and winter rice.
I Tovinces	The area is taken from the crop statements based on field-to-field inspections, which are furnished by patwaris and checked by higher revenue officers. The estimates of the standard yield are based on the results ascertained from crop-cutting experiments conducted in selected districts. The standards, which are separate for irrigated and unirrigated crops, are revised every five years on a consideration of the results of crop experiments, and are applied to the condition of the crops reported by district officers and selected land-holders whose number
	exceeds five hundred.
(Wheat)	The estimates of the wheat crop relate to all the districts of the province except Almora and Garhwal. The rates of standard outturn are different in the various districts.
(Cotton)	the average for the province being irrigated 1,250 b and unirrigated 850 b. The estimates of the cotton crop relate to all the districts of the province where cotton is grown to any considerable extent. The rates of standard outturn are different in the various districts, the average for the province being irrigated 220 b and unirrigated 130 b. The Native State of Rampur, which is the only cotton-growing State in the province,
(Oilsoeds)"	is included in the estimates for that crop from 1905-06. The estimates of both area and yield are based on the figures furnished by the six tahsils of the State. The estimates for all oilseeds show separately the mixed crop, that is, crop grown in the same field with other crops, which is gathered in small quantities over a wide area mostly for home consumption. The estimates of the mixed crop are, however, highly conjectural.
(Indigo)	The average yield of the unmixed crop is estimated at 5001b per agree for linseed, 6001b for rapeseed, and 2801b for sesamum. In estimating the yield of indigo (dye), it is assumed that one-tenth of the total area is annually set aside for seed, and that one-fourth of a factory maund (about 751b) of dye represents the full average yield in an average year.
(Sugarcane)	The estimates for sugarcane relate to all the districts of the province except Jhansi, Jalaun, Bánda, Almora, Garhwal and Bahraich. The crop is planted in February and March and reaped in December and January, and is wholly an irrigated crop. Separate rates of normal outturn have been adopted for the different districts varying between 1,50015 and
(Winter rice)	S,2001b. Estimates of winter rice were made for the first time in 1912-13. The rates of standard outturn are different in various districts, the average for the province being in the case of rice irrigated 1,1001b and unirrigated 8501b.
	· · · · · · · · · · · · · · · · · · ·
Punjab	Estimates are prepared for wheat, cotton, rapeseed, sesamum, indigo, and sugarcane. The figures of area are based on actual measurements by the revenue staff. Estimates of yield are recorded by Collectors after personal enquiry from tabsildars and leading agriculturists. The total number of agriculturists consulted by the Collectors and tabsildars must amount to several thousands.
(Wheat)	The estimates of the wheat crop relate to all the districts of the province, and include the following Native States from 1907-08 :Patiala, Kapurthala, Nabha, Jind, Bahawalpur, Faridkot, Maler Kotla, Mandi, and Suket. Separate rates of normal outturn have been adopted for the different districts varying between 500lb and 1,180lb for irrigated and between 380lb and 720lb for unirrigated wheat.
(Cotton)	The estimates of the cotton crop relate to all the districts except Simla, and include the following Native States from 1904-05 :Patiala. Kapurthala, Bahawalpur, Nabha, and Jind.
-	The rates of normal outturn vary between 481b and 1921b for irrigated and between 411b and 1321b for unirrigated cotton.
(Oilseeds)	The estimates for rapeseed relate to all but four districts, the exceptions being Simla, Jalandhar, Kangra, and Gurdaspur.
	The estimates for sesamum relate to twenty-two districts: Hissar, Gurgaon, Karnál, Ambala, Ferozpur, Kángra, Hoshiarpur, Jalandhar, Multan, Jhang, Montgomery, Lahore, Amritsar, Gurdáspur, Siálkot, Gujrát, Gujránwála, Ráwalpindi, Attock, Mianwali, Dera Ghazi

Khan, and Muzaffargarh. Until 1904-05 the estimates for indigo related to seven districts: Hissar, Rohtak, Gurgaon, Karnál, Multan, Dera Ghazi Khan, and Muzaffargarh; in two of these (Hissar and Party for seed and partly for seed and partly for seed and partly Re\_tak) the crop was grown only for seed, and in the remaining five partly for seed and partly for dye. From that year the estimates relate to four districts only: Rohtak, Multan, Dera Ghazi Khan, and Muzaffargarh. The estimates for sugarcane include all but eleven districts, the districts omitted being Hissar, Simla, Ferozpur, Jhelum, Rawalpindi, Attock, Mianwali, Montgomery, Jhang, Multan, and Dera Ghazi Khan. The crop is sown in March and April.

(Sugarcane)

(Indigo)

Estimates are prepared for wheat, cotton, rapeseed, and sugarcane. Until 1903-04 an N-W. Frontier estimate was made for the sesamum crop also, but as the area never exceeded 10,000 acres it has been discontinued.

The figures of area are based on actual measurements made by the patwaris in their fieldto-field inspection in each harvest. They are further checked by higher revenue officers.

The estimates of the standard yield are based principally on data derived from a large number of tests made during the progress of settlement operations in which crops were cut and weighed. They were framed for each assessment circle which is the unit of area, and separately for lands irrigated by canals, by wells, for alluvial (sailab) lands, and for lands entirely de-pendent on rain. The standards are applied to the estimates received from the district officers who frame their estimates in consultation with local agriculturists. The exact number of agriculturists consulted by the district officers is not available, but it must amount to several hundreds.

The estimates for wheat relate to all the districts of the province, and include the Tochi (Wheat) Agency from 1904-05, and the Kurram Agency from 1906-07. For irrigated wheat the rate of normal outturn is taken to be 7411b for four districts and 8231b for three districts; the rates for unirrigated wheat vary between 3291b and 5351b.

The estimates of the cotton crop include all the districts of the province.

The estimates for rapeseed up to 1905-06 relate to all districts except Kohat. From (OilseeJs) 1906-07 Kohat has been included.

The sugarcane crop is sown in March and April. The estimate relates to three selected (Sugarcane) districts, namely, Hazara, Peshawar, and Bannu.

Estimates are framed for wheat, cotton, linseed, rapeseed, sesamum, groundnut, and Bombay and Sind sugarcane.

The estimates include British districts as well as Native States.

In the British districts of the Presidency the area under different crops is ascertained in the first instance by village officers and recorded in village returns which are checked by circle inspectors and other revenue officers, and compiled by the former for their circle, and then for the taluka. The taluka figures are totalled up for each district in the Director's office. For Sind this work is done by local officers, and the Director receives district-by-district figures. The information received is for villages for which regular statistics are available, the proportion of reporting area being 91.4 per cent in the Presidency proper and 99.6 per cent in Sind. From 1909-10, however, estimates for the non-reporting areas have been made so far as possible and included in the table. In the case of Native States the acreage is estimated on the best local data available. The approximate numerical strength of the report-ing agency is 175 in the Presidency proper, 57 in Sind, and 33 in the Native States. No standard of yield has yet been adopted. 4 Local estimates are converted to quantitative

figures on the basis of a formula showing the average yield of crops which has been adopted provisionally. This formula is now being revised quinquennially, the revision being based on the ascertainment of actual yield in different parts of the Presidency by careful local enquiry by officers of the Provincial Agricultural Department who are tabulating the results and com-paring them for the purpose. The unit of area in the formula is the district and dry and irrigated cross are separately dealt with irrigated crops are separately dealt with.

Each year's estimate is prepared by the mamlatdars (or mahalkaris where the taluk is sub-divided) from notes which they make and from reports from village accountants and circle inspectors. The estimate is sent direct to the Director of Agriculture, who, in the light of the general prospects of the season, makes the quantitative calculations. A copy of the estimate is at the same time sent to the Collector through the sub-divisional officer, who sends his remarks, if any, to the Collector, forwarding a copy of the same to the Director. The Collec-tor on receipt of these remarks forwards to the Director his opinion as regards the general condition of the whole district condition of the whole district.

For Sind there are no formulæ, and all the necessary information is obtained from the District Collectors in the form of estimates on the basis of twelve annas for a normal crop, together with quantitative equivalents gathered from general experience.

For the Native States estimates are obtained, and the formulæ for adjoining British districts is applied.

The estimates for wheat include the British districts and Native States in Gujarát, Deccan, Karnátak, and Sind.

The figures for cotton relate to the whole area under that crop in the Bombay Presidency (including Sind), and include both the early crop of the Deccan sown in July to August and harvested in December, and the late crop of Gujarát, Karnátak, and Sind sown in September to October and reaped in February to March. The estimates for linseed include the British districts and the Native States in Gujarát,

(Oilsced.) Deccan, and Karnátak.

Those for rapeseed include the British districts and the Native States in Gujarát and Sind.

The estimates for sesamum include the British districts and the Native States in Gujarát,

Deccan, Karnátak, Konkan (excluding Kanara), and Sind. The estimates for groundnut include the British districts and Native States in the Deccan (Groundau!) and the Belgaum district in Karnátak.

5

(Cotton)

(Cotton)

(Wheat)

(Sugarcane)

Central Provinces

(Wheat)

(Cotton)

(Oilseeds)

The estimates for sugarcane include the British districts and Native States in Gujarát (except Panch Mahals and Broach), Dectau, Karnátak, and Konkan (except Kolaba and Ratuagiri).

Estimates are framed for wheat, cotton, linseed, and sesamum.

As regards acreage, the figures for cotton and sesamum are estimates based on reports furnished by the local officials of the Land Records staff. The figures for wheat and linseed represent the actual areas sown with those crops as disclosed by the field-to-field inspection by patwaris. The reporting agency consists of 217 revenue inspectors with, on an average, 24 patwaris working under each inspector. Each tabsil has usually 4 revenue inspectors.

Standards of outturn were framed for each crop from the results of crop-cutting experiments on selected fields under the supervision of responsible and selected officials during the years 1884-85 to 1887-88. For wheat the standard was framed separately for first and second class lands, and the proportion in which the area of each class was cropped was taken into account; irrigation also was taken into account, but in a less degree, as it is of importance only in the case of the rice crop for which no estimates are made. These standards have been revised from time to time on the basis of the results of crop-cutting experiments since made, the last revision having been made in 1912. The yield expressed by the people in terms of annas in the rupee is converted into percentages, 13.3 annas, or a normal crop, being taken to be equal to 100. A full crop or 16 annas is denoted by 120, and a bumper crop or 20 annas by 150. All deductions based on the standards are made by the Director of Land Records and Settlements from the year's figures furnished by district officers, who are supposed to bear in mind the standards when estimating the yield of the season.

Until 1897-98 the figures did not take into account the zamindari areas in Raipur, Biláspur, and Drug, for which no statistics were available, the survey being in progress. Since that year the surveyed portions of these zamindari areas have been included.

The estimates of the wheat crop relate to all the districts of the province, and include the Native States of Khairagarh and Nandgaon from 1907-08. The standard rates of outturn vary between 450lb and 660lb per acre.

The area sown with wheat as a mixed crop with gram is reduced for the purpose of excluding gram by 15 per cent in the districts of the Nagpur and Chattisgarh Divisions, and by from 25 to 40 per cent in the rest of the province.

The cotton crop is grown in all the districts of the province. The rate of standard outturn is taken to be 951b per acre in one district, 90 in three, 80 in one, 70 in three, 60 in one, 55 in four, and 45 in five.

The area on which cotton is grown mixed with other crops is reduced by deductions varying if the different districts from 7 to 16 per cent.

The estimates for oilseeds (linseed and sesamum) also relate to all the districts of the province. The standards vary between 1801b and 3001b in the case of linseed and between 1501b and 3001b in the case of sesamum.

In the case of linseed sown with gram the area is reduced by 20 per cent for the purpose of excluding gram,

Berar

Estimates are framed for wheat, cotton, linseed, and sesamum.

The system by which areas are returned is similar to that in the Central Provinces. No standard yield was fixed until 1903-04 and there was no specific system for estimating the yield of the harvests for the purposes of the forecasts. The estimates from 1903-04 have been calculated on the lines followed in the Central Provinces. The standards of normal outturn adopted in 1903-04 were revised in 1908 and again in 1912. The standards are 58015 per acre for wheat, 8715 for cotton, 33015 for linseed, and 30015 for sesamum.

Madras

(Rice)

(Cotton)

(Sesamum)

Estimates are framed for rice, cotton, sesamum, groundnut, indigo, sugarcane, and castor seed. [Figures for castor seed are not included in these tables.]

The estimates of the rate of yield are those reported by tahsildars or deputy tahsildars, which are scrutinized and tabulated by the Director of Agriculture.

For rice the standard rates are based on the results of crop-cutting experiments either conducted by district officers or made in Government Agricultural Farms.

For coston the standard rates have been determined on a full consideration of all available data. The rates for unirrigated cotton are 90% per acre for *Tinnevellies*, 75% for *Cocanadas*, 55% for *Salems*, and 50% for *Northerns*, *Westerns*, and others; the rates for irrigated cotton are 150% per acre for the variety grown in the Bellary district and 400% in the case of South Arcot, Salem, Coimbatore, Trichinopoly, Tanjore, Madura, Ramnad, and Tinnevelly districts. The sowings of cotton continue from July to October in the Central and Deccan districts, and in the southern districts until the end of December. The harvesting of the crop begins in February and continues until July or August. For sesamum the standard of yield has been fixed with reference to the latest crop-cutting

For sesamum the standard of yield has been fixed with reference to the latest crop-cutting experiments at 3361b per acre for the Vizagapatam, Godavari, Tanjore, and Trichinopoly districts, 2241b for Malabar and the Deccan districts and 2801b for the remaining districts. The groundnut crop is chiefly grown in Anantapur, North Arcot, South Arcot, Tanjore, Cuddapah and Salem, more than one-third of the area being cultivated in South Arcot. (Groundnut) The rate of outturn has been fixed at 10 cwts of nuts in shell per acre.

The estimates for indigo comprise the districts in which it is mainly grown: Guntur, Nellore, Karnul, Cuddapah, Chingleput, South Arcot, and Salem. The standard of yield has been taken, on the best information on record, at 35lb of dye to the acre.

The sugarcane crop is grown chiefly in South Arcot, Godavari, Bellary, and Coimbatore. The standard of yield has been fixed at 45 cwts of manufactured jaggery (gur) to the acre.

Estimates are made for cotton only. As regards area the information is taken from the Ajmer-Merwara field book (khasra girdawari), prepared by the patwaris in November each year and checked by the higher revenue officers. The estimates of yield are based on the average of the results obtained by crop-cutting experiments conducted each year. The Ajmer-Merwara district is divided into 12 girdawars' circles and in each circle the girdawar carries out crop experiments. ments every harvest. The Revenue Extra Assistant Commissioner docs the same in the Ajmer tahsil, and the tahsildars of Beawar and Todgarh in the two tahsils in Merwara. At each harvest a piece of land under a particular crop is selected and its yield weighed. The results of all the experiments are sent to the Revenue Extra Assistant Commissioner, in whose office a combined return is prepared and included in the annual report.

The figures include khalsa as well as jagir areas.

Estimates are framed for wheat and cotton. They are generally defective in consequence Rajputana and of the absence of figures for unsurveyed areas and privileged tenures in many cases. Central India

Estimates are framed for wheat, cotton, and oilseeds. Until 1902-03 the figures excluded Hyderabad jagir and such other revenue-free lands or privileged tenures; since then statistics for these areas have been obtained as far as possible and included in the statement.

Estimates are framed for wheat and cotton.

As regards area the information is based on the entry made by the Shanbog (village accountant) in his crop inspection book, which is checked by the Shekdar (taluk officer) and the Amildar (collector). The outturn is also noted by the Shanbog in his book in terms of annas (16 annas being taken for a normal or 100 per cent crop) and this is converted into tons in the case of wheat and bales in the case of cotton by reference to the standard normal outturn per acre fixed for each taluk. The figures are finally scrutinised and consolidated in the Revenue Commissioner's Office.

No information is at present available for inam villages in certain districts, but instructions have been issued to obtain this information so far as possible.

(a) Includes the State of Baroda
(b) The estimate for the year is too low, as the mill consumption for the year ending the 30th June and the net exports for the year ending the 30th September were 605,000 bales. For both the proceeding and the following years the trade figures are however lower than the estimates, so that for the 3 years 1898—1901 the production would seem to be understated only by 109,000 bales. In this calculation the excess of the exports from the districts of the North and East Deccan over their reported production, which averages 208,000 bales in the twelve years 1891—1903, has been taken to represent imports by road into the Presidency from the neighbouring Native States
(c) The figures of production for Berar for the years previous to 1903-04 and those for the Central Provinces for the years ending the 30th June and the exports for the year ending the 30th September, as the provincial estimates of the outtarn were extremely defective
(d) The figures for the years provious to 1902-03 evolue jagir areas
(e) The estimates for Madras up to 1902-03 evolue jagir areas
(e) The setimates for Madras up to 1902-03 evolue jagir areas
(f) Includes Nutive States from 1904-05.

Note .- The figures for 1912-13 are subject to revision

the whole of the reported area under cotton in India

(g) Constituted in 1901 ont of the Punjeb
(h) No information
(i) Included under Bengal
(j) Includes Bihar and Orissa up to 1910-11, Assam from 1903-04 to 1910-11, and the Hill Tipperah State from 1906-07
(k) For the years up to 1911-12 the exports as well as the mill consumption are for the year ending the 30th September
For 1912-13 they are for the year ending the 30th June. No reliable information exists as to the annual consumption outside the nulle, but in 1911 it was settled in consultation with the Bombay Couton Trade Association to adopt the conventional estimate of 450,000 balas. This figure has been included in the figure for each year shown in this columna. Note.—Figures for 1912-13 are subject to revision

Sesamum-(a) The figures in Italics represent "mixed" erop, i.e., seed sown in the same fields with other crops. The estimates of the mixed crop of the United Provinces are highly conjectural; hence they have been kept separate
(b) The estimates of yield for Berar for years previous to 1903-04 are defective, being based on incorrect data
(c) Includes the State of Baroda
(d) The figures for the years previous to 1902-03 exclude jagir areas
(e) The estimates for Madras up to 1906-07 relate only to raivatwari villages; but since that year estimates for certain samindari and whole inam villa ges have also been include?
(f) Includes Bihar and Orissa up to 1910-11 and Assam for 1910-11
(g) The figures forthoth area and yield from 1904-05 relate to the Punjab only; the forecast of the Sesamum crop of the North-West Frontier Province having been discontinued from that year
(h) Included under Bengal
(i) No information

. ·

Note-The figures for 1912-13 are subject to revision
