CENSUS OF INDIA, 1951.

MADRAS AND COORG STATES.

THE REPORT ON THE CENSUS.

GENERAL INTRODUCTION.

Introductory.—This report on the 1951 Census covers both Madras and Coorg States. For the convenience of all concerned, the report has been prepared in two sections—Section I dealing with Madras and Section II with Coorg. This general introduction will be confined to matters, which are common to both the States; other matters which are relevant only in respect of one of the States will be dealt with in the section relating to that State.

2. Territorial Changes.—The 1951 Census has the proud distinction of being the first Census conducted in the Republic of India. Thanks to India's position as a completely independent country and the merger of the Pudukottai. Banganapalle and Sandur States in Madras State, the administrative set-up for the 1951 Census became very considerably simplified. At the 1941 Census, the Superintendent of Census Operations for Madras had not only to deal with the Census of Madras State and Coorg, but also to supervise the enumeration in Pudukottai State as well as the Civil and Military Station, Bangalore, and in the Administered areas in Hyderabad State and the States of Sandur and Banganapalle. Pudukottai State carried out its own Census tabulation but the tabulation for Coorg, Sandur and Banganapalle was undertaken by the Superintendent of Census Operations for Madras, while the work relating to the Civil and Military Station, Bangalore, and the Administered areas in Hyderabad were entrusted to the Census Superintendents of Mysore and Hyderabad, respectively. Thanks to their merger, the Pudukottai, Banganapalle and Sandur areas are now part of Madras State, Pudukottai being a revenue division of the Tiruchirappalli district, Banganapalle a subtaluk in Nandyal revenue division of the Kurnool district, while the Sandur area, along with some adjoining areas of Hospet

and Kudligi taluks, has been constituted into a new taluk, viz., the Sandur taluk, of Bellary district.

- 3. Changes made at the 1951 Census.—At this Census, the Superintendent of Census Operations for Madras and Coorg had to deal with two administrative entities, viz., the Madras State and the Coorg State. A number of important changes were made in connection with the 1951 Census, in regard to enumeration as well as the tabulation of the data collected at the Census. The more important of these changes are referred to below:—
- (1) Enumeration.—Long prior to the enumeration period, in 1948 to be exact, a permanent scheme of house-numbering was introduced. Each small village was treated as a separate unit for the purpose of this house numbering, while large villages and towns were split up into suitable blocks. If the block in a town was a large one with well-formed streets, each street in the block. technically called a locality, was assigned a separate number within the block, and the houses were numbered in a separate series in each street. In all other cases. the houses were numbered in a separate series for each block, and in the case of small villages, for the village as a whole. panchayat or town is a separate unit for house-numbering, irrespective of the number of villages comprising it.) The numbers thus assigned were marked in tar or painted on the houses, and they were to be maintained on a permanent basis, this maintenance being watched annually under the orders issued by the State Government. In the case of huts, metal or cardboard discs hung up from the roofs were used for marking the house number. By the adoption of this system, it was possible to formulate enumeration blocks in a precise and convenient manner. Each enumeration block was assigned to an enumerator.

whose work was over-checked, to the extent of 20 per cent, by supervisors, each of whom was generally allotted five enumerators' blocks for supervision.

- (2) The Census time for the 1941 Census was sunrise on the first March 1941. while that for the 1951 was sunrise on the first March 1951. At the former Census. 20 days were allotted for the enumeration in the rural areas and 13 days for the enumeration in the towns. As the enumerators were, as usual, mostly persons who had to do the work on an honorary basis, without prejudice to their normal work, which often took the best part of their working days, and as this work had to be done mostly out-of-office hours and on holidays, it was considered that it was unnecessary to make any distinction between rural and urban areas, and all enumerators were allowed 20 days time, i.e., from the 9th to the 28th February 1951, both days inclusive, for \mathbf{the} enumeration. For their final check up and for correcting and bringing their enumeration up to date, with reference to subsequent births and deaths occurring prior to sunrise on the 1st March 1951, they were allowed three days, viz., 1st, 2nd and 3rd March 1951, instead of being asked to rush through the work on one day, as was done in 1941.
- (3) The system of enumeration of the entire population on a single night—the night preceding the Census date—was abandoned after the 1931 Census, and the system adopted at the 1951 Census was the same as the 1941 system, with some refinements. The system of de facto enumeration adopted up to 1931 involved not only enormous administrative difficulties, but was also not really conducive to sound enumeration, as the work had necessarily to be done under conditions which made accurate and thorough enumeration difficult. The system introduced first in 1941 is a modified de jure method, the de facto method being resorted to only to the extent absolutely necessary. Under this scheme, there is no need to hold up travellers at any time. For purposes of the Census, the population was classified into the following categories :---
- (i) Household population, i.e., population residing in houses.
- (ii) Population residing in public institutions like hotels, hospitals, asylums and jails.

- (iii) Houseless persons.
- (iv) Persons not enumerated anywhere previously during the enumeration period and who were actually travelling even during the period of final check.

Under the present system of enumeration. introduced in 1941, persons falling under category (i) are dealt with during the main enumeration period preceding the Census date and even those who are away from their houses throughout the enumeration, period will be enumerated during the period of the final check, except in the negligible number of cases falling under the last category. At the 1941 Census, the persons falling under category (ii) were enumerated in the morning of the day preceding the Census date, while the third category was enumerated—this is obviously the most convenient and suitable method-on the night preceding the Census date. The refinement introduced at the 1951 Census was, that the persons falling under the second category were also enumerated along with the household population in the same blocks. This was obviously the most convenient arrangement to adopt, and there is no reason at all, from the point of view of convenience or from any other point of view, why their enumeration should be postponed to the day preceding the Census date. The last category will include as already mentioned, not only the household persons who are away from their houses throughout the enumeration period and the final check period, but also the houseless persons, who were on the move even on the night preceding the Census date. It may be safely said that this number is negligible and that our failure to enumerate this category cannot vitiate the Census. The total number of travellers enumerated at the 1921 Census in Madras State was 41,324, the corresponding figure for 1931 being 73,121. This number would be further reduced, if we take into account the fact that most of these travellers on the night preceding the Census date would have arrived somewhere during the final check period and would have been enumerated there.

(4) The enumeration staff consisted mostly of Government servants, employees of local bodies, village officers and teachers, and only a small number of non-officials were employed for the purpose. The non-official element, was as usual, larger in Coorg than in Madras State.

Whole-time paid staff for enumeration was employed only in some exceptional areas of Visakhapatnam and Srikakulam Agencies and in Wynaad. Everywhere else, the enumerators did their census work in an honorary capacity and did it without prejudice to their normal official duties, doing the work outside office hours and on holidays. Credit is due to them for maintaining this great tradition of the Indian Census.

(5) As in 1941, there was no enumeration of Indians on the high seas, and enumeration of persons, who were not on the shore or inland, was confined to those in vessels arriving in ports between the 1st March and the 20th March 1951. In accordance with the recognized diplomatic practice, non-Indian Nationals in the Embassies were not enumerated.

(6) The census data were collected by recording answers to fourteen questions relating to (1) name and relationship to head of household, (2) (a) nationality, (b) religion, (c) classification of community, (3) civil condition, (4) age, (5) (a) birth place, (b) name of father, karnavan or husband, (6) displaced person, (7) mothertongue, (8) bi-lingualism, (9) economic status (dependency and employment), (10) principal means of livelihood, (11) secondary means of livelihood, (12) literacy and education, (13) infirmity (incidence of leprosy) and (14) sex. The question relating to 'displaced persons' is a new one necessitated by the large and important problem arising from the movement of displaced persons from Pakistan on account of the partition of India. The question relating to the incidence of leprosy was one chosen by the State Governments of Madras and Coorg, in exercise of the option left to them by the Government of India. Naturally, many of these questions occurred also in the 1941 questionnaire, but there are some important differences. The questions relating to means of livelihood and economic status have been put in a more comprehensive and precise form in the 1951 Census. In fact, one of the fundamental changes introduced at the 1951 Census was the emphasis on economic classification in preference to classifications based on religion or community. Another important decision taken by the Government of India in connection with the 1951 Census was that castes and tribes should not receive any undue and artificial prominence in the Census report, and that the data collected

and tabulated should be confined to what is required for implementing the provisions of the Constitution of India, in regard to Scheduled Castes, Scheduled Tribes and Backward Classes.

The 1941 question relating to race, tribe or caste was replaced by the 1951 Census question relating to nationality, i.e., citizenship, and the question relating to 'classification of community', i.e., whether the person enumerated belongs to a Scheduled Caste or Scheduled Tribe or to a backward or non-backward class. In Madras State, the list of Scheduled Castes notified by the President under Article 341 of the Constitution was strictly adopted for deciding whether the person enumerated belonged to a Scheduled Caste or not. Similarly, in respect of tribes, the list of Scheduled Tribes notified by the President for the Madras State under Article 342 of the Constitution was adopted. The Government of Madras furnished a list of nonbackward classes and the detailed enumeration of castes was confined to those not found in this list of non-backward classes. In respect of Coorg, the lists of Scheduled Castes, Scheduled Tribes and non-backward classes were furnished by the State Government, as no lists of Scheduled Castes or Scheduled Tribes had been notified by the President by then; they were subsequently accepted and notified by the President.

The questions relating to the number of inchildren born to a married woman and number surviving and her age at the time of the birth of her first child were omitted at the 1951 Census. The 1951 questionnaire was formidable enough, especially with the emphasis on the economic classification, without these additional questions.

The question relating to unemployment was also omitted at the 1951 Census. So also the question relating to literacy in English. The question relating to literacy in English can hardly be of any great practical importance in a country with so much illiteracy and the question is also inappropriate as our national language is Hindi.

(7) Scope of the questions asked.—The only questions which require special mention here are those relating to means of livelihood, economic status and incidence of leprosy. It was made clear in the instructions to the enumerators that a person should be treated as self-supporting.

if he got a regular income, whether in cash or kind or both every year, and if that income was sufficient for his subsistence on his existing standard of living. If he had a regular income, but that was insufficient even for his own subsistence, he was to be treated as an earning dependant, as, obviously, someone else was finding the balance, required for his subsistence. Persons who made no contribution to the family income were to be treated as nonearning dependants. In the case of selfsupporting persons, his means of livelihood which gives him the largest part of his income, if he had more than one source of income, was to be treated as his principal means of livelihood and his next important source of income as his secondary means of livelihood. In the case of earning dependants and non-earning dependants, the principal means of livelihood of the person, on whom they were dependant, was to be enumerated as their principal means of livelihood. In the case of earning dependants, their most important source of income was to be entered in the column for secondary means of livelihood and there was to be no entry regarding their less important means of livelihood. It will be seen that we have, frankly, not gone into the difficult questions of standard of living, and that the enumerators were only expected to explain the questions clearly and fully and record the answers, as to whether the persons enumerated were self-supporting persons or earning dependants or non-earning dependants. Even this limited kind of inquiry has its value and we could not aim at anything more ambitious at a mass census of this kind, with enumerators, most of whom could not be expected to deal with subtle or complicated questions.

Self-supporting persons were to be classified under three categories, viz., employers, employees and independent workers. A person must be treated an employer only if he employs one or more other persons for carrying on the business which is his means of livelihood and pays them a salary or wage in cash or kind. A person should be treated as an employee if he works for some other person for a salary or wage as the means of earning his livelihood. A person should be treated as an independent worker if he is not employed by anyone else for a salary or wage and who does not also employ anyone else for a salary or wage, in cash or kind

and works by himself or with only the unpaid assistance of his dependants, in order to earn his livelihood. The instructions also pointed out that self-supporting persons who were neither employers nor employees nor independent workers should be classsified under the residuary category '0'. As was anticipated, these questions led to innumerable conundrums, and they were answered as clearly and fully as possible.

Incidence of Leprosy.—The enumerators were asked to classify the persons enumerated under three categories (1) Not suffering from leprosy, (2) Definitely suffering from leprosy and (3) Doubtful cases. Correct enumeration, with reference to this question, naturally depended on the enumerator's capacity for patient and careful observation and tactful questioning and the co-operation of the persons enumerated, particularly in the doubtful cases. The instructions were made as detailed as possible and were drafted in consultation with the Director of Public Healthcopy of these instructions will be found in Appendix I-and explained to the enumerators at the training classes. The enumerators were instructed to be careful not to treat ordinary skin diseases including leucoderma as cases of leprosy.

(8) Tabulation.—The most important and fundamental change introduced at the 1951 Census was the discontinuance of the sorting of Census slips by religion and the substitution of sorting by livelihood classes. For purposes of tabulation at the 1951 Census, four agricultural livelihood classes and four non-agricultural livelihood classes were prescribed as follows:—

Agricultural Classes—

I. Cultivators of land, wholly or mainly owned and their dependants,

II. Cultivators of land, wholly or mainly unowned, and their dependants,

III. Cultivating labourers and their dependants,

IV. Non-cultivating owners of land, agricultural rent receivers and their dependants.

Non-Agricultural Classes-

Persons (including dependants) who derive their principal means of livelihood from—

V. Production other than cultivation,

VI. Commerce, VII. Transport, and . VIII. Other services and miscellaneous sources.

The scheme of economic classification adopted at this census is based on the 1931 scheme of occupations but has been extensively revised and re-arranged, so as to secure the following purposes:—

- (1) The establishment of a comprehensive economic classification of the people as a whole, and not merely of persons who are gainfully occupied.
- (2) Simplification and improvement of the method of presentation of the data and provision of additional data.
- (3) International comparability of data as recommended by the Economic and Social Council of the United Nations.

The correlation between the 1931 scheme of occupations and the scheme adopted at the 1951 census is therefore not one which can be indicated with any accuracy. A rough idea of the correlation may be obtained from Appendix II. No attempt will therefore be made in this report to compare the statistics of 1931 and 1951, and my remarks will be confined to an analysis of the 1951 data. The 1931 scheme provided for four classes, 12 sub-classes, 55 orders and 195 occupational groups; but in the present scheme, for the industries and services, i.e., non-Agricultural classes, there are 10 divisions, subdivided into 88 subdivisions—Vide appendix IV of Part II of the Registrar-General's Tabulation Plan for the 1951 census, reproduced in Appendix III for ready reference. The scope of the activities included in each subdivision is indicated by its title, as well as by the specifications by groups which are comprised in them. Obviously, no such detailed classification need be made for the agricultural classes. Economic activities include all activities of which the result is the production of useful commodities or the performance of useful services, excluding the performance of domestic or personal services by members of a family household to one another. All non-earning dependants are, of course, economically passive. All earning dependants are economically semi-active only, as their contribution is not sufficient even for their own subsistence. All selfsupporting persons are ordinarily economically active, but there are the following exceptions :-

(1) All self-supporting persons of Agricultural Class IV.

- (2) The following groups of self-supporting persons, who are included in non-Agricultural Class VIII:—
- (a) Non-working owners of non-agricultural property,
 - (b) Pensioners and remittance holders,
- (c) Persons living on charity and other persons with unproductive occupations, and
- (d) Inmates of penal institutions and asylums.

The unit of classification in every case is the individual. All employers and all independent workers have been classified with reference to the commodity produced, or service performed by them, individually. Similarly, employees engaged in production, commerce or transport, excluding domestic servants, have been classified under the appropriate subdivisions, with reference to their own activities and without reference to that of their employers. Domestic servants have been classed in a subdivision under division 9, without reference to the nature of their work. All other employees (including the managerial supervisory employees, clerical services, messengers, watchmen and unskilled labour of every description) have been classified, with reference to the commodities produced or the services. rendered by their employers.

At the 1941 census, there was a drastic curtailment of tabulation, though elaborate data were collected, as mentioned above, and tabulation was restricted for financial reasons. The tabulation was confined so as to produce only the most important statistical tables and the village statistics. 1/50 samples were, however, taken and with reference to these, the Government of India arranged for the tabulation and publication in 1950 of statistics relating to age and civil condition, age and literacy and age as on last birthday.

At the present census, however, we have been able to carry out a full tabulation of the data collected. The answers to the more important questions recorded in enumeration slips were transcribed into a National Register of Citizens covering the entire population and prepared by households separately for each house numbering unit of local area. With reference to this register, data relating to sample households based on 1/1000 sample have been tabulated in Main Table C-I. The tabulations relating to age groups (Main Tables C-II, C-III, C-IV and C-V) have been based on 10 per cent samples. The ages actually returned

by the persons enumerated have been adopted in these Tables, without applying any smoothing formula. For the age groups, the decennial groups recommended by the United Nations Population Commission have been adopted: they include all the digits with the most favoured digit (0) at the centre, so as to eliminate, as far as possible, the effect of preferences for particular digits.

The data relating to economic classification have been tabulated in three Tables, B-I, B-II and B-III. These correspond to the Means of Livelihood Tables prepared at the 1931 Census, but as already indicated, embody some important changes—the most important of the tabulation changes made at this Census.

- 4. Natural Divisions and State Population Divisions.—Since 1911, it has been usual to tabulate the Ce sus data by what are called Natural Divisions to facilitate the review of the data. These divisions for Madras State used to be: the Agency division comprising all the Agency tracts; the East Coast North division comprising the districts of Srikakulam, Visakhapatnam, East Godavari, West Godavari, Krishna, Guntur and Nellore; the Deccan division comprising the districts of Cuddapah, Kurnool, Bellary and Anantapur; the East Coast Central division comprising the districts of Madras, Chingleput, Chittoor, North Arcot, Salem, Coimbatore and South Arcot; the East Coast South division comprising the districts of Tanjore, Tiruchirapalli, Madurai, Ramanathapuram and Tirunelveli and lastly the West Coast division comprising the districts of the Nilgiris, Malabar and South Kanara. Strictly speaking, for these divisions to be very useful, two conditions must be satisfied:
- (1) Each division must be fairly homogeneous and there must be substantial uniformity in the areas comprising the division, in regard to natural conditions, which have a bearing on population, and
- (2) there must be a significant difference in this respect, between one division and another.

Judged by these tests, the Agency division, the Deccan division and the West

Coast division are undoubtedly suitable, but this cannot be said of the other divisions. Taking for example the East Coast South division, which includes the bulk of the Cauvery delta, the conditions vary substantially from this delta to the uplands in Tiruchirapalli, Madurai and Tirunelveli and comparable conditions can be found only in the Periyar delta in Madurai district and the Tambaraparni delta in Tirunelveli district. Ramanathapuram district has no delta and is entirely an upland area. The South Arcot district included in the East Coast Central division covers the portion of the Cauvery delta to the north of the Coleroon river. The remaining districts in that division are all non-deltaic.

On the whole, apart from the Cauvery delta, there is no sufficient case for distinguishing between the East Coast Central division and the East Coast South division. At the 1951 Census, these two divisions have accordingly been clubbed together and formed into the South Madras division. The East Coast North division, which is now included in North Madras division, is not also homogeneous by any means. From the census point of view, there are substantial differences between the deltaic areas and the upland areas, particularly in the districts of East Godavari, West Godavari, Krishna and Guntur. Most of Nellore district is upland, and the whole of Srikakulam and Visakhapatnam districts falls under the upland category. Again, in the four northern-most districts of the State, viz., Srikakulam, Visakhapatnam, East Godavari and West Godavari, there are Agency tracts. The conditions in these tracts are quite different even from the upland portions in the Plains areas of those districts. The hilly nature of these tracts, the prevalence of malaria and the heavier rainfall make all the difference, particularly the prevalence of malaria. Conditions in the Agency tract and in the rest of these districts are substantially dissimilar. I have, therefore, for purposes of review of the Census data, thought it would be sounder to adopt the state population divisions specified below:-

Code number	Natural Division.	State Population Division.	Districts comprising the State Population Division.			
(1)	(2)	(3)	(4)			
	Madras Deccan Division.		Anantapur districts.			
4-23	West Madras Division.	4.231 West Madras Division	Malabar, South Kanara and the Nilgiris districts.			

Code	Natural Division.	State I	Population Divis	ion.		Districts comprising the State Population Division.
(1)	(2)		(3)			(4)
5-12	North Madras Division.	5-121	Agency tracts	••	••	Agency tracts of Srikakulam, Visa- khapatnam, East Godavari and West Godavari districts.
	Do.	5 ·122	Plains upland	••	••	Srikakulam and Visakhapatnam districts excludin the Agency areas in those districts.
						Upland taluks of East Godavari— Rajahmundry, Peddapuram, Pithapuram and Tuni.
						Upland taluks of West Godavari— Chintalapudi and Kovvur.
				i		Upland taluks of Krishna— Nandigama, Nuzvid and Tiruvur.
						Upland taluks of Guntur district— Palnad, Sattenapalle, Vinukonda, Ongole and Narasaraopet.
						All taluks of Nellore district.
	Do.	5.123	Plains deltaie	••	, •• ,	Taluks of Amalapuram, Razole, Ramachandrapuram and Kaki- nada of East Godavari district.
					•	Narsapur, Tanuku, Bhimavaram, Tadepalligudem and Eluru taluks of West Godavari district.
		ţ			•	Divi, Masulipatnam, Gudivada, Kajkalur, Gannavaram and Vija- yavada taluks of Krishna district, Tenali, Repalle, Bapatla and Guntur taluks of Guntur district.
5.21	South Madras Division.	5.211	Madras City Sp politan.	ecial Me	tro-	Madras City.
	Do.	5.212	Northern belt	••	••	Chingleput, Chittoor, North Arcot, Salem, Coimbatore and South Arcot, except Chidambaram taluk and upland taluks of Tiruchirapalli district—Per mbaiur, Udayarpalayam, Karur, Kolattur, Alangudi and Tirumayam.
	Do.	5.213	Cauvery delta	:	••	Chidambaram taluk of South Arcot district, Tanjore district and the taluks of Kuli talai, Tiruchirapalli, Lalgudi and Musiri of Tiruchirapalli district.
	Do.	5-214	Southern belt	••	••	Madurai, Ramanathapuram and Tirunelveli districts.

It will be seen that these state population divisions substantially satisfy the two tests referred to above. The decision regarding the state population divisions could not be taken early, with the result that the main tables have been tabulated only with reference to the natural divisions, and the state population divisions could not be adopted even for all the subsidiary tables.

It will be noticed that, for obvious reasons, I have treated Madras city as a special State Populatoin Division. Undoubtedly, the City is, in a class by itself, a purely urban area with peculiar conditions of its own.

The Coorg State is a highland situated on the slopes of the Western Ghats with the Mysore plateau on the north and the east and the West coast districts of South Kanara and Malabar on the west and south. Though Coorg has much in common with South Kanara and Malabar districts, it has its own peculiar features, as will be seen from section II. It has been treated as a separate natural division called the Coorg division.

The West Madras division comprises the districts of South Kanara, Malabar and the Nilgiris. The first two districts are situated in the narrow strip of land between the Western Ghats and the sea, while the Nilgiris is a high mountainous area projecting beyond Wynaad and above the Coimbatore plains. This is a division with abundant, regular and dependable rainfall and the country is hilly, except quite near the coast.

The Madras Deccan division is the famine zone of Madras State. Owing to its situation in the middle of the peninsula, it does not get the full benefit of either monsoon and famines are of frequent occurrence, particularly in Bellary and Anantapur districts and the western portion of Kurnool district. The influenza epidemic of 1918 took a heavier toll in these districts than in other parts of Madras State. Outside the Agencies, which are in a class by themselves, this division is undoubtedly the most backward area in the State.

The North Madras division is roughly a long strip lying between the Eastern Ghats and the Bay of Bengal, extending northwards from the northern boundary of Chingleput district to the Orissa border. This division includes the prosperous Krishna and Godavari deltas which constitute an area quite distinct from the rest of the division.

The South Madras division comprises the remaining districts of Madras State including Madras city, and Chittoor. The local rainfall in this region is mostly derived from the north-east monsoon, but it is the south-west monsoon that contributes most to the irrigation of the Cauvery, the Periyar and the Tambaraparni deltas, which constitute the prosperous tracts in this division from the point of view of agriculture.

The main area liable to periodical famines in Madras State comprises the whole of Anantapur district, the eastern taluks of Bellary district and the western taluks of Kurnool district adjoining Bellary district. Inadequate and ill-distributed rainfall in both the monsoons and consequent failure of crops are of frequent occurrence in this area.

5. Cities and towns.—As in the past censuses, towns having a population of 50,000 and over have been treated as cities at the 1951 census. Three towns, viz., Palayamcottai in Tirunelveli district, Pudukottai in Tiruchirapalli district and Ootacamund in the Nilgiris district which have not reached this population limit have, however, been specially treated as cities in view of their importance and urban features superior to those found in towns generally. In classifying towns, the usual definition has been followed, viz., every municipality, all civil lines not included within municipal limits, every cantonment, every other continuous collection of houses inhabited by not less than 5,000 persons, which the Superintendent of Census Operations may decide to treat as a town for census purposes. The classification should of course be made with reference to the physical characteristics of the residential localit es and the bazaar, the relative density of the dwellings and the importance of the place as a centre of trade or for other reasons.

Even large villages with no urban characteristics hould not of course be treated as towns. With reference to these criteria, Collectors were consulted and the 1941 list of towns was scrutinized. As a result of my scrutiny, 58 new towns in Madras State have been added at this census and two former towns have been removed from the list. Some places have been classified specially as towns even though their population may be slightly below the 5,000 limit on the ground that they have definite urban qualifications in other respects.

- 6. Houses.—As regards the statistics of houses given in the tables and discussed in this report, it may be noted that no standard of housing has been adopted and that every dwelling with a separate main entrance has been treated as a house, whether it is a crude little hut, or a substantial building constructed in a luxurious way.
- 7. Census report not written for the 1941 Census.—As already mentioned, elaborate data were collected at the 1941 Census. Retrenchment was, unfortunately, carried too far, and even a brief report reviewing the figures disclosed by the important tables to which the tabulation was confined was not written. Such a gap in the census report series is, undoubtedly, a great handicap for the Superintendents of Census Operations in charge of succeeding censuses.
- 8. Scope of this Report.—I feel that a general census report should not attempt anything more than brief running comments on the data yielded by the census. I propose to confine my remarks accordingly: I shall content myself with indicating the broad conclusions which one can safely draw from the figures, and avoid dealing with points which are not very clear and about which there seems to be room for difference of opinion, and which would therefore be best left to be dealt with by experts. It will be best for the experts at the Centre and in the States to examine the census data from the point of view of their own problems, and to prepare brochures which will be useful to their own departments as well as to Government for the formulation of policies and their implementation in future.

The main tables prepared at this census will be found in Part II of this Volume, and they will be referred to in this report thus: M.T. A-III. The subsidiary tables which have been prepared for the purpose of this report will be found at the end of the appropriate chapter and will be referred to by their numbers thus: S.T. 6·1, S.T. 6·2, etc.

9. Acknowledgments.—My thanks are due to the Collectors, Heads of departments—Central and State—and all the Revenue Divisional Officers and Subordinate officers for their ready co-operation in this great national task which the decennial census represents. I must also express my gratitude to the Chief Commissioner, the Assistant Commissioner and all the officials in Coorg and also to the Presidents of the Mercara and Virajpet Municipalities for their co-operation which made it possible for me to function effectively as the Superintendent of Census Operations for Coorg State also.

My thanks are also due to the Superintendent, Government Press, Madras, and his assistants for their help in carrying out expeditiously the very heavy printing work entrusted to the press.

I must also place on record my gratitude to the A.I.R., Madras, and to the Press for giving very valuable publicity to the Census and for supporting my appeal for public co-operation.

The efficiency of the Tabulation Officers varied, but some of them were quite up to the mark. I must place on record my appreciation of the excellent work done by Sri S. Venkataraman, Sri T. Selvaraj and Sri Gangadharan, Deputy Superintendents in charge of the Regional Tabulation Offices at Mayuram, Palayamkottai and Mangalore, respectively.

Sri S. Venkataraman has given me further valuable assistance in a special manner in connection with the preparation of the subsidiary tables and this report. His mastery of the main and subsidiary tables was invaluable to me; in fact, without his help and resourcefulness, I could not have prepared

this Report within the short time available to me for the purpose. I must place on record my high appreciation of the able and conscientious manner in which he discharged his duties, first as the Deputy Superintendent of the Mayuram Tabulation Office and then as my Office Superintendent in charge of Subsidiary tables and all the miscellaneous data required for the Census Report.

As the Deputy Superintendent in charge of the Regional Tabulation Office at Pallavaram, which dealt with the districte of Madras City, North Arcot, Chingleput and South Arcot, and as the officer in charge of the Central Tabulation Office, a branch of my office, Sri S. Rajam Ayyar has given me most valuable help. I must place on record my grateful thanks to him. His work was characterised by his usual care and thoroughness. I must also place on record my appreciation of the continuous assistance given to me by Sri J. I. Arputhanathan, my Joint Superintendent of Census Operations. who relieved me of most of the routine work of the office and conducted the bulk of the training classes for the enumerators and supervisors.

I am afraid that there are many short-comings in this report, but it has not been possible to do better on account of the limitations under which I have had to work, thanks to my voluntary act in offering my services to the 1951 Census for the Madras and Coorg States in addition to the conduct of the first General Elections based on adult franchise in Madras State. I trust that these short-comings will be put down entirely to my foolhardiness in undertaking this formidable combination of special duties.

SECTION I.

CHAPTER I—GENERAL POPULATION.

Introduction.—Madras State as now constituted, comprises Madras Province as it was at the 1941 Census together with the merged States of Pudukottai, Banganapalle and Sandur and subject to the other changes as specified below:

I. Exchange of enclaves under the Provinces and States (Absorption of Enclaves) Order, 1950 and the India and Hyderabad (Exchange of Enclaves) Order, 1950:—

South Kanara district-Heb- Transferred to Mysore bige, Nagodi and Kotishirur villages.

State.

Anantapur district—Kanaja nahalli, Sarjammanahalli, Kotagarlahalli and Tsautikuntapalli villages.

Do.

district-Morasur, Madivalam, Ettakodi Araleri, Rayasandiram and Tholakanapalli villages.

Do.

Malabar district-Portion of Vadavannur Amsom, Peruvemba, Palathulu, Panyur, Koodalur, Elavancherri, Elapully and Thenari villages.

Transferred to the United States of Travancore-Cochin.

Tirunelveli district-Anjengo, Thangasseri and a portion of Panagudi village.

Do.

Krishna district-Lingagiri, Sarvavaram, Kalavapalli, Lakkavaram, Amaravaram, Ganagalanda, Molugumada, Rompimalla and Mallavaram villages.

Transferred Hyderabad State.

The following enclaves were absorbed in Madras State from other States:

Mysore State—Varadikoppa, Bayappa Reddihalli, Jodi Volgala Koppa, Kayamgattaharakehinnapalli, Gallahalli, Hosepeta and Chinnaradoddi villages. Absorbed in Chittoor district.

Mysore State—Jodikasinayakanahalli, Gowripura, Jodibommanahalli, Bommagatta, Sarvainam, Obalapuram, Devarabuddenahalli villages.

Absorbed in Bellary district.

Mysore State-Koladasanapura village.

trict.

Mysore State-Badagalpur village.

Absorbed in Coimbatore district.

United States of Travancore-Cochin—Portions Nallipulli. Chittoor, Tatamangalam and Vallangi villages.

Absorbed in Malabar district.

Absorbed in Salem dis-

Hyderabad State-Kodavati-Absorbed in Krishna kallu, Ustepalli, Partala, Gani Atkur, Mogulur, Batdistrict. tinapadu, Ganugupadu, Boravancha Mallavalli and Pullapadu villages.

II. Visakhapatnam district was bifurcated into two districts, viz., Srikakulam and Visakhapatnam in 1950. The Polavaram taluk, which is mostly Agency, and which lies to the west of the Godavari river, was transferred from East Godavari to West Godavari district and included in the contiguous Kovvur revenue division of the latter district. Fourteen villages that had been transferred from Dindigul taluk of Madurai district to Karur taluk of Tiruchirapalli district were re-transferred to Dindigul taluk during the decade 1941-51. About 15 square miles were added to the Ramanathapuram district from Madurai district. From Chingleput district, about 11 square miles were transferred to Nellore district, while about 19 square miles in Chingleput district comprising Saidapet Municipality and some other suburbs of Madras were included in Madras City.

The area of Madras State is 127,790 square miles, including the merged States of Pudukottai, Banganapalle and Sandur. This discloses an increase of 22 square miles over the 1941 figure which is due to the exchange of enclaves referred to above and the adoption of the latest figures furnished by the Surveyor-General of India.

2. Growth of population.—The population of the State as revealed by the 1951 Census is 57,016,002 that is, it has increased by 14.4 per cent during the decade 1941-51. percentage increases during the previous decades were 11.6 per cent in 1931-41; 10 per cent in 1921-31; 2.5 per cent in 1911-21 and 7.9 per cent in 1901-11. The net increase for the fifty years 1901 to 1951 was 20,340,446 or 55.5 per cent. It is a safe conjecture that the increase during 1911-21 would not have lagged behind that of 1901-11, but for the influenza epidemic of 1918. There is no room for doubt that there has been a tendency for a steady growth of population after 1921. The figures for the State and for the natural divisions are given north-east monsoon that is fickle and below:-

Percentage increase in

[Statement No. 1.]

A	population.						
Area.	. (1941-51, 1931-41, 1921-3					
(1)		(2)	(3)	(4)			
Entire State		14.4	11.6	10.0			
Deccan Division		12.4	10.8	10.3			
West Madras Division		20.5	11.6	13.5			
North Madras Division		13.3	11.6	12.1			
South Madras Division		14.0	11.7	8.3			

M.T.—A. I S.T.—1·2

Undoubtedly the most important factor contributing to the growth of the population has been the elimination of the effects of famines and distress arising from the seasonal vicissitudes through the activities of Government and the increasing effectiveness of the measures taken for the general improvement of public health, in particular for the prevention and control of epidemics, thanks to the work of the Public Health department since 1922, when that department was started.

The decade 1941-51 had not only its normal share of unfavourable seasons, but also witnessed a very unusual and serious succession of bad years from 1947-48 (from fasli 1357), resulting from the failure of the north-east monsoon. The latter statement is confirmed by the rainfall figures extracted below:

RAINFALL IN INCHES. Madras State.

[Statement No. 2.]

Year.	South-west monsoon (7th June to 26th Sep- tember).	North-east monsoon (27th Sep- tember to 31st January	Hot weather (1st February to 6th June).
(1)	(2)	(3)	(4)
Average of a series of years ending with— 1940 1941-42 1942-43 1943-44 1944-45	68·29	41·89	14·16
	56·29	46·57	13·64
	63·84	40·60	32·14
	57·89	50·39	21·43
	65·03	54·46	12·89
1945-46 1946-47 1947-48 1948-49 1949-50	60·09	36·71	17.01
	68·34	73·21	16.92
	73·49	31·58	13.53
	62·61	39·40	21.88
	76·31	28·39	18.24

The south-west monsoon in this State is on the whole a steady and dependable monsoon, though failure of crops occur in the Ceded Districts (Deccan Division) periodically due to failure of this monsoon also. It is the

undependable and shows wide variations from year to year. It is the monsoon on which the bulk of the upland areas including upland irrigation sources in the State depend. A series of failures of this monsoon cannot therefore but seriously affect the food production in a large portion of the State. It is well known that the distribution of rainfall is not of less importance than the total quantity of rainfall. Thus, in 1945-46, though the total rainfall in the State due to the northeast monsoon was only 5 inches below the average, the season was mainly adverse and there had to be an increase in land revenue remissions.

3. Seasonal conditions and prices of foodgrains.—In an agricultural country like India, a review of the seasonal conditions is very relevant when considering the growth of population. The following brief notes have been prepared from the official Jamabandi Reports and the Season and Crop Reports for Madras State: --

1931-41.

Fasli 1341 (1931-32).—Season fairly Takkavi loans Rs. 12.38 satisfactory. Seasonal remissions Rs. 12.56 lakhs.

Fasli 1342.—Season fairly satisfactory on the whole and better than in the previous

Fasli 1343.—Season fairly satisfactory, though not as good as the previous year. Seasonal remissions Rs. 13:73 lakhs. Takkavi loans Rs. 7.55 lakhs. The Government remitted 12½ per cent of the land revenue of fasli 1342 in ten districts and in portions of three districts of the Presidency, the collection of which had been suspended on account of the general economic depression. In view of the continued fall in the prices of agricultural products, the Government remitted 61 per cent of the dry assessment in all the districts and 121 per cent of the assessment on wet lands in areas in which the re-settlement rates were introduced in or after 1918-19, and 93 per cent of the assessment on wet lands in the other areas. The total amount so remitted on account of the depression was Rs. 61.62 lakhs for fasli 1343.

Fasli 1344.—The season for the Presidency as a whole was fairly satisfactory outside the Deccan. Relief operations under the Famine Code were started in parts of Bellary and Anantapur districts. Seasonal remissions Rs. 31.76 lakhs. Remissions had to be granted both on dry and wet lands in the affected areas in Anantapur and Bellary districts. Special all-round remission granted on account of the general economic depression amounted to Rs. 55.45 lakhs. Takkavi loans Rs. 9.19 lakhs.

Fasli 1345.—Season fairly satisfactory. Seasonal remissions Rs. 22.8 lakhs. The amount remitted on account of the low level of prices of agricultural products Rs. 59.45 lakhs. Loans advanced Rs. 9.83 lakhs.

Easli 1346.—Season fairly satisfactory. Seasonal remissions Rs. 20.44 lakhs. Remission of dry assessment in parts of Bellary, Anantapur and Kurnool districts. Land revenue remissions on account of continued low level of prices of agricultural products granted to the extent of Rs. 52.02 lakhs. Loan advances Rs. 12.14 lakhs.

Fasli 1347.—Season fairly satisfactory outside parts of the Deccan. Parts of the Deccan suffered from famine. Parts of Bellary, Kurnool and Anantapur districts were affected. Seasonal remissions Rs. 23·13 lakhs. Special remissions for depression Rs. 71·4 lakhs. Remission of dry assessment in the affected parts of Kurnool, Anantapur and Bellary districts was granted. Loans advanced Rs. 9·54 lakhs.

Fasli 1348.—Season generally unsatisfactory, and particularly disappointing in parts of the Central districts. Famine relief in parts of Coimbatore district. Seasonal remissions Rs. 51.93 lakhs. Depression remissions continued (amount involved Rs. 67.07 lakhs). Dry remissions in parts of Anantapur, Chingleput, Coimbatore, Tanjore and Tirunelveli granted. Loans advanced Rs. 17.34 lakhs.

Fasli 1349.—Though better than the previous year, the seasonal conditions continued to be disappointing in Visakhapatnam, Ramanathapuram, Tirunelveli and North Arcot districts. Distress in parts of Chingleput district. Seasonal remissions Rs. 22·54 lakhs. Depression remission continued (amount Rs. 70·11 lakhs). Loan advanced Rs. 14·49 lakhs.

Fasli 1350.—Season favourable and better than the previous five years. Seasonal remissions Rs. 6·38 lakhs. Depression remissions continued (amount involved is Rs. 74·31 lakhs). Loan advances Rs. 5·93 lakhs.

It will thus be seen that during the decade 1931-41, the seasonal conditions

were on the whole fairly satisfactory, but agricultural prosperity was affected to a noticeable extent, by the all-round economic depression.

1941-51.

In 1941-42, the season was not favourable and large seasonal remissions had to be granted, including remissions of dry assessment in Kurnool and Bellary districts.

1942-43 was not a good year owing to inadequate and ill-distributed rainfall during both the monsoons and the consequent failure of crops. Famine relief operations had to be started in Kurnool, Bellary and Anantapur and also road works in Cuddapah district. Land revenue remissions had to be granted on a large scale.

1943-44 was a much better year than 1942-43 and the relief works started during the previous year were closed.

1944-45 was fairly satisfactory and there was no need for any famine relief operations. There was a decrease in the land revenue remission granted.

In 1945-46, owing to the adverse seasonal conditions already referred to, relief measures had to be taken in parts of Anantapur and Bellary and the whole of Rapur taluk in Nellore district, and land revenue remissions had to be increased. The southwest monsoon was late and insufficient and a severe cyclone destroyed the ripening crops in the Godavari and Krishna deltas in the early stages of the north-east monsoon. The Southern and Central districts received a scanty rainfall. These causes led to a large deficit in food production.

In 1946-47, the season was generally fair, except in parts of the Deccan division and land revenue remissions were appreciably reduced.

From 1947—48 and up to the time of the 1951 Census, there was a serious failure of the north-east monsoon. The failure of crops was particularly serious in the South Madras division. The north-east monsoon is fickle, as stated already, but it does not usually fail in this way for so many successive years. Large scale remissions had therefore to be granted every year since 1947—48, and road and irrigation works were taken up on a large scale for relief of unemployment. Relevant figures relating to seasonal remissions and takkavi advances to cultivators

taken from the annual Jamabandi Reports of the Board of Revenue are given below:—

Statement showing seasonal remissions granted and advances made to agriculturists during the decade 1941-50.

[Statement No. 3.]

Fasli.	Seasonal remissions granted (in lakbs).	Advances made under the Madras Land Improvement Loans and Agriculturists Loans Acts (in lakhs).

Figures taken from the Season and Crop Reports of Madras State.

 Not available in the Season and Crop Report for 1931–32.

It will be seen that, while during the decade 1931-40 the level of prices of agricultural products was low on account of the general economic depression, the decade 1941-50 saw a rapid mounting up of prices.

During the war, prices recovered from the depression and the shooting up of prices became more pronounced after the war. ...

The decade 1941-51 was definitely unsatisfactory from the point of view of seasonal conditions, but Governmental action, which under modern conditions can be taken in time and is never grudged, did not allow these adverse conditions to have any serious effect on the health of the people. During the first part of the decade, World War II was waging; but actually economic conditions were worse after the war ended, and controls had to be introduced and enforced to meet the situation caused by the serious shortages of consumer goods and scarcity of even food. The existence of food control made it easy for the Government to deal effectively with the situation caused by the serious failure of the north-east monsoon referred to above. Throughout, the decade was one of high prices, and was therefore, on the whole, a prosperous one for the agriculturists. There were thus a number of factors effectively counteracting the consequences of the adverse seasonal conditions with the net result that conditions during the decade were actually favourable to the normal growth of population.

As will be seen later, there is nothing in the rate of natural increase, i.e., the excess of the birth-rate over the death-rate, to explain the jump in the rate of growth of population from 11.6 per cent in the decade 1931-41. to 14.4 per cent during the decade 1941-51. It seems to me, on an examination of all the data available, and which I shall refer to later in this report, that the increase in the rate of growth during 1931-41 (i.e., 11.6 per cent as against 10 per cent in the previous decade) would have been larger but for the very considerable emigration to Ceylon and Malaya, which took place during this decade: It was only in 1939, that a ban on the emigration of unskilled workers to these countries was imposed. Large numbers of Madrasis remained in a number of countries outside India, notably Burma, Cevlon, the Federaration of Malaya and the Colony of Singapore, and the exodus back to their homes did not start till after 1941. The figures of the 1951 Census have thus been swollen by the large number of emigrants who have returned from these countries. I think the explanation for the jump in the rate of growth from 11.6 per cent during 1931-41 to 14.4 per cent during 1941-51 is largely to be found in the fall in emigration.

4. A review of the growth of population in each district between 1941 and 1951.—It will be useful to examine in some detail the factors which have affected the growth of population in each district during the decade 1941-50. As already mentioned, the population of the State has increased by 14.4 per cent during this decade. The corresponding figures for the divisions are 12.4 for the Deccan division, 20.5 for the West Madras division, 13.3 for the North Madras division and 14.0 for the South Madras division. These are differences which one would expect to find with reference to the description of these divisions given in the Introductory Chapter.

The North Madras and South Madras divisions are, as already explained, not homogeneous tracts, and the figures relating to them can be usefully examined only by districts.

The following review has been prepared after consultation, wherever necessary, with the Collectors and the Director of Public Health. The taluk figures referred to in the review will be found in the Main Table 'E'.

Cuddapah district.—The district population has increased by 10 per cent. The increase in the taluk populations ranges from 4.4 per cent in Kamalapuram to 18.2 per cent in Proddatur. The large increase in the Cuddapah and Proddatur taluks, by 18.1 per cent and 18.2 per cent, respectively, has been offset by the abnormally low increase in the taluks of Jammalamadugu 5.8 per cent, Badvel 5.3 per cent, Pulivendla 7-1 per cent, Kamalapuram 4-4 per cent and Rajampet 5.9 per cent. The last mentioned tive taluks are dry taluks and rainfed, without many irrigation sources, and owing to the adverse seasonal conditions, there has been an appreciable migration from the adjoining taluks to Proddatur town where the population has increased by 35.8 per cent. There has been a similar migration to Cuddapah town where the population has increased by 32.5 per cent. Rajampet taluk was affected by floods and many labourers have migrated from this taluk to work in the Tungabhadra Project works in Bellary district.

Kurnool district.—District increase: 6.7 per cent. The variations in the taluk populations range from-2.6 per cent in Banganapalle to + 12.0 per cent in Nandyal. There was actual decrease or only a slight increase of population in the following taluks as shown

below and this accounts for the small increase of population in this district:—

Name of tale	decr	ntage ease/ ease.	
Pattikonda		+	0.03
Dhone		+	3.6
Banganapalle		_	2.6
Koilkuntla		_	0.4

The district is malarial and is in the famine zone and the figures for these taluks reflect the cumulative effect of malaria and adverse seasonal conditions.

Bellary district.—District increase: 16.4 per cent. This jump from 8.5 in the previous decade is largely due to Hospet and Bellary taluks which have registered an increase of 62.8 per cent and 22.1 per cent The variations in the taluk respectively. populations range from 6.1 per cent in Sandur 62.8 per cent in Hospet. The spectacular increase in the Hospet taluk is of course due to the large labour population from other districts attracted by the Tungabhadra Project works, the dam-site being close to Hospet town. Many families who had their homes in the submersible areas of Hadagalli taluk have shifted their permanent residence to Hospet taluk. There has also been some immigration into this taluk owing to the Razakar trouble in Hyderabad State, just across the Tungabhadra river. The large growth in Bellary taluk is due to Bellary town which is the district headquarters and has all modern amenities including educational and medical facilities and it is one of the two important trade centres in the district, the other centre being Adoni.

At the other end is Sandur taluk which has the lowest growth rate in the district, viz., 6·1 per cent. This is a newly formed taluk comprising the entire 'merged' area of Sandur State and some adjoining firkas of Hospet and Kudligi taluks. This is a backward, interior taluk, and there is a large area under hills and forests and it is malarious. The manganese mines in this taluk have not attracted any large population and the taluk is handicapped by inadequate internal road communications.

Anantapur district.—District increase: 16.8 per cent. The variations in the taluk populations range from 4.0 per cent in Tadpatri to 21.7 per cent in Kalyandrug. In spite of this district being in the famine zone, the taluks in this district have recorded large increases ranging from 13.3 per cent to 21.7 per cent with the exception

of Tadpatri taluk which has registered a low increase of 4.0 per cent. It is a dry and healthy tract, and the large increase in the population of this district is evidence of the effective manner in which Governmental activities have been counteracting the effects of adverse seasonal conditions. While the area under food crops has decreased during the decade, that under commercial crops has increased: the decade was one of general prosperity and there has been an increase in the total area under cultivation in the district. The Tadpatri taluk is a black soil area, depending mostly on rainfed crops. It is one of the taluks visited by famine periodically. Due to adverse seasonal conditions in 1950, a large number of families belonging to the labouring classes left the taluk in November 1950 and did not return to their homes till May or June 1951. temporary emigrants went to the Tungabhadra Project works in Bellary, Cuddapah and Kurnool districts, and also hired themselves out as labourers for picking cotton and harvesting groundnut, etc., in Bellary, Cuddapah and Kurnool districts.

Nilgiris district.—District increase: 48.7 per cent. The variations in the taluk populations range from 33-1 per cent in Gudalur to 63.9 per cent in Ootacamund. This district has the largest percentage of persons born outside its limits. Apart from the large labour population attracted by the tea and coffee estates, the immigrant labour population has increased on account of the two major hydro-electric schemes which have been in progress in this district, and a large extent has been brought under cultivation under the Grow More Food campaign for the cultivation of potatoes and English vegetables. The large percentage increase in the population is, therefore, nothing surprising.

Malabar district.—District increase: 21·1 per cent. The Laccadive and Minicoy Islands have registered an increase of 14·9 per cent though these are backward and unattractive islands. In the mainland, leaving out Wynaad taluk and the small taluk of Fort Cochin, which consists practically only of Fort Cochin Municipality, the increase in the population of the taluks has ranged from 15·6 per cent in Ponnani to 26·9 per cent in Kozhikode. The hilly interior areas in Kozhikode, Kurumbranad, Kottayam, Chirakkal, Ernad and Walluvanad taluks, where there is considerable virgin land, have attracted a large emigrant

population from Travancore-Cochin. In Wynasd taluk, there has been an increase of 59.2 per cent. There is a colonization scheme here and a large number of immigrants have settled down. The marked increase in Palghat taluk (18.2 per cent) is partly attributable to the large influx of labourers to the major irrigation works such . as the Malampuzha Project, Cheramangalam, etc. The increase in the northern taluks is larger than in the southern taluks, mainly due to the fact that the immigration into the northern taluks, especially to the Wynaad taluk, has been on a larger scale than into the southern taluks as the former has vast areas of undeveloped lands and the better communications and medical facilities have had a greater attraction for immigrants.

Another relevant fact is, that since 1946, birth rates in Malabar have been much higher than for the State as a whole while the death rates have been distinctly lower than for the State as a whole, as will be seen from the figures given below:—

Statement No. 5.

		Madras	State.	Malabar district.		
Average.		Birth rate.	Death rate.	Birth rate.	Death rate.	
(1)		(2)	(3)	(4)	(5)	
1941-45		32 ·8	24.6	29.67	23.99	
1946		34.0	20.3	34.57	16.07	
1947	• •	34.0	20.9	36.69	15.95	
1948		32.3	18-7	35.96	15.51	
1949	4.	32.3	17-4	35.04	14-21	

The general conditions affecting the growth of population are similar in the Travancore-Cochin State which is similarly situated in the West Coast. It is not, therefore, surprising that that State should have shown a similar high increase, viz.; nearly 24 per cent for the 1941-51 decade. During the previous decades, both Cochin and Travancore States registered quite a large increase as may be seen from the figures below:—

	State.	1921-30.	1931-40	
Cochin			 23-1	18-1
Travancore			 27.2	17-1

The large increase in Malabar district is also partly attributable to the fall in emigration and to the return of emigrants on a large scale from Burma, Ceylon and Malaya.

South Kanara district.—District increase: 14.9 per cent. The Amindivi Islands have registered an increase of

14 per cent which is about the same as that registered by the Malabar islands, where conditions are exactly similar. The increase in the mainland taluks has ranged from 10.1 per cent in Puttur taluk to 20.1 per cent in Kasaragod taluk. The large increase in Kasaragod taluk is due to the fact that undeveloped areas in this taluk which had been practically fallow till 1941, attracted during the decade. number of settlers large from Travancore-Cochin State. The increase of 15.3 per cent in Mangalore taluk is nothing surprising, seeing that the headquarters of this taluk, viz., Mangalore is also the district headquarters and also a Port with considerable trade and industrial activity. Next to Mangalore, Udipi is the most important place in the district and the taluk is a prosperous one. There has been some industrial development in this taluk, and next to Mangalore it is the most advanced taluk in the district. Udipi town, apart from being a famous religious centre, is also an educational centre and a meeting point of roads leading to Coondapur in the north, Mangalore in the south and Karkal and Puttur in the south-east. The increase of 16.1 per cent in Udipi taluk is thus fully explicable. Karkal, Puttur and Coondapur contain more hilly areas and the villages near the Ghats are malarious. This explains the smaller increases, viz., 10·1 per cent in Puttur taluk, 12 per cent in Karkal taluk and 10.6 per cent in Coondapur taluk.

Srikakulam district.—District increase: 5.4 per cent. The increase in the plains area is 5.7 per cent. The variations in the taluk populations in the plains area range from 1.1 per cent in Pathapatnam to 11.3 per cent in Srikakulam. This is a backward district with malaria, both in the coast in the eastern part of the district, and in the Agency tracts on the western side of the district. There has been neither industrial activity nor agricultural prosperity to promote any large increase in population. For these reasons, and owing to the fact this is a deficit district, there has been emigration on an appreciable scale. From Pathapatnam taluk, there has been migration to Parlakimedi in Ganjam district in Orissa State, which is a surplus area for rice. From Tekkali taluk, owing to the failure of crops during the four years preceding the Census, there was migration from the coastal area to West Bengal, notably to Calcutta and Kharagpur and to Assam. There is no

taluk in this district, which is entirely Agency. The Agency portions of Parvatipur and Salur taluks have shown decreases of 9.7 per cent and 18.3 per cent, respectively, while the Agency portion of Palakonda has registered an increase of 10 per cent. The plains portions of these same taluks have registered increases of 9 per cent, 4.3 per cent and 6.3 per cent, respectively.

Visakhapatnam district.—District increase: 13.1 per cent. The plains portion has shown an increase of 13.5 per cent, while the Agency portion has registered an increase of 9.5 per cent. Visakhapatnam taluk has shown an increase of 43.8 per cent. The circumstances, which have led to the appreciable increase of population in this district are, the growth of Visakhapatnam town, which has a harbour and a shipbuilding yard employing a large number of labourers, the development of the Agency tracts and the return of the emigrants from Burma. Bheemunipatnam has recorded only an increase of 5'7 per cent, as it is a dry and backward taluk, and owing to food scarcity there has been emigration. The coastal taluks of Visakhapatnam, Anakapalle and Sarvasiddhi are about the average of upland areas in the Northern Circars. The interior taluks are not so well off, while further west, there are the Agency tracts, which are very hilly and malarious. These explain the variations in the growth rates in the taluks of this district. The large increase of 19.9 per cent in the Srungavarapukota Agency is due to the colonization of Araku valley, promoted by the Government and large road works which attracted labourers from the plains and even from other districts. The Golugonda and Gudem Agencies show moderate increases of 7.8 per cent and 7.3 per cent, respectively, while the population in the Veeravalli Agency is practically stationary. (It has shown a decrease of 4 persons.)

East Godavari district.—The agency portion has recorded an increase of 11.4 per cent, while the upland and deltaic portions have recorded increases to the extent of 20.8 per cent and 14.2 per cent, respectively. The variations in the taluk populations in the agency tracts range from 8.6 per cent in Yellavaram to 16.1 per cent in Nugur. The variations in the upland taluks range from 14.9 per cent in Peddapuram to 27.5 per cent in Rajahmundry; in the deltaic taluks the variations range from 11.8 per cent in Amalapuram to 19.9 per cent in Kakinada.

Yellavaram Agency has shown only a moderate increase of 8.6 per cent. In Bhadrachalam, Chodavaram and Nugur taluks, which are all in the Agency tracts, as well as in the Rajahmundry taluk, there has been large extension of cultivation of Virginian tobacco and labourers from the plains have migrated into these areas. This accounts for the larger increase in population in these taluks. At the time of the Census enumeration there were many labourers, who had come from the plains for harvesting the tobacco crop. In Bhadrachalam and Nugur taluks there have also been immigrants from the plains, who have settled down for cultivation purposes, there being large extents of uncultivated land in these areas.

In Rajahmundry taluk, labourers from Visakhapatnam and Guntur districts have come for working under the Indian Leaf Development Co., and other Tobacco tobacco companies. There are also immigrants, who have settled down in the upland area of this taluk for cultivation. The fact that East Godavari is a large surplus district for rice is another attraction for immigrants. There has been a large increase of population in Rajahmundry Municipality which is a vital trade centre of this district, as it is at the head of the Godavari Eastern delta and also the most convenient centre for timber and all forest produce from the Agency tracts. It is also a large educational centre. and the headquarters of the District Judge. The Andhra Paper Mills, which is now owned and managed by the State Government, has attracted an increased number of workers and other employees. The large increase of 27.5 per cent in the population of Rajahmundry taluk cannot, therefore, be a matter for surprise. In Pithapuram as well as in Tuni taluks, there are large numbers of migrants from the Visakhapatnam district, which is a deficit district for food. Tuni has a large market and is a trade centre, through which a considerable amount of Agency produce is disposed of. This has attracted a large number of immigrants from the adjoining Visakhapatnam district, and this explains the large increase of 22.3 per cent in this taluk. The delta taluks are prosperous, but they have shown only moderate increases, except for Kakinada taluk, which has registered an increase of 19.9 per cent. Apart from the growth of population in Kakinada town, which is the district headquarters, and a trade and educational centre, large numbers of evacuees from Burma have settled down in this taluk and there are also labourers from Visakhapatnam district.

West Godavari district.—The Agency area has shown an increase of 14.4 per cent, while, in the plains, the upland area has shown an increase of 18.5 per cent and the delta an increase of 15.4 per cent. The district as a whole has shown an increase of 15.9 per cent. The taluk increases range from 12.3 per cent in Tanuku to 21.3 per cent in Eluru taluk. Polavaram is the only Agency taluk in this district, but except in the north-east portion of the taluk beyond Polavaram town and to the east of a line drawn from Kannapuram to Jeelugumilli, the area is hardly different from the adjoining plains area. In the uplands generally, there has been a large extension of tobacco cultivation which has attracted emigrants from other taluks. There has been considerable cultivation of dry and garden crops also in the uplands by immigrants from the deltaic areas. In Chintalapudi taluk, the immigrants have been attracted by large blocks of waste lands which are being cultivated with commercial and garden crops. Large numbers of immigrants from other taluks in this district and even from other districts have settled down at Kovvur and Nidadavole which have grown in importance on account of their convenient situation on the railway—the former is just across the Godavari river from Rajahmundry and the latter is a railway junction—and the tobacco trade. Eluru is a large municipality and is also the district headquarters. Both at Eluru and Bhimavaram, educational facilities have been expanded—there are now colleges in both these townsand this has attracted a large number of immigrants into these towns. The large increase in population in these taluks, 21.3 per cent and 16.7 per cent respectively, is largely due to this increase in the urban population. Tanuku and Narasapur taluks have shown only a small increase, viz., 12.3 per cent and 13.3 per cent respectively. as one would expect to find in a congested deltaic area where every available inch of space has been taken up for cultivation. In fact, the increase in rural population in these taluks is small, viz., 8.6 per cent and 6.2 per cent, respectively, and the larger increase has been in the urban population.

district.—District increase: Krishna 22.7 per cent—17.4 per cent in the uplands and 24.7 per cent in the deltaic area. The taluk increases range from 15.4 per cent in Gudivada taluk to 43.8 per cent in Vijayavada taluk. The large increase in the district is in fact due to the very large increase in Vijayavada taluk (43.8 per cent) which again is due to the enormous increase (77.8 per cent) in Vijayavada Municipality. It is not surprising that the smallest increase is in Gudivada taluk which is the most congested deltaic area in the district. Being a heavily surplus district in food, this district has been benefited by the increases in food prices during the decade. The profitable nature of groundnut cultivation and the cultivation of Virginian tobacco have made a lot of difference to the uplands. In Nuzvid taluk, there has been disafforestation on an appreciable scale and cultivation of the disafforested lands with groundnut. Groundnut cultivation proved so profitable that it spread not only in the uplands but also in the delta. The increase of population even in Kaikalur taluk (20 per cent) is attributable partly to groundnut cultivation and partly to the larger area cultivated with paddy in the Collair lake area. Considerable numbers of landless poor have migrated into this taluk from Guntur district and have taken part in the extension of paddy cultivation. The enormous growth of Vijayavada Municipality is nothing surprising. It is at the head of the Krishna delta and is one of the most important railway junctions in India. The Railway Colony has considerably expanded, and the town has been growing in importance as a commercial centre. There has been also a large increase in the number of rice mills. Metal quarries in and around the city have led to immigration not only from the surrounding villages but from Guntur district also. Apart from the large numbers of labouring classes attracted by a growing town, considerable numbers of the landed gentry have migrated into this town from rural parts of the district, partly for the education of their children and partly on account of the attraction of urban facilities and amenities in this important and convenient town in the district.

Guntur district.—District increase: 12
per cent—4·1 per cent for the uplands area
and 19·5 per cent for the delta. The figures
for the fully upland taluks range from 0·2
per cent in Palnad taluk, 2 per cent in Vinukonda taluk, 3·7 per cent in Sattenapalle

taluk, 4.5 per cent in Narasaraopet taluk, to 7.1 per cent in Ongole taluk. These figures reflect the comparative conditions in these taluks. Conditions in Palnad and Vinukonda are similar to those in the adjoining areas of Kurnool district and these taluks are equally liable to be affected by adverse seasonal conditions. They are both backward and interior taluks. Between these taluks on the extreme west and the delta are to be found the good upland areas of the district where dry crops can yield very well indeed in a good year, but the upland area of this district is liable to periodical adverse seasonal conditions. The delta in this district is part of the Krishna delta, the other part of which lies in Krishna district to the east of the Krishna river, but it has no large outstanding town comparable to Vijayavada; otherwise, the conditions in the two parts of the Krishna delta are not materially different. The difference in the rate of increase in these two deltas, viz. 24.7 per cent in Krishna district and 19.5 per cent in Guntur district is therefore explicable. In all the upland taluks, the seasonal conditions were adverse during the year 1950-51, with the result that large numbers of the labouring classes migrated to deltaic areas in search of work and food. On account of terrorist Communist activities there was some panicky migration to towns outside these taluks from villages where some outrages took place.

Nellore district.—District increase: 10-4 per cent. The deltaic area constitutes only a small portion of the district, and it is mostly in the taluks of Kovur and Nellore. The rest of the district is of the poor upland type, very liable to periodical failure of rains, particularly in the western taluks of Venkatagiri, Rapur, Udayagiri, Kanigiri and Darsi. The prosperous portion of the district is the eastern portion which is served by the Madras-Calcutta Railway line and the Great Northern Trunk Road from Madras to Calcutta. The taluk figures of increase correctly reflect the conditions in the various taluks. It is no wonder that Kovur, which is the cream of the Pennar delta, shows the largest increase in rural population, viz., 20.6 per cent, Nellore taluk coming next with 14.8 per cent. But Nellore taluk has shown a larger increase of population than Kovur taluk (22.7 per cent against 17.1 per cent) which is of course due to the growth of the headquarters town of Nellore. Owing to the failure of the monsoon in the years since

1947-48, there has been a large-scale migration of the labouring classes to the deltaic areas.

Sulurpet taluk has shown an actual decrease of population to the extent of 4.4 per cent, and the position would have been worse but for the growth of the two towns in this taluk, viz., Sulurpet and Nayudupet. which are weaving and dyeing centres and are conveniently situated on the Madras-Calcutta Railway line and road. The coastal villages are malarial and filarial and vast areas are unfit for cultivation. The main occupation of the people in the coastal area is cutting and export of firewood to Madras and other places outside the taluk. The major portion of the forest growth has been cut and removed and most of the population in these areas has, in consequence, migrated to Madras City and other areas in Chingleput district. The rest of the taluk depends mainly on rainfed dry crops, but on account of the failure of the north-east monsoon for a number of years as already mentioned, large numbers of the labouring classes have migrated to the mica mines in Gudur and Rapur taluks and the deltaic areas further north. In Venkatagiri taluk, conditions are exactly similar to those in the adjoining noncoastal areas of Sulurpet taluk, and there has been a similar migration of labouring classes. Owing to acute shortage of yarn, about 2,000 weavers migrated to Nellore town in January 1951 from Venkatagiri town. Rapur taluk has shown an increase of 7.4 per cent, and this is largely due to the mica mines; otherwise, it would have fared almost like Venkatagiri taluk which has registered an increase of only 1.1 per cent. Gudur taluk has achieved an increase of 11 per cent, due largely to the mica mines in the taluk and the growth of Gudur town which is the headquarters of the mining interests and is conveniently situated on the Madras-Calcutta road and is also the Railway junction connecting the Madras-Calcutta line with the branch line to Katpadi in North Arcot district through Chittoor district. From both Udayagiri and Darsi taluks, which are poor and backward, there was considerable migration of labouring classes on account of the failures of the north-east monsoon. The low increases of 8-1 per cent and 5-1 per cent for these taluks cannot, therefore, cause any surprise.

Madras City.—The population of the city has increased by 60.6 per cent, the largest increase in any district in the State.

This is the increase for the adjusted population of the city, i.e., for the population within its present limits. As already mentioned, these limits were extended during the decade by the addition of about 19 square miles, including Saidapet Municipality and some adjoining suburban areas on the south and west from Chingleput district. There is naturally a large immigrant population always in a place like Madras. which is the headquarters of one of the major States of India. From 1942, there has been an abnormal flow of immigrants from other districts in the State, particularly from the adjoining districts of Chingleput, North Arcot and South Arcot, for educational facilities and the urban amenities available in the premier city of the State. Owing to the failure of the north-east monsoon for a number of years in succession from 1947 onwards, there has been a large immigration of labouring classes from the adjoining districts referred to above in search of work and food. The immigrants include also 3,902 displaced persons from Pakistan. who have settled down in the city. The elaborate and successful statutory rationing which was in force in Madras City till recently was definitely one of the reasons which attracted immigrant families who could afford the cost of living in the city and who found that, by living in Madras, they could secure regular and adequate supplies of consumer goods more easily than in any other part of the State. Apart from being the headquarters of the State Government, Madras is a great railway and trade centre and is served by a useful and important harbour. There has been some industrial development also as will be mentioned later in this report. The present population of the city is 14.16 lakhs as against 7.77 lakhs in 1941.

Chingleput district.—District increase: 8.3 per cent as against 9.6 per cent in the previous decade. The seasonal conditions have been very adverse since 1947-48 owing to the continued failure of the north-east monsoon and this has made a lot of difference: the seasons were much more satisfactory during the previous decade. This explains the smaller increase of population during the present decade. Madurantakam as usual was the taluk most affected by the adverse seasonal conditions. From this and other taluks, there has been considerable migration to Madras City. In Madurantakam taluk, the tappers from a number of villages have migrated to Madras

City and other areas and some even to Mysore in search of employment. Excluding Saidapet taluk which is referred to below, Ponneri taluk has shown the largest increase (11.3 per cent). The increase in the rural area in Ponneri taluk is only 8.5 per cent which is only about the district average, while, in the urban area, the increase is 80·1 per cent. Of the three towns in this taluk, there has been a large increase in Arani which is an important weaving centre and a still larger increase in Ponneri town which has attracted emigrants on account of the educational facilities (High School) available and a number of families who left Madras City during the evacuation period have continued to stay on there, as it is conveniently connected by rail with Madras City. In Sriperumbudur taluk, there has been an actual decrease (2.2 per cent) in the rural population, while, in Kancheepuram, the increase in the rural population is only 1.5 per cent. In Chingleput taluk also the rural population has decreased (1.6 per cent). All these figures undoubtedly reflect the migrations resulting from the adverse seasonal conditions since 1947-48.

Saidapet taluk presents a contrast, as its population has increased by 36.7 per cent. Its urban population has decreased by 29.2 per cent. This is of course due to the transfer of Saidapet Municipality to Madras City. The spectacular increase in the rural area (131.9 per cent) is due to the fact that there is, in the suburban area in Saidapet talukup to Tambaram in the south, Ennore in the north and Avadi in the west-a large population which depends for its work on Madras City but resides in these areas for want of accommodation in the City proper. Many workers in Madras City prefer to live in their own or rented buildings in the suburbs rather than in the congested City. These suburban areas are well connected by rail and bus with the City. The suburbs extending up to Tambaram are the most popular, thanks to the electrification of the suburban railway up to this point. Tambaram has grown enormously owing to the establishment of the Madras Christian College and the Railway Colony there. The civil aerodrome at Meenambakkam and the Tuberculosis Sanatorium near Tambaram are also factors which have contributed to the increase of population in this suburban area in Saidapet taluk.

Chittoor district.—District increase: 10.8 per cent as against 12.8 in the previous

decade. This is also a district affected by the failure of the north-east monsoon from 1947-48 onwards. The district depends mostly on rainfed dry crops and cultivation of paddy under rainfed tanks. The rural population in the western taluks Madanapalle, Vayalpad, Punganur, Chittoor and Palmaner has increased by 12 per cent, 10.4 per cent, 9 per cent, 10.4 per cent and 19.3 per cent, respectively, as against 3.4 per cent in Kalahasti taluk, 1.9 per cent in Tiruttani taluk, a decrease of 1.1 per cent in Puttur taluk, and an increase of 2 per cent in Chandragiri. These figures should not cause any surprise, as the western taluks get the benefit of the monsoon, while the eastern south-west taluks depend mostly on the north-east monsoon. Owing to the adverse seasonal conditions and shortage of yarn, there have been migrations from the eastern taluks to adjoining districts and even to more distant places like the Kolar Gold Fields. In Palmaner taluk, there is a considerable extent of fertile land and cultivation of commercial crops has been increasing year by year. There has been industrial development in Palmaner and Kuppam towns, where industries like sandalwood factories, bonemeal factories, and quilt factories exist and trade in commercial produce has been increasing, with the result that the labourers even from Mysore State and Salem district and other places have migrated to this taluk and settled down there. Further, portions of seven enclave villages have been transferred to this taluk from Mysore State.

Arcot district.—The recorded North population has shown an increase of 10.9 per cent during the decade 1941-50, as against 13.7 per cent during the previous decade. This is another district badly affected by the failure of the north-east monsoon successively from 1947-48 onwards and there has been, in consequence, migration on an appreciable scale from this district to Madras City, Bangalore, Shimoga, Kolar and other places. The large increase in Vellore taluk (23.5 per cent) is partly due to migration from Madras City during the evacuation period (1941-42) of families, who have settled down in this taluk. The southern taluks of Chengam, Tiruvannamalai, Wandiwash and Cheyyar were the ones most affected by the adverse seasonal conditions and this is reflected in the rural figures: decrease of 5.1 per cent in Tiruvannamalai taluk, and low increases of 0.9 per cent, 2.8 per cent and 4.4 per cent

in · Chengam, Wandiwash, and Cheyyar taluks. Migrations have taken place on a larger scale from Chengam and Tiruvannamalai taluks.

Salem district.—The population has increased by 17.7 per cent during the decade under review, as against 17.9 per cent in the previous decade. The figures reflect the fact that, on the whole, the decade has been a prosperous one for this district. The marked increases, which call for comment are those in the Salem taluk 31.6 per cent, Omalur 29.1 per cent, Attur 19.8 per cent, and Hosur taluk 23.1 per cent. The dominant factor in Salem taluk has been the industrial and commercial development of Salem Town. Two new textile mills have come into existence during the decade and also other industries, viz., magnesite mines, carpet and druggets factories, coffee-curing factory, aluminium factory, tanning factory, sandalwood oil factory, cinema studio, etc.

In Omalur taluk, the dominant factor has been the setting up of industries at Mettur—a textile mill, Mettur chemicals, etc.—and the large number of immigrants that have been attracted as a consequence. Attur taluk is the chief paddy-producing centre for the district and has consequently attracted many families and labouring classes from areas where there is food scarcity. The other attractions for immigrants have been the agricultural colonies opened in this taluk, motor works, opening of glass factories and rice mills. Hosur taluk has, it is reported, a plentiful supply of ragi which has attracted immigrants from scarcity areas. A large number of persons displaced from the Mettur Reservoir area have settled down in this taluk.

Coimbatore district.—The population has registered an increase of 17.2 per cent as against 14.9 per cent in the previous decade. As might have been expected, the rural population has shown an increase of only 10.4 per cent, while the urban population has registered an increase of 56.4 per cent. The marked increases are in Gobichettipalayam taluk 27.5 per cent, Coimbatore taluk 36.9 per cent and Pollachi taluk 21.5 per cent. As is well known, in this district, the taluks Palladam, Udumalpet and notably Dharapuram are affected periodically by failure of crops—these are entirely dry taluks. The figures for the rural population in these taluks, viz., increase of only 1.9 per cent in Palladam, 2 4 per cent in Udumalpet taluk and a decrease of 07

per cent in Dharapuram taluk, reflect the series of adverse seasonal conditions, which have led to large-scale migrations from these taluks. Gobichettipalayam taluk is a fertile and important grain-producing area in the district and has attracted large numbers of immigrants of the labouring classes from the Palladam, Dharapuram and Udumalpet taluks. The Lower Bhavani Project, which has been under execution and which has attracted thousands of labourers, is in this taluk. Pollachi has tea and coffee estates and also large-scale groundnut cultivation, which have attracted large numbers of the labouring classes from Dharapuram, Palladam and Udumalpet taluks. In Coimbatore taluk, the dominant factor which has led to the large increase in population is its industrial development - mostly textile mills and associated industries in Coimbatore municipality and its suburban areas.

South Arcot district.—There is an increase of 6.4 per cent in the district as a whole, 4.7 per cent rural and 21.2 per cent urban. The very low increase in the rural population is significant. It reveals the severe effect of the adverse seasonal conditions which the district has suffered as a result of the failure of the north-east monsoon from 1947-48, and the increase has been affected to this extent, in spite of the fact that a large portion of one taluk in this district, viz., Chidambaram is in the Cauvery delta. The figures for the non-deltaic and deltaic portions of the district are 5.5 per cent and 12.5 per cent, respectively. The effect that the adverse seasonal conditions had on the district can be seen from the figures for the rural population in the various taluks: 2.1 per cent in Gingee taluk, 0.5 per cent in Tindivanam, 3.3 per cent in Kallakurichi, 5.2 per cent in Tirukoilur taluk, 2.9 per cent in Villupuram taluk, 6.6 per cent in Cuddalore taluk and 6.4 per cent in Vriddachalam taluk. As is well known, there has been a large-scale migration of labouring classes from this district to Madras, particularly from the northern taluks of Tindivanam, Gingee and Villupuram. At Ulundurpet in Tirukoilur taluk. there were about 4,500 labourers in 1941 on account of the construction of the aerodrome there. The aerodrome was closed down in 1946, and the 1951 Census recorded a fall of 4,971 persons at Ulundurpet.

The increase of 12.5 per cent in the deltaic area in this district calls for no special comment.

Tanjore district.—The recorded population has registered an increase of 16.4 per cent during the decade 1941-50 as against 7:4 per cent in the previous decade. This is a purely agricultural district and constitutes the heart of the Cauvery delta. The Cauvery Mettur Project came into operation during the decade 1931-40. Being a heavy surplus district for rice, the district has prospered very well indeed during the decade 1941-50. Even normally, this district requires lot of extra labour during the transplantation season, i.e., during the months of July-September and the harvesting season, January-March. But, owing to the food scarcity during the decade 1941-50, and particularly on account of the failure of the north-east monsoon since 1947, there has been a large scale immigration of labouring classes for work and food. The immigrant population in this district, as enumerated at this Census, is 172,500. The chief contributors are Ramanathapuram district, 65,076, Tiruchirapalli district, 41,258, and South Arcot district, 21,558. The number of people who have gone out of the district is not far less: 139,872-52,038 to Tiruchirapalli, 33,548 to Madras City, 18,018 to South Arcot district, 5,548 to Chingleput district and 4,329 to Coimbatore district. This number includes of course a certain number of temporary absentees, but the rest are mostly persons who are employed in the services or are engaged in professional or business activities.

The large increase of 33 per cent in Pattukkottai taluk reflects the fact that this is the taluk, which has been most benefited by the extension of irrigation made possible by the Cauvery Mettur Project. The same cause explains the large increase in Arantangi taluk (18.9 per cent). The low increase of 9.9 per cent in Nagapattinam is due to the migrations to Malaya from this taluk.

Papanasam taluk has shown the lowest increase (7.4 per cent) in this district. It is a purely agricultural taluk and is surrounded by the much more attractive and advanced taluks of Tanjore, Kumbakonam and Mannargudi.

Tiruchirapalli district.—The population has increased by 13.5 per cent during the decade 1941-50, as against 12.1 per cent during the previous decade. The deltaic portion has shown an increase of 18.9 per cent (as against 14 per cent during the previous decade), while the non-deltaic portion has shown an increase of 8.4 per

cent (as against 10.4 per cent during the previous decade). These figures include the old Pudukottai State area, which has been merged in this district. Thirumayam taluk of the Pudukottai revenue division has shown a decrease of 3.9 per cent. This is a dry taluk, which suffered badly on account of the failure of the north-east monsoon for a number of years in succession during the latter part of the decade, and large numbers of labouring classes migrated to Tanjore district for work and food. Udaiyarpalayam taluk has shown an increase of only 4.8 per cent. This is a dry taluk, and for want of seasonal rains there was even scarcity of water in 1950-51, and at the time of the Census enumeration, large numbers of the labouring classes migrated to adjoining areas in Tanjore district for work and food. The large increase of 30.3 per cent in Tiruchirapalli taluk is mainly due to the growth of Tiruchirapalli town: this is one of the premier towns in the State, is an important railway junction on the banks of the Cauvery river with a large Railway workshop in the Golden Rock colony, and is, besides, a large trade and industrial centre and also an important educational centre. It is the main market for the portion of the Cauvery delta, which is situated in this district.

Though Tiruchirapalli and Srirangam are distinct municipalities, they really constitute only one city, with only the Cauvery dividing them.

Madurai district.—The population has registered an increase of 16.9 per cent, as against 13.2% during the previous decade. Except for the Periyar delta, this is a dry district. Palni is a purely dry taluk, and has had a number of adverse seasons in succession, and this is reflected in its low increase of 3.1 per cent. The increase of 17.8 per cent in Melur cannot be a matter for surprise, as most of the villages in this taluk are in the Periyar delta and there has been migration, into this taluk, of labouring classes from the neighbouring droughtaffected areas in Ramanathapuram district. Tirumangalam is a dry taluk and has also suffered due to the failure of the north-east monsoon since 1947-48, and there has been migration, from this taluk, of labouring classes for work and food. Hence the low increase of 7 per cent in this taluk. Kodaikanal taluk has shown an increase of 19.4 per cent. The extension of large scale plantain cultivation which is a speciality

in this taluk on the hills has attracted immigrants from the plains, though the European population in Kodaikanal settlement has gone down appreciably. The large increase of 40.2 per cent in Madurai taluk is largely due to Madurai City which, next to Madras, is the largest City in the State. It is the headquarters of two districts, viz., Madurai and Ramanathapuram; a great pilgrim centre, and also a centre where there are ample educational facilities and also medical facilities. It continues to be a prosperous and important textile and dyeing centre. One of the largest spinning mills in the world which is situated in this taluk, viz., the Harvey Mills, is located in this town and there are also other spinning mills and power loom factories. This is also one of the largest and most important handloom weaving centres in the State. As in other districts, the imposition of controls and food rationing has attracted a large number of families into this town.

The number of immigrants in Madurai district, as enumerated at this Census, is, 160,732, and they came mostly from Ramanathapuram district (81,113) and Tirunelveli district (33,298).

Ramanathapuram district.—The recorded population has registered a low increase of 4.5 per cent, as compared with 7.6 per cent during the previous decade.

Sattur and Srivilliputtur are the best taluks in this district from the point of view of agriculture and they are also important from the point of view of industry and trade. The increase of 12.9 per cent in Sattur and 16.1 per cent in Srivilliputtur are therefore fully explicable. In Sattur, Sivakasi and Virudhunagar, all in Sattur taluk, there are many match factories and they are also important trade centres. In Srivilliputtur taluk, Rajapalayam has grown as an industrial and trade centre, and there are also a few textile mills here. It is also a large handloom weaving centre. It has attracted a large number of immigrants from the adjoining dry areas in Tirunelveli district. In the rest of the district, the rainfall is always poor and precarious and these areas have been hit hard by the failure of the north-east monsoon since 1947-48, with the result that there was a large-scale emigration of labouring classes to the adjoining districts of Madurai, Tiruchirapalli and Tanjore. There is also considerable migration from these taluks to Ceylon. These factors explain the low increases in these taluks. Mudukalathur has shown a large decrease to the extent of 20°4 per cent. The factors which have contributed to this are the adverse seasonal conditions referred to above and the prevalence of small-pox and cholera in an epidemic form in October 1950; both these factors leading to emigration on a large scale to adjoining districts. This is also a backward and unattractive taluk with poor communications.

Tirunelveli district.—The population has shown an increase of 9.3 per cent during the decade as against 9.7 per cent during the previous decade. Ambasamudram, Tirunelveli and Srivaikuntam taluks cover the best part of the fertile Tambaraparni delta. increases of 13.3 per cent, 14.3 per cent and 16.3 per cent, respectively, in these taluks are therefore fully to be expected. The two poor dry taluks of Nanguneri and Tiruchen- dur have shown only the moderate increases of 7.7 per cent and 7.9 per cent, respectively. These taluks also have suffered from the recent failure of the north-east monsoon for a number of years in succession, and there has been migration of the labouring classes to fertile portions in the Tambaraparni delta for employment. These taluks contain vast barren blocks and sandy tracts unfit for cultivation.

Tenkasi taluk has good dry lands and a considerable extent of irrigated land close to the Courtallam hills. It is not surprising therefore that this taluk has had an increase of 14 per cent. Sankaranayinarkoil and Kovilpatti are also dry taluks, but while the former has shown an increase of 12.1 per cent, the latter has shown an actual decrease to the extent of 4.5 per cent. The decrease in Kovilpatti is due to the fact that it suffered badly from the adverse seasonal conditions referred to above during the latter part of the decade, and there has been considerable emigration of labourers to the Tambaraparni delta in the district, as well as to Tanjore district and to tea and coffee estates in Madurai, Malabar and Nilgiris districts. Sankaranayinarkoil taluk has fared far better because it has had a better rainfall than Kovilpatti, and has a larger extent of wet lands (42,609 acres against 8,492 acres in Kovilpatti) under tanks which do not ordinarily fail, thanks to the supply from the small rivers and streams flowing down from the Western Ghats.

5. General distribution and density.— The map facing this page will show, at a glance, the relative densities of the various areas in the State. The density of population has steadily increased from 318 in 1921 to 446 in 1951, an increase of 40.3 per cent. 0.6 per cent of the population lives in taluks with a density below 100, 2 per cent in taluks with densities in the range 100 to 150, 6.6 per cent in the range 150 to 200, 7.6 per cent in the range 200 to 300, 15.5 per cent in the range 300 to 450, 16.3 per cent in the range 450 to 600, 17:1 per cent in the range 600 to 750 and 34.3 per cent in the range 750 and above. Nearly 68 per cent of the population occupies about 40 per cent of the area of the State in taluks the density of which is 450 and above. Nearly 52 per cent of the population lives in taluks, the density of each of which is 600 or above. The taluks with density below 100 are, of course all in the Agency tracts in the North Madras division.

In all the divisions, the density has been steadily increasing, as will be seen from Subsidiary Table 1.2. In the Deccan division, it has increased from 139 in 1921 to 191 in 1951; the 1941 figure was 170. No taluk in this division has a density exceeding 450. 12.5 per cent of the population in this division lives in taluks, the densities of which range from 300 to 450. 21.8 per cent of the population is in taluks with densities ranging from 200 to 300. 52.9 per cent of the population is found in taluks with densities ranging from 150 to 200, and these taluks account for 57.5 per cent of the area of the division. About one-eighth of the population occupy less than 20 per cent of the area and live in taluks the densities of which range from 100 to 150. For the State, as a whole, the density of 450 may be taken as the dividing line between thinly populated areas and the well-populated ones.

West Madras Division.—Nearly 87 per cent of the population is in well-populated taluks. 78 per cent of the population occupies about 53 per cent of the area and lives in taluks with a density of 600 and above. The Nilgiris district has a density of 317. Malabar district is, as is well known, thickly populated in spite of the large number of emigrants. Leaving out the special case of Madras City, which is an urban district, there are only two areas in the State, which are more thickly populated than Malabar (density 814), viz., the deltaic portions of East Godavari and South Arcot districts.

South Kanara is just below the dividing line of 450 for thickly populated areas and has a density of 432.

North Madras Division.—In the case of non-homogeneous tracts like the North Madras division and the South Madras division, only an examination by the State population divisions can be useful.

Agency tracts.—As one would expect to find, over 60 per cent of the population in these hilly and feverish tracts is in taluks with a density below 100, and these taluks account for nearly 79 per cent of the total area of these tracts. No taluk in these tracts has a density above 200. The West Godavari agency is the most thickly populated, and it has a density of 176. The Srikakulam Agency comes next with a density of 106, while the Visakhapatnam and East Godavari agencies are almost on a par, with a density of about 67. This reflects correctly the overall conditions in the Agency tracts in these districts.

Plains—Upland and delta.—The sharp difference between the deltaic and plains areas is well brought out by the density figures given in Subsidiary Table 1.1. No taluk in the deltaic areas has a density below 300, while, in the upland tracts, 22 per cent of the population lives in taluks with a density below 300, and these taluks account for nearly 45 per cent of the area. Again, while nearly 66 per cent of the population occupying 53 per cent of the area in the deltas, is in taluks with a density of not less than 750, the corresponding figures for the upland areas is 25.7 per cent of the population and 11.6 per cent of the area.

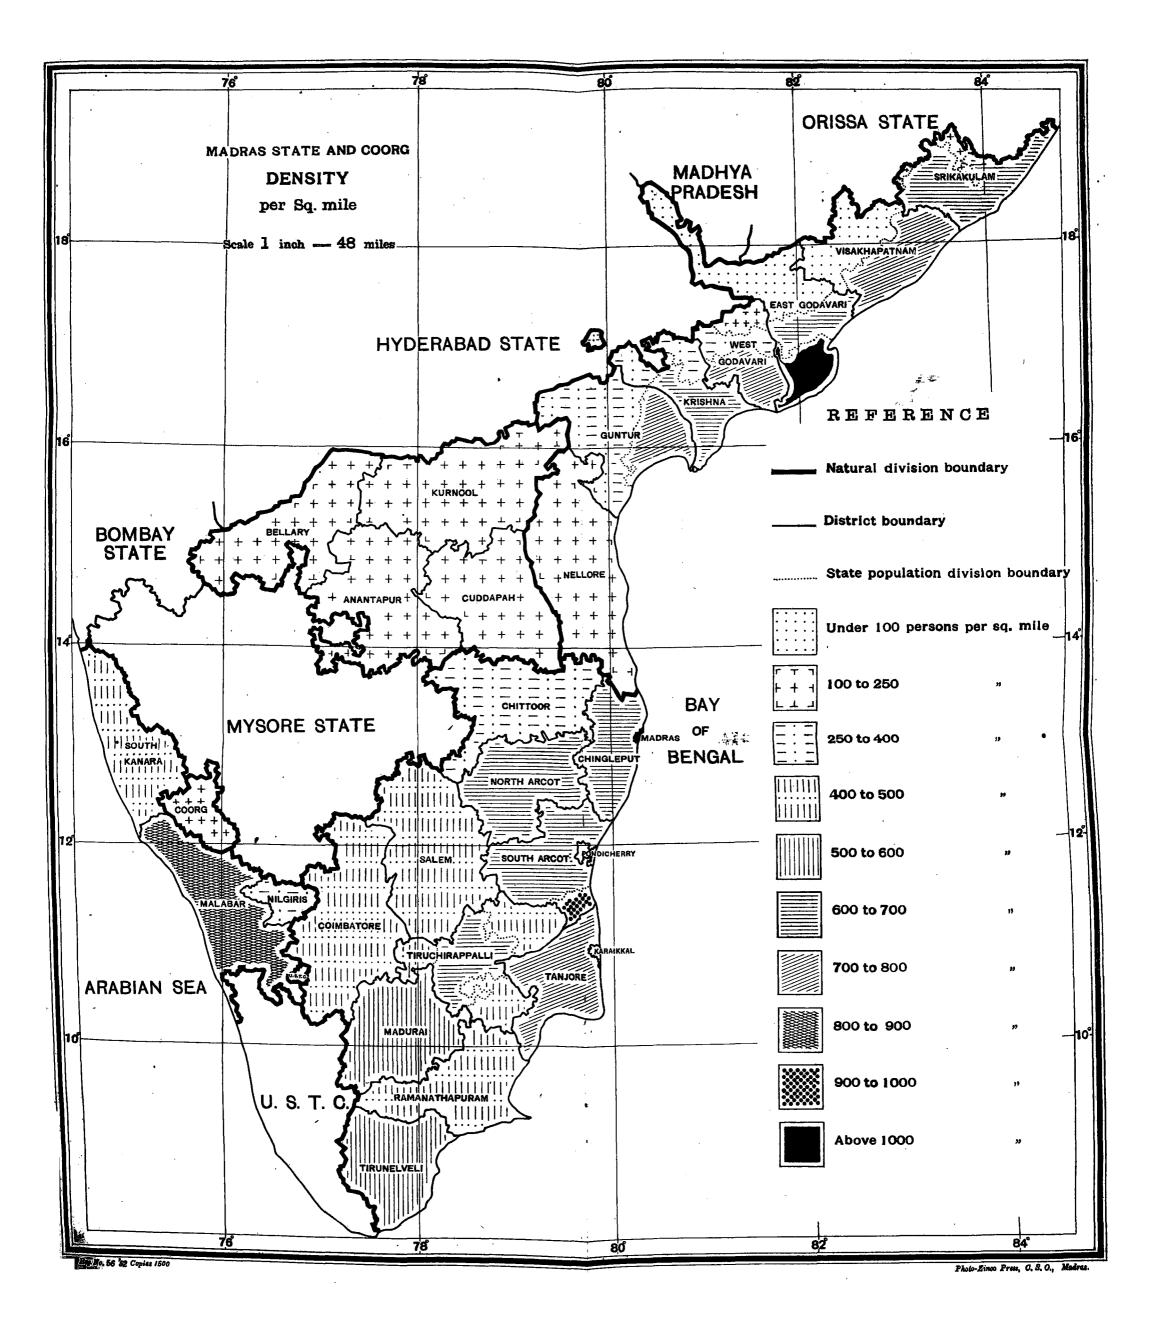

The upland areas have an average density of 402, the Visakhapatnam uplands ranking first with a density of 757, East Godavari coming second with a density of 672, and Srikakulam coming third with a density of 610. The upland areas in the remaining four districts, West Godavari, Krishna, Guntur and Nellore are thinly populated, the densities correctly reflecting the conditions in these districts.

Deltaic areas.—This is a thickly populated area, with East Godavari leading with a density of 1,012 and Krishna district at the bottom of the list with 638.

South Madras Division.—Thanks to Malabar district, the West Madras division is the most thickly populated in the State with a density of 627. The South Madras division comes next with a density of 554.

8.T.--1-2

S.T.-1-1

The North Madras division ranks third with a density of 411, while the Deccan division is far below, with a density of 191. These figures undoubtedly give a correct picture of the relative density in those divisions. Madras City, even though all parts of it are not so crowded as some other cities in India, has a population of 14·16 lakhs huddled together in an area of 49 square miles.

In the Northern dry belt, i.e., the area excluding the Cauvery delta as well as the districts of Madurai, Ramanathapuram and Tirunelveli, the average density is 489, the non-deltaic area of South Arcot heading the list with a density of 628, closely followed by North Arcot and Chingleput districts, and with thinly populated Chittoor at the bottom with a density of 305. Even in this dry belt, nearly 66 per cent of the population occupying about 47 per cent of the area, lives in thickly populated taluks with densities not below 450.

The difference between deltaic and nondeltaic areas is again prominently brought out by the density figures for the Northern belt and the Cauvery delta: while 63 per cent of the population in the Cauvery delta lives in taluks with densities not below 750. and these taluks account for about 45 per cent of the deltaic area, only a little over 20 per cent of the population in the dry belt lives in equally thickly populated taluks and such taluks account for less than 11 per cent of the area of the belt. The average density in the Cauvery delta is 754. i.e., a little less than that of the deltaic area in the North Madras division. In the South Madras division, the deltaic portion of South Arcot district tops the list with a density of 963; Tanjore comes next with 798, while Tiruchirapalli comes third and last with a density of 646.

Southern belt.—The fact that the bulk of this area is dry is brought out by the fact that the position in the highest density group, viz., 750 and over, is only slightly better than in the northern belt: 23.7 per cent of the population lives in taluks which account for 12 per cent of the area and which have a density of not less than 750 each. The average density in this belt is only 526, Madurai heading the list with 589, Tirunelveli closely follows with 563, while Ramanathapuram, as one would expect brings up the rear with a density of 429.

Comparison with other States.—The Madras State ranks second in the order of population among the States in India; with Uttar Pradesh topping the list with a difference of 6 million population over Madras. In area, this State is the second largest in India with Madhya Pradesh occuping the first place with a small difference, and Uttar Pradesh coming below it with a difference of 15,000 square miles. Judging by density of population, West Bengal tops the list, Madras occupying the fourth rank, with Uttar Pradesh and Bihar coming in between. The relevant figures are given in the statement below:—

Comparative Statement of area and population of Part "A" States in Indian Union.

[Statement No. 6.]

MOVEMENT.

6. Emigration to countries outside India.

—Accurate and up-to-date, information is lacking in respect of emigration to countries outside India and we have to be content with making as good an estimate as is possible. In this matter, I have been greatly assisted by the information supplied to me by Sri K. S. Seshan, Controller of Emigration, Madras. But for the valuable assistance given by him, I would not have been able to frame any reliable estimates, and I must place on record my gratitude to him.

The countries which are important from the point of view of emigration from Madras are Ceylon, Burma, the Federation of Malaya, the colony of Singapore, Indonesia and Thailand.

As regards Thailand, the official estimate is that there were about 25,000 Indians there in 1949, but a separate estimate for emigrants from Madras is not available. As shown below, detailed estimates can be framed regarding emigrants from Madras to Indonesia, Burma, the Federation of Malaya, the colony of Singapore and Ceylon. In

respect of other countries we may assume a total of 25,000 emigrants from Madras including my estimated figure of 13,000 emigrants from Madras in the Fiji Islands. My estimate for Fiji is a rough one based on the fact that, according to 1931 Census Report, there were about 20,000 emigrants from Madras there then.

Emigrants to Burma.—According to the 1931 Census Report, the Indian population in Burma was 10.18 lakhs, out of which 2.4. lakhs persons were from Madras. Conditions in Burma have been unfavourable equally to all Indians, and we may safely assume that, of the present estimated population of 6 lakhs of Indians in Burma, 24 per cent of 6 lakhs, that is, about 1.5 lakhs are Madrasis. Apart from the increasingly unfavourable conditions in Burma after the transfer of power from the British to the Burmese, there has been active restriction of movements from India to Burma. In 1947, the Government of Burma the Burma promulgated Immigration (Emergency Provisions) Act, under which no person can enter Burma without a permit issued by the Immigration authorities. That Government have also been enforcing regular passport restrictions for entry of Indians into Burma with effect from 1st September 1950. The Indian evacuees from Burma, who were in possession of evacuee identity certificates were permitted to return to Burma on the strength of those certificates up to 31st December 1950. After that date, even such persons were made subject to passport restrictions. On 21st July 1941, the Government of India imposed a ban on the emigration of unskilled workers to Burma, and since then, the ban has been in operation. Emigrants to Burma, in the order of importance, were mostly from Srikakulam, Visakhapatnam, East Godavari, West Godavari, Krishna, Tanjore, Ramanathapuram, Madurai, Tirunelveli and Malabar.

Emigrants to the Federation of Malaya.— Emigrants to Malaya, in the order of importance, are mostly from the districts of North Arcot, Salem, Tiruchirapalli, South Arcot, Chingleput, Tanjore, Malabar, Chittoor, Visakhapatnam and Madurai. In 1931, out of a total Indian population of 624,009 in Malaya, 582,625 were Madrasis or 93 per cent of the total Indian population. There was a large scale and brisk emigration to Malaya from South India till the set back caused by the depression in the rubber industry in 1930-32. The effects of the depression were so serious that the Malayan Government stopped fresh recruitment and repatriated all unemployed Indian labourers to their homes in India. About 190,000 Indian labourers were so repatriated in 1930-32. When the rubber trade began to recover early in 1934, shortage of labour was experienced, and non-recruited assisted emigration of Indian labour was permitted. From June 1934, there was again a large scale emigration of labourers to Malaya. This led to a surplus of labour and wage cuts, and the Government of India imposed in 1939, a ban on assisted emigration of Indian nationals for the purpose of unskilled work to Malaya from Madras. Since then, Indian labour is not permitted to emigrate to Malaya. After the Japanese occupation, there was a cessation of sailings during the years 1942-46, and sailings were revived in 1947. Owing to the large loss of lives of Indian labourers during the Japanese occupation and the return of large numbers of Indians to India after the defeat of Japan, the Indian population in Malaya decreased from 748,829 in 1940 to 530,638 in 1947. Since then the population has increased to 564,454 in 1950. These figures include Indians as well as Pakistanis, but the Pakistanis account only for a negligible fraction. Assuming that Madrasis continued to account for 93 per cent of the Indian population in the Federation of Malaya, which seems probable, the Madrasi population in 1950 would work out to 93 per cent of 564,454 or 524,900. Allowing for the rate of natural increase of the Indian population furnished in the Annual Report for the Federation of Malaya for 1950, the Madrasi population in 1951 may be estimated at 532,800.

Emigrants to the Colony of Singapore.—The estimated number of Indians and Pakistanis in the colony of Singapore, as on 31st December 1950, is 75,000. Assuming that Madrasis form the same proportion of this population, as in the adjoining territory under the Federation of Malaya, the Madrasi population in the colony of Singapore may be estimated at 93 per cent of 75,000 or 69,800.

Emigrants to Indonesia.—I understand from a gentleman who has stayed in Indonesia for a considerable period recently, that, at the time of the 1951 Census, there were about 35,000 Indians in Indonesia, and that out of this number, about 10,000 were

Madrasis, mostly in Sumatra, and practically all of them casual labourers.

Emigrants to Ceylon.-Most of the emigration to Ceylon has been of labourers who go to work on the rubber and tea estates there. There is also an appreciable number among the emigrants who have gone there for purposes of trade. Emigration of unskilled labourers to Ceylon took place on a large scale till 1930 when there was a setback on account of the depression in the rubber industry. Fresh recruitment for rubber estates was stopped in 1930. The depression grew worse during the following two years, and also affected the tea industry which employs a much larger number of labourers than rubber. Large numbers of labourers were repatriated to India. Recruitment for tea estates was restricted in 1931 and completely stopped in 1932. After 1933 conditions improved with the introduction of the Rubber Restriction Scheme, and the international scheme for restricting tea cultivation. This stimulated recruitment, but the supply of labour exceeded the demand for it, and all recruitment from India was stopped from September 1935, and measures for repatriation had to be considered. Subsequently, during 1937-39, there were negotiations for re-opening emigration to Ceylon, but they were not successful in regard to the assurances demanded on behalf of the emigrants, and the Government of India had to stop, with effect from the 1st August 1939, the departure by sea of all unskilled workers to Ceylon unless exempted by a special order. From 1939 onwards, there has, therefore, been a steep fall in the number of Indian labourers going to Ceylon. There has been in recent years further discouragement to Indian emigration owing to the denial of franchise rights to Indians in Ceylon and the promulgation of the Ceylon Citizenship Act and the Ceylon Immigrants and Emigrants Act, under which every person desiring entry into Ceylon must possess a valid passport and a residence permit, temporary or permanent. It is seen from the Report of the Agent of the Government of India in Ceylon for the year 1948, that the Indian population in Ceylon during that year was 854,000 out of which the Indian population in the estates was 752,000. These Indian emigrants are practically all from South India and that from

districts being Tiruchirayalli (including the Pudukottai area), Salem, North Arcot, South Arcot, Ramanathapuram, Tanjore, Madurai, Tirunelveli and Chingleput. Allowing for the natural increase of population (3 per cent per annum as seen from the above mentioned report), the Madrasi population in Ceylon in 1951 may be estimated at 905,200.

To sum up, the total number of emigrants from Madras to countries outside India may be estimated at 1,692,800.

7. Migrations from Madras State to other parts of India, migrations within the State and migrations into Madras from other parts of India.—The figures for these migrations can be obtained from the statistics given in main Table D-IV. An abstract of these figures is given below:--

[Stat

India.

(f) Born beyond India

[Statement No. 7.]	Actual number.	Number per 1,000	M.T.—D-IV 8.T.—1·4
(1)	(2)	(3)	
(a) Born in the districts of enumeration.	53,917,333	946	
(b) Born in other districts of the same natural division.	2,024,829	36	
(c) Born in other parts of the State.	522,920	, 9	
(d) Born in adjacent States	416,834	7	
(e) Born in other parts of	56,618	1	

59.003

(g) Birth place not returned. 118,465 It will be seen that, out 3 of the recorded population, 94.6 per cent consist of persons who were born in the districts, where they were enumerated, while migrations within the State account for 4.5 per cent-3.6 per cent accounting for migrations within the same natural division and 0.9 per cent for migrations from other parts of the State. Items (d) and (e) show that 0.8 per cent of the recorded population has migrated into Madras State from other parts of India-0.7 per cent from adjacent States and 0.1 per cent from other parts of India. At the time of the Census, there were 59,003 persons born outside India and enumerated in Madras State (about 0-1 per cent)-11,285 born in Pakistan and the rest in other territories beyond India. Migration is thus confined to 5.4 per cent of the population, out of which 4.5 per cent are migrants within the State. An idea of the extent of this internal migration can be obtained from the statement below. Tamil districts, the important contributing which gives, for each district, the number

of persons born in the district of enumeration per thousand of the general population:—

The immigrants indicated by the statement in respect of each district include, of course, all persons born outside that district and enumerated in that district; their birthplace may be within or outside the State or even outside India. The last mentioned item is very small and these figures can give a good idea of the volume of migration into the districts. In the State, as a whole, 54 persons per thousand of the whole population are immigrants. The corresponding figures for the natural divisions are 61 for the Madras Deccan division, 40 for the West Madras division, 40 for the North Madras division and 63 for the South Madras division. The district figures are the most interesting in this regard and useful comments can be made about them. (For the sake of brevity only the number of immigrants per thousand will be mentioned in the comments.) These figures are based

only on the answers regarding the birth place of the person enumerated and would therefore include, e.g., women born in one district and staying with their husbands in another district and also a man's children born in another district where he was employed for a time and enumerated in his own district. The general comments below will accordingly deal with only immigrants in the strict sense.

The large figure of 92 for Bellary district is due to the very large number of labourers, who have been attracted to this district by the Tungabhadra Hydro-Electric Project works—the headworks as well as the works on the canals.

The Nilgiris figure of 454 is due to the development of the estates and the increasing number of settlers, especially after the war, the development of potato cultivation and the fact that the execution of two Hydro-Electric Projects, viz., the Moyar and Pykara Extension Schemes, was in progress at the time of the Census.

The small figure of 23 for Malabar is not surprising, seeing that the heavy population and the food deficit of the district have led to considerable emigration from the district, rather than to immigration. The immigrants include an appreciable number of persons who have migrated from Travancore and Cochin States and taken up cultivation in this district, particularly in Kurumbranad taluk, and the persons who have settled down under the colonization scheme in Wynaad.

The South Kanara figure is only 11. There is nothing much to attract outsiders to this remote district, except for the business in Mangalore town and port. Some settlers from Travancore-Cochin have taken up cultivation in the large uncultivated areas in the interior hill villages of the Kasaragod taluk. Travancore-Cochin is a very thickly populated area and has a large food deficit. Appreciable emigration from that State is therefore to be expected.

The Agency tracts attract immigrants to the extent to which they have been developed from the point of view of communications and eradication of malaria. This is reflected in the figures for the Agency tracts.

The figure of 7 for the plains portion of Srikakulam district confirms that there is hardly anything in that district to attract outsiders.

The Visakhapatnam plains figure of 18 is mostly due to Visakhapatnam town and port and the Scindia Ship Building Yard there.

The East Godavari, West Godavari and Krishna plains include the prosperous Godavari and Krishna deltas. They have a special attraction in times of food scarcity. There has been considerable industrial development in Vijayavada municipality in Krishna district and also large scale cultivation of Virginian tobacco (export variety) in all these districts. These factors account for the figures of 92 in Krishna, 40 in East Godavari and 65 in West Godavari.

There has been considerable industrial development and cultivation of Virginian tobacco in Guntur district and a substantial portion of the Krishna delta is in this district. The Guntur figure of 35 cannot therefore come as a surprise.

Nellore district is not only a surplus area for rice, but there has been also considerable attraction for labour in the mica mines in this district. The figure of 32 for this district is therefore quite explicable.

The Madras City figure is 406. The enormous crowding of people into the City from 1943 onwards is well-known. Apart from the attractions of a large city, people flocked to Madras from mufassal districts. particularly from the adjoining districts, for educational facilities for their children and on account of the assured food supplies ensured by the elaborate rationing system in the City. Besides the industrial development of the City during the decade, the very adverse seasonal conditions since 1947 in the adjoining districts of Chingleput, South Arcot and North Arcot have been responsible for the large influx of agricultural labourers from those districts to Madras City in search of a regular income and food.

The Chingleput figure of 55 is largely due to the fact that large numbers of persons, whose business or profession has to be carried on in Madras City, could find housing accommodation only in the suburbs of Madras extending up to Tambaram in the south and to Tiruvallur in the west. Quite a number of persons working in the City have had to seek housing accommodation even in more distant places like Chingleput and Kancheepuram.

The Chittoor figure of 62 is largely due to the large pilgrim population enumerated at Tirupati and the Tirumalai hills and the immigrants in Palmaner taluk.

The North Arcot figure of 35 is largely due to the families who moved out from Madras and settled down at Vellore and other places during 1942, when there was a serious apprehension of Japanese invasion.

The Salem figure of 26 is due to the industrial development of Salem and Mettur towns.

The Coimbatore figure of 47 can hardly be a matter for surprise, as this is, as has been said, the Manchester of South India, and as there has been rapid industrial development not only in Coimbatore and its suburbs, but in a number of other centres, also, e.g., Tiruppur, Erode, Pollachi and Udumalpet. The Lower Bhavani Project in this district, the execution of which is in progress, has attracted large numbers of labourers from outside.

The South Arcot figure of 38 is mainly due to the fact that this district includes a portion of Cauvery delta (Chidambaram taluk) and the migration of several families from Madras during the days of the Japanese scare referred to above. The Annamalai University has of course attracted a large number of immigrant students, teaching staff and others employed in the university area.

The Tanjore figure is 63. This is a prosperous deltaic district and has attracted very large numbers of agricultural labourers from the districts, affected by the failure of the north-east monsoon for a number of years in succession, viz., Ramanathapuram, the Pudukottai area of Tiruchirapalli district and South Arcot.

The Tiruchirapalli figure of 74 is due to the fact that it includes a good portion of the Cauvery delta and the Tiruchirapalli and Srirangam municipalities, and the Golden Rock Railway Workshop and the Cement Factory in Dalmiapuram which have attracted large numbers of immigrants. Tiruchirapalli town is not only a very large railway junction and centre, but also a very important educational centre, and the town has also grown as a trade centre and from the industrial point of view.

The Madurai figure of 60 is due to the industrial development of this district. Next to Madras, Madurai is the largest city in the State. The facts that it is an important educational centre and the headquarters of two districts and provides not only all the amenities of city life, but also guaranteed supplies of food under the rationing system have attracted large numbers of immigrants.

. The Ramanathapuram figure of 41 is attributable largely to the industrial and trade developments, particularly in Rajapalayam, Virudhunagar and Sivakasi.

The Tirunelveli figure of 16 confirms the fact that there has been nothing much in this district to attract immigrants.

5.8 Migration from Madras State to other States in India.—The birth place tables D-IV prepared by the Superintendents of Census Operations in other States furnish information as to the number of persons born in Madras State and enumerated in their States. The total number of emigrants from Madras State thus ascertained is 1,291,037. Out of this, 1,167,069 persons are in the adjacent States of Travancore-Cochin, Mysore, Coorg, Bombay, Hyderabad and Orissa as shown below:-

[Statement No. 9.]

S.T.—1.5

Name of the State.	EL T	Persons.	Males.	Females.
(1)		(2)	(3)	(4)
1 Travancore- Cochin.		188,516	88,513	100,003
2 Mysore .		525,517	278,731	246,786
3 Coorg		52,384	33,868	18,516
4 Bombay .		237,070	159,567	77,503
5 Hyderabad .		129,455	64,121	65,334
6 Orissa	•.	34,127	19,519	14,608
	_	1,167,069	644,319	522,750
and the second s	_			

Mysore has attracted the largest number of emigrants from this State; then comes Bombay, Travancore-Cochin comes next, followed by Hyderabad, Coorg and Orissa. The emigrants to Coorg are mostly labourers. who go to the estates in that State for employment every year soon after the commencement of the south-west monsoon and return to their homes in March. The male emigrants to other States are mostly businessmen and persons employed under the State Government or the Union Government or in private firms or teachers, doctors and lawyers. Except in respect of Hyderabad and Travancore-Cochin, there is a large excess of males over females among

the emigrants, which confirms the wellknown fact that large numbers of male migrants go by themselves leaving their families and children behind in their homes. The difference between male and female emigrants in Hyderabad is very small and calls for no comment. The excess of females over males is more appreciable among the migrants to Travancore-Cochin. Migration to this State is largely a family migration, i.e., the entire family migrates. In fact, large numbers of families of Tirunelveli district have settled down years ago in the Trivandrum and Nagercoil areas in the Travancore-Cochin State. The sex ratios will have to be examined for a number of decades before we can hold that there is any significance in the disparity noticed in the excess of females over males. The number of migrants to Orissa is small and may be due to trans-border movements for short periods.

The number of emigrants to other States in India, i.e., to the States other than the adjacent States referred to above is 123,968. Out of this, 74,659 are males and 49,309 are females. Naturally enough when they go to distant places, many of the male emigrants leave their wives and children behind. The more important component State-wise figures are given below:-

[Statement No. 10.]

s	٠	Number of emigrants from Madras.			
	(1)				(2)
West Bengal .					52,001
Bihar					18,311
Madhya Prades	sh				16,949
Uttar Pradesh					13,511
Assam .		••	•		10,413
Delhi .		••	••	• •	3,920

The emigrants to the States other than Assam are mostly employees of Governments or private firms. The emigrants to Assam are mostly the labourers in the tea estates.

9. Movement of displaced persons -The total number of displaced persons in this State is 9,113 (5,410 males and 3,703 females). Of these, 8,063 came from West Pakistan and 1,050 from East Pakistan. The influx of displaced persons into this M.T.-D-V. State started with the arrival of 44 persons in 1946 and reached its maximum in August-September 1947. The year 1947 saw the largest number of displaced persons arriving

in the State. The total number of displaced persons who arrived during each of the years 1947 to 1951 is given below:—

	Year.	•		Number of arrivals.	
1947			 	5,889	
1948			 	1,891	
1949			 	707	
1950			 	549	
1951	• •	••	 • •	33	

Most of the displaced persons in this State hail from Sind and were small traders before their emigration from Pakistan.

These displaced persons have settled down in this State on their own, or have been rehabilitated by the State Government in the more important towns in the State. The South Madras division has 7,123 displaced persons (78 per cent); of these, 3,902 were in Madras City and 1,313 in Chingleput district at the time of the Census enumeration. The Chingleput figure relates to the large number of persons with businesses allotted to them in Madras City, but for want of accommodation in the City, still remaining at the Malayan Emigration Depot, Avadi, where the Relief Camp for the displaced persons was in existence for a considerable time, before it was closed down on the 1st November 1949. These persons have shifted to the City a few months ago.

The next largest number of displaced persons is found in Coimbatore district (819). There are only 375 persons in the West Madras division—mostly in the Nilgiris (214); 465 in the Madras Deccan division and 1,150 in the North Madras division. Details by districts are available in the Main Table D-V (i).

10. Emigration to Pakistan.—The statement below compares the rate of growth of the Muslim population with that of the general population in the various divisions in the State.

[Statement No. 11.]

•		Percentage increase in			
State and Natural Division.	Muslim population.	General population.			
(1)		(2)	(3)		
Deccan Division		10	12.4		
West Madras Division		. 19	20.5		
North Madras Division	• •	18	13.3		
South Madras Division		13	14.0		
State	••	16	14.4		

.The figures give no room for any impression, that Muslims have left any division in

large numbers. Some migration of Muslims took place from Malabar and North Arcot districts on a more appreciable scale than from any other area in the State but no reliable figures are available as to the number of actual emigrants. The emigrants went in search of employment or for trade. It can, however, be said confidently that the extent of migration from this State to Pakistan has been negligible. It may be mentioned in this connection that, so far, action has been taken under the Evacuee Properties Act in respect of less than 400 persons.

11. Anglo-Indians.—The population of the Anglo-Indian community in Madras State (inclusive of the merged States of Pudukottai, Banganapalle and Sandur) as recorded at the various Censuses is given below:—

7.6	70 I.						
1901			, .	26,209 (E	urasians		
1911		• •		26,023	_		M.T—D.III
1921	• •	• •		23,492	. 19		
1931	• •			28,694	•		
1941	• •	• •		28,697		, .	
1951		• •		27,253	**	• •	

These variations compare as shown below with the variations in the general population:—

[Statement No. 12.]

			Percentage growth of				
Year.		Anglo-Indian population.	General population.				
(1))		(2)	(3)			
1911			 0·7	7:9			
1921	••		— 9·7	2.5			
1931			22-1	10-0			
1941			Nil.	11.6			
1951			 5·0	14-4			

The increase recorded at the 1941 Census would not have been so nominal (3 persons only) but for the recruits in World War II who left the State. The variations between the 1941 and 1951 figures, i.e., the decrease by 5 per cent is understandable from the reports received from the Collectors and the Commissioner, Corporation of Madras.

During the decade 1941-51, there was an increase of population to the extent of 4,835 in all, in Madras City (3,637), North Arcot district (336), South Arcot district (315) and Malabar district (542) ignoring the small increase of 5 persons in South Kanara district. In the remaining districts, there have been decreases amounting in all to 6,279. There has thus been a net

decrease of 1,444 in the Anglo-Indian population of this State. The statement below gives the variations by districts.

Statement showing the variations in Anglo-Indian population by districts.

	*	•				

In the Malabar district, the general population has increased by 21·1 per cent during this decade and the increase in the Anglo-Indian population has been about the same. Some of the important towns in the West Coast, particularly Kozhikode, have always had an Anglo-Indian colony. The Malabar figure does not therefore call for any special explanation.

In Madras City, allowance has to be made for the fact that an extent of about 20 square miles including places like Sembium, Ayanavaram, Guindy, etc., where there are Anglo-Indian colonies was transferred to Madras City during the decade from the suburbs in Chingleput district. The large decrease in Chingleput district (1,567) confirms this.

The general explanation for the decrease in the Anglo-Indian population in this State is of course the fact that the special preferences shown to them in the days before the transfer of power in regard to recruitment to the Railways, Jails and Police Reserves have disappeared and those who are not still in jobs at particular centres or have retired have naturally emigrated to large towns like Madras and Bangalore where they can secure better conditions of living and also opportunities for employment. There has been some migration of retired Anglo-Indians and their families to places like Pondicherry and Karaikal on account of the enforcement of Prohibition in this State. It may be noticed that, as against the net decrease of 1,444 in the Anglo-Indian population in Madras State. the population of the community in Mysore State has increased by 1,730. It is undoubtedly true that there has been some migration from this State to Bangalore and its neighbourhood, and there is a large Anglo-Indian colony in Whitefield near Bangalore.

Most of the Anglo-Indians in the mufassal have been employed in the railways and the variations in their figures except in the case of retired persons are largely attributable to transfers of these railway employees. Anglo-Indians are, as is well known, to be found mostly in and near large railway centres.

The increase of 336 in North Arcot district is due to the employment of Anglo-Indians in the railways at Arkonam and Jalarpet junctions. Some families have also settled down in the Elagiri hills in this district.

The increase in South Arcot district (315) is due to the number of Anglo-Indian families who are residing in the railway colonies at the Villupuram and Vriddachalam junctions. At the former place, some retired persons have also settled down close to the railway colony as they can always be sure of an Anglo-Indian colony at this junction, and there is the further attraction of an Anglo-Indian boarding school here.

Some of the apparently large decreases in the mufassal districts are due to the fact that World War II was in progress at the time of the 1941 Census, with consequent congregation of Anglo-Indian men and women employed in war establishments in these districts. After the cessation of

hostilities, these have naturally migrated from those centres.

Salem, Coimbatore and the Nilgiris are plantation districts where European planters employed a large number of Anglo-Indians. After the transfer of power, a large number of these plantations has passed into the hands of Indians and the Anglo-Indian employees have also therefore migrated.

The decrease of 520 persons in the Tirunelveli district is due to the transfer, in 1950, of the enclaves of Anjengo and Tangasseri to Travancore-Cochin State. The latter has an Anglo-Indian_colony.

12. Birth and death rates.—The registration of vital statistics in this State is being reviewed every year by the Director of Public Health in his Administration Report entitled "Report on Health conditions in Madras State". I propose to give some of the relevant figures from the Director's report for 1950. These reviews have shown that, though the registration is defective and that there is need and scope for considerable improvement, the figures of registered births and deaths give a reliable indication of the trend of birth and death rates. From 1865 to 1884, births and deaths were being recorded in this State under the executive instructions of the Government in the Revenue Department. Since 1884, registration of births and deaths has been compulsory in municipal areas under the Madras District Municipalities Act. The Madras Registration of Births and Deaths Act, 1899, provides for compulsory registration in non-municipal areas. This Act was first extended to the larger villages in the State and to other villages from time to time. Till 1940, only about 40 per cent of the total number of villages in the State was thus covered by compulsory registration. The Act has since been extended to cover all but a small fraction of the area of the State. Registration of births and deaths is now compulsory in all municipal areas and in all non-municipal areas excepting the West Coast islands, part of the Agency tracts and a number of hill and backward villages-vide Appendix IV. The registration work in municipalities is attended to by qualified full-time Birth and Death Registrars and in villages by the village headmen. In some of the larger panchayats to which relevant sections of the District Municipalities Act have been extended,

separate Birth and Death Registrars have been appointed. Even in areas where registration of births and deaths is not compulsory, registration is carried out by the village headmen under executive instructions, except in the Agency tracts in the Srikakulam and Visakhapatnam districts where even this arrangement has not so far been found feasible for lack of an adequate agency in these remote, backward and feverish areas. The birth and death registers are checked by touring officers of the Revenue and Public Health Departments and unregistered births and deaths brought on record. The number of omissions detected by the checking officers during the years 1941-1950 is shown below:--

[Statement No. 14.]

V			Number of case detected.					
I ear.	Year. (1) 1941	Births.	Deaths.					
(1)			(2)	(3)				
1941			56,58 3	22,032				
1942	• •	• •	46,296	17,925				
1943		• • •	34.512	14.515				
1944			25,742	15,315				
1945			25,054	12,634				
1946			22.629	7,108				
1947			42.895	10.859				
1948		• •	39,000	13,828				
1949			47,660	15,990				
1950	• • •	••	35,726	12,905				

The registration of deaths is thus far more satisfactory than that of births.

Monthly returns of births and deaths are obtained from the Registrars and tabulated in the office of the Director of Public Health, Madras. The following statement shows the extent of arrears in regard to the submission of these returns to the Director:—

[Statement No. 15.]

Year.		Number of monthly village birth and death returns in arrears.	Percentage of arrears to the total number of returns due for the year.
(1)		(2)	(3)
1941	•• .	1.288	0.3
1942		11,424	2.7
1943		20,050	4.8
194 4		19.321	4.6
1945		18,800	4.5
1946		29,405	7.0
1947		16,051	3.8
1948		13,469	3 2
1949		8.030	19
1950	• •	6,061	i 4

Apart from omissions to record births and deaths, the main difficulty is the meagre or wrong classification of causes of deaths.

From the point of view of the present report, the omissions to record births and deaths are more important than the defective record of the causes of death. The correct and complete registration of births and deaths is the crux of the problem in regard to the maintenance of vital statistics and measures for securing it are under the active consideration of the Government of India and the State Government. An experimental scheme is to be tried in the current year 1952–53 to enable a decision being taken regarding the permanent measures that should be adopted.

In spite of defects in the existing scheme of registration of births and deaths, however, the registered birth-rates and death-rates are sufficiently reliable for broad conclusions being drawn from them.

Birth-rates.—The registered birth-rates per thousand of the population during the years 1931-50 are given below:—

[Statement No. 16.]

Lower		v 1.0. 10.]				
Year,		Registered birth-rate per 1,000 of population.	Year.	P	Registered birth-rate or 1,000 d opulation	of
(1)		(2)	(1)	• •	(2)	
1931		35· 4	1941		34.8	
1932	٠.	35·5	1942		34.8	
1933		35.5	1943	••.	32.7	
1934		34.8	19 44		30.8	
1935	••	35.2	1945	• •	30.8	
1936		· 35·5	1946		34.0	
1937		96.0	1947		34.0	
1938		95.0	1948		32· 3	
1939		25.1	1949		$32 \cdot 3$	
1940	• • •	34.9	1950		31.2	

It will be seen from these figures that the birth rates between 1931 and 1941 were more or less steady, but since 1942, there is a definite declining trend. The birth-rate has decreased from 34.8 in 1942 to 31.2 in 1950. The birth-rate is still, however, very high compared with those of economically more advanced countries as may be seen from the following figures:—

Name	of the cou	ntry	·•	Birth- rate per 1,000 (1941–43)
Great Britai	n and Irelai	nd		 16.3
Germany				 16· 2
U.S.A.			••	 22.6
Australia	••			 20.7

Apart from the other conditions which produce this difference between India and economically more advanced countries, a higher birth-rate must be expected in a country like India where marrying is

almost a universal rule. The following figures relating to the number of unmarried persons per thousand of each sex will be found instructive in this connection:—
[Sta'ement No. 17.]

	Yea			Number of ur per 1,00		
	Ioai.			Women.	Men.	
	(1)			(2)	(3)	
1921				377	534	
1931				383	531	
1941				408	548	
1951				407	528	

Out of these numbers, the number of persons of the age of 15 and above are as shown below:—

	Year	·.	•	Women.	Men.
	(1)			(2)	(3)
1921				4	152
1931		• •	• •	• • •	135
1941		••		49	158
1951	••		• •	60	166

Universality of marriage.—As will be mentioned later 46 per cent of males are below the age of 20 and 36 per cent of females are below the age of 15. The 1951 figures given above therefore indicate that only about 6 per cent of men above the age of 19 remain unmarried and 4 per cent of women above the age of 14 remain unmarried. The figures for women show a definite upward trend, confirming the impression that marriage is tending to become less universal than before. This is undoubtedly one of the contributory causes for the decline noticed in the birth-rate. tendency, which may have an opposite effect, and which is revealed by the tabulated figures, is the downward trend in the number of widows, as shown by the following figures :-

[Statement No. 18.]

		Year.		Number of widows per 1,000 females.
		(1)		(2)
1921			 ••	 188
1931	• •	••	 	 178
1941			 	 165
1951	• •	• •	 • •	 148

Fertility of women.—We have no recorded information on fertility of women in this State. A rough idea can however be obtained from the following figures, which compare the ratio of children in the agegroup 0 to 4 to women in the productive age-group, viz., 15 to 45.

Statement showing children-women ratio [Statement No. 19.] for 1901-51.

Decade) .	Children 0-4.	Women 15-45.	Number of children per 1,000 women.
(1)		(2)	(3)	(4)
1901		5,228,552	8,870,067	589
1911		5,597,636	9,852,482	568
1921	••	5,262,658	10,100,008	521
1931	• •	6.831.549	11,280,536	606
1931	••	6.523,000	11,630,800	561
1941	••	6.878.310	13.166.910	522

The fertility rate was at its lowest during the decade 1911-21, as mentioned in the Census Report for 1921. The mortality due to influenza was higher among men and women of reproductive age than among children and old persons, and the epidemic had a selective incidence among women. There was a marked increase in fertility during the decade 1921-31, but since then there has been a definite downward trend. The high fertility rate of 1931 is reflected in the high birth-rates during the decade 1931-40. The declining fertility rate indicates that the pressure of economic conditions which came to a head during the war and even more markedly after the war, is having its effect in making at least some sections of the population more careful about too many children.

Death-rate.—The registered deaths forn the years 1931 to 1950 were as show below:—

[Statement No. 20.]

Year.			Death- rate per 1,000.	Year.	Death rate per 1,000.
(1)			(2)	(1)	(2)
1931			23.7	1941	 23.1
1932			21.6	1942	 23.1
1933			23.0	1943	 26· 6
1934			24.0	1944	 26· 6
1935	••	••	23.7	1945	 23· 4
1936			21.9	1946	 20.3
1937			22.3	1947	 20.9
1938			21.6	1948	 18.7
1939			23.0	1949	 17.4
1940		• • •	22.5	1950	 19.9

The figures show that there was a slight, though not steady, downward trend from 1931 to 1940. There was actually an upward trend from 1941 to 1944 and a downward trend after 1944. The sharp increase in the death rate in 1943 was due to casualties from cholera epidemics. In 1944, there was a sharp fall in the number of deaths from cholera, but there was some

increase in the number of deaths from smallpox and more deaths than in 1943 from fevers and other causes. In 1945 there was a distinct decrease in the number of deaths from epidemics and a definite decline set in from that year. The death-rates for some economically advanced countries are given below for comparison:—

[Statement No. 21.]

.	ame of th	e coun	try.		rate per 1,000 (1941-43).
	(1))			(2)
Great Britain	and Irela	ınd	••		12.5
Germany	••	••	••	••	12.6
U.S.A.			••	••	11.7
Australia			-	, ·	10.3

Infantile mortality.—As pointed out by the Director of Public Health, infantile mortality affords a sensitive index of the state of health of the population. The average infantile mortality rates recorded for the last three decades are as given below:—

[Statement No. 22.]

Dec	ade.	Infantile mortality.		
(1)			(2)	
1921-30		••	177.5 per 1,000 births.	
1931-40	••	••	177.0	
1941-50	••	0.0	153.6	

The infantile mortality rate has considerably decreased, indicating the progress made in public health and the services rendered by the Child and Maternity Centres, though the numbers of these are still far from adequate. Over 217,641 babies under one year died in 1950, and accounted for nearly 20.4 per cent of the total number of deaths in that year. Of these infants, who died within one year, nearly 50 per cent died in their first month. The position is thus still far from satisfactory.

Maternal mortality.—Our maternal mortality is still very high. We have only to compare the figures given below with the rate of 0.97 for England and Wales and 1.2 for the United States of America.

[Statement No. 23.]

Decad	ie.		Maternal mortality. (2)							
(1)									
1931-35	••	••	8.2 per 1,000 births (live and still).							
1936-40	••	••	8-6							
1941-45	••	••	9-1 🚅 .							
1946-50	••	••	7-1							

Though there are slight ups and downs from year to year, there seems to be a downward trend here also.

Registered deaths in the State according to age excluding all the towns were as shown below for the year 1950:—

(Registered deaths according to age in the State excluding all towns during the year 1950—Taken from the Report on the Health Conditions in Madras State, 1950.)

[Statement No. 24.]

Age grou	ıp.	Males.	Females.	State total.
(1)		. (2)	(3)	(4)
Under 1		91,988	79,458	171,446
1-4	••••	74,479	73,686	148,165
5-9	•••	21,173	21,175	42,348
10-14		15,137	15,976	31,113
15-19	••	17,315	19,965	37,280
20-29	••	23,015	30,067	53,082
30-39	••	26,707	29,857	56,564
40-49		32,828	28,053	60,881
50-59		31,098	25,844	56,942
60 and above.		99,486	99,002	198,488
		Total of	all ages	856,309

It will be seen that the excess of female deaths over the male deaths is largest in the age groups 20 to 30 and 30 to 40, which are the important reproductive age groups for women.

Rate of natural increase.—This rate, that is, the excess of the birth-rate over the death-rate varied as shown below, during the period 1931 to 1950:—

[Statement No. 25.]

			Per 1,00	of popul	lation.
	Year.		Birth- rate.	Death- rate.	Rate of natural increase.
	(1)		(2)	(3)	(4)
1931			35.4	23.7	11.7
1932			35.5	21.6	13.9
1933		•	35.5	23.0	12.5
1934			34.8	· 24·0	10-8
1935	••	• •	35.2	23.7	11.5
1936			35.5	21.9	13.6
1937			36.0	22.3	13.7
1938			3 5·8	21.6	14· 2
1939	• •		35-1	23.0	12· 1
1940	••	••	34.9	22.5	12.4
1941			34.8	23.1	11.7
1942		• •	34.8	23.1	11.7
1943		•••	32.7	26·6	6∙1
1944			30.8	26· 6	4.2
1945	••	• • •	30.8	23 ·4	7-4
1946			34.0	20.3	13.7
1947		••	34.0	20.9	13-1
1948	•••		32.3	18.7	13.6
1949	•••		32.3	17.4	14.9
1950	• • •	••	31.2	19-9	11.3

As already mentioned, the population increased by 11.6 per cent during the decade 1931-41 and by 14.4 per cent during the decade 1941-51. The disparity between these rates and the rates of natural increase of the corresponding periods is attributable partly to the error in the registration of births and deaths, to which reference has already been made, and partly to emigration and immigration.

13. More about birth and death-rates -migration-cum-registration error.—Till 1942, birth and death-rates were compiled by the Director of Public Health, Madras. only with reference to the population as recorded at the preceding Census and it was only from 1942 that he has been allowing for the annual growth of population. It is, therefore, considered sounder when reviewing the growth rates, birth-rates and deathrates for each decade, to calculate them with reference to the mean decennial population for the decade, i.e., the arithmetical average of the population at the beginning and at the end of the decade. The mean decennial growth rates, birth-rates and death-rates thus calculated have been given in Subsidiary Table 1.3. The statement below gives the mean decennial growth rates for the State as a whole and for each of the natural divisions:-

[Statement No. 26.]

Area.	Mean decennial growth rate.							
Area	1941–50.	1931-40.	1921–30.					
(1)	(2)	(3)	(4)					
State	13.4	11.0	9.5					
Madras Deccan Division.	11.7	10.3	9.8					
West Madras Division.	18-6	10-9	12-6					
North Madras Division.	12.5	11.0	11.4					
South Madras Divi-	13-1	11-1	7.9					

In the State as a whole, and in the Deccan and South Madras divisions, there has been a steady increase in the growth rate. In the West Madras division, there has been a drop during the decade 1931-40 and a sharp increase during the decade 1941-50. This is exactly what happened in the districts of Nilgiris and Malabar, while the district of South Kanara had a steady increase during these decades. The drop in Malabar and Nilgiris during the decade 1931-40 was due to the increase in emigration and fall in immigration, respectively, on account of the economic depression which prevailed during that decade and the

S.T-1.8

North Madras division also. The sharp decennial population. increase in most of the districts during the decade 1941-50 was due to the fall in emigration and the return home of large numbers of emigrants from countries outside India.

Birth-rates.—The mean decennial birthrates, based on the registered births, is given in the statement below:-

Di-th soto

[Statement No. 27.]

100 to 100 1 3Tatanna1		Dirtii-rate.	
Madras Deccan Divi- sion. West Madras Divi- sion. North Madras Divi- sion.	1941-50. (2)	1931–40. (3)	1921-30. (4)
State	30.8	34.7	31.9
Madras Deccan Divi- sion.	33.1	38.5	35.7
West Madras Division.	31.3	35.0	35.8
North Madras Divi- sion.	30.5	34.7	30.9
South Madras Divi-	30·4	34.0	31.0

It will be seen that there was an increase in birth-rates during the decade 1931-40, and that thereafter there has been a decline to below the level of the 1921-30 figures. This trend is observed in all the districts with the exception of Malabar, South Kanara, West Godavari and Chingleput where there was a slight decrease during the decade 1931-40.

Death-rates.—The mean decennial death rates are given in the statement below:-[Statement No. 28.]

	Death-rate.							
State and Natural Divisions. (1)	1941–50. (2)	1931–40. (3)	1921-30. (4)					
State	20.6	$22 \cdot 3$	22.1					
Madras Deccan Division.	22.7	26·1	25.7					
West Madras Divi- sion.	18.3	20.6	22.2					
North Madras Divi- sion.	20.7	22.4	21.3					
South Madras Divi-	20.7	21.9	21.9					

In all the divisions there was an appreciable drop in death-rates during the decade 1941-50. But during the decade 1931-40, there was a very slight increase in the State as a whole, while among the divisions, there was an increase in the Deccan division and the North Madras division, a decrease in the West Madras division, the death-rates in the South Madras Division remaining stationary.

Death-rates by specific age groups for the decade 1941-50 are given in the state- \mathbf{ment} below. They are based on the registered deaths compiled by the Director of Public Health, Madras, and have been

name trend prevailed in some districts of worked out with reference to the mean

[Statement No. 29.]

•	A	 Ige gre	oup.		•	Death rate per 1,000 of the popu- lation.
		(1)				(2)
1-4			• •	• •		35
5-9		••		• •	• •	8
10-14		••			• •	5
15–19			• •		• •	7
20-29	• •		• •	• •	• •	8
30-39		• •	• •	• •	•••	10
40-49				• •	• •	' - 14
50-59					• •	21
60 and	ver	• •	••	••	• •	78

It will be seen that the death-rates are heaviest in the age groups 60 and over. Next comes children in the age group 1-4, and then the age group 50-59 while the age group 40-49 stands fourth. Death-rates are lowest in the age groups between 5 and 39.

The decennial rate of natural increase, i.e., the difference between the mean decennial birth-rate and the mean decennial death-rate has been given in columns 27 to 29 of the Subsidiary Table 1.3. The difference between these rates and the mean decennial growth rates already referred to, represents the allowance to be made for migration and registration errors. The net effect of the migration and registration errors has been indicated in columns 30 to 32 of the same subsidiary table. An attempt to estimate the migration registration errors separately has been made in the statements below for the State as a whole, for the decade 1921-30 and for the period 1931-50. The latter period could not be split up into two decades for want of the relevant data relating to the 1941 Census.

Registration error	+ 4.8
•	1001 00

It will be seen that for the decade 1921–30 migration error was — 1.6 while the registration error was + 1.3. The corresponding figures for the period 1931-50 are -3.0 and + 4.8. Our general impression is that deaths are recorded more accurately than births. A plus entry for the registration error takes one, therefore, by surprise. Another noticeable feature is the fact that the registration error for the period 1931-50 is more than twice that for the decade 1921-30. There is reason to think that this is due to a deterioration in registration of births and deaths since World War II, the over-worked Revenue Department being unable to maintain even the pre-war standard of supervision of village headmen who register these births and deaths in villages.

Prima facie, one would expect to find lower birth-rates and death-rates in Madras City than elsewhere in the State. But as will be seen from columns 18 to 24 of Subsidiary Table 1.3, there are a number of districts with lower birth-rates and death-rates than Madras City. I have consulted the Director of Public Health about this surprising feature. I do not agree with all

the explanations that he has attempted, and I would subscribe only to the following explanations:—

- (a) Registration of both births and deaths is more complete and accurate in the City than in the mufassal districts.
- (b) The large number of general and special (including maternity) hospitals in the City attract a large number of non-residents for treatment. The births and deaths occurring among these non-residents are included in the figures for Madras City. Information furnished by the Health Officer, Corporation of Madras, shows that on the average, 9 per cent of the total recorded deaths in the City relate to such non-residents.
- (c) While, in respect of Madras City, the Director of Public Health is able to secure and take into account all the monthly birth and death returns for each year, all these returns are not received and included in respect of mufassal districts.

In view of the fact that there are varying degrees of error in the registration of births and deaths in all the districts, I do not think any useful or confident analysis of the variations in the birth-rates and death-rates in the various districts can be made. There is also the fact that compulsory registration is not in force throughout the State.

14. Livelihood pattern of the general population.—The data discussed in this paragraph will be found in Subsidiary Table 1.8. The agricultural classes constitute 65 per cent of the population, and the nonagricultural classes 35 per cent. The dependence on agriculture is greatest in the North Madras division (71 per cent) and least in the West Madras division (53 per cent). The South Madras division presents a picture, which is only slightly different from that of the State, as a whole; 64 per cent of its population consists of agricultural classes, while the non-agricultural classes account for 36 per cent. The Deccan division is intermediate between the South Madras division and the North Madras division, with the agricultural classes accounting for 68 per cent and the non-agricultural classes for the remaining 32 per cent of its population. 35 per cent of the population of the State consists of persons who cultivate mostly their own lands, while 10 per cent cultivate mostly lands belonging to others.

S.T.—1·8

18 per cent of the population, while the non-cultivating owners of land, agricultural rent receivers and their dependants make up only 2 per tent of the population. Production other than cultivation, which category includes plantations, the large textile industry in this State and other manufacturing industries, supports 12 per cent of the population. Commerce supports 7 per cent, while transport supports 2 per cent of the population. Other services and miscellaneous sources of income, which include the professional services, employees under Government and local bodies, support 14 per cent of the population.

It is interesting to note that the number of owner cultivators and their dependants is much larger than that of the agricultural labourers nearly 35 per cent against 18 per cent. The figure for agricultural labourers will, of course, include persons who own some land of their own, but the number of these cases may be confidently said to be negligible, and in all these cases the land held by them is insufficient even for the subsistence of the managing member of the family.

Deccan Division.—This division has the largest percentage of owner cultivators (46 per cent), that is, in other words, peasant proprietorship is more widespread in this area than in the other areas. This is of course what one would expect in this dry tract, which is liable to periodical failure of crops as a consequence of which the owners must work on the lands themselves to make both ends meet and cannot afford to employ others on anything like the same scale as in the areas with assured irrigation. The cultivators of land, wholly or mainly unowned and their dependants account for 5 per cent of the population; the cultivating labourers and their dependants for 14 per cent of the population, while the non-cultivating owners of land, agricultural rent receivers and their dependants account for 3 per cent of the population. The facts that there are no plantations and that industrial expansion has been least in this division, is brought out by the fact that this division has the smallest percentage (9) of population depending on Livelihood Class V. The figure of 17 per cent under Class VIII, that is, persons depending on other services and miscellaneous sources of income, may come as a surprise at first sight, but the explanation is to be found, in the Tungabhadra Project works,

which is under execution in this division and the proportionately large number of persons (relative to the population) employed on these works. This category thus includes a large number of immigrants.

Consistently with the widespread peasant proprietorship, there is not much scope for leases and this is brought out by the figure 5 under Livelihood Class II.

In the district figures, the only feature, which calls for comment in this division, is that Cuddapah district tops the list under Livelihood Class V with a little over 10 per cent of the population under this category. This is due to the large number of handloom weavers in this district.

North Madras Division.—Thirty-eight per cent of the population depend on cultivation of their own lands while lessees and their dependants account only for 8 per cent of the population. The position in respect, of these two classes is the same in the South Madras division. While cultivating labourers and their dependants account for 23 per cent of the population in North Madras division, the corresponding figure for South Madras division is only 16. per cent, and this is due to the much larger deltaic area in the North Madras division. While nonagricultural classes account for 29 per cent of the population in the North Madras division, they account for 36 per cent in South Madras division and this is attributable to the facts that there are many plantation areas in South Madras division while there are none in the North Madras division, and that a larger proportion of the population is supported by industries in the South Madras division compared to the North Madras division.

Agency tracts.—There is hardly any non-agricultural occupation in this division apart from the collection of timber and forest produce. This is reflected in the high percentage of the figures under Class I in districts where there is a large Agency area, viz., Srikakulam 60 per cent, Visakhapatnam 79 per cent and East Godavari 62 per cent. As mentioned already, there is only a small Agency tract in the West Godavari district.

Plains Uplands.—Except in the West Godavari and Krishna uplands, production other than cultivation accounts for 10 per cent or more of the population in the upland area in this division, and this is due mainly to collection of forest produce and

timber in these districts and also fishing in Nellore district. There are also jute mills in Visakhapatnam district and at Eluru in West Godavari district.

Deltaic area.—It is not surprising that, in the more prosperous deltas of East Godavari and West Godavari districts, the percentage of population under Class I, viz., cultivators of land wholly or mainly owned is less than in the Krishna delta (Krishna and Guntur districts). For similar reasons, we find a larger percentage of lessees and their dependants in the East Godavari and West Godavari districts and a larger percentage of cultivating labourers and their dependants than in the Krishna delta. Consistently with these, we find also a larger percentage in the East Godavari and West Godavari districts under Class IV (non-cultivating owners of land, agricultural rent receivers and their dependants) than in the other two districts. The comparative figures are given below:-

· District.			Class II.	Class III.
. (1)			(2)	(3)
East Gedavari		••	11	31
West Godavari	• •		12	28
Krishna			5	. 20
Guntur			5	21

The figure under Class V is below 10 per cent in the West Godavari, Krishna and Guntur deltas, while it is 12 per cent in the East Godavari delta, due largely to the handloom industry in that district at a number of centres.

West Madras Division .- It is significant that 23 per cent of the population consists of persons who cultivate mostly lands not owned by them, and their dependants. Persons who cultivate mostly their own lands account for only 8 per cent of the population, while non-cultivating owners of land represent 2 per cent of the population. All these figures confirm the well-known fact that, in this division, the lands are owned by fewer persons than in any other part of the State. This position is largely due to Malabar where only 6.5 per cent of the population falls under Class I. Twenty per cent of the population in this division are cultivating labourers.

Lessees and their dependants account for a larger percentage of the population in South Kanara than even in Malabar (34 against 20). This is closely connected with the fact that the cultivating labourers constitute a larger proportion (22 per cent) in Malabar than in South Kanara (15 per cent).

This division has the largest percentage (16) of population under production other than cultivation. This is of course largely due to the plantations in the Nilgiris and Malabar and the large textile industry in Malabar district. Coffee, cardamom, tea and other plantations are found in the high hills in this division.

As already mentioned, the concentration of land in the hands of a few persons is most marked in Malabar. There is concentration of land ownership, though not on anything like the same scale, in South Kanara and Nilgiris (10 per cent and 19 per cent respectively under Class I). The laws of inheritance applicable, viz., the Marumakkattayam Law in Malabar and the Alivasanthana Law in South Kanara have preserved large holdings. The concentration in Nilgiris is of a peculiar type, in the sense that only enterprising persons with considerable financial resources can take up cultivation in this area. The number of non-cultivating landowners and agricultural rent receivers is least in the Nilgiris, as the cultivation of potato and other vegetables on ordinary land and the plantations are largely directed by the owners personally. The dominant position occupied by plantations in the economy of the Nilgiris district is brought out by the figure of 34 per cent under Livelihood Class V.

South Madras Division.—For a proper discussion of the South Madras division, Madras City, which stands in a class by itself, should be considered separately from the other areas, viz., the northern belt, the Cauvery delta and the southern belt, included in this division.

Madras City.—The markedly urban character of this metropolitan City is clearly brought out by the fact that the agricultural classes account for less than 2 per cent of the population, i.e., over 98 per cent of the population depend on non-agricultural occupations. Twenty-five percent of the population is supported by "production other than cultivation"; 22 per c nt by commerce, 9 per cent by transport, while 42 per cent depend or "Other services and miscellaneous sources of income". This large figure of 42 per cent for the professional services and employees of the State and Central Government at the headquerters of the State can hardly be surprising. The large textile industries, the numerous workshops and factories, including motor

factories, account for the figure of 25 per cent under Class V. Nor can 22 per cent under commerce be anything surprising for this premier trade centre, harbour and railway centre in the State. The City naturally leads in regard to transport also (9 per cent) as railway and road routes radiate from here.

Northern belt.—From the point of view of widespread peasant proprietorship, Tiruchirapalli (56 per cent) heads the list, Chittoor comes second, South Arcot third, Salem next, while Coimbatore comes lastvide the figures under Class I in Subsidiary Table 1.8. The extent to which lands are leased is smallest in Salem district and largest in Chingleput district—vide the figures under Class II in Subsidiary Table 1.8. The percentage of cultivating labourers and their dependants varies from 12 per cent in Chittoor district to 23 per cent in South Arcot district. The percentage under Class IV, viz., non-cultivating owners of land, agricultural rent receivers and their dependants, varies from 1 per cent in Tiruchirapalli to 2 per cent in North Arcot district.

Production other than cultivation accounts for more than 10 per cent of the Arcot, Chingleput, Salem and Coimbatore. All these are districts, in which there are large handloom industries including textile mills in North Arcot, Salem and Coimbatore, particularly in the last two districts. There are many tanneries in North Arcot district and plantations in Salem and Coimbatore districts. As for commerce, it is not surprising that Coimbatore should head the list, thanks to its large trade in textiles and cotton apart from general and Tirunelveli). trade.

under Class I, 14 per cent under Class II, some selected States in India:— [Statement No. 30.]

and engineering workshops and match 21 per cent under Class III and 4 per cent under Class IV. The Tanjore figures under these classes are not far different from the figures of the West Godavari Delta.

> The figure of 12 per cent against Tiruchirapalli under Class V, i.e., production other than cultivation, is no doubt due to the large industries in this district; the Golden Rock Railway Workshops, the Dalmia Cement Works and the textile mill and factories, and also the very large handloom industry in this district. Tanjore shows a larger figure under commerce than Tiruchirapalli, only because of its much larger trade in paddy. The large Railway junction and colony in Tiruchirapalli accounts for the much larger figure under transport in Tiruchirapalli, as compared with Tanjore.

Southern belt.—The fact that, from the agricultural point of view, Ramanathapuram is the least prosperous, is brought out by the figures under Classes, I, II and IV, viz., 45 per cent, 6 per cent and 1 per cent, respectively.

Production other than cultivation accounts for 12.6 per cent of the population in Madurai, 12.3 per cent of the population in Ramanathapuram and 18.8 per cent of the population in Tirunelveli. Madurai district, there is a large textile population only in the districts of North industry and also plantations (in the Ghats above the Cumbum valley as well as on the Palni and Sirumalai hills). In Ramanathapuram district, there are large factories at Sivakasi and Sattur, textile mills at Rajapalayam and a number of handloom weaving centres. In the Tirunelveli district, there are textile mills and a large handloom industry and also some plantations, and the recently started cement factory at Tazhaiyuthu (between Maniyachi

CHAPTER II—RURAL POPULATION.

Preliminary Remarks.—Rural population means the population enumerated in the rural areas of the State, i.e., in the areas other than those treated as towns or cities at this Census. The rural area thus comprises all entire revenue villages including panchayats (major or minor) and portions of such local areas, which are not towns or cities or portions thereof. A village is thus an administrative entity which may be uninhabited or have only one residential locality or more than one such locality. In Malabar district, the desams are the administrative units except in the Ernad and Ponnani taluks where only amsams have been treated as villages, the component desams being subunits as they are of the nature of hamlets in the amsam.

M.T.—A-I

There are 37,096 villages in Madras State with a total population of 45,832,268, i.e., as much as 80.4 per cent of the total population of the State. The average population per village is 1,236.

2. General distribution and distribution among villages classified by size.—Subsidiary Table 2·1 classifies villages in a convenient way as shown below:—

8.T.--2·1

	Description	77.		Population limits.
	(1)			(2)
Very large	••		• •	5,000 and over.
Large	• •			2,000 to 5,000.
Medium	• •		••	500 to 2,000.
Small	• •	• •	• •	Below 500.

About 16.6 per cent of the villages fall under the first category, 38.7 per cent under the second category, 38.6 per cent under the third category, and 6.1 per cent under the last category. Seventy-seven per cent of the rural population thus lives in the medium size and large villages.

The average population per village varies from division to division. It is naturally as low as 153 in the Agency tracts, 1,085 in the plains upland area of the North Madras Division, 2,130 in the deltaic portion of that division, 1,226 in the South Madras Division (1,203 in the Cauvery delta), 1,245 in the Deccan Division and 2,751 in the West Madras Division. This is not as significant a figure as it may appear at first sight, as it depends on the administrative entity which constitutes the village, and this varies from

division to division according to the exigencies of the revenue administration. In other words, these figures depend not only on the absolute population but also on the size of the administrative entities which constitute the villages. Thus, the small figure of 553 for Ramanathapuram district indicates the large number of small villages in an area which is not thickly populated.

The percentage of population which lives in the rural areas is 84 in the Madras Deccan division, 88 in the West Madras division, 100 (cent per cent) in the Agency tracts, 87 in the plains upland area of the North Madras division, 76 in the deltaic area of the same division and 77 in the South Madras division (78 in the Cauvery delta).

In the Madras Deccan division, Bellary has the smallest percentage of the rural population (78 per cent) which undoubtedly gives a correct picture of this district as compared with the other districts in the division. Owing to the existence of large towns, viz., Ootacamund, Wellington, Coonoor and Kotagiri, only 71 per cent of the population in the Nilgiris is rural. The figures of Malabar and South Kanara, viz., 89 and 86 would have been less but for the well-known fact that the houses in these districts, except in the large towns, are mostly scattered in the farms of the owners of the houses and are not in compact areas such as would facilitate the growth of towns. The Agency tracts are cent per cent rural, as there are no places deserving to be treated as towns even according to any generous definition of that term. In the plains upland area of the North Madras livision. the percentage of the rural population varies from 75 in the East Godavari district to 94 in Krishna district, which reflects correctly the relative urbanisation of these areas. In the deltaic portions of the North Madras division, the percentage of the rural population varies from 74 in the Guntur and Krishna districts to 82 in the East Godavari district which again reflects the relative position in these districts correctly.

In the Northern belt of the South Madras division, the rural percentage varies from 80 per cent in Coimbatore to 91 in Chittoor which reflects the relative position in this belt correctly. In the Cauvery delta, Tanjore and South Arcot are on a par with a

80 per cent rural population, while the rural percentage for the Tiruchirapalli district is 73. This marked difference in Tiruchirapalli district is of course due to the outstandingly large Tiruchirapalli-cum-Srirangam municipal area.

The Southern belt is an instance in point to show that an area which is not fully deltaic and where large building areas are available in consequence, lends itself easily to the formation of towns. In deltaic areas, practically every inch of land is occupied for profitable cultivation and the land value is consequently very high. It is this factor rather than any greater prosperity that accounts on the whole, for the difference seen in the figures of the Southern belt when compared with those of Tanjore.

It is hardly surprising to find that only 5 per cent of the population in the Agency tracts live in very large villages, and that the figure for the Madras Deccan division is only slightly better with 6.2 per cent. The position in the Plains upland area in the North Madras division is, in this respect, the same as in the Madras Deccan division. The position is different in the South Madras division, where, in the Northern belt, 12.7 per cent of the population lives in very large villages, and 17 per cent in the Southern belt. The figures for the deltas are 21 for the North Madras division and 7 for the South Madras division. It is well-known that, for instance in Tanjore delta, the villages are generally of the medium size.

For the large villages, the figures are 39 per cent for the Madras Deccan division, 29 per cent for the West Madras division, 7-6 per cent for the Agency tracts, 40 per cent for the Plains upland area in the North Madras division and 51 per cent for the delta area of the same division, while, for the South Madras division, the figures are 39 per cent for the Northern belt, 40 per cent for the Cauvery delta and 40 per cent for the Southern belt.

As regards the medium-size villages, i.e., those with a population ranging from 500 to 2,000 these account for 49 per cent of the population in the Deccan division, 20 per cent in the West Madras division, 23 per cent in the Agency tracts, 46 per cent in the Plains upland portion of the North Madras division and 27 per cent in the deltaic portion of the same division, while in the South Madras division, the corresponding figures are 42 per cent for the Northern belt, 47 per

cent for the Cauvery delta and 36 per cent for the Southern belt.

Taking the small villages, i.e., those with a population below 500, the population residing in them account for 5.6 per cent of the total population in the Madras Deccan division, the corresponding figures for the other divisions being 1.3 for the West Madras division, 64.2 for the Agency tracts, 8.2 for the Plains upland area of the North Madras division, 1.3 for the deltaic area in the same division, 5.9 per cent in the Northern belt of the South Madras division, 5.6 per cent in the Cauvery delta and 7.5 per cent in the Southern belt of the same division.

No general comments will be justified on these figures as the formation of the villages has been largely a matter of historical accident and the Revenue Department has accepted these accidents. One truly significant figure is the 64·2 per cent for the Agency tracts which undoubtedly gives a correct picture of this extremely backward, hilly and feverish area, where most of the population lives in very small settlements.

3. Growth of Rural population.—The growth in the general population is of course made up of the growth in the rural population and that in the urban population. In this Chapter, we shall be concerned only with the former, while the next Chapter will deal with the latter. In this connection it should be noted that the figures of rural and urban population given in the tables represent the position as at the Census concerned and the tables do not show the decreases or increases resulting solely from the changes in the rural and urban areas.

In an agricultural country like India, which is being slowly industrialised, we should expect a more spectacular growth in the urban population than in the rural population. Not only more villages qualify to be treated as towns, but many of the old towns tend to expand in size and population. These factors have operated in a particularly spectacular manner during the decade 1941-51 for reasons which I have explained fully in Chapter I. Briefly put, the movement into the towns is for urban amenities, educational facilities and for being in a position to secure steady supplies of food and consumer goods when control measures are in operation. The widespread failure of the north-east monsoon since 1947-48 has aggravated this drift towards the towns even among persons like agricultural labourers who would have been quite content to stay on in their own places if they could be assured of a tolerable crop yield and sufficient employment to enable them to make both ends meet.

The rural population has increased by 9.5 per cent during 1941-51 as against 9.3 per cent and 8.5 per cent respectively in the previous two decades, and these compare, as shown below, with the increase in the general population during the same decades:—

MADRAS STATE.

Percentage increase in population.

	1941-51.	1931-41.	1921-31.
(1)	(2)	(3)	(4)
General population.	14-4	11.6	10.0
Rural population	9.5	9.3	8.5

It is significant that, while the general population has shown a marked jump from 11.6 per cent to 14.4 per cent during the last two decades, the rural figure has increased only slightly from 9.3 to 9.5, again confirming the much larger proportionate increase in the urban population. Sudden large growths are possible in towns, but not under present conditions in our rural areas.

MADRAS DECCAN DIVISION.

•	1941-51.	1931-41.	1921-31.
(1)	(2)	(3)	(4)
General population.	12-4	10.8	10.3
Rural population	9-1	7-1	10.3

In this division, Bellary district tops the list with an increase of 13·3 per cent in the rural population during the decade 1941-51, Anantapur coming next with 11·8 per cent. The explanation given for the disparities in the increase in general population in these districts is equally valid for that in the rural increases. The Bellary figure is due to the fact that the Tungabhadra Project Headworks has attracted large numbers of immigrant labourers to that district.

WEST MADRAS DIVISION.

	1941-51.	1931-41.	1921-31.
(1)	(2)	(3)	(4)
General population	20.5	11-6	13.5
Rural population	18-0	9⋅6	12.7

The increase during 1941-51 varies from 9.9 per cent in South Kanara to 19.6 per cent in Malabar, and 57 per cent in the Nilgiris district. The explanation for this disparity

is to be found in the varying conditions described in Chapter I. One interesting factor to be noticed is that, while in Malabar and South Kanara, the percentage increase in general population is larger than that of the rural population, in the Nilgiris district, the general population has increased by 48.7 per cent, as against an increase of 57 per cent in the rural population. The reason for this position in the Nilgiris district is, of course, that the plantations have attracted immigrants and that these and most of the cultivated lands are outside towns.

NORTH MADRAS DIVISION.

(1)	1941–51. (2)	1931 -4 1. (3)	1921-31. (4)
General population	13-3	11.6	12-1
Rural population.	9-1	9.3	11.9
Con	pletely rur	al.	
Agency	9.4	8.2	14-9
Plains Upland-			
General population.	10.6	11-3	9.9
Rural population.	7.8	10-0	9.7
Plains Delta-			
General population.	18.3	12.5	15.9
Rural population	11.6	8.3	15-7

The figures show that there has been some development of the agency tracts during 1941-51. It is interesting to find that the agency tracts have shown a larger increase (9.4 per cent) than the plains upland area of the same division (7.8 per cent). This is not really surprising, because the agency figures show the effect of immigration, while the upland figures reflect partly the effect of the adverse seasonal conditions and partly the effect of emigration from those areas. The Guntur uplands have fared badly: the increase has been only one per cent, as against 12.8 per cent in the delta in the same district. This brings out clearly not only the difference between areas which have assured irrigation and upland areas depending on precarious rainfall, but the effect of the adverse seasonal conditions during the latter part of the decade.

Another interesting feature, which may be noticed is that, while the Northern delta shows an increase of 11.6 per cent and the Southern delta (the Cauvery delta) 12.2 per cent, the West Godavari uplands have done far better (17.3 per cent). All these are areas into which there has been appreciable immigration, but the effect of the immigration is naturally much more pronounced in

an upland area than in the already thickly populated deltas.

SOUTH MADRAS DIVISION.

•.	1941–51.	1931-41.	1921-31.
(1)	(2)	(3)	(4)
General population	14.0	11.7	8.3
Rural population	7.7	9.6	5.7
Madras City.	Ent	irely urban	١.
Northern belt-			
General population	12-0	12.6	9.5
Rural population	8.0	10-4	9-1
Cauvery Delta-			•
General population	16.8	9-3	2.4
Rural population	12.2	8.5	0.6
Southern belt—			
General population	10-7	10.3	8.0
Rural population	4:1	8-2 ′	3.8

A striking feature in these figures is the decrease in the rate of growth of the rural population in the Northern and Southern belts, as seen from a comparison of the 1931-41 and 1941-51 figures. There is nothing surprising about this, because it really reflects the very large effect of the emigrations to other districts and urban areas caused by the failure of the north-east monsoon since 1947-48. There is not such a marked decrease in the North Madras division, for the simple reason that that area does not depend on the north-east monsoon to such a large extent as the southern division. The low figure of 4.1 per cent in the Southern belt calls for some explanation. Madurai district with 9.9 per cent calls for no explanation, and the low increase in the Southern belt is due to the very low figures of the remaining two districts: Ramanathapuram (+ 0·1 per cent) and Tirunelveli (+ 1·1 per cent). The Ramanathapuram figure is a true reflection of the distress suffered by this district on account of the failure of the north-east monsoon during the latter part of the decade, and the consequent large scale emigration. Ceylon being next door to this district, so to speak, this district contributes largely to emigration to that country. The very large emigrations from this district to Tanjore and Tiruchirappalli districts have already been mentioned in Chapter I. The emigrations which took place from Tirunelveli district for similar reasons, though on a smaller scale, have also been mentioned in Chapter I, but in the case of this district, the position is not so bad as the figure of 1.1 per cent might indicate, because of the substantial population involved in the places which

have been newly treated as towns at the 1951 Census—vide particulars given below:—

Name of town.	Population
(1)	(2)
1 Kalakad	16,312
2 Arumuganeri	13,801
3 Panagudy	11,551
4 Sawyerpuram	7.631
5 Kadambur	7.128
6 Pudur	4,378
7 Karivalamvandanallur	4,364
8 Vilathikulam	3,158
Total	68,323

Allowing for the loss of rural population on account of these new towns, the Tirunelveli figure for the increase in rural population during 1941-51 would be 4.8 per cent.

The 1941-51 figures for the Cauvery delta call for some special remarks. The decade was one of undoubted prosperity for the districts in this deltaic area as explained in Chapter I and there was immigration on an appreciable scale from distressed districts. The jump in 1931-41 as compared with 1921-31 was of course due to the Cauvery-Mettur Project which was inaugurated during the decade 1931-41, and which has not only made a larger extent of irrigation possible in the Tanjore district but has also assured steadier supplies throughout the irrigation season for all portions of this delta.

- 4. Density of rural population.—The density of rural population in the State as a whole is 367 per square mile: 162 in the Deccan division, 559 in the West Madras division, 351 in the North Madras division (79 in the Agency tracts, 355 in the Plains Upland and 629 in the deltaic area), and 438 in the South Madras division (423 in the Northern belt, 612 in the Cauvery delta and 396 in the Southern belt). These variations in density generally follow the variations noticed in respect of the general population; but, there are some disparities arising from the variations in the number of towns in each of these areas and the density of the urban population in those areas, e.g., while the East Godavari delta continues to be the most congested area in the mufassal even in respect of rural population, the Tanjore delta has a higher density of rural population (663) than the deltaic areas in West Godavari and Krishna (634 and 493).
- 5. Birth and Death rates.—The statement below gives the mean decennial birth rates and mean decennial death rates for the three

5.**T.—2**·2

decades 1921-30, 1931-40 and 1941-50 for in respect of general population, rural the State as a whole, and for each division, population and urban population.

8.7s.—1·8; 2·8 and 8·8.

Comparative rates of births and deaths.

[Statement No. 31]

[Succeed No. 31.]				1	Birth rates.	Death rates.

West Madras Division— General population Rural population Urban population	••	••	••	31·3 31·2 32·2	35·0 35·3 32·1	35·8 36·2 32·4	18·3 18·0 20·4	20-6 20-5 21 1	22·2 22·0 2 4·3
North Madras Division— General population Rural population Urban population	••	••	••	30·5 31·0 27·3	34·7 35·0 32·5	30·9 31·2 28·5	20·7 21·2 17·8	22-4 22-4 22-0	21·3 21·3 21·0
South Madras Division— General population Rural population Urban population	••	••	••	30·4 30·2 31·1	34·0 34·1 34·0	31·0 30·8 31·7	20·7 20·6 20·9	21·9 21·5 23·9	21·9 21·2 25·9

We should normally expect to find the birth and death-rates to be higher for the rural population than for the urban population, the general population occupying an intermediate position in this respect. But, as may be seen from the statement above, this is not the position everywhere, or during all the decades. In fact, no confident analysis of these figures is possible for the following reasons:—

- (1) There are registration errors, in regard to birth-rates as well as death-rates, and the extent of these errors cannot be assumed to be the same in all rural areas, or in all urban areas, though it can be claimed, that, on the whole, registration is more satisfactorily carried out in the urban areas than in the rural areas.
- (2) The Director of Public Health, who has compiled the data relating to the registered births and deaths, has been treating, as towns, all local areas with a population not below 5,000, whereas, at the Cesnuses, we have been adopting the criterion of urban features, and going below the 5,000

limit in exceptional cases, where the places concerned have definite urban features.

- (3) The urban figures get inflated, to some (varying) extent, by births and deaths relating to persons, who have come into the urban area temporarily for confinement or medical treatment, as the case may be.
- 6. Movement of population.—For the reasons explained in the previous paragraph, it is not possible to deduce any reliable estimates of inter-district movements by comparing the mean decennial growth rates and the mean decennial rate of natural increase. There is really no need to do so, as the movements of population discussed in Chapter I are practically all from rural areas. The emigrants moved either into towns or to places outside the State or even outside India. The towns have been growing in numbers and in size, and there is, as yet, no question of any large movements from them to rural areas.
- 7. Livelihood pattern.—The statement below gives the distribution of the rural population by livelihood classes, for the State as well as for each division:—

8.T.-2-4

[Statement No. 32.]

			Class I	Class II	Class III	Class IV	Class V	Class VI	Class VII	Class VIII
(1)			(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
State	••		42	11	21	2	10		`,	•
Madras Deccan Division	••	••	53	6	15	3	7	i	••	13
West Madras Division	••	• •	9	25	23	2	15	7	2	17
North Madras Division	••	••	43	9	26	2	9	3	ī	7
South Madras Division	••	••	47	10	20	2	9	3	1	8

That 76 per cent of the rural population is supported by agriculture is no surprise; on the other hand it is gratifying to find that as much as 24 per cent of the rural population is able to support itself on non-agricultural occupations. Fourty-two per cent of the rural population cultivate their own land, while 21 per cent are cultivating labourers. Lessees and their dependants account for 11 per cent of the population, while 2 per cent are non-cultivating owners of land, agricultural rent receivers and their dependants. Production other than cultivation supports 10 per cent of the population. Commerce supports 4 per cent, transport 1 per cent. while the professional services, employees of Government and local authorities and other miscellaneous sources of income account for 9 per cent of the rural population.

The percentage of population falling under Class IV, viz., non-cultivating owners of land, agricultural rent receivers and their dependants is more or less the same in all divisions.

Madras Deccan Division.—As already mentioned in Chapter I, peasant proprietorship is more widespread in the Deccan division than in the other parts of the State. This explains the fact that this division has the largest figure under Class I and the lowest figures in the other three agricultural classes in the entire State. Fifty-two per cent of the population cultivate their own lands; lessees and their dependants account only for 6 per cent and cultivating labourers for 15 per cent. This division is at the bottom of the list with 7 per cent as far as production other than cultivation is concerned. and this indicates its backward condition.

West Madras Division.—The concentration of land in the hands of a comparatively few persons in West Madras Division already referred to in Chapter I explains the fact that this division has the smallest percentage of population under Class I. Lessees account for 25 per cent of the population and cultivating labourers for 23 per cent. Production other than cultivation accounts for 15 per cent of the population, and this is of course due to the fact that this division contains the largest area under plantations in the State; tea, coffee, cardamom, etc.

Only 7 per cent of the population in Malabar falls under Class I, viz., cultivators of their own lands and their dependants. Twenty-two per cent are lessees and their dependants, while 25 per cent are cultivating labourers. Though the physical and climatic conditions are similar in South Kanara, the position is different in that district owing largely to the differences in land tenures; 11 per cent under Class I, 38 per cent under Class II and 18 per cent under cultivating labourers.

North Madras Division: Agency Tracts.

—In the Agency tracts, 63 per cent of the population cultivate their own lands; 8 per cent are lessees and their dependants, while the cultivating labourers account for 18 per cent.

Plains Upland.—In this area, 46 per cent of the population cultivate their own lands; 8 per cent are lessees and their dependants and 24 per cent are cultivating labourers. Production other than cultivation accounts for 10 per cent of the rural population, which is due largely to the handloom industry in the area. Production other than cultivation accounts for an appreciable percentage of the population in Visakhapatnam (12.2 per cent), Guntur (10 per cent), Nellore (11 per cent), Srikakulam (9.3 per cent), and East Godavari (9.4 per cent). In Guntur and Nellore this is largely due to stock raising (rearing of cattle) and fishing; while in the other three districts it is due to collection of timber and forest produce, and in Visakhapatnam district also due to jute manufacture.

Deltaic portion of North Madras Division.—In the deltaic portion of this division, 37 per cent of the population cultivate their own lands, 10 per cent are lessees and their dependants, while 30 per cent are cultivating labourers. The figure under Class I-Cultivating owners and their dependants, varies from 24 per cent in East Godavari district to 48 per cent in Guntur district; lessees and their dependants account for 13 per cent in East Godavari, 15 per cent in West Godavari and 6 per cent in Krishna and Guntur districts. The cultivating labourers account for 35 per cent in East Godavari, 32 per cent in West Godavari and about 25 per cent in Krishna and Guntur. The relative profits of cultivation in the Godavari and Krishna deltas are reflected in these figures. Production other than cultivation accounts for less than 10 per cent in this division, except in East Godavari district, which has 11 per cent under this class, thanks to its large handloom industry and collection of timber and forest produce.

South Madras Division—Northern belt.— It is not surprising that the Northern belt, which is a dry area, has 50 per cent under

Class I, 8.5 per cent under Class II, and 19.7 per cent under Class III. Under Class I. the percentage in this belt varies from 34 per cent in Coimbatore to 63 per cent in Tiruchirapalli. In Coimbatore, 34 per cent of the population cultivate their own lands, 7.3 per cent are lessees and their dependants, while 21 per cent are agricultural labourers. In Chingleput, the corresponding figures are 37 per cent, 12 per cent and 26 per cent. The Chingleput figures indicate the large number of absentee landlords, who get their lands cultivated on lease. For many of these absentee landlords, the attraction of Madras City closeby must be irresistible. The large figures under production other than cultivation, viz., Coimbatore (18 per cent), Salem (10 per cent) and Chingleput (10 per cent) are due to the large handloom industry in these districts and also in the case of Salem and Coimbatore to plantations.

The Cauvery Delta.—37 per cent of the population cultivate their own lands, 17 per cent are lessees and their dependants, while 26 per cent are cultivating labourers. Non-cultivating land owners, agricultural rent receivers and their dependants account for 3 per cent of the population. The predominantly agricultural character of the population is brought out by the small

figures under Classes V to VII. The figure under Class I varies from 31 per cent in Tanjore to nearly 50 per cent in Tiruchirapalli. The percentage of lessees and their dependants is largest in Tanjore with 19 per cent (16 per cent in South Arcot and 12 per cent in Tiruchirapalli). Cultivating labourers account for 29 per cent of the rural population in Tanjore, 32 per cent in South Arcot and 18 per cent in Tiruchirapalli.

Southern belt.—48 per cent of the population cultivate their own lands, 9 per cent are lessees and their dependants, while 18 per cent are cultivating labourers. The percentage under Class I is the least and that under Class II the largest in Tirunelveli. district. Cultivating labourers account for 23 per cent of the population in Madurai, and for 14 per cent in each of the other two districts. Ramanathapuram is, generally speaking, a poor district from the agricultural point of view. We accordingly find that it has the largest figure under Class I (57 per cent) and the smallest figure (7 per cent) under Class II. Production other than cultivation accounts for the largest percentage in Tirunelveli (14), thanks to the large handloom industry in the rural areas also of that district and some plantations.

2.1 Distribution of population between villages.

CHAPTER III—URBAN POPULATION.

Preliminary remarks.—This Chapter deals with the urban population, i.e., the population living in local areas treated as towns and cities, as distinguished from villages dealt with in the previous chapter.

In this State there are 473 towns classified as shown below :---

M.T.-A-IV

The number of towns has been progressively increasing as specified below:-

_		Number of
		towns.
(1) Year.		(2)
1931	 	350
1941	 • •	420
1951	 • •	473

The percentage of urban population to the total population is given in the statement below :-

Decade ending with			Percen- tage.
(1)			(2)
1901			11-1
1911		• •	11.7
1921			12.4
1931			13.6
1941		• •	16.0
1951	••	• •	19.6

The number of towns has thus been steadily increasing and there has been a larger jump in the urban population during the decade 1941-51 than previously. The attraction of towns is due to the following

- (1) When controls over food and consumer goods in short supply were in operation, it was advantageous to be in towns and not. in villages:
 - (2) Educational facilities:
 - (3) Medical facilities:
- (4) The setting up of industries ensuring a steady demand for labour which is attracted by the fact that it cannot fare so well on agriculture in areas where the pressure of the population on the land is already high;
- (5) The scope for non-agricultural occupations, not only for the professional services but also for other miscellaneous

earners, including domestic servants and daily casual labour of various kinds;

(6) The increase in the demand for, urban amenities besides educational institutions and medical facilities.

All these factors have been in continuous operation, and even if all the controls go, the other factors will remain, and continue to force up the urban population. The rural-urban classification is, of course, of great significance in demographic studies. This is because the growth of population is vitally affected by the physical environment in which the population lives, the means of livelihood available in the different areas, and the facilities available for educational advancement and for the prevention and cure of diseases. In respect of all these matters, there is a significant difference between rural and urban areas. It is the existence of these conditions or their lack that should really determine the demarcation of local areas into villages and towns and not so much an absolute limit of population. In this view, the limit of 5,000 which has generally been adopted is an arbitrary one, but on the whole it may be said to be a reasonable one, as it is very rarely that one comes across a place with a smaller population which really deserves to be treat- (9) ed as a town. The fundamental criterion for classification of a local area as a town is thus the existence of urban features. which can be judged by the way in which the houses are situated and how they have been built, and the availability of urban amenities such as a bazaar where one could buy one's normal requirements throughout the year, facilities for education. recreation and medical treatment. Naturally enough, in a real town, there will be many persons who provide, so to speak. the urban amenities, and their occupation will thus be largely of a non-agricultural character. It is for this reason that one normally finds in towns a higher proportion of non-agricultural classes.

The statement below gives the number of places classified as towns in each of which I M.T.-A.V the agricultural population exceeds the nonagricultural population. These towns cover only a small fraction of the urban population in the State. In a State which is still, predominantly agricultural, it is not surprising to find that town dwellers in some

rural towns are still predominantly agricultural. It is only where there has been a that we can expect the non-agricultural more appreciable industrial development population to exceed the agricultural populaor the place is a large trade centre serving a tion.

considerable area in the neighbourhood

Statement showing the number of towns in each district in which the Agricultural population exceeds the Non-Agricultural population.

Of the places which have been treated It must be admitted that we have not as towns, only 23 have a population less insisted on any very high standard of urban than 5,000. Of these, in all except 3, i.e., features or amenities, while deciding the Kadayam and Pudur in Tirunelveli district classification of towns, and there may be and Pandalkudi in Ramanathapuram dis- room for difference of opinion in particular trict, the proportion of non-agricultural cases. But, generally speaking, the people classes is distinctly higher. Of the three in the places which have been classified exceptions, Pudur is the only place newly as towns, live under conditions of greater treated as a town at the 1951 Census. It physical comfort and they are better able was included on the recommendation of the to command facilities not only for the Collector, but it has proved to be a doubtful prevention and cure of diseases, but also case; its population has not risen to above for help in connection with maternity 5.000 as estimated by him. Kadayam and child welfare. As already explained. is a prosperous place with a railway station this makes a significant difference and and a dispensary. The town has been electrified and electric power is used for as towns. There are, however, a very town. It has now got a High school also.

Further inquiries made by me show that the treatment of Pandalkudi Panchayat as a town may stand; it is an important centre for communications and trade in Aruppukkottai taluk and is the gateway to Tirunelveli district from this part of Ramanathapuram district.

justifies the treatment of these places irrigating the famous lime gardens in this few doubtful cases which I think should be looked into at the next Census and the eligibility of these places to be continued as towns should be looked into thoroughly example, and settled. For Pulicat in Ponneri taluk, Chingleput district, was recognized as a town even prior to the 1951 Census. Personally, I am inclined to consider that there is no sufficient reason for treating it as a town. That the population of this place consists of 3,330 persons belonging to non-agricultural classes and 290 belonging to agricultural classes is merely due to the fact that the people here depend mostly on fishing in the Pulicat lake closeby. There is no reason for considering that conditions of life in Pulicat are superior to those in many other villages with equal population and which are situated in much healthier areas unlike Pulicat which is malarious. Three other doubtful cases which I would mention are Tekkalakota in Bellary district, Keeranur in Madurai district and Pudur in the Kovilpatti taluk of Tirunelveli district, which I have already referred to.

On the other side of the picture we have places not treated as towns so far, but which deserve consideration for treatment as towns and these cases may also be looked into at the next Census. In this connection, I would mention the following cases:—

[Statement No. 34.]

* There is a textile mill at this place.						

All these places have a population of over 5,000 each.

There are 96 municipalities in this State including the Corporation of Madras of which 13 are in Class I, 20 in Class II, 58 in Class III and 5 in Class IV. The five municipalities in Class IV, i.e., which have a population below 20,000 are Tadpatri (19,369) in Anantapur district, Tiruvallur (18,847) in Chingleput district, Walajahpet (12,601) in North Arcot district, Kodaikanal (10,941) in Madurai district and Bheemunipatnam (10,477) in Visakhapatnam district. Of these, Bheemunipatnam is not a growing town but the others are. The average population per town in each of these six Classes is as specified below:—

[Statement No. 35.]

Class.			Average population per town in the class in column (1).	
			(2)	
I		<i>•</i>		259,933
II				75,523
III	• • .			29,558
\mathbf{IV}				13,741
v			.:	7,705
$\mathbf{v}\mathbf{I}$				3.856

I think, that, on the whole, the classification of places as towns has been satisfactory and that there are no errors which are likely to vitiate that classification seriously for purposes of demographic studies.

2. General distribution and distribution among towns classified by size.—As already mentioned, about 20 per cent (19-6 per cent to be exact! of the total population of the State lives in towns. The urban population is 11,183,734 which gives an average population of 23,644 per town in this State. Sixty eight per cent of the urban population lives in towns with a population exceeding 20,000; 21 per cent in towns with a population ranging from 10,000 to 20,000; 11 per cent in towns of the population ranging from 5,000 to 10,000. The percentage of population living in towns below 5,000 is negligible, being 0.8 per cent. The figures confirm the preference shown by people for really large towns with a population of 20,000 and over. which may be said to be fully urban in character and provide urban amenities of a high standard and also opportunities for following non-agricultural occupations on a large scale.

There are no towns in the Agency tracts, but the time is not far distant when, with 8.T.—8·1

the development of these areas, some of the larger places will qualify to be treated as towns. In the matter of urbanisation, South Madras division (even excluding Madras City) leads with 19.6 per cent. The North Madras division comes next with 16.4 per cent, followed by the Madras Deccan division with 16.4 per cent. The West Madras division comes last with 12.3 per cent. The last mentioned division would, undoubtedly, have shown a higher percentage of urban population but for the fact already mentioned, viz., that, normally, in this area, houses lie scattered in agricultural farms and consequently the compactness which is necessary for the formation of a town is lacking in many places.

In the Madras Deccan division, the urban population varies from 11.6 per cent in Cuddapah district to 21.7 per cent in Bellary district. In the West Madras division the corresponding figures are 10.7 per cent for Malabar, 13.9 per cent for South Kanara and 28.6 per cent for the Nilgiris. In the plains upland portion of the North Madras division, the urban percentage varies from 6.3 in Krishna to 25.3 in East Godavari. In the deltaic portion of the same division, the urban percentage varies from 17.9 per cent in East Godavari to 26 per cent in Krishna and Guntur districts.

Coming to the South Madras division, leaving out Madras City, which is cent per cent urban, we have, in the northern belt, an urban percentage varying from 9.4 per cent in Chittoor district to 19.8 per cent in Coimbatore district. In the Cauvery delta, the urban percentage is 21.7 per cent as against 23.6 per cent in the deltaic portion of the North Madras division. The district percentages are 19.8 per cent in the South Arcot portion of the Cauvery delta, 19-4 per cent in Tanjore district and 26.9 per cent in the Tiruchirapalli portion of the delta. The outstandingly large figure for the Tiruchirapalli portion is of course due to the large Tiruchirapalli-cum-Srirangam municipal area. If we leave out Tiruchirapalli and Scirangam, Tanjore Municipality is the largest town in the Cauvery delta. The figures for these municipalities are given below :-

 Tiruchirapalli
 ...
 218,921

 Srirangam
 ...
 36,702

 Tanjore
 ...
 100,680

The southern belt has the largest urban percentage, viz., 28.4 per cent in the mufassal. The component figures are 27.9 for Madurai district, 25.9 per cent for Ramanathapuram district and 31.3 per cent for Tirunelveli district. The bulk of the rural area in Ramanathapuram district, excluding that of the Nagarathars (Nattukottai Chettiars) consists of thinly populated small villages. The large figure for Tirunelveli must be attributed to the fact that, generally speaking, the village sites in this district are more compact, and the houses are better built with street formations, than in the other two districts. This is particularly the case in the Tambaraparni delta. It is not, therefore, surprising that as many as 43 places have qualified for treatment as towns in Tirunelveli district as against 33 in Ramanathapuram district and 26 in Madurai district.

In Madras Deccan division, 53 per cent of the population lives in the large towns with a population of 20,000 and over; the corresponding figures for the other divisions being 79 per cent for the West Madras division, 55 per cent for the plains upland portion of the North Madras division, 66 per cent for the deltaic portion of the same division, 63 per cent for the Northern belt of the South Madras division, 61 per cent for the Cauvery delta and 65 per cent for the Southern belt. In Malabar district, as much as 86 per cent of the urban population lives in large towns, as against 66 per cent in the adjoining district of South Kanara. In the deltaic portion of the North Madras division, Krishna district leads with 80 per cent of the urban population living in large towns, a fact largely due to the Vijayavada Municipality, the population, of which has now gone up to 161,198. In the northern belt of the South Madras division, Coimbatore district leads, as one would expect to find, with 73 per cent of the urban population living in large towns. In the southern belt, Madurai leads with 71 per cent, due of course to Madurai Municipality the population of which has grown to 361,781.

3. Growth of urban population.—It will be seen from Subsidiary Table 3.2 that the percentage increase in the population treated as urban is 40.5 per cent for the decade 1941-51, as against 25.6 per cent and 19.8 per cent, respectively, for the two previous decades, 1931-41 and

S.T.-3.2

1921-31. In appreciating these figures, it has to be remembered that the percentages are with reference to the population in the places treated as towns at each of the Censuses concerned, and that the figures do not make any allowance for the deletion of any towns from a previous list or for inclusion of any new towns at a later Census. But these changes, as will have been seen from what I have said earlier in this Chapter, have not been of an order to make any serious difference to the conclusions that may be drawn from these figures. The 40.5 per cent growth in the urban population in the State during 1941-51 is made up of a 33.2 per cent growth in the Madras Deccan division, a 41.4 per cent growth in the West Madras division, 33.8 per cent in the Plains Upland portion of the North Madras division, 46.9 per cent in the Deltaic portion of the same division, 60.6 per cent in Madras City, 41.8 per cent in the Northern belt of the South Madras division, 37.5 per cent in the Cauvery delta and 31.8 per cent in the Southern belt.

The figures for individual districts cannot be taken at their face value, in view of the changes in the number of towns at each Census referred to above, and it is not therefore worthwhile discussing these figures in detail. The large figures noticed in the case of some districts are sufficiently explained by the tremendous growth in some towns, as will be explained later when I proceed to deal with the cities. There is no room for doubt however, as to the marked jump in urbanisation during the decade 1941-51. In fact, conditions have been quite favourable for urbanisation since 1921, and there was an appreciable increase, in spite of the economic depression which commenced in 1930-31 and which persisted till the commencement of World War II. During the decade 1941-51, there have been some special factors in operation as already explained, accelerating the pace of urbanisation.

Subsidiary Table 3.4 gives figures relating to the growth of population in each of the six classes of towns referred to above. It is significant of the conditions which have accelerated urbanisation during the decade 1941-51, that the largest increase is in Class I (116 per cent), the increases in the other classes being 3.4 per cent in Class II, 63 per cent in Class III, 29 per cent in Class IV, minus 17.6 per cent in Class V, and 34.7 per cent for Class VI. The minus figure in

Class V is due to the fact that some of the towns formerly in this class have qualified for the higher Class IV, and that their places have not been filled up by promotions, so to speak, from Class VI.

In examining these figures, it has to be remembered that this Subsidiary table makes no allowance for new additions to the list of towns, deletions or even for transfers of towns placed in a particular class at one census which have qualified for a different class at a later Census. It can, however, be said that these complications do not affect the clear indication of the table that the largest growth has been in the topmost class, i.e., in the large cities, which is understandable for reasons which I have already mentioned. These large cities have not only more attraction for the people who want to move into towns, but also have, within their limits, a larger capacity to absorb some more population and provide means of livelihood for them, than smaller towns. Trade inevitably develops with the growth of towns and that increases its attraction for people and also its capacity to absorb a larger population. and there is often also the growth of industries, which are most conveniently located in large towns, rather than in small towns. Commerce and industry re-act on one another: and they thrive where there is a large population as in these large towns and good communications.

What I have stated above is confirmed by the figures given in the statement below, which have been compiled differently, i.e., to be exact, by comparing, for each class, the growth of population of all the towns, which were treated as such at the 1921 Census, ignoring the changes in their classification during the subsequent decades. [Statement No. 36.]

Class of towns.			Percentage of variation [increase (+)].			
			1921-31.	1931-41.	1941-51.	
(1)			(2)	(3)	(4)	
Class I	••		+24	+22	+70	
Class II			+21	+18	+36	
Class III	••		+21	+17	+33	
Class VI		••	+21	+40	+27	

These figures indicate clearly, not only that there has been an appreciable increase of population every decade, but that there is a marked trend for the towns in Class I to grow at a more rapid pace than the towns in the other classes and that this

trend was exhibited in a spectacular manner during the decade 1941-51. Classes IV and V have been omitted from this statement as the numbers of towns included in these classes are very large.

4. Growth of cities.—The normal Census definition of a city is "a town containing not less than one lakh inhabitants, and any other place, which the Superintendent of Census Operations may, with the sanction of the State Government, decide to treat as a city for Census purposes." Accordingly, at this Census, following the previous practice in this State, towns with a population of 50,000 and above, have also been treated as cities. There are thirteen cities in the State, which have a population of one lakh and more. The twenty towns in Class II, i.e., with a population of 50,000 and above, have also been treated as cities. Three towns, viz., Pudukottai, Palavamcottai and Ootacamund have also been treated as cities, as a special case, with the approval of the State Government. Palavamcottai was in the list of cities even previously for the reason that, combined with the Tirunelveli Municipality from which Palayamcottai Municipality is separated only by the river Tambaraparni, it forms a compact urban area with an aggregate population of 113,486. It, is therefore correct to treat both these municipalities as cities. The two towns together really constitute the headquarters of Tirunelveli district.

Pudukottai.—Pudukottai was the capital of the former Pudukottai State. It is an exceptionally well laid-out town, and its lay out, its buildings and some of the amenities which it provides can compare favourably with some of the best cities in the State. Its population at the 1951 Census was 44,527. It was therefore considered that this town deserved to be treated as a special case and classified as a city.

Octacamund.—The case of Octacamund is well known. It has most definitely the characteristics and appointments of a modern city and provides all city amenities. Its population at the time of the enumeration in 1951 was 41,370. If the Census had been taken in or after April, the temporary population which resorts to this popular hill station in the hot months would have forced up the figure to well above the 50,000 limit. Its classification as a city cannot therefore be grudged.

The list of these thirty-six cities will be found in Subsidiary Table 3.5: 7 towns came into Class I from Class II during the decade 1941-51 while 6 towns came into Class II from Class III during the same decade. Though \mathbf{the} population Srirangam is less than that of Palayamcottai, on the analogy of the latter town, the former deserves to be classed as a city along with Tiruchirapalli. Just like the Tirunelveli-cum-Palayamcottai municipalities area, the Tiruchirapalli-cum-Srirangam municipalities area is really one city which is the headquarters of Tiruchirapalli district and an important railway and educational centre. The inclusion of Srirangam in the list of Cities may be considered at the next Census.

The figures in Subsidiary Table 3.5 do not make any allowance for the increase in the limits of the respective towns during the decades concerned. There is, however, no mistaking the fact that there has been generally a large jump in the population of cities for reasons which have been sufficiently explained already. Nagapattinam, in which the increase has been the smallest (9.3 per cent), has lost its importance as the gateway to Malaya for passenger traffic as well as trade. Another blow which it has suffered is the transfer of the meter gauge Southern Railway Workshop to the Golden Rock Colony during the decade 1921-31. It is not, therefore, surprising that it has shown only a small increase,less in fact than the average increase of the general population in the State as a whole. There is, of course, still a certain amount of migration, particularly of Muslims in the Nagore part of this City to Malaya. It is not, however, a flourishing town, and this is clearly reflected in the small percentage of increase in the population. During 1941-51, it has done only slightly better than during the decade 1931-41 when its population increased by 9.1 per cent.

Kancheepuram has had only a 13.6 per cent increase during the decade 1941-51, as against its increase of 14.4 per cent during the decade 1931-41. This is a famous pilgrim centre, and one of the most important handloom centres in the State, for silk weaving as well as for cotton weaving. There was not much else till recently to promote a rapid growth of population in this town. In fact, the increase would have been less but for the World War II.

S.T.—8·5

Quite a number of families, which evacuated from Madras during the war, went to Kancheepuram, and they have stayed on there for want of equally comfortable accommodation in Madras City. A number of persons employed in Madras City are even now living in Kancheepuram and coming every day to Madras City by train for their work, going back to their homes at night after the day's work is over. The educational facilities in this town have since improved with the establishment of a college and further growth is likely.

Cuddalore town has done far better than during the previous decade; 13.9 per cent against 2.7 per cent. But it is well known that it is not an attractive town. But such increase as has taken place is inevitable in a district headquarters where facilities for education and medical treatment and some urban amenities are available.

In the other cities, the increase in population during 1941-51 has been above 20 per cent, and this is due, apart from the exodus to the towns after the imposition of controls, to the scramble for educational facilities and the development of trade and industries. All these towns, with the exception of thirteen, are headquarters of districts. The spectacular increases have been in Madras City (82-1 per cent), Madurai (51.3 per cent), Salem (56 per cent), Coimbatore (51-7 per cent), Visakhapatnam (53-8 per cent), Vijaya ada (87 per cent), Adoni (51.2 per cent) and Tiruppur (58.6 per cent). Of the other cities not already mentioned. those which call for some special notice are Rajapalayam (31.5 per cent), Tenali (43 per cent), and Erode (45.8 per cent). Rajapalayam has been growing in industrial importance on account of the textile mills which have been started there, and the town has developed also as a commercial centre, thanks to the enterprising Kshatriya community in this town.

Tenali is the most important town in Guntur district next to Guntur, and it is also the most important town in the delta in this district and a large trade centre for paddy.

Erode is an important Railway Junction linking the Cauvery delta with Coimbatore district. It has grown in importance as a trade centre, particularly in textiles.

Madras City.—The present population of Madras City is 1,416,056. It is maintaining its place as the third I rgest city in India, though it is appreciably below the other two cities: Bombay leads with 28.39 lakhs, followed by Calcutta with 25.49 lakhs. Hyderabad ranks fourth with a population of 10.86 lakhs. A small part of the increase is due to the expansion of the limits of the city during the decade 1941-51 by the inclusion of Saidapet Municipality, Sembiam Panchayat, Adyar and Guindy and a few other suburban areas in Chingleput district. The City has, within its limits, a famous spinning and weaving mill, viz., the Buckingham and Carnatic Mills, which is one of the biggest mills in the Indian Union. There are several oil mills, match factories and various other industries. During the decade, the motion picture industry has expanded enormously, and the City has now as many as 10 studios. The scramble for residential accommodation and admission into colleges has been very marked after World War II. Commercial activities have been on the increase. Madras City is now the headquarters of the integrated Southern Railway. There are still vacant plots and large gardens, but these are being built up fairly rapidly, and a considerable growth of population seems certain during the decade 1951-61.

In this connection, it has to be remembered that the de facto limits of the City extend up to Tambaram in the south and Avadi on the west; large numbers of persons who are employed in Madras City are actually living here for want of accommodation in the City proper. These suburban areas are really population annexes, so to speak, for the City and these areas account for a population of about 1½ lakhs included in the figures of Chingleput district. These suburban areas are also developing industrially and a further growth during 1951-61 may be expected.

Madurai.—The population of Madurai town has increased by 51·3 per cent during the decade under review to 361,781. This is not surprising in a town which continues to maintain its place as the second largest city in the State. It is the headquarters of two districts, viz., Madurai and Ramanathapuram, and besides being a famous pilgrim centre en route to Rameswaram and a railway and trade centre, it has always been an important centre for the

textile industry. There is a large handloom industry and a number of famous dye-houses. In this City is located one of the largest spinning mills in the world, viz., the Madurai Mills. The decade has seen a considerable addition to the number of textile factories and oil mills in this City.

Salem.—In Salem, the increase has been 56 per cent and the present population is 202,335. Salem town is the largest single handloom centre anywhere in the State. There are also two textile mills and also a carpet industry. During the decade, a number of hosiery and tobacco factories have sprung up. There are also some magnesite mines closeby. Salem is also important on account of its position close to the plantations on the Shevroy hills.

Coimbatore.—The population of this town has increased by 51.7 per cent to 197,755. Coimbatore is one of the most important textile centres in the Indian Union, comparable only to Bombay and Ahmedabad. It is on the edge of the cotton belt in the south, and commands the Palghat Gap in the Western Ghats. It is thus naturally a general trade centre, particularly for cotton and cotton textiles. It is undoubtedly the most conspicuous example of an industrial town in this State. For a similar concentration of major industrial units, one will have to go to Bombay or Ahmedabad. Its pleasant climate attracted many retired persons to settle down there.

Vijayavada.—The population of this town has shot up by 87 per cent to 161,198. The importance of this town at the head of the Krishna delta has already been mentioned, and it is one of the important railway junctions in India. Oil mills, a cement factory and various other mechanical workshops and stone quarries have attracted many businessmen and labourers to this town. It seems certain to grow further in spite of its being one of the hottest places in South India and thus hardly attractive during the hot weather.

Visakhapatnam.—The population of this town has increased by 53.8 per cent during the decade under review to 108,042. Its harbour and ship-building yard have attracted large numbers of labourers. It is the headquarters of the Andhra University and has the pleasantest climate on the Circars coast. Its large growth is not,

therefore, surprising and some further growth is certain.

Adoni.—Next to Bellary, this is the largest town in Bellary district. It is an important cotton market and is the home of a very large cotton carpet industry. A number of cotton ginning and oil factories and two spinning mills have sprung up in this town during the decade.

Tiruppur.—The population of this town has increased by 58.6 per cent to 52,479. It is the most important cotton market in South India, and there are also some textile mills and cotton ginning factories, apart from a considerable number of handlooms. The growth of this town in an industrialized district like Coimbatore is, therefore nothing surprising.

5. Density.—The average density of urban population in Madras State is 3,740 per square mile as against the density of 367 in the rural areas. The urban density in the various divisions are: 1,723 in the Deccan division, 5,037 in West Madras division, 3,429 in the Plains Upland portion of the North Madras division, 3,211 in the Deltaic portion of the same division, while, in the South Madras division, the figures are 3,835 for the northern belt, 4,573 for the Cauvery Delta and 3.108 for the southern belt. It will thus be seen that the highest density is in the West Coast, the South Madras division comes next, and then the North Madras division and lastly the Deccan division. The individual figures disclose, as one would expect to find, what may be called the idiosyncracies of particular towns: a small town may be very congested on account of the small space in which it has sprung up, while a large town way be less congested. The districts where the urban density is very large are Malabar with 6,809, Visakhapatnam with 11,734, Nellore with 6,705, South Kanara with 4,057, Krishna Delta with 4,001, North Arcot with 7,112, Salem with 4,746, Coimbatore with 4,439, Tanjore with 5,172, Tiruchirapalli delta with 4,051, and Ramanathapuram with 4,140.

Of the very large cities with a population exceeding one lakh, Madurai is the most congested with a density of 42,562 per square mile. Madras, though standing second in this respect, is far better with a density of 28,940. Incidentally, this Madras figure confirms the impression that every visitor to the City carries, viz., that it is more

S.Ts.—3-5 and 3-2 widespread than other modern cities. Coimbatore comes third with a density of 27,971, closely followed by Vellore, Rajahmundry, Salem and Tiruchirapalli.

The small port of Tuticorin is quite congested (density 33,514), while the major port of Visakhapatnam has a density of only 17,917. These density figures do not contain the whole picture regarding congestion in the towns concerned: the overall density may not be large, but portions of the same town may be very badly congested, e.g., Adoni and Tenali and even Madras. Generally, in the new extensions, where reasonable building regulations are being enforced, the congestion is much less than in the other areas of the same towns.

6. Birth rates, death rates and movement of population.—It has been explained in paragraph 5 of Chapter II, why a detailed discussion of these based on figures is not feasible.

Some reliable indication of the trend, regarding the growth of population, can, however, be obtained from the statement below, which gives the child-woman ratio, based on the figures of the 1951 Census. The figures in the statement give the number

of children, in the age group 0-4, per thousand women in the age group 15-45. [Statement No. 37.]

	Chil	ki-woman r	atio.
State and natural division.	General popula- tion.	Rural popula- tion,	Urban popula- tion.
(1)	(2)	(3)	(4)
Madras State	522	530	492
Madras Deccan Division.	56 4	567	55 3
West Madras Divi-	561	563	542
North Madras Division.	494	498	475
South Madras Divi- sion.	520	531	485

The figures show a definitely higher ratio among the rural population than among the urban population. There is, undoubtedly, an appreciably higher rate of growth in the rural population than in the urban population. The figures indicate also that urbanization is one of the factors which mitigate a large increase in population,

7. Livelihood pattern of urban population.—Livelihood pattern of urban population can be seen from the abstract below which is based on the figures in Subsidiary Table 3.7.

[Statement No. 38.]

Percentage of urban population in livelihood class.

State and natural division.	I	11	ш	īv	All Agri- cultural classes.	v	VI	VII	VIII	All Non- agri- cultural classes.
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)
Madras State	7	3	5	2	17	24	19	. 6	34	83
Madras Deccan Divi- sion,	11	3	6	,2	. 22	20	18	6	34	78
West Madras Divi- sion.	2	3	3	2	10	24	20	6	40	. 90
North Madras Divi- sion.	10	. 3	8	4	25	18	16	5	36	75
South Madras Divi- sion.	6	3	4	2	15	26	20	6 .	33	85

Eighty-three per cent of the urban S.T.-8.7 population depend on non-agricultural occupations and only 17 per cent depend on agriculture. It will be remembered that the corresponding figures for the rural population are 24 per cent for non-agricultural classes and 76 per cent for agricultural classes. One would of course expect to find such a difference between the rural and urban population. Reverting to the urban population, the corresponding figures for the divisions are: Madras Deccan division, 78 per cent for the non-agricultural classes and 22 per cent under agricultural classes; West Madras Division, 90 per cent

under non-agricultural classes and 10 per cent under agricultural classes; North Madra; division, 75 per cent under non-agricultural classes and 25 per cent under agricultural classes; South Mad as division, 85 per cent under non-agricultural classes and 15 per cent under agricultural classes. The figures for Madras Ci y are 98 per cent for the non-agricultural classes and 2 per cent under agricultural classes, which is nothing surprising in such a completely urban area as the headquarters City of this State. Next to Madras, West Madras division has the largest percentage under the

non-agricultural classes. This again is not surprising seeing that this division has the largest percentage under non-agricultural classes even among the rural population.

The figures for the plains upland portion of the North Madras division are 77 per cent under non-agricultural classes and 23 per cent under agricultural classes; while those for the deltaic portions of the same division are 74 per cent under non-agricultural classes and 26 per cent under agricultural classes. In the northern belt of the South Madras division 84 per cent are under non-agricultural classes and 16 per cent under agricultural classes, while, in the Cauvery delta, 80 per cent are under nonagricultural classes and 20 per cent under agricultural classes. In the southern belt, the figures are 79 per cent under nonagricultural classes and 21 per cent under agricultural classes. No detailed comments on these figures are called for. It will be noticed that, in all the divisions, the largest percentage under non-agricultural classes is in Class VIII (professional services and employees under Government and local authorities and miscellaneous means of livelihood) and that Class V (production other than cultivation) comes next. It will also be seen that commerce comes third and that it supports a much larger percentage of the urban population than transport (Class VII). The figures under Class VIII must, as we find in this State and other States in India, be higher than those in Class V, in a country like India where industrialization has not progressed far.

S.T.—3·6

It will be interesting to see how many of the general population under each livelihood class live in towns. Subsidiary Table 3.6 gives the figures, which have been tabulated for this purpose. The object of this examination is to see, whether any particular livelihood class shows a decided preference for towns. The statement below gives the percentage under each class for the State, as a whole and for each division:—

[Statement No. 39.]

State and natural	Percer	ntage of p	ersons w	ho live
division. (1)	· (2)	II (3)	III (4)	IV (5)
Madras State Madras Deccan Division.	4 . 4	6 9	5 7	23 15
West Madras Division.	3	2	2	13
North Madras Division.	4	. 7	6	24
South Madras Division.	4	8	5	28

State natu divis	ıral	Percer	ntage of p	ersons w	
	-	V (6)	VI (7)	VII (8)	VIII (9)
Madras S Madras Divisio	Deccan	38 37	56 58	67 78	47 33
West Divisio	Madras on.	18	28	34	25
North Division	Madras on.	28	48	67	51
South Division	Medras on.	47	66	76	55

It will be seen that, among the agricultural classes, Class IV, that is, non-cultivating owners, agricultural rent receivers and their dependants, has a distinct preference for urban life. That is what one would expect to find from the fact that this class is economically inactive, as they do not attend to the cultivation of their lands themselves and they prefer the more comfortable life in towns. Among the non-agricultural classes, persons engaged in Transport services, Class VII, preponderate in the towns. This again is what one would expect to find, as buses and lorry services are mostly operated from towns and as all important railway stations are in towns.

Fifty-six per cent of the persons depending on commerce are in towns. This again is what we should expect to find, as towns have a much greater attraction for traders than villages where the turnover of business cannot be much. It is also the case that every town is a trade centre for villages in its neighbourhood.

The comparatively small figures under Class V, among the non-agricultural classes, confirm the fact that most of our production is still of the cottage or small-scale type, which is carried on in rural parts, and that major industries, which prefer towns to villages, have yet to develop on an appreciable scale.

Class VIII is a residuary category and it includes the professional services, employees of Government and local authorities and miscellaneous means of livelihood. The figures under Class V can catch up the figures under Class VIII only as the major industries develop.

All the divisions follow the pattern of the State, but the percentages are smaller in the West Madras division. This should cause no surprise, in view of what I have already pointed out, viz., that isolated houses.

standing in the midst of fields are the rule in these areas, and that towns are therefore slow to grow here, and that even nonagricultural occupations are practised on a more appreciable scale in the rural areas in Malabar and South Kanara than in the other districts.

The fact that a small percentage is found under Class I, is just what one would expect to find—only about four per cent of the persons who fall under this class, viz., persons cultivating mostly their own lands and their dependants, are to be found in towns. Persons under Class II (lessees and their dependants) and Class III (cultivating labourers and their dependants) are found only in small numbers in towns, though their numbers are slightly larger than those of cultivating owners and their dependants.

The livelihood pattern of the urban population in this State compares, as shown

below, with that in the States of Uttar Pradesh, West Bengal, Orissa and Mysore:— [Statement No. 40.]

States.		I.	П.	Ш.	IV.
(1)		(2)	(3)	(4)	(5)
Uttar Pradesh	• •	8.4	1.6	1.0	1.4
West Bengal	••	1.8	0.7	1-0	0.7
Oriasa	• •	7.8	1.5	2.0	2.7
Mysore	• •	7·2	1.8	1.8	2.6
Madras	• •	7.1	3.0	4.6	2.6
* •	•	v.	VI.	ΫII.	VIII.
		LB)	(7)	(8)	(9)
Uttar Pradesh		24.9	21.9	6.2	34.6
West Bengal	• •	28.7	24.2	9.3	33.6
Orissa		13.3	17.5	5.6	49.6
Mysore	• •	28.6	17.9	4.3	35.9
Madras	• •	23.6	19.0	5.8	34.3

I am not sure that some of the differences noticed are not attributable to the varying vagaries in the enumeration of livelihood classes by the enumerators which was the most difficult part of the enumeration attempted at the 1951 Census.

CHAPTER IV-AGRICULTURAL CLASSES.

Agricultural population ratios; selfsupporting persons and dependants.—The abstract below based on Subsidiary Table 4·1 shows the percentage of the agricultural population under the four agricultural livelihood classes:—

[Statement No. 41.]

State and natural	Percentage of class								
division.	ī	п	III	IV					
(1)	(2)	(3)	(4)	(5)					
Madras State	54	15	28	3

North Madras	54	11	32	3					
Division.									
South Madras	59	13	25	3					
Division.		•							

M.T.—B·I 8.T.—4·1 It will be seen that a little over 50 per cent (54 per cent to be exact) of the agricultural population consists of persons who cultivate mostly their own lands and their dependants. The next largest category is that of cultivating labourers (28 per cent). Lessees and their dependants account for 15 per cent of the agricultural population, while 3 per cent are non-cultivating owners, agricultural rent receivers and their dependants. What I have already said about the extent of peasant proprietorship in the Deccan division and the West Madras division explains the fact that Deccan division has the largest percentage (68) under Class I and the West Madras division the smallest (15 per cent). The figures under Classes II and III which are lowest in the Madras Deccan division and the highest in the West Madras division are due to the same factors. The percentage under Class IV does not vary appreciably from division to division.

In the Agency tracts, nearly 70 per cent fall under Class I, 9 per cent under Class II, 20 per cent under Class III and 1 per cent under Class IV. As one would expect to find, in the Visakhapatnam and East Godavari districts, where we find the most remote, hilly and feverish areas, as much as \$2 per cent of the agricultural population cultivate their own lands in Visakhapatnam and 71 per cent in East Godavari. As already mentioned, the small Agency in the West Godavari district is hardly distinguishable from the adjoining upland areas except

for a small area in the north-east corner of Polavaram taluk. Large numbers of plainsmen have settled down in this area. It is not surprising, therefore, to find that the percentage under Class I is only 46, while that under Class II (lessees and their dependants) is 12 per cent, and the cultivating labourers and their dependants account for 40 per cent of the agricultural population.

Under Class IV, the Nilgiris district has the lowest percentage (0.23), Kurnool and Tanjore delta being at the other end with 6 per cent. I have left out the case of Madras City which is a special one, and there, one finds 60 per cent under Class IV. Madras City naturally has a great attraction for well-to-do absentee landlords. The reason for the low figure under Class IV for the Nilgiris is the same as that given already: the nature of the cultivation requires personal attention of the owner of the land. The percentage under Class I in the Nilgiris district is 57 which stands out in marked contrast to the figures of Malabar and South Kanara (13 and 16). In Malabar, the cultivating labourers form the largest category (44 per cent), while in South Kanara the lessees form the largest category (54 per cent).

The percentage under Class I varies from 34 in the East Godavari district to 63 in the Visakhapatnam district. It is noteworthy that, in the East Godavari and West Godavari districts, which have very large deltaic areas, cultivating labourers constitute the largest category, viz., 46 per cent and 40 per cent, respectively. In the comparable district of Tanjore, which is even more completely deltaic, the cultivating owners constitute the largest category (37 per cent) and the cultivating labourers form only 34 per cent of the agricultural population. In the southern division, the most remarkable fact of course is that Tanjore has got the smallest percentage under Class I among the mufassal districts. That the more profitable the cultivation, the more the temptation to get the lands cultivated by others, is borne out by the fact that among the mufassal districts in the southern division, Tanjore has the smallest percentage under Class I (37 per cent) while Chittoor and Ramanathapuram are at the opposite end with 70 and 71 per cent, respectively. Tanjore has the largest proportion of delta in any district in the State, while Chittoor and Ramanathapuram are dry districts dependant mostly on a precarious rainfall. In the South Madras division, Tanjore has the largest figure under Class II (lessees). In the northern delta, the Godavari delta is more fertile than the Krishna delta, and this is reflected in the figures under Classes I and II for the East Godavari, West Godavari, Krishna and Guntur districts.

The following statement based on the figures in columns (4) to (6) of Subsidiary Table 4.1 shows the percentage of self-supporting persons, non-earning dependants and earning dependants among the agricultural population in each of the divisions.

Percentage of

[Statement No. 42.]

sion.

sion.

South Madras Divi-

ang kang ak			
State and natural division.	Self- supporting persons.	Non- earning depend- ants.	Earning dependants.
17. 55 (1) 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	(2)	(3)	(4)
Madras State	26	69	5 `
Madras Deccan Divi- sion.	27	67	6
West Madras Division.	24	72	4
North Madras Divi-	26	• 66	8

It is remarkable that the pattern is almost uniform throughout the State. Only about 26 per cent of the agricultural population is self-supporting. The uniformity of the pattern indicates definitely that, by and large, the average level of agricultural income is roughly the same in all parts of the State.

The number of non-earning dependants is $2\frac{1}{2}$ to 3 times the number of self-supporting persons, while earning dependants account for 4 to 8 per cent of the total agricultural population.

In the Agency tracts, 28 per cent of the agricultural population are self-supporting, while non-earning dependants and earning dependants account for 64 per cent and 8 per cent, respectively.

In the Srikakulam and Visakhapatnam districts, the earning dependants account for as much as 11 per cent of the agricultural population. The reason for this is not far to seek. These districts used to contribute a large percentage of the emigrants to Burma, and stoppage of migration to that country has, therefore, thrown large numbers of the people of these districts on the land in these not-too-prosperous districts, and a much larger proportion of dependants than elsewhere are compelled to work and make their contribution to the family income.

2. Cultivators of land wholly or mainly owned and their dependants.—This Class (Livelihood Class I) forms, as already mentioned, 35 per cent of the total population in the State and 54 per cent of the agricultural population. An idea of the economic status of this class can be had from the statement below:—

[Statement No. 43.]

	P	Percentage of								
State and natural division.	Self- supporting persons.	supporting earning		S.T.—4 M.T.—						
(1)	(2)	(3)	(4)							
Madras State	24	71	5							
Madras Deccan Divi- sion.	25	69	6							
West Madras Division.	21	76	3							
North Madras Division.	23	70	7							
South Madras Division.	25 ∂1○ 1 3	72 86 × 1	3							

It will be seen that only 24 per cent of the persons in this class are self-supporting and that the number of non-earning dependants is nearly thrice that of self-supporting persons, the earning dependants accounting only for 5 per cent of the number. There is a remarkable uniformity in this distribution of economic status throughout the State, and this pattern is roughly the same as that of the agricultural population as a whole. The implication of this uniformity has already been indicated, i.e., the picture of the average agricultural family is roughly the same throughout the State.

Dependency is largest in the West Madras division where the percentage of non-earning dependants is 76 and that of earning dependants is only three. These figures indicate that the lands are owned largely by persons who are fairly high up in the social scale and among whom it is not customary for dependants to work. The only other

significant figures which call for comment are the 11 per cent and 10 per cent, respectively, under earning dependants in the plains areas of Srikakulam and Visakhapatnam districts. The explanation is the same as that given in the previous paragraph.

Self-supporting persons with Secondary means of livelihood .- An analysis of the self-supporting persons shown in column (3) M.T.—B-II of Subsidiary Table 4.2 with reference to 4.7.—42 their secondary means of livelihood is given in the statement below:—

[Statement No. 44.]

9. 4 . 1 . 4		Self-supporting persons with secondary means of livelihood in class.											
State and natural division.		ī	11	Ш	IV	v	VI	VII	VIII	Total.	Percentage.		
(1)		(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)		
Madras State	••	• •	27	73	7	71	45	7	79	309	. 8		
Madras Deccan Div	vision	••	22	59 .	5	79	52	7	130	354	.▲		
West Madras sion.	Divi-	••	48	. 13	43	85	76	. 4	106	. 375	4		
North Madras	Divi-	••	39	100	4	80	· 41	10	82.	3 5 6	4		
South Madras sion.	Di vi -	••	21	65		65	45	6	66	274	8		

It will be seen that the proportion of selfsupporting persons to the total number of self-supporting persons with secondary means of livelihood is-

For the State, as a whole—24:3. For the Madras Deccan Division-25:4. For the West Madras Division-21:4. For the North Madras Division-23:4. For the South Madras Division-25:3.

This gives also a more or less uniform picture for the State as a whole. Employment as agricultural labourers, productive activities other than cultivation, commerce and other services and miscellaneous sources of income are the chief secondary means of livelihood of self-supporting persons in Class I. The largest percentage having commerce as the secondary means of livelihood is in West Madras division. other striking features in this division are. the fact that it has the smallest proportion under Class III and the largest proportion under Class IV, which indicate that this class in the West Madras division is largely composed of persons who are fairly high in the social scale, and who would normally look down upon work as cultivating labourers.

Earning dependants in Class I.—An analysis of the earning dependants with reference to the means of livelihood which enables them to make their contribution 8.7.42 to the family income is given in the statement below:-

[Statement No. 45.]

[Statement No. 45.]]	,			•	·			
State and natural			Earni	ng depend	iants who	se means of	livelihood	is	
division.	ī	п	ш	IV	V	VI	VII	VIII	Total
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
Madras State	110	14	182	2	49	20	3	57	, 439
Madras Deccan Division,	135	12	188 .	. 3	47	29	6	127	546
West Madras Division.	46	26	53	13	48	30	3 .	56	275
North Madras Division.	258	18	261 :	2	50	20	4	65	678
South Madras Division.	38	13	150	1	49 .	. 18	2	39	311

It will be seen that the most important secondary means of livelihood of earning dependants in this class are; cultivation of owned land, employment as agricultural

labourers, other services and miscellaneous sources of income, and productive activities other than cultivation. This general picture is found in all the divisions. That West Madras division has the smallest figure of 53 under Class III confirms the view already expressed: even among the dependants who work and make a contribution to the family income, only a small proportion, much smaller than in the other divisions. work as cultivating labourers. From this point of view, the position is most marked in Malabar district, where the 229 earning dependants are distributed among the various secondary means of livelihood thus-

> Class I—14. Class V—57. Class II-28. Class VI-36. Class III-23. Class VII-4. Class IV-6. Class VIII-55.

The largest proportion of the number of earning dependants under Class VIII is in the Deccan division, indicating that there is not the same scope for the other means of livelihood here as in the other divisions.

3. Cultivators of land wholly or mainly unowned and their dependants.—This class forms 10 per cent of the total population of the State and 15 per cent of the agricultural population. The economic status of this class of persons in the several divisions of the State is indicated in the statement below :--

Statement No. 46.]

	P	ercentage (of
State and natural division.	Self- supporting persons.	Non- earning depend- ants.	Earning dependants.
(1)	(2)	(3)	(4)
Madras State	23	72	5
Madras Deccan Division.	25	68	7
West Madras Divi-	20	76	4
North Madras Divi-	23	67	10
South Madras Divi-	23	73	4

This picture is not materially different from that of Class I, already discussed. Taking the State, as a whole, only 23 per cent under this class are self-supporting and the remaining 77 per cent are dependants-72 per cent non-earning dependants and 5 per cent earning dependants. The general comments made in paragraph 2 above, in respect of Class I, apply to this class also.

Self-supporting persons in Class II .-An analysis of the self-supporting persons M.T.—B-II S.T.—4.8 in this class, with reference to the secondary means of livelihood, if any, is given below:-

[Statement No. 47.]

State and natural division.		Self-supporting persons with secondary means of livelihood in class											
Draw and navital maisi	UIL,	ī	П	ш	IV	v	VI	VII	VIII	Total.	Percentage.		
(1)		(2)	(3)	(4)	(5)	(6)	(7)	(8)	_. (9)	(10)	(11)		
Madrae State		28		108	4	73	36	14	77	340	3		
Madras Deccan Division		54		103	7	83	47	11	199	504	5		
West Madras Division	••	9	••	43	6	112	53	10	89	322	3		
North Madras Division	• •	55		229	2	73	33	28	73	493	5		
South Madras Division	••	26		94	2	48	26	10	59	265	3		

Employment as agricultural labourers, productive activities other than cultivation, and "Other services and miscellaneous sources." are the chief secondary means of livelihood for the self-supporting persons in this class. Commerce comes next in importance. The figure of 43 for the West Madras division under Class III has the same significance as has been explained in connection with Class I. It is not surprising to find Class V, which includes plantations, showing the largest proportion in West Madras division. The Deccan figure of 199, which is the highest under Class VIII reflects the poor return from land in that area and the consequent resort to 'Other services and miscellaneous sources of income'. The proportion of self-supporting persons having secondary

means of livelihood to the total number of self-supporting persons in this class is:

For the State as a whole—3: 23

For the Madras Deccan Division-5: 25

For the West Madras Division—3:20

For the North Madras Division-5:23

For the South Madras Division—3:23

It will be found that the proportion is the highest in the North Madras and Deccan divisions, which is explained by the fact that in the backward areas with infertile soils or poorly cultivated lands, secondary means of livelihood have to be resorted to, to make both ends meet for the families.

The North Madras division has the largest proportion, viz., 229 to 493 in Class III, which indicates that lessees in this area

M.T.—B-I

are drawn more from the lower sections in the social scale than from among those, who normally take up lands on lease in this State.

Earning dependants in Class II.—The analysis of the earning dependants in Class I with reference to their (secondary) means of livelihood is given below:-

[Statement No. 48.]

M.T.—B-II S.T.-4.8

90 to 3 to 13 divide		its whose means of livelihood is								
State and natural divisi	ion,	I (2)	II (3)	111 (4)	IV (5)	V (6)	VI (7)	VII (8)	VIII (9)	Total
Madras State	••	21	71	279	2	57	20	5	69	525
Madras Deccan Division	• •	41	84	284	4	57	30	4		713
West Madras Division	4.6	2	61	127	2	72	27	6	69	367
North Madras Division	••	46	173	561	1	58	20	6	81	947
South Madras Division		19	30	247	2	48	16	4	50	146

this class are mostly employed as agricultural labourers. Classes II and VIII (cultivation of unowned land and other services and miscellaneous sources) are next in importance. The proportion under Class VIII is largest in the Deccan division, due of course to the poor return from the lands and its inadequacy for absorbing even the earning dependants. The largest proportions under Classes II and III are found in the North Madras division. There was keen demand for labour in the upland areas of the North Madras division on account of from the figures given below:-

It will be seen that earning dependants in profitable commercial crops which made a large headway in these districts during the decade.

> 4. Agricultural labourers and their dependants.—This class works on land for wages as casual labour, or for a long or short term or permanently, and their interests and rights are confined to their wages. This class accounts for 18 per cent of the total population of the State and 28 per cent of the agricultural population. An idea of the economic status of this class can be obtained

M.T.—B-I

[Statement No. 49.]

<u> </u>				·	Pro tage of	
State and natura	al divis	ion.		elf-supporting persons.	Non-ea ning dependants.	Earning dependants.
(<u>I</u>)				(2)	(3)	(4)
Madras State	• •	••	••	30	63	7
Madras Deccan Division	••	••	••	32	62	6
West Madras Division	••	••	••	30	66	4
North Madras Division	••	••	••	31	59	10
South Madras Division	••	••	••	30	66	4

Non-earning dependants thus form about 63 per cent of this class, and number twice the self-supporting persons in this class. Only a very small percentage (7) contribute anything as family income as earning dependants. Seventy per cent of this class are dependants as against 74 per cent in the total agricultural population. This is not surprising, as among labouring classes, it is usual even for children to work and earn what they can. In Ma ras City, nonearning dependants account for more than

71 per cent of this class. No special comments are called for in view of the fact that the agricultural population accounts for only 2 per cent of the population of the Citye Chingleput district has the next largest percentage of non-earning dependants, i.e., 70 per cent, and this is presumably due to the fact that large numbers of the earning members of the families have moved to Madras City for earning their livelihood leaving their families in their homes.

Self-supporting persons in Class III.— self-supporting persons in this class are The secondary means of livelihood of analysed below:-

[Statement No. 50.]

Self-supporting persons with secondary means of livelihood in class. State and natural division. I VI VII VIII Percentage_ (1)(2)(3) (4)(5) (6) (7) (8) (9) (10).(11)Madras State . 20 . 43 159 Madras Deccan Division 78 West Madras Division 52 167 **North Madras Division** 35 South Madras Division 20 33 117

sources' are thus the main secondary means of livelihood of agricultural labourers, and cultivation of owned lands comes next in importance. It is not surprising to find that the West Madras division has the smallest number of persons who have lands of their own to cultivate, and that the Deccan division has the largest number of such persons. My remarks in paragraph 14 of Chapter I regarding the extent of peasant proprietorship in the various divisions are relevant Only a small percentage are here also. able to supplement their income by cultivating lands not owned by them. The means of livelihood of earning dependants proportion of self-supporting persons in this are analysed in the statement below:—

Productive activities other than cultivation, class, who have secondary means of liveli-'Other services and miscellaneous hood is also small; 2:36 in the State as a whole, 3:32 in the Deccan division, 2:30 in the West Madras division, 2:31 in the North Madras division and 1: 30 in the South Madras division. Work as an agricultural labourer usually engages a man for the whole day and such persons can therefore hardly find time for supplementary occupations. The Deccan division figures, viz., 52 under Class I and 18 under Class IV, are the highest under these classes and they underline of course the generally poor and uncertain return from land in this area.

Earning dependants in Class III.—Tho

[Statement No. 51.]

Earning dependants whose means of livelihood is

South Madrae Division		15	15	346	2	42	12	2	L 35	460			

It will be seen that most of the earning dependants in this class are employed as agricultural labourers and that 'Other services and miscellaneous sources of income' come next in importance and then, productive activities other than cultivation. It is natural to find the bulk of these persons earning by working as agricultural labourers. All members of families of agricultural labourers generally follow the same occupation. In West Godavari Agency, 926 persons out of the 959 earning dependants in this class earn their livelihood from 'Other services and miscellaneous sources of income'. The next highest figure under the same class is 610 out of 1,235 and is also in the same district (West Godavari Plains). In the West Godavari Agency, the figure is nil under Class III. There has been misclassification by the enumerators in this district in respect of Classes III, V and VIII.

5. Non-cultivating owners of land, agricul- M.T.—BII tural rent receivers and their dependants. S.T.-4.5 -This class forms 2 per cent of the total population of the State, and 3 per cent of the agricultural population of the State. The distribution of this class according to economic status is given below:-

[Statement No. 52.]

	·	Percentage o	of .
State and natural division.	Self- support- ing persons.	Non- earning depen- dants.	Earning depen- dants.
· (1)	(2)	(3)	(4)
Madras State	29	68	3.
Madras Deccan Division.	29	65	6 ,
West Madras Divi- sion.	26	72	2
North Madras Divi-	30	66	+
South Madras Divi- sion.	29	. 63	٠. ش

68 per cent of this Class are thus non-earning dependants. This is more than double the number of self-supporting persons, while earning dependants form only a negligible fraction (3 per cent).

Among non-earning dependants, the largest percentage is found in the West Coast division (72 per cent), Tanjore (72 per cent) and Madurai (71 per cent). The Madras figure of 73 per cent deserves no special comment because of the negligible percentage of the agricultural population in the City.

The percentage of self-supporting persons is thus largest and the dependency least in Class III which is economically and socially at the bottom of the scale.

The State figures for dependency in the agricultural Classes I to IV compare as shown below:—

[Statement No. 53.]

		Percentage of			
Class.		Self- support- ing persons.	Depen- dants.		
(1)		(2)	(3)		
All Agricultural Classes Class I	• •	26 24 23 30 29	74 76 - 77 70 71		

Self-supporting persons in Class IV.— The number of self-supporting persons analysed with reference to secondary means of livelihood is given below:—

[Statement No. 54.]

M.T.—B-II

Self-supporting persons whose secondary means of livelihood is in class State and natural division. v VI Percen-Ι II VII VIII ш IV Total, tage. (2)(6) (7) (8)(9). (1)(3)(4)(5)(10)(11)159 232 Madras State ... 33 10 66 114 622 6 230 Madras Deccan Division 16 3 96 146 308 803 8 West Madras Division 100 203 40 3 67 491 5 North Madras Division 35 104 139 176 292 758 South Madras Division 24 54 150 187 535

As one would expect to find, these selfsupporting persons seek to supplement their family income mainly through means of livelihood falling under Class VIII 'Other services and miscellaneous sources', commerce and production other than cultivation. The proportion is naturally largest under Class VIII which covers the professional services and services under Government and local authorities. The proportion of the persons in this class which seeks any supplementary source of income is 6:29 in the State as a whole, 8:29 in the Deccan division, 5.26 in the West Madras division, 8:30 in the North Madras division and 5:29 in the South Madras division.

These proportions are higher than those of Classes I to III. Land is largely an investment for this Class, and their standard of living is generally higher than that of the other Agricultural Classes. To maintain this standard of living, this class augments its income by resorting to secondary means of livelihood mainly non-agricultural occupations—utilizing them also, as far as possible, as investments for any surplus income from their lands.

Earning dependants in Class IV.—An analysis of the earning dependants in this Class, with reference to their means of livelihood, is given in the statement below:—

[Statement No. 55.]

State and natural divi	Earning dependants whose means of livelihood is									
State and natural their	SIOII.	î	II	111	IV	<u>v</u>	VI	VII	VIII	Total
(1)		(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
Madras State	••	14 "	6	73	21	59	57	4	90	325
Madras Deccan Division	••	16	11	136	18	85	96	2	181	545
West Madras Division	••	11	11	10	15	29	41	3	76	196
North Madras Division	• •	19	3	101	40	60	52	4	101	379
South Madras Division	••	10	5	60	12	62	57	4	67	278

'Other services and miscellaneous sources of income', production other than cultivation, and commerce are, as one would expect to find, the chief sources of livelihood for these persons.

In regard to Class III, the West Madras division figure 10:196 is understandable. In this area, the lands are largely in the hands of persons, who are economically well-off and high-up in the social scale. The percentage of persons among this Class, who would be prepared to work as agricultural labourers, is therefore, small, and confined to those, whose income from the land is far from adequate, and who are also not high-up in the social scale.

6. Active and Semi-Active workers in cultivation.—Persons connected with agriculture may be either active or semi-active, i.e., partially active, or inactive. Selfsupporting persons in Classes I to III may properly be treated as active workers and persons falling under Class IV as inactive. The semi-active workers will consist of (1) the earning dependants in all the eight Livelihood Classes, whose personal earning is from means of livelihood falling under Class I, II or III, and (2) the self-supporting persons in Non-Agricultural Classes, i.e., Classes IV to VIII, who supplement their income through occupations falling under Class, I, II or III. The total numbers of active and semi-active workers in cultivation are accordingly as specified below:-

8.T.—4-6

[Statement No. 56.]

It will be seen that the vast majority (84 per cent) of the persons actively engaged in cultivation are self-supporting. This is not without significance, though, no doubt, it is all relative to the standard of living of the agricultural population. One would also expect this to be the case in a country where industrialisation has not progressed very far and means of livelihood other than agriculture are not available everywhere or on any large scale. The percentage of earning dependants included in the active workers is 14, while the percentage of self-supporting persons in non-agricultural classes who supplement their income through agricultural occupations is negligible. This again is not surprising. The proportion of persons who have cultivation as their secondary means of livelihood to the total number of persons actively engaged in cultivation is least in the South Madras division; and this is due to the fact that, comparatively speaking, in this division, industrialisation has gone farther than in the other areas. Agricultural occupations being to a large extent, part-time and seasonal, agriculturists can engage themselves in other occupations to supplement their income. Those engaged in industry will not generally find it possible to

combine their industrial activity with agricultural occupations.

Barring Madras City which is not an agricultural district, the Srikakulam and Visakhapatnam plains have the smallest percentage of self-supporting persons among persons who are actively engaged in cultivation in this State. In other words, the extent to which land is able to support its population is smallest in these two districts and there has consequently always been a compelling motive for emigration. The low figure for Nellore district (76 per cent) is understandable, as, except in the small deltaic portion, and particularly in the western half of the district, the soil is generally infertile and rainfall precarious. Seventy-one per cent for the Srikakulam and East Godavari Agencies reflects the fact that cultivation in the Agency tracts, especially by the hillmen, is generally of an indifferent type. The figure of 89 per cent for the Visakhapatnam Agency can hardly be taken at its face value as there is no reason why the figure for this area should be better than the East Godavari figure, and this large figure is presumably due to incorrect or optimistic statements made by the persons enumerated. The hillmen who constitute the bulk of the residents in these areas are backward and ignorant and are therefore quite capable of committing such mistakes. The East Godavari and West Godavari Plain figures of 77 and 78 per cent, on the other hand, reveal an under-statement as to the self-sufficiency of the persons enumerated.

The earning dependants whose means of livelihood fall under Class I, II or III are, of course, mostly persons belonging to agricultural families, i.e., families where the self-supporting persons are in one of these classes. The number of earning dependants is a variable factor, dependent upon the resources of the family, the number of self-supporting persons in it, and the extent to which agricultural occupations are available in the area. No detailed comments on the variations in the figures in column (5) of the statement are, therefore, called for or are feasible.

It will be seen from Subsidiary Table 4.6 that the bulk of the earning dependants are agricultural labourers. Out of 1,537,000 earning dependants in the State, 285,000 earn by cultivating their own lands, 93,000 by cultivating lands belonging to others, and 1,159,000 by working as agricultural labourers.

Srikakulam, Visakhapatnam and East Godavari contribute the largest number of earning dependants, and this, as will be seen later, is due to the heavy pressure of the population on land in these districts.

The statement below shows the percentage of the persons actively engaged in cultivation in each of the Classes I, II and III:—

[Statement No. 58.]

	Tirunelveli	396	52	14	34		

In the State as a whole, 48 per cent fall under Class I, 12 per cent under Class II and 40 per cent under Class III. It will be noticed that the bulk of the active workers engaged in cultivation are in Classes I and III and that the percentage of the persons in Class III is quite considerable.

The following statement shows the extent of cultivated area per individual actively engaged in cultivation:—

[Statement No. 59.]

It will be seen that the cultivated area per active worker in the State is 281 cents, and this figure ranges from 229 cents in the West Madras division, to 237 cents in the South Madras division, 238 cents in the North Madras division and 707 cents in the Deccan division. The cultivated area given here is the average of the area cultivated during the five years ending with the cultivation year 1949-50 (Fasli 1359). The return from cultivation depends not only on the work and manure put in by the cultivator, but also on seasonal conditions, the fertility of the land and the extent of unirrigated and irrigated land in the holdings. The largest cultivated area per head is in the Deccan division, where the extent of wet land is very small and the bulk of the land is dry and unirrigated. It will be seen that the pressure of population, on land is heaviest in the Srikakulam, Visakhapatnam and East Godavari districts where the cultivated area per worker varies from 146 to 180 cents. In Malabar and South Kanara districts, the figures are 242 and 196, respectively. Here, the low figures are partly the result of the limited area available for cultivation and partly the pressure of the heavy population, particularly in Malabar.

West Godavari is not far better than East Godavari, and the heavy population, particularly in the deltas, results of course in corresponding pressure on the land available. The position in Krishna and Guntur appears better but the disparity is really due to the large upland areas in those districts.

In Chittoor the extent of cultivated area per active worke is 190 cents. This shows how much pressure there is on the land, and

ed it must be remembered that this is purely a dry district and the rainfall not too certain in the eastern part of the district. In the other districts (outside the Deccan and West Madras divisions) not referred to above, the cultivated area per worker varies from 203 cents in Chingleput to 338 in Coimbatore district. Barring Coimbatore, the figure is less than 3 acres in all the districts. The North Arcot figure is 207, while the Ramanathapuram figure is 251, and the figures of both these districts would have been worse, but for the large scale emigrations from these districts. In the South Arcot, Tanjore, Tiruchirapalli and Madurai districts also, there is a very heavy pressure on the land, the figures of these districts ranging from 218 in South Arcot to 226 in Madurai.

Holdings.—The statement below gives the average extent of wet and dry lands per holding in each district in the State:—

The figures above relate of course only to ryotwari areas in the State and therefore do not cover the non-ryotwari areas which account for nearly one-fourth of the State. But there is no reason to think that the

position is very different in the latter areas. The figures show the very small size of the average holding. There is only about 80 cents of wet land and 3.2 acres of dry land in the average holding in the State. For the South Madras division, the corresponding figures are 60 cents of wet land and 2.4 acres of dry land, in the Deccan division, 30 cents of wet land and 7.1 acres of dry land, while in the North Madras division the figures are 1.1 acre of wet land and 2.9 acres of dry land. The acute position in Srikakulam district can be seen from the fact that the average holding in that district has only 90 cents of dry land and 1.1 acre of wet land. In the Ceded districts, the lands are mostly dry, and as against the extent of dry land ranging from 3.8 acres to 10.7 acres. it has to be remembered that rainfall in this area is quite precarious, resulting in periodical failure of crops. In Tanjore district, which has the largest proportion of wet land, the average holding comprises only 1.6 acre of wet land. Practically everywhere in the State therefore the occupied land is inadequate to make satisfactory holdings even for the present registered owners.

7. Density of population with reference to cultivated and cultivable areas.—The following statement gives the density of population, i.e., the number of persons per square mile of cultivated and cultivable area:—

[Statement No. 61.]

Dangity non

Barring Srikakulam and Visakhapatnam districts, the higest density is to be found in the Malabar district (1,163). I do not think the Srikakulam and Visakhapatnam figures of 1,038 and 1,205 can be correct: presumably, due allowance has not been made in the Season and Crop Reports from which these figures are taken, for the large extent of cultivable land available in the Agency tracts. This comment is supported by the fact that, in East Godavari district which has a very thickly populated delta, and where also the agency area is very considerable in size, the density is only 860.

Excluding the Srikakulam and Visakhapatnam districts, the district densities range from 264 in the Anantapur district to 1,163 in Malabar district. Malabar occupies the first place, while the second and third places are occupied by North Arcot (1,110) and Tanjore (1,081).

8. Classification of areas in the State.—
The statement below extracted from the Season and Crop Report for Madras State for 1949-50 gives the percentages of the area covered by (1) forests, (2) barren and unculturable land, (3) land put to non-agricultural uses, (4) cultivated and cultivable land, in the State as a whole and in each division:—

[Statement No. 62.]

-		Percentage of	of _	
State and natural division,	Forests.	Barren and uncultur- able land.	Land put to non- agricul- tural uses.	Rest.
(1)	(2)	(3)	(4)	(5)
Madras State	17	12	6	65
Madras Decear Division.	22	6	4	68
West Madras Division.	22	8	6	64
North Madras Division.	17	16	7	60
South Madras Division.	14	12	. 8	66

It will be seen that, in the State as a whole, 17 per cent of the area is covered by forests, 12 per cent is barren and unculturable land, 6 per cent consists of land put to nonagricultural uses, while the remaining 65 per cent is cultivated and cultivable land. The percentage of the cultivated and cultivable area varies from 60 in the North Madras division, 64 in the West Madras division 66 in the South Madras division to 68 in the Deccan division.

S.T.-4.7

9. Progress of cultivation.—Subsidiary Table 4.7 shows the progress of cultivation in the State. The figure for each area shown in that table is the average of the figures for the quinquennium ending with 30th June of the year previous to that specified in the table. The average net area irrigated, i.e., the average area irrigated not less than once, has increased from 86.63 lakhs in 1921, with a slight setback in 1931, to 87.27 lakhs in 1941. Between 1941 and 1951 there was an appreciable increase to 96.65 lakhs acres. The increase is, of course, due to the fact that, during 1941-51, apart from small irrigation projects, there has been an appreciable area brought under cultivation under the Grow More Food and other Food Production schemes both under irrigation sources and under wellsold wells as well as the wells newly constructed or repaired by the ryots themselves or under the Government's Well Subsidy Scheme. The cultivation of the irrigated area under wells has been greatly facilitated in appreciable areas by the use of pumps, both oil driven and those driven by electric power. The increase in the Deccan division during 1941-51 is naturally very small (from 5.64 to 6.14 lakhs) as the area under major irrigation sources in this division is not considerable. There is an increase of 5 lakhs acres in 1941-51 in the North Madras division where Godavari and Krishna deltas are situated. During the same period, South Madras division showed an increase of 4 lakhs acres, the largest increase being naturally in the Tanjore district (Cauvery delta). increases were by no means confined to these deltas: the non-deltaic areas also in most districts have shown an increase.

The average area irrigated more than once, which has been about 18 lakhs acres, has not shown large variation in the State as a whole. The largest contributions are, of West Godavari districts (Godavari, delta), induced an extension of cultivation.

South Arcot, Tanjore and Tiruchirapalli (Cauvery delta), Madurai (Periyar project) Tirunelveli (Tambaraparani delta). Apart from these deltas, there is a considerable second crop area under wells and spring channels. The figures for districts and divisions have shown considerable variation. The large decreases during 1941-51 in the Chingleput, Chittoor, North Arcot and Nellore districts were undoubtedly due to the failure of the north-east monsoon during the last three years of the quinquennium ending with 1949-50.

Net area sown.—The average net area sown, i.e., the area sown at least once. showed a very slight increase between 1921 and 1941 and a decrease of 10.8 lakhs between 1941 and 1951. The percentage varations are shown in the statement below :--

[Statement. No. 63.]
Percentage increase (+) or decrease (--). State and natural 1941-51, 1931-41, 1921-31 division. (2) (3) (4) - 0.04 -- 3.40 Madras State ± 1.40 -- 3⋅23 **--** 0·64 Madras Deccan + 5.68 Division. West Madras Divi-+ 1.73 + 3.94 + 4.94 sion. North Madras Divi--- 0.09 -- 1.29 + 4.43 sion. South Madras Divi--- 6.17 --- 0.43 - 2.84 sion,

The decrease in area between 1941 and 1951 in spite of food scarcity and attractive prices for foodgrains was undoubtedly due to the serious failure of the northeast monsoon for a number of years in succession from 1947. This decrease amounted to 3.4 per cent in the State as a whole, and varied from the negligible figure of 0.09 per cent in the North Madras division to 3.23 per cent in the Madras Deccan division and 6.17 per cent in the South Madras division. The West Madras division is a pleasant contrast and showed an increase of 1.73 per cent, and this is, of course, due to the fact that this area is practically all rainfed, and gets an assured and heavy rainfall from the usually dependable southwest monsoon. The increase in the West Madras division was mostly in Malabar district, the increases in South Kanara and the Nilgiris being very slight. Malabar is the district with the largest food deficit in this State owing to its very heavy population. It is not surprising, therefore, course, those of the East Godavari and that the food scarcity and attractive prices

In the Deccan division, there is a small increase in Anantapur and small decreases in the other three districts, viz., Bellary, Cuddapah and Kurnool. In the North Madras division, the districts of Srikakulam and Visakhapatnam show a large decrease between 1941 and 1951, showing the effect of deficient rainfall in an area only a small portion of which is protected by major irrigation sources.

As already mentioned elsewhere in this Report, the South Madras division is the one most affected by failures of the northeast monsoon, and this is reflected in the large decreases in the net area sown between 1941 and 1951. Ramanathapuram was the worst affected, and has shown a drop of nearly 3 lakhs acres in the net area sown. (It should be noted that the figures in Subsidiary Table 4.7 relate to the area actually sown, and include the cultivated areas where the failure of the north-east monsoon resulted in partial or total failure of the crops raised, which was very considerable.) In the Cauvery delta, South Arcot and Tanjore districts have shown an increase, naturally a larger increase in Tanjore than in South Arcot, which covers only a small part of the Cauvery delta. The rest of the Cauvery delta is in the Tiruchirapalli district, where the figures show a decrease of about 1.8 lakhs on account of the upland area in the district. Salem has shown a very slight increase. All the districts except, Salem, South Arcot and Tanjore have shown large decreases for the reason already mentioned. The division as a whole, has, for the same reason, shown a decrease of about 8.7 lakhs acres. An idea of the serious nature of the failure of the north-east monsoon referred to above can be had from the fact that the loss of production in the year 1949-50 was estimated at 13.93 lakhs tons (10.56 lakhs tons of rice and 3.37 lakhs tons of millets) of foodgrainsvide page 34 of "Food and Agriculture in Madras State" by Dr. B. Natarajan, Economic Adviser to the Government of Madras.

It will thus be seen that not only has the area cultivated not kept pace with the increase of population, but that there has been an appreciable fall in that area on account of the failure of the north-east monsoon during the latter part of the decade.

Areas sown more than once.- It will be seen from columns (7) to (10) of Subsidiary Table 4.7 that there has been a more 1949-50.

or less steady increase in the average area sown more than once. All the divisions have shown an increase in 1941-51, and there would have been a larger increase in the South Madras division and in the State as a whole but for the failure of the north-east monsoon during the latter part of the decade. For this reason, the South Madras division has shown only a small increase of less than 15,000 acres. Coimbatore, Tiruchirapalli, Madurai and Tanjore (98,000 acres) have shown increases, while the other districts have shown a decrease. (I have ignored the trivial increase in the figures for the Ramanathapuram district.) Thus it is largely a case of an expected appreciable increase in the second crop area in the Cauvery delta which has been almost nullified by the decreases in the upland areas of the division consequent on the failure of the north-east monsoon.

In the State as a whole, the area sown more than once has increased by 1.3 lakhs acres.

10. Areas cultivated with food and nonfood crops.—The statement below shows the areas under foodcrops and non-food crops in the fasli year 1940-41 and fasli year 1949-50:--

[Statement No. 64.]

Area sown with crops (in acres).

South Madras Division	4,063,319	3,627,085
Note.—Figures taken f. Report of the Madras State	rom the Seasor of or the years l	

The figures for the foodcrops have been shown separately for the chief foodcrop. viz., paddy and other foodcrops. The other foodcrops are of course millets and pulses. The non-foodcrops include some profitable commercial crops of which the most important are groundnut, tobacco and cotton. It will be seen that, of the total extent sown, 75.8 per cent is under foodcrops and 24.2 per cent under non-foodcrops. The corresponding figures for the divisions are 68 and 32 in the Deccan division, 72.9 and 27.1 in the West Madras division, 81.5 and 18.5 in the North Madras division and 76.8 and 23.2 in the South Madras division. These percentages relate to fasli 1359.

11. Cultivable area per capita.—The cultivable area available per capita is shown in the statement below:—

[Statement No. 65.]

* Not an agricultural district.

This is the potential area still available for cultivation, but generally speaking, the best land is already under cultivation in all districts, barring a few areas of which the Agency tracts are the most important and considerable, and only a poor yield can be generally obtained from these lands not yet occupied but cultivable.

12. Cultivated area per capita.—But for the failure of the north-east monsoon during the latter part of the decade 1941-50, there would have been an increase in the area sown, but there is no reason at all to think the increase would have kept pace with the growth of population. Subsidiary Table 4.8 shows how unsatisfactory the actual position has been: the unirrigated single crop cultivation per capita has decreased from 50 cents in 1921 to in 1951. In the Deccan cents division there was a decrease from 178 to 128 cents; in the West Madras division from 33 to 25 cents; in the North Madras division from 34 to 19 cents; and in the South Madras division from 40 to 23 cents. Even in the West Madras division where there has been no failure of the monsoon. there has been a decrease from 33 to 25 cents.

It will be seen that unirrigated double-crop cultivation per capita is larger in the North Madras division than in the South Madras division.

The irrigated single-crop cultivation per capita is naturally largest in the districts, where there are major irrigation systems, viz., East!" Godavari, West Godavari, Krishna, Guntur, Nellore and Tanjore. The figures of Ramanathapuram, which are nearly as large as those of Guntur, are really misleading. While Guntur covers a portion of the Krishna delta, Ramanathapuram, except for the Srivilliputtur area, depends mainly on poor rainfed tanks. Even in Tanjore, there has been a fall in the per capita area since 1921 in spite of the development of irrigation under the Cauvery-Mettur Project.

Land and cultivation per capita.—
Columns (5) to (8) of Subsidiary Table 4.9
give the total cropped area, i.e., the aggregate of the relevant columns in Subsidiary
Table 4.8. It will thus be seen that the total
cropped area per capita has steadily
decreased from 78 cents in 1921 to 54 cents
in 1951—a decrease of 30.8 per cent as
against the increase of 40.5 per cent in the
population. All the divisions show a steady
decrease: the percentage decrease in
cultivation and the percentage increase of

S.T.-4·8

3. T.-4's

population from 1921 to 1951 in the various divisions are shown below:—

[Statement No. 66.]

State and natural division.	Percentage decrease in the area of cultivation per capita. Columns (8) minus (5) of Subsidiary Table 4.9.	Percentage increase is population during 1921 and 1951.
(1)	(2)	(3)
Madras State	30.8	+ 40.5
Madras Deccan Division	 25·9	+ 37-4
West Madras Division	25.0	+ 52.5
North Madras Division	— 32·9	+ 41.7
South Madras Division	 35·4	+ 38.0

The pressure of the population on the cultivated area has undoubtedly been increasing steadily on a disquieting scale.

Columns (3) and (4) of Subsidiary Table 4.9 give respectively (1) the total land area per capita, i.e., including forests and uncultivable land and lands not available for cultivation and (2) area cultivated and cultivable percapita. As already mentioned, it is doubtful if the figures in column (4) against Srikakulam and Visakhapatnam are correct, in so far as the cultivable areas are concerned.

4.1 Agricultural classes per 1,000 persons of general population; number in each class and sub-class of 10,000 persons of all agricultural classes and comparison with agricultural holdings by size.

¹⁹⁵¹ Five years ending with crop year 1949-50.

¹⁹⁴¹ Five years ending with crop year 1939-40.

¹⁹³¹ Five years ending with crop year 1929-30.

¹⁹²¹ Five years ending with crop year 1919-20.

[•] No sources of irrigation in this division.

[†] Included under Krishna.

Newly constituted. Information for quinquennia 1921 to 1951 included under Visakhapatnam.

Includes figures for West Godavari.

The figures in brackets against Srikakulam district represent the figures for 1949-50 only and the figures against Visakhapatnam district represent the average for the Srikakulam and Visakhapatnam districts for the quinquennium ended 1949-50.

The figures have been adjusted for the changes in the area of Visakhapatnam district consequent on the formation of Orissa Province.

Figures for Bellary, Kurnool and Tiruchirappalli include also figures for Sandur, Banganapalle and Pudukottai States for 1941, 1931 and 1921.

[♦] The figures for Polavaram taluk for 1951 are included in the figures of West Godavari district.

CHAPTER V-NON-AGRICULTURAL CLASSES.

General remarks.—As mentioned in the Introductory Chapter, the non-agricultural classes are those which depend for their livelihood on Livelihood Class V (Production other than cultivation) or Class VI (Commerce), Class VII (Transport) or Class VIII (Other services and miscellaneous sources of income).

M.T-B-I

19,994,212 persons, that is, about 35 per cent of the total population of the State, are dependent on these non-agricultural occupations. It may be noted in this connection, that Class VIII includes not only persons who are engaged in activities of the kind which fall under 'Other services and miscellaneous sources of income', but also persons who are economically inactive, i.e., persons falling under the following categories, details for which are given in the fly-leaf to Economic Table B-III:—

- (i) Persons living principally on income from non-agricultural property;
- (ii) persons living principally on pensions, remittances, scholarships and funds;
- (iii) inmates of jails, asylums, alms houses and recipients of doles;

(iv) beggars and vagrants; and

(v) all other persons living principally on income not derived from any economic activity.

The total number of self-supporting persons falling under these economically inactive categories is 106,051 in the entire State (74,141 males and 31,910 females).

The percentage of the non-agricultural population to the total population is 29 per cent in the North Madras division, 32 per cent in the Deccan division, 36 per cent in the South Madras division and 47 per cent in the West Madras division. As one would expect to find, this percentage is very small in the Agency tracts being only 10 per cent.

In the Deccan division, the Cuddapah and Kurnool districts have a larger percentage of non-agricultural population than Bellary and Anantapur districts, the difference being largely due to the handloom industry.

In the West Madras division, Nilgiris tops the list with 67 per cent mainly on account of its plantations, while Malabar with its textile industry, large trade in timber, forest produce, eccoanut and plantations, and fishing comes second. In South Kanara, the textile industry is unimportant, and the trade in forest produce is far less than in Malabar. It is not surprising therefore that it comes last in this division with 37 per cent.

The Agency figures, varying from 4 per cent in Visakhapatnam to 20 per cent in West Godavari reflect the comparative development of the Agency tracts in these four districts, viz., Srikakulam, Visakhapatnam, East Godavari and West Godavari.

In the plains portion of the North Madras division, the percentage of the non-agricultural population varies from 23 in Srikakulam district to 35 in Krishna district. The figures for the other districts are: East Godavari 33, Visakhapatnam 32, Guntur 31, West Godavari and Nellore 27.

In the South Madras division, Madras City, of course, leads with 98 per cent, on account of the industrial and commercial activities in the City, and the fact that the population depends mostly on non-agricultural occupations. It is not surprising to find Coimbatore coming next with 47 per cent, on account of its large textile industry, both textile mills and handlooms, and large general trade. Tirunelveli district comes third with 45 per cent, thanks mainly to its textile mills and large number of handlooms. The percentages are low in South Arcot (18 per cent), Chittoor (25 per cent), Tiruchirapalli (29 per cent) and Salem (29 per cent). South Arcot district is industrially backward and its handloom industry is mainly confined to some places in and near the coastal belt Cuddalore and Chidambaram taluks. Chittoor is an industrially backward district, while in Salem and Tiruchirapalli there has been some appreciable industrial advancement in a very few centres, but the other areas of these districts are industrially backward.

Appendix V gives an idea of the important industries in each district other than cottage industries. The handloom industry in this State is mainly a cottage industry except in a few centres where handloom factories have come into existence, notably in Cannanore and Kozhikode in Malabar district, Mangalore in South Kanara district, Karur in Tiruchirapalli district and Madurai town.

8.T.—5·1

The important trade centres in each district and the articles handled at each centre have been furnished in Appendix VI.

These appendices have been furnished to me by the Chief Inspector of Factories and the Director of Industries and Commerce, respectively.

2. Classification by livelihood class.—
The percentage of the non-agricultural population in each of the livelihood classes V to VIII is given below:—

[Statement No. 67.]

	Percentage under										
State and natural division.	Class V.	Class VI.	Class VII.	Class VIII.							
(1)*	(2)	(3)	(4)	(5)							
Madras Deccan	36 28	19 16	5 4	41 52							
Division. West Madras Division.	35	18	5	42							
North Madras Divi- sion.	37	18	5	40							
South Madras Division.	36	20	5	39							

The position is thus roughly the same in all the divisions, except for the low figure of 28 under Class V in the Deccan division, which truly reflects the industrially backward nature of that tract compared with the other divisions. Two textile mills have come into existence at Adoni during the decade, and industrial advancement of the area may be expected after the completion of the Tungabhadra Hydro-electric project. The largest percentage under transport (over 9 per cent) is naturally in Madras City and commerce is a close rival in the City to other productive activities (22 per cent under Class VI and 25 per cent under Class V).

3. Economic status.—The economic status of the non-agricultural population is analysed in the statement below:—

[Statement No. 68.]

S.T.-54

8.T-5·1

end		Percentage of							
. State and natural division.	Self- supporting persons.	Non- earning depen- dants.	Earning depen- dants.						
(1)	. (2)	(3)	(4)						
Madras State	27	69	4 .						
Madras Deccan Division.	28	67	, 5 .						
West Madras Divi- sion.	28	69	3						
North Madras Divi- sion.	27	67	6						
South Madras Divi-	27	70	3						

There is a remarkable uniform ty in these figures, just as we noticed in respect of agricultural classes. The non-earning dependants account for as many as 69 per cent of the population, i.e., about $2\frac{1}{2}$ times the number of self-supporting persons, while the earning dependants account for only 4 per cent of the population.

In the Agency tracts, 30 per cent of the non-agricultural population are self-supporting, while 62 per cent and 8 per cent are, respectively, non-earning dependants and earning dependants. Wages and other incomes are appreciably lower in these tracts than in the Plains. More people have therefore to work and dependency is consequently less. In the Srikakulam and Visakhapatnam Plains, the percentage of earning dependants is the highest in the plains areas, being 9 per cent and 7 per cent, respectively, confirming what has already been mentioned about these districts, viz., that the stoppage of emigration, particularly to Burma, has increased the pressure on the locally available means of livelihood, and a larger percentage of these dependants have to work to enable the families to make both ends meet.

The percentage of non-earning dependants is very high in Salem and North Arcot districts viz., 73 per cent against 23 per cent of self-supporting persons in Salem and 73 per cent against 24 per cent of self-supporting persons in North Arcot district. I do not think that there are any peculiar conditions in these districts to explain this abnormal dependency, and I think there has been some inaccurate classification of self-supporting persons—the lowest in the State—in these two districts.

The statement below analyses the self-supporting persons in the non-agricultural population according as they are employers, employees and independent workers or the residuary category (others):—

[Statement No. 6	Percentage of										
division.	Emplo- yers.	Emplo- yees.	Inde- pendent workers.	Others.							
(1)	(2)	(3)	(4)	(5)							
Madras State	6	45	47	2							
Madras Deccan Division.	6	37	55	2							
West Madras Division.	3	61	34	2							
North Madras Divi-	5	37	56	2							
South Madras Division.	7	45	46	2							

S.T.-5-1

The substantial figure of 47 per cent under independent workers is due to the large number of persons still working as artisans, particularly in the villages, handloom weavers (other than the small fraction working in handloom factories) and the large numbers of casual workers who are not attached to any employer on a permanent or semipermanent basis. Employees, account for 45 per cent and employers for 6 per cent of the non-agricultural population. The percentage of employers is small as only persons with resources can be employers. In the West Madras division, the independent workers account for only 34 per cent of the non-agricultural population, while the employees account for 61 per cent of the same population, indicating the existence of fair sized or large establishments in which the bulk of the labourers are working, and this is of course just what one would expect in a region where there are plantations and large handloom factories; the percentage of independent handloom weavers is small in Malabar district. As fair-sized or large establishments require considerable financial resources, the percentage of employers is small-only 3 per cent.

In the Agency tracts, the independent workers account for 58 per cent of the non-agricultural population, the employees for 38 per cent and employers for 3 per cent. The employers in these areas are practically all well-to-do outsiders or Government departments or the contractors working under those departments, and labour is employed mainly on Government works like improvement of road communications, work in the Government forests, collection of forest produce, etc. The figures referred to above are, therefore, quite explicable.

That the bulk of the labour in the Nilgiris district is regularly employed in plantations is brought out by the figure of 82 per cent under employees and 13 per cent under independent workers. The corresponding figures for Malabar, viz., 61 per cent and 34 per cent, respectively, have already been explained.

The large percentage of independent workers in the Plains areas of Srikakulam district (69 per cent) and Nellore district (65 per cent) indicates the lack of organized industrial or other establishments employing appreciable numbers of labourers.

The Madras City figures of 63 per cent under employees and 28 per cent under independent workers are due to large establishments each of them employing a large labour force.

In Coimbatore and Madurai districts, which are industrially the most advanced in the South division, 43 per cent of the non-agricultural population are independent workers, while 50 per cent and 49 per cent, respectively, are employees. The former figure is of course due to the large numbers of artisans and casual workers in the rural areas and the large number of independent handloom weavers throughout the district.

4. Non-agricultural population in rural and urban areas.—The rural-urban break up for the non-agricultural classes in the State and in the Natural divisions is given below:—

[Statement No. 70.]

8.Te-5.1 (a) and 5.1 (b)

	Percentage of non-agri- cultural		entage ing in
State and natural division.	classes in the general population in the entire area.	Rural areas.	Urban areas.
(1)	(2)	(3)	(4)
Madras State	35	19	16
Madras Deccan Divi-	32	19	13
West Madras Division.	47	36	11
North Madras Division.	29	17	12
South Madras Division.	36	16	20

It will be seen that the West Madras division has the largest percentage (36) of non-agricultural classes residing in rural areas and the South Madras division the largest percentage in urban areas. This is to be expected in the light of what I already said regarding the extent of urbanisation in these divisions.

The statement below compares the classification, according to their economic status, of the non-agricultural classes in the rural and urban areas of the State as well as in the natural divisions:—

[Statement No. 71.]

	Percentage of									
• • •	Self-sup	port- I	Yon-eas lepend	ning	Earni	ng ole.				
State and natural division.	Rural areas.	Urban areas.	Rural areas.	Urban areas.	Bural areas.	Urban areas.				
(1)	(2)	(2)	(4)	(5)	(6)	(7)				
Madras State	27	26	68	70	5	4				
Madras Deccan Division.	29	26	66	70	5	4				
West Madras Division.	28	28	60	70	8	2				
North Madras Division.	28	27	65	00	7	4				
South Madras Division,	27	24	•	70	4	4				

These figures indicate a slightly larger dependency in the urban areas than in the rural areas, which is due, of course, to the comparatively higher incomes and standard of living in the urban areas and the consequent disinclination of the dependents to take up any work themselves.

The rural-urban percentages are given below for each of the non-agricultural classes V to VIII:-

Statement No. 72.]

Percentage	of '	persons	dependent on
LOLCOMUNE	O.	horsome	acpoinaging on

State and natural division.			Production other than cultivation.		Commerce.		Transport.		Other services and miscella- neous sources.	
			Rural area.	Urban area.	Rural area.	Urban area.	Rural area.	Urban area.	Rural area.	Urban area.
(1)			(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
Madras State	• •		41	29	16	23	3	7	40	41
Madras Deccan Division	••		29	25	12	24	1	8	58	43
West Madras Division			37	27	17	22	4	7	42	44
North Madras Division	••,		46	24	17	21	3	7	34	48
South Madras Division	••		43	30	15	24	3	7	39	39

It is interesting to find that production other than cultivation is carried on more in the rural areas than in the urban areas. This is to be expected from the fact that the plantations are in rural areas and so also most of the handlooms and fishing. Persons engaged in commerce are naturally found in larger numbers in the urban areas than in the rural areas, and similarly as regards transport. In Deccan division the proportion of the non-agricultural population depending upon transport is only one per cent in the rural areas as against 8 per cent in the urban

areas. This reflects correctly the poor volume of transport in these backward areas. 'Other services and miscellaneous sources of income' are so numerous and variable that the distribution between rural and urban areas does not follow any particular pattern.

The statement below gives an analysis of the non-agricultural population for rural as well as urban areas, according to their description as employers, employees, independent workers or those belonging to the residuary category (others):—

[Statement No. 73.]

Percentage of persons under

State and natu	Employers.		Employees.		Independent workers.		Others.				
				~		<u></u>		بـــــ			
				Rural area.	Urban area.	Rural area.	Urban area.	Rural area.	Urban area.	Rural	Urban area.
(1)				(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
Madras State	••.	• •		5	7	38	53	55	38	2	2

West Madras Divisio	n			2-	4	59	67	37	26	2	3
North Madras Divisi	on	•		5	5	27	50	66	42	2	3
South Madras Division	on	••	• •	6	8	34	53	59	37	1	2

percentage of employers in the urban areas in the urban areas, as the large industrial and the rural areas is not without significance and is just what one would expect as persons with large resources will generally be found more in the urban areas than in the villages and the small difference indicates, of course, that our urbanisation has not gone very been mentioned in respect of employees. (2) (3) (4) (2) (5)

Even the slight difference between the far. Employees are found in larger numbers establishments employing a large labour force are mostly in urban areas. As for independent workers, their percentages are naturally larger in the rural areas than in the urban areas, and the reason is the same as has just 5. Livelihood Class V—Production other than cultivation.—The statement below gives an analysis of the non-agricultural population falling under Livelihood Class V from the point of view of dependency:—

[Statement No. 74.]

	Percentage	of perso	ons unde
State and natural division.	Self- supporting persons.	Non- earning depen- dants.	Earning depen- dants.
(1)	(2)	(3)	(4)
Madraa State	27	68	5
Madras Deccan Divisio	on 27	67	6
West Madras Division		66	4
North Madras Divisio		65	8
South Madras Divisio		69	4

The slight superiority of the West Madras division is, of course, attributable to the fact that this is the main plantation area in the State.

In the statement below, the percentages of persons under Livelihood Class V who are self-supporting persons, non-earning dependants or earning dependants, as the case may be, have been given separately for rural areas and urban areas:—

[Statement No. 75.]

	Percentage of persons under					
State and natural division.			Non-ea depend		Earn depends	
	Bural areas.	Urban areas.	Rural areas.	Urban areas.	Bural areas.	Urben areas.
(1)	(2)	(3)	(4)	(5)	(6)	(7)

Agency Plains	29 27 27	27 27	59 64 69	68 69	12 9 4	5 4

Here also non-earning dependants form a slightly larger percentage in the urban areas than in the rural areas. An analysis of self-supporting persons under Livelihood Class V, according as they are, employers, employees or independent workers, is given below:—

[Statement No. 76.]

State and natural	Percentage of				
division.	Emp- loyer.	Emp- loyee.	Indepen- dant worker.		
(1)	(2)	(3)	(4)		
Madras State .	. 5	35	60		
Madras Deccan Divisio		21	71		
West Madras Division.		54	44		
North Madras Division		19	76		
South Madras Division	n. 6	37	57		

These figures also disclose the existence of a larger number of establishments employing a large labour force in the West Madras division and the South Madras division than in the other two divisions. The percentages for the Nilgiris district are 1 per cent, 92 per cent and 7 per cent, respectively, due to the preponderance of plantations and the large number of labourers employed by them. The percentage of casual labourers is correspondingly very small, being only 7 per cent. In the Srikakulam district, employees account only for 9 per cent and the indepen dent workers for as much as 85 per cent, indicating the lack of establishments employing a large number of workers. Visakhapatnam is better in this respect, thanks mainly to the Visakhapatnam town and a few other centres; but even in that district employees account for only 15 per cent, while the independent workers account for as much as 81 per cent. Madras City naturally shows the largest percentage under employees (60 per cent) outside the Nilgiris, and the smallest percentage under independent workers, evidencing the existence of large units of employment.

The classification of the self-supporting persons under Livelihood Class V into employers, employees and independent workers, separately for rural and urban areas is indicated in the statement below:—

[Statement No. 77.]

	Percentage of persons who are						
State and natural division.			p- ers.	Em		Independent workers.	
	(5) Rural.	S Urban.	(4) Rumi.	(9) Urban.	(9) Burni.	J Urban.	
Madras State Madras Deccan Division. West Madras Division North Madras Division—	5 8 2	6 7 8	29 18 53	45 27 62	66 74 45	49 66 85	
Agency Plains South Madras Division.	5 5	5 7	17 15 27	82 48	80 80 6 8	63 45	

The percentage of independent workers is naturally much higher in the rural areas than in the urban areas, and the reverse is the position in regard to employees, the disparity being most marked in the South Madras division. The position in South Madras division is to be expected, because of its being more advanced from the point of view of industries.

Secondary means of livelihood.—In the State, as a whole, 54 per cent of the earning dependants obtain their earnings from production other than cultivation and 21 per cent from employment as agricultural

labourers. Only 220 out of 2,735 self-supporting persons, that is, 8 per cent have any secondary means of livelihood, and their number under each category of seconddary means of livelihood is small. This is to be expected, as self-supporting persons will normally be engaged fully on their principal means of livelihood and may not find it possible to engage in other means of livelihood also. The percentages for the divisions are 13 for the Deccan division, 6 for the West division, 14 for the North division and 6 for the South division.

In the Deccan division out of 589 earning dependants, 220 get their income from production other than cultivation and 139 from employment as agricultural labourers, i.e., the percentage employed as agricultural labourers is larger than in the State as a whole.

In the West Madras division, out of 405 earning dependants, only 55 are employed as agricultural labourers, while 249 get their earnings from production other than cultivation, reflecting the large employment in plantations and collection of timber and forest produce.

In the North Madras division, out of 757 earning dependants, 235 are employed as agricultural labourers, while 379 are engaged in production other than cultivation.

In the agency tracts, out of 1,166 earning dependants, 588 are employed as agricultural labourers, and 340 in production other than cultivation. In these tracts, nearly half the number of earning dependants thus work as agricultural labourers though the persons on whom they depend are engaged mostly on production other than cultivation. This is, of course, due to the fact that, in these areas there is hardly anything under 'Production other than cultivation,' apart from the collection of timber and forest produce. The scope for employment being thus limited, the dependants are thrown back on work as agricultural labourers.

In the South Madras division, out of 417 earning dependants, only 66 work as agricultural labourers, while 243 are engaged in production other than cultivation, indicating the much larger scope for employment in productive activities other than cultivation in this division, when compared with the Deccan division and the North Madras Division.

In Ma dras City, out of 444 earning dependants, 253 (like the persons on whom they depend) are engaged in production other than

cultivation, while 59 are engaged in commerce and 114 in 'Other services and miscellaneous sources of income,'—just what one would expect to find in an area like Madras City.

. 6. Livelihood Class VI—Commerce.—The percentage of self-supporting persons, non-earning dependants and earning dependants among those engaged in Commerce are given in the statement below:—

[Statement No. 78.]

S.T---3.5

• .	Percentage of persons who are					
State and natural division.	Self- supporting persons.	Non- earning depen- dants.	Earning depen- dants.			
· (1)	(2)	(3)	(4)			
Madras State	25	72	(4) 3 3			
Madras Deccan Divi- sion.	26	71	3			
West Madras Divi- sion.	23	75	2			
North Madras Divi-	26	70	4			
South Madras Divi-	25	72	3			

There is a substantial uniformity in the pattern throughout the State. It will be noticed that the proportion of dependents is larger than in the aggregate non-agricultural population: the number of dependents being nearly three times that of the self-supporting persons. This is not surprising, as depend ants in this class would be normally disinclined to work: the average incomes will be larger and the standard of living higher than in the other non-agricultural classes.

In Salem and North Arcot districts, the percentage of self-supporting persons is only 20 per cent and 22 per cent, respectively, which is abnormally low, and the percentage of dependants is proportionately higher, indicating erroneous classification by the enumerators in these districts.

The rural-urban break-up for self-supporting persons, non-earning dependants and earning dependants in this livelihood class is given in the statement below:—

[Statement No. 79.]

Percentage of persons who are

	Tutoningo or parion was are					
State and natural division.				n-earning Earning pendants. dependa		
	Rural.	Urban.	Rural.	Urban.	Rural.	Urban,
(1)	(2)	(3)	(4)	(5)	(6)	(7)
Madras State Madras Deccan Division. West Madras Division North Madras Division—	26 29 23	24 24 24	71 67 75	73 73 75	3 4 2	3 3 1
Agency Plains	29 26 26	25 24	67 69 71	72 73	4 5 3	 3 3

The figures indicate that, on the whole, there is a tendency for the percentage of non-earning dependants to be larger in the urban areas than in the rural areas, for the reasons already indicated.

The statement below gives an analysis of the self-supporting persons in livelihood Class VI, according as they are, employers, employees or independent workers:—

[Statement No. 80.]

	Percentage of						
State and natural division.	Em- ployers.	Em- ployees.	Inde- pendent workers				
(1)	(2)	(3)	(4)				
Madras State	13	23	64				
Madras Deccan Division.	12	13	75				
West Madras Division.	7	21	72				
North Madras Division.	10	13	77				
South Madras Division.	15	29	56				

The large percentage of independent workers underlines the fact that the bulk of the persons engaged in commerce in the State are of the small petty trader class, working by themselves, or with the assistance of only their family members, and not employing even one outsider. The figures show also that the scale of business of the average trader is largest in the South Madras division and there is more large scale business in the South Madras division than in the other divisions. In the Deccan division, Bellary has the smallest percentage (60 per cent) under independent workers which is due to its large scale business in cotton. In the West Madras division, the independent workers form the smallest percentage in the Nilgiris. The number of settlements in this hilly district being small, there is hardly room for small traders. In the Madras division, Madras City has, of course, the smallest percentage (39 per cent) of independent workers in the entire State, as the City contains a much larger percentage of large dealers than any other division. Madurai district comes next with 47 per cent. Madurai town is really the clearing house for the trade in the Southern districts of Madurai, Ramanathapuram and Tirunelveli.

The rural-urban break-up for the figures of employers, employees and independent

workers discussed above is given in the state ment below:—

[Statement No. 81.]

rural figures of in	dene	nden	t wo	rker	2	J
	Po				- -	

Secondary means of livelihood.—Thirtyseven per cent of the earning dependants are also engaged in Commerce; 21 per cent under Production other than cultivation and 18 per cent under 'Other services and miscellaneous sources of income.' It is natural to find that dependants in Livelihood Class VI should also earn their livelihood by . engaging in occupations, which are more easily available in the urban areas than in the rural areas. It is noteworthy that, in the North Madras division, out of 391 earning dependants, 182 are engaged in Commerce. 74 are employed as agricultural labourers. while 42 are engaged in production other than cultivation and 46 in 'Other services and miscellaneous sources of income'. It is natural to find that in this area, where industry has not so well advanced, but agricultural conditions are satisfactory, there should be more earning dependants engaged as agricultural labourers than in production other than cultivation. In the South Madras division, out of 284 earning dependants, 100 are engaged in Commerce, 70 in production other than cultivation, 56 in 'Other services and miscellaneous sources,' while 26 are employed as agricultural labourers. Industries and Commerce are more advanced in the South Madras division than in the North Madras division. In Madras City, out of 427 earning dependants, 186 are engaged in commerce, 150 in 'Other services and miscellaneous sources of income.' and 67 in production other than cultivation. The

large proportion under 'other services and miscellaneous sources of income' is not surprising, in view of the easy availability of such sources of livelihood in a large City like Madras.

Out of every 2,489 self-supporting persons in this livelihood class, 216 have secondary means of livelihood (8.7 per cent). Out of these 216 persons, 51 get their supplemental income from cultivation of owned land, 18 from cultivation of unowned land, 15 from employment as agricultural labourers, 49 as agricultural rent receivers or non-cultivating owners of land, 22 from production other than cultivation, 32 from commerce, 2 from transport and 27 from 'Other services and miscellaneous sources of income'. These figures confirm the fact that persons engaged in commerce are drawn from nearly all sections of the population. As so many of them are petty traders, it is not surprising to find that a small fraction seeks employment as agricultural labourers to supplement its income; evidently these petty traders are almost of the hawker type, working as agricultural labourers, whenever opportunity offers. The percentages of self-supporting persons having a secondary means of livelihood to the total number of self-supporting persons in this class are 12.7 in the Deccan division, 9.3 in the West division, 11.4 in the North division and 7.0 in the South division.

7. Livelihood Class VII—Transport.—The percentages of self-supporting persons, non-earning dependants and earning dependants in livelihood class VII in the State as a whole and in each natural division, are given in the statement below:—

[Statement No. 82.]

	Percentage of persons who are						
State and natural division.	Self- supporting persons.	Non- earning depen- dants.	Earning depen- dants.				
(1)	(2)	(3)	(4)				
Madras State	26	71	3				
Madras Deccan Division.	25	71	4				
West Madras Division.	26	70	4				
North Madras Division.	26	70	4				
South Madras Division.	25	72	3				

There is a remarkable uniformity in the pattern throughout the State, and the

number of dependents is only a little less than three times the number of self-supporting persons.

The rural-urban analysis of self-supporting persons, non-earning dependants and earning dependants under this class is given in the following statement:—

[Statement No. 83.]

	Percentage of persons who are					
State and natural divi- sion.	Self-su ing pe	pport- rsons.	Non-e	arning las ts.	Earn depen i	ing uts.
	Rural.	Urban.	Bural.	Urban.	Rural.	Urban.
(1)	(2)	(3)	(4)	(5)	(6)	(7)
Madras State	25	25	71	72	4	3
Madras Deccan Division.	27	25	68	72	5	8
West Madras Division North Madras Division-	26	26	. 70	72	4	2
Agency	27	••	69	••	4	
Plains	26	25	69	71	5	4
South Madras Division	25	25	72	72	3	3

Here again, there is a substantial uniformity in the pattern throughout the State.

An analysis of the persons in this livelihood class under employers, employees and independent workers is given in the statement below:—

[Statement No. 84.]

Ct - t 3 t 1	Percentage of persons who ar					
State and natural division.	Emplo- yers.	Emplo- yees.	Inde- pendent workers.			
(1)	(2)	(3)	(4)			
Madras State	4	68	28			
Madras Deccan Division.	3	67	30			
West Madras Division.	1	79	20			
North Madras Division.	4	58	38			
South Madras Division.	4	69	27			

The West Madras division figures of 1 per cent under employers and 79 per cent under employees indicate that the bulk of the persons in this class in this division are regularly employed in a small number of large transport organisations and the percentage of independent workers is only 20, the least in the State. Among the other divisions, the South Madras division leads with 69 per cent employed under transport organisations.

S.T -5·4

Analysing the figures separately for rural and urban areas, we get the following table:—

[Statement No. 85.]

[Diate	P	ercent	age of p	ersor	n under		
State and natural division.	Emplo	Employers.		Employees.		Independent . workers.	
(1)	& Bural.	© Urban.	(f) Rural,	S Urban.	(9) Rural.	3 Urban.	
Madras State	3	4	66	70	31	26	
Madras Deccan Division.	4	3	63	68	33	29	
West Madras Division North Madras Division—	1 ,	1	75	87	24	12	
Agency	9		58	••	38	••	
Plains 8outh Madras Division	6 8	4 5	58 64	58 71	36 83	38 24	

As one would expect, the number of independent workers is larger in the rural areas than in the urban areas where there is a larger percentage of persons regularly employed in transport organisations.

Out of the proportionate number of 2,546 self-supporting persons in the State as a whole, only 124 have a secondary means of livelihood, i.e., 5 per cent of the self-supporting persons have supplemental sources of income, the main source of supplemental income being cultivation of owned land and rent from land. In Madras City, the main sources are Class VIII, viz., 'Other services and miscellaneous sources' which include income from non-agricultural property, e.g., house-property, and Class IV, viz., rent from agricultural land. In Coimbatore, Class VIII is slightly more important than Class IV, Class I coming first. In Ramanathapuram, the main sources are Classes I and VIII.

Out of the proportionate number of 331 earning dependants in the State as a whole, 94 depend on other services and miscelleneous sources of income, 82 on production other than cultivation, 62 on transport and 43 on employment as agricultural labourers.

In the Deccan civision, out of the proportionate number of 364 earning dependants, 122 get their income from other services and miscellaneous sources of income, 60 from transport, 54 from production other than cultivation and 53 from employment as agricultural labourers.

In the West Madras division, as a whole, out of the proportionate number of 341 earning dependants, 164 are engaged in production other than cultivation, 57 on transport, 43 are engaged as agricultural

labourers, and 42 on other services and miscellaneous sources of income. In the Nilgiris, however, Class VIII is more important than Class V for earning dependants.

In the North Madras division, out of the proportionate number of 395 earning dependants, 117 are engaged in other services and miscellaneous sources of income, 83 on work as agricultural labourers, 81 on transport and 62 on production other than cultivation.

In the South Madras division, out of the proportionate number of 300 earning dependants, 97 are engaged in other services and miscellaneous sources of income, 69 on production other than cultivation, 56 on transport and 40 in commerce. Employment as agricultural labourers is not so important. In Madras City, out of the proportionate number of 458 earning dependants, 205 are engaged in other services and miscellaneous sources of income, 115 in transport, 78 in production other than cultivation, and 58 in commerce. There are no special features in these figures calling for comment.

8. Livelihood Class VIII.—The statement below gives the percentages of self-supporting persons, non-earning dependants and earning dependants in the State, as a whole, and in each Natural division, in respect of Livelihood Class VIII:—

S.T--5.5 .

[Statement No. 86.]

	Percentage	of persons unde			
State and natural division.	Self- supporting persons.	Non- earning depen- dants.	Earning depen- dants.		
(1)	(2)	(3)	(4)		
Madras State	28	68	4		
Madras Deccan Divi-	29	66	5		
West Madras Divi-	28	69	3		
North Madras Divi-	28	67	5		
South Madras Divi-	27	69	4		

There is a substantial uniformity of pattern throughout the State, the number of non-earning dependants being only a little less than 2½ times the number of self-supporting persons. This is a miscellaneous class. In the Agency tracts, 31 per cent are self-supporting, 63 per cent are non-earning dependants, while 6 per cent are earning dependants. The low level of income in these tracts compels more people to work for

their livelihood and this is the explanation, for the different position noticed in these tracts.

The Nilgiris figures are in marked contrast to those of the other two districts, Malabar and South Kanara, in the same division, and there are as many as 37 per cent under self-supporting persons, while the percentage of non-earning dependants and earning dependants are only 58 and 5, respectively. The difference is due to the fact that the two Projects in this district employ a large number of immigrants, many of whom have left their families behind in their homes.

The rural and urban percentages for self-supporting persons, non-earning dependants and earning dependants in this livelihood class are compared in the statement below:—
[Statement No. 87.]

- Tan - Carlos - Carl	Percentage of persons who are					
State and natural division.	Self-support- ing persons.		Non-earning dependants.		Earning dependants	
	Rural.	Urban,	Rural.	Urban.	Rural.	Urban.
(1)	(2)	(3)	(4)	(5)	(6)	(7)
Madras State	28	28	68	69	4	3
Madras Deccan Division	29	28	66	69	5	8
West Madras Division	28	29	69	68	3	3
North Madras Division—						
Agency	31		63	••	6	
Plains	29	27	65	69	6	4
South Madras Division	27	28	69	69	4	3

The percentages are roughly the same in the rural areas as well as in the urban areas.

The percentages of employers, employees, independent workers and those falling under the residuary category (others), among

the self-supporting persons in this livelihood class, are given in the statement below:—

[Statement No. 88.]

State and	Percentage of persons under					
natural division.	Emplo- yers.	Emplo-	Inde- pendent workers:	Others.		
(1)	(2)	(3)	(4)	(5)		
Madras State	3	60	32	5		
Madras Deccan Division.	3	49	44	4		
West Madras Divi- sion.	1	80	15	4		
North Madras Divi- sion.	2,	59	33	6		
South Madras Divi-	4	57	.35	4		

Any person whose means of livelihood falls under Class V, VI or VII must necessarily either be an employer, employee or an independent worker, but among the persons who are included in Livelihood Class VIII, there may be those, who are neither employers, nor employees nor independent workers—hence the residuary category (others) referred to above. Employees of Government and local authorities and the professional services, of course, fall under this class.

In the Deccan division, the percentage under employees is the largest in the Bellary district (65 per cent), which is evidently due to the very large labour force employed on contract terms, as well as the Government servants employed in the Tungabhadra Project works in this district. Similar is the explanation for the large percentage (82 per cent) of employees in Malabar district in the West Madras division, (Malampuzha Project).

The rural and urban percentages for these four categories of employers, employees, independent workers and others, in this livelihood class, are given below:—

[Statement No. 89.]

Percentage of persons under

							A			
· State and natural div	vision.		Em	oloyers.	Emp	oloyees.	Indepe wor	endent kers.	Ot	hers.
¥			است.							
•			Rural.	Urban.	Rural.	Urban.	Rural.	Urban.	Rural.	Urban.

Madras Deccan Division	• •.	<i>:</i>	4	3	46	55	47	38	. 3	4
West Madras Division	••		1	3	79	80	16	11	4	6
North Madras Division-	•									
Agency	• • •		ļ	••	66		31	• •	2	
Plains	. • •	,	3	2	48	70	43	22	6	. 6
South Madras Division	••	••	4	4	49	64	. 44	27	3	, 5 , ∤

Under employees, the figures are distinctly larger in urban areas than in the rural areas, and the reverse is the position in respect of independent workers. These are due to the fact that persons employed under Government and local authorities are found in much larger numbers in urban areas than in the rural areas. Domestic servants also fall under this livelihood class. They are employed, as is well known, on a much larger scale in the urban areas than in the rural areas.

The large percentage (71 per cent) of employees in Madras and Chingleput districts is due to the very large number of Government servants in the City and in the suburban areas in Chingleput district.

Secondary means of livelihood.— Out of the proportionate number of 2,782 self-supporting persons in this class, only 199 have a secondary means of livelihood, i.e., 7 per cent. The percentages for the divisions are 9 in the Deccan division, 6 in the West division, 11 in the North division and 6 in the South division. The sources of supplemental income are spread over all the livelihood classes, the contribution from transport being negligible.

Out of every 393 earning dependants in this livelihood class, 222 are engaged in 'Other services and miscellaneous sources of income', 71 are employed as agricultural labourers, and 46 in production other than cultivation. In the Deccan division, out of a proportionate number of 470 earning dependants, 269 are engaged in 'Other services and miscellaneous sources of income', 101 in employment as agricultural labourers and 34 in production other than cultivation. The large figure under Class VIII in Bellary district in this division is clearly attributable to the Tungabhadra Project works. In the West Madras division, out of a proportionate number of 278 earning dependants, 142 are engaged in 'Other services and miscellaneous sources of income', 62 in production other than cultivation, while 31 are employed as agricultural labourers. In the Nilgiris district, in this division, out of a proportionate number of 538 earning dependants, 311 are engaged in 'Other services and miscellaneous sources of income', while 127 depend on rent from agricultural land. In the North Madras division, out of a proportionate number of 538 earning dependants

320 depend on 'Other services and miscellaneous sources of income and 123 on employment as agricultural labourers. This comparatively large percentage under agricultural labourers is a feature that one would expect to find in this division. In the South Madras division, out of a proportionate number of 357 earning dependants, 200 are engaged in 'Other services and miscellaneous sources of income', 58 are employed as agricultural labourers, 48 are engaged in production other than cultivation and 23 in commerce.

As already mentioned, Livelihood Class VIII, includes also the five categories of economically inactive persons specified in paragraph 1 of this Chapter. The total number of self-supporting persons under each of these five categories in each of the divisions is given below:-

[Statement No. 90.]

State and natural division.	Persons living principally on income from non- agricultural property.	Persons living principally on pensions remittances, scholarships and funds.	Inmates of falls, asylums, alms houses and resi- pients of doles.	Beggars and vagrants.	All other persons living principally on income not derived from any economic activity.
(1)	(2)	(3)	(4)	(5)	(6)
Madras State	11,919	26,701	7,562	54,671	5,198
North Madras Divi- sion	2,744	8,959	1,177	19,227	1,812
Madras Decom Divi- aion.	1 121	769	78	7,578	642
South Madras Divi-	7,731	15,520	8,950	23,262	2,609
West Madras Divi- sion.	1,823	6,453	2,862	4,604	685

It will be seen that the largest of these groups is group (iv), beggars and vagrants.

9. Industries and Services—General.— All Industries and Services have been classified under 10 divisions in the manner specified in Annexure III. Livelihood Class V covers five of these divisions, viz., Division 0 (Primary industries not elsewhere specified), Division 1 (Mining and quarrying), Division 2 (Processing and manufacture— M.T-B-III foodstuffs, textiles, leather and products 8.7-57 thereof), Division 3 (Processing and manufacture-metals, chemicals and products thereof) and Division 4 (Processing and manufacture not elsewhere specified). Livelihood Class VI corresponds to Division 6 (Commerce). Livelihood Class VII corresponds to subdivisions 7.0 to 7.4. Livelihood Class VIII includes all other non-agricultural services and all miscellaneous non-agricultural

occupations and includes Division 5 (Construction and utilities), subdivisions 7.5 to 7.9 (Storage and warehousing, Postal services, Telegraph services and Wireless services) and transport and communications otherwise unclassified and incidental services, Division 8 (Health, Education and Public Administration) and Division 9 (Services not elsewhere specified). As already mentioned, Class VIII includes also the other miscellaneous sources of livelihood, e.g., income from investments, pensions, and family remittances, proceeds of begging and other sources of income of economically inactive persons.

The total number of self-supporting persons in the State depending for their livelihood on all Industries and Services is 5,289,698. The percentage of distribution of these persons in the various natural divisions is specified below:—

Natural division		Percentage.
(1)		(2)
Madras Deccan Division	••	. 8
West Madras Division		17
North Madras Division		21
South Madras Division		54

Of the 54 per cent in the South division, 7 per cent are in Madras City and 47 per cent in the mufassal districts.

The better position in South Madras division is due to the larger extent of industrialization, the larger handloom industry and plantations. Malabar district has, among all the districts in the State, the largest percentage (12 per cent) of population under industries and services. Coimbatore comes next with 8 per cent and then comes Madras City with 7 per cent, followed by Madurai and Tirunelveli with 6 per cent, and then Tanjore, Salem and Tiruchirappalli and Guntur with 4 per cent. Analysing by divisions, we find that, out of this population engaged in industries and services-

7 per cent are under Division 0— 'Primary industries not elsewhere specified'.

1 per cent are under Division 1—
' Mining and quarrying'.

18 per cent are under Division 2— 'Processing and manufacture—Foodstuffs, textiles, leather and products thereof'.

3 per cent are under Division 3— 4 Processing and manufacture—Metals, chemicals and products thereof. 7 per cent are under Division 4—
'Processing and manufacture not elsewhere specified'.

6 per cent are under Division 5—
'Constructions and utilities'.

18 per cent are under Division 6— 'Commerce'.

5 per cent are under Division 7— 'Transport, storage and communications'.

10 per cent are under Division 8— 'Health, Education and Public Administration'.

25 per cent are under Division 9— 'Services not elsewhere specified'.

It will thus be seen that, leaving out, the Miscellaneous services not elsewhere specified (Division 9), the two most important divisions are (1) Commerce, and (2) Processing and manufacture of foodstuffs, textiles, leather and products thereof. Next comes Division 8 (Health, Education Public Administration) with 10 per cent. Then there is a large gap before we come to Divisions 4 and 0 with 7 per cent each, i.e., processing and manufacture not elsewhere specified, and primary industries other than cultivation mining and quarrying. In the Deccan division, Divisions 5 and 2 are the most important, and the next in importance is Division 6 (Commerce). In the West Madras division, Commerce is the most important, but the second place is taken by Division 0-Primary industries not elsewhere specified, while fourth and places \mathbf{third} go Divisions 2 and 4. In the North Madras division, Commerce leads, followed by Division 2. The next two places, leaving out Division 8, which is a special one, go to Divisions 4 and 0. The Agency is hardly in the picture, as far as industries and services are concerned. Only 15,868 persons in the Agency tracts are engaged in industries and services, i.e., 0.3 per cent of the State population under all industries and services. This emphasises the well-known backward condition of these tracts. In the South Madras division, Division 2 comes first and then Divisions 6, 8 and 4. In Madras City, as one would expect, Division 6 (Commerce) leads, followed by Divisions 8 and 7. In Salem, Coimbatore, Madurai and Tirunelveli, the most important division is 2 on account, of course, of the dominant position occupied by the textile industry in these districts. The great importance of commercial activities in Coimbatore is

brought out by the fact that, in that district, commerce ranks second. In Malabar district, commerce ranks first and then Divisions 2, 0 and 4.

Fifty-five per cent of the population, engaged in all industries and services, are found in the rural areas and 45 per cent in the urban areas. In the rural area, in the State as a whole, Division 2, processing and manufacture of foodstuffs, textiles, leather and products thereof, comes first thirdly, primary and then commerce, industries other than cultivation, mining and quarrying, and fourthly Division 4. In the urban area, in the State as a whole, commerce leads, and the second, third and fourth places go to Divisions 2, 8 and 7 respectively. This picture is just what one would expect in the urban area.

The rural-urban break-up for the population engaged in industries and services in the State and in each of the natural divisions, is given in the statement below. All the figures are percentages of the total number of self-supporting persons in all industries and services in the State.

[Statement No. 91.]

State and natural division.	Rural.	Urban.	Total.
(1)	(2)	(3)	(4)
Madras State	55	45	100
Madras Deccan Division	5	3	8
West Madras Division	13	. 4	17
North Madras Division	12	9	21
South Madras Division	25	29	54

It will be seen that, except in the South Madras division, the rural figure is higher. Though the non-agricultural population is found in large numbers in compact areas in the towns, the vastness of the rural areas and population has produced this result. In the South Madras division, the urban figure apparently exceeds the rural figure, but if we deduct the Madras City figure of 7. the urban figure will be reduced to 22, thus showing a larger rural proportion in this division also. The apparently large disparity between the rural and urban figures in the West Madras division is due to the comparative smallness of the urban element in this division. It is not surprising that the net result for the State as a whole is also a larger rural figure.

10. Division 'O'—Primary industries NOT E'LSEWHERE SPECIFIED.—The number of self-supporting persons in the State as a whole engaged in primary industries not elsewhere specified is 363,769, or

7 per cent of the number of self-supporting persons engaged in all industries and services in the State. Out of this number, 36 per cent are engaged in plantation industries, 34 per cent in fishing, 18 per cent in stock raising and 11 per cent in forestry and wood cutting. The largest contribution to this division is from the South Madras division with 42 per cent, West Madras division coming next with 33 per cent, North Madras division coming third with 22 per cent, and the Deccan division coming last with 3 per cent.

In the South Madras division, plantation industries come first, next comes fishing. then stock raising, and lastly forestry and wood cutting. The highest figure under plantation industries is, as one would expect, in Coimbatore district where we have the tea plantations in the Anamalais. Madurai and Tirunelveli also have some plantations, the former more than the latter. The Tanjore figure of 120 is all due to betel vines. In Salem district, we have the plantations in the Sheveroy hills and also the large-scale plantain cultivation in some of the other hills in the district. The large contribution of fishing is to be expected thanks to the long coastal belt in this division. The chief fishing districts are Chingleput, Tanjore, Tirunelveli, Ramanathapuram, Madras City and South Arcot.

The important districts for stock raising are Tirunelveli, Tanjore, Ramanathapuram and North Arcot. The Tanjore figure evidently includes shepherds from other districts, e.g., Ramanathapuram, who bring their herds to Tanjore district and were in Tanjore district at the time of the Census enumeration, and hired out their herds for manuring the fields.

In the West Madras division, the most important subdivision is 0.3 plantation industries; next comes fishing; thirdly, though far behind, comes forestry and wood cutting. Under plantations, the Nilgiris comes first, then Malabar and lastly South Kanara, which is a correct picture. Under fishing, Malabar of course is the main contributor and then South Kanara, the contribution of the Nilgiris which is a non-coastal district being practically nil. Under forestry and wood cutting, Malabar, as one would expect, leads, with South Kanara and the Nilgiris coming far behind, which is also a correct picture.

In the North Madras division, fishing is the most important subdivision. Stock raising comes second, while forestry and 8.T. 5-8

wood cutting comes third. As this division has a long coastal belt from its northern to its southern limit, fishing is naturally the most important item. The contribution of the Agency tracts, which are far away from the sea coast, is negligible, while in the Plains, the important fishing districts are East Godavari, Visakhapatnam, Srikakulam and Nellore. The Agency tracts are backward even in regard to stock raising, and in the Plains area the important districts are Nellore, Srikakulam, Guntur and Visakhapatnam. As regards forestry and wood cutting, the important districts are Srikakulam, Guntur, Nellore, Visakhapatnam and Krishna. It is difficult to say that the classification has been done quite correctly in all the districts in respect of this item. West Godavari is a prosperous district with a large delta; it has some forests in the .Chintalapudi and Polavaram taluks, whereas Krishna district has hardly any large forests. It is, therefore, difficult to understand West Godavari returning a figure of 5 under this item and Krishna 32. Even on the basis that all the Krishna figures relate to wood cutters, there can be no explanation for the very low figure of West Godavari. Again, East Godavari has a very large Agency tract which is full of forests. It is also a prosperous district with a large delta. It is therefore difficult to see why it should return the figure of 11.

It is noteworthy that there are hardly any plantation industries in this division. Most of the hilly areas in this division consist of low hills with an altitude which is insufficient for plantations.

In the Deccan division, as one would expect to find, the only important item is stock raising, with forestry and wood cutting coming next, but far behind. Practically in every village in this dry and backward tract, one can find herds of sheep. Cuddapah and Anantapur are the most important districts for stock raising, and then come Kurnool and Bellary. Sheep's wool is used for crude blankets which are locally woven in these districts. The herds are hired out for manuring fields and also sold in small lots for food.

Eighty-two per cent of the self-supporting persons in this division are found in rural areas, and the remaining 18 per cent in urban areas, which is nothing surprising, seeing that the occupations falling under this division are really of a rural character. In the rural areas. plantation industry is the most important;

fishing comes next, stock raising third, and forestry and wood cutting fourth, which is just what one would expect to find. In the urban area, fishing accounts for only a little less than half the number of self-supporting persons in this division. This is also what one would expect to find, and the contribution must be from the coastal towns. The next largest figure is under plantation industry which must be due to persons residing in towns close to the plantation areas. The figure under forestry and wood cutting evidently relates to wood cutters and Forest Officers rather than to those engaged in any manual work in forests.

11. Division 1—Mining and quarrying.— As already mentioned, this is the smallest division under all industries and services the number of self-supporting persons engaged in it being only 54,913 in the entire State (about 1 per cent). Forty-five per cent of these persons are found in the South Madras division, 35 per cent in the North Madras division, 13 per cent in the West ST-59. Madras division and 7 per cent in the Deccan Division. Stone quarrying, clay and sand pits, as is well known, is the predominant category in this division and it accounts for 58 per cent of the self-supporting persons engaged in mining and quarrying in the State. The percentages for the other subdivisions are 14 per cent for mica, 12 per cent for salt, 8 per cent for metal mining except iron ore mining and 7 per cent for nonmetallic mining and quarrying not otherwise classified. Mica comes second—just what one would expect to find—and it is mostly contributed by Nellore district, where mica mines have developed on a considerable scale during and after the war. The largest figure under stone quarrying, clay and sand pits is in Malabar, evidently reflecting the large quantities of white clays and pottery clays which are found in large quantities in the West Coast and which are utilized for the manufacture of what are known as Mangalore tiles and also for bricks and pottery. These brick and tile factories employ a large number of workers daily.

Under subdivision 3, metal mining except iron ore mining, the important districts are Bellary, Srikakulam, Visakhapatnam and West Godavari. Fairly large deposits of iron ore and manganese ore occur in the Sandur mountains in Bellary district. The iron ores, amounting to 130 million tons of high grade, have not been worked, but the present annual output of

manganese ore is about 100,000 tons. Deposits of barytes, asbestos and steatite occur in the limestones of Anantapur, Cuddapah and Kurnool districts, the barytes deposits being the largest in India. The annual production of barytes ranges between 20,000 and 28,000 tons, while that of steatite from Anantapur and Kurnool districts is about 2,000 tons. The output of asbestos is negligible and is less than 100 tons per annum. Large quantities of ochre are obtained from Kurnool and Sandur, and the total annual production has increased from less than 200 tons in 1947 to nearly 4,000 tons in 1948-49. Diamonds used to be worked formerly in Anantapur and Kurnool districts, but there is no production at present.

The magnesite deposits in the Cheepurupalli, Vizianagaram and adjoining areas of the Srikakulam and Visakhapatnam districts have been worked for many years and still contain some reserves of ore at depths. The output in 1948–49 amounted to over 32,000 tons.

The Rajahmundry sandstones are quarried extensively for building purposes.

Deposits of chromite occur in the Kondapalle forest in Krishna district near Vijayavada, and the production of chromite has increased from about 500 tons in 1946-47 to 5,142 tons in 1949.

The limestones in the Palnad area and kankar deposits near Guntur in Guntur district are worked for cement manufacture.

The mica area in the Nellore district (Gudur, Rapur and Udayagiri taluks) contains some of the largest deposits of muscovite mica in India, the annual output in recent years being about 15,000 to 21,000 cwt.

Among ceramic materials, good deposits of white clay occur in East Godavari, West Godavari and Nellore districts.

The southern portion of the South Arcot district, between Vriddhachalam, Cuddalore and Pondicherry, is underlain by lignite-bearing sandstones and the possibility of exploiting it is now under investigation.

Large deposits of magnetite iron ore estimated at over 300 million tons, occur in the Salem-Tiruchirapalli region, but owing to the non-availability of coal in South India, these deposits have not so far been worked for large-scale iron and steel manufacture. The Salem magnesite deposits contain estimated reserves of 90 million tons and the annual production of magnesite has been 30,000 to 40,000 tons in recent years. There are bauxite deposits in the Shevarov hills and recently there has been a production of 1,500 tons of bauxite per annum in this area. In Tiruchirapalli district, the annual output of gypsum has increased from 15,000 to 30,000 tons in recent years, and there was a record production of 44,000 tons in 1949. Some of the limestone deposits of Tiruchirapalli and Tirunelveli districts are now utilized for cement manufacture.

Under subdivision 7 (salt), the most important districts are Tirunelveli, Tanjore, South Arcot, Nellore and Visakhapatnam. These figures evidently refer to the salt factories in these coastal districts; but there are salt factories in other districts also, e.g., Guntur and East Godavari. There has evidently been some misclassification between this and 4.4.

Under non-metalic mining and quarrying not otherwise classified, the most important districts are Malabar, Madurai, Tiruchirapalli, Tirunelveli, Coimbatore, Ramanathapuram and Krishna.

The Malabar figure evidently relates to the quarrying of laterite for building purposes. The other figures mostly relate to quarrying of limestone.

There is no coal mining, iron ore mining or petroleum or gas industry in this State. The very small figures, which we find under these items are evidently due to the enumeration of persons, who are employed in these industries elsewhere, and had come home at the time of the census enumeration.

Accurate classification under subdivision '0' (Non-metalic mining and quarrying not otherwise classified) and subdivision '3' (Metal mining, except iron ore mining) was not easy for the tabulation staff. I am afraid there has been some misclassification under these subdivisions, e.g., I am unable to explain otherwise some of the figures under subdivision '3'—those of Madurai, Tirunelveli, Guntur and Nellore.

Of the self-supporting persons engaged in mining and quarrying, 77 per cent are in the rural areas and 23 per cent in urban areas. As mining and quarrying are mostly carried on in rural areas, this reflects the correct position.

12. Division 2-Processing and manufacture of foodstuffs, textiles, leather and products thereof: -The self-supporting persons engaged in the occupations specified in this division number 947,446 and account for 18 per cent of the self-supporting persons in all industries and services in this State. It is no surprise to find that 53 per cent of these persons are engaged in cotton textiles, 9 per cent in processing and manufacture of leather, leather products and foot-wear, 8 per cent in the manufacture of wearing apparel (except foot-wear) and made up textile goods, and 7 per cent in tobacco industries, i.e., manufacture of bidis and manufacture of tobacco products such as cigarettes, cigars and also operations connected with the preparation of raw leaf Next tobacco for these manufactures. comes subdivision 8, namely, textile industries otherwise unclassified which includes, among others, silk, woollen and jute spinning and weaving, manufacture of rope, twine, string and other related goods from coconut fibre, aloes, etc. Next in importance is subdivision 4, beverages, which, in view of the total Prohibition in this State, can cover only manufacture of aerated water and other beverages, ice, etc. The distribution of self-supporting persons engaged in these occupations is as shown below:-

Madras Deccan Division—7 per cent. West Madras Division—12 per cent. North Madras Division—20 per cent. South Madras Division—61 per cent.

In the North Madras division, the Agency area is hardly in the picture. These occupations are carried on only in the plains area in that division. Sub-division 6, cotton textiles, covers both the large handloom industry in the State and also textile mills. Except for three textile mills in East Godavari district, one mill at Guntur, two at Adoni in Bellary district and three in Malabar district, the textile mills (71 in number) are all in the South Madras division which has also a larger number of handlooms than in the North Madras division. This explains how South Madras division leads with 36 per cent. The important districts where there are textile mills are Coimbatore, Salem, Madurai, Tirunelveli and Ramanathapuram. There are three textile mills in the West Madras division and two textile mills at Adoni in the

Deccan division—vide the statement below:—

[Statement No	. 9	92.]

80

Under tobacco, the important districts are Malabar, South Kanara, Guntur, Madras City and North Arcot. There is heavy consumption of tobacco in Malabar and to a lesser extent in South Kanara. Guntur is the leading district for tobacco cultivation, particularly Virginian tobacco. It was in this district that the Indian Leaf Tobacco Development Company worked for many years before it extended its activities to other districts in the Circars. Manufacture of bidis is carried on, on a large scale, in Madras City and also in North Arcot district, generally by the Muslims.

Of the self-supporting persons in this division, 58 per cent are in rural areas and the remaining 42 per cent in urban areas. Out of the 53 per cent engaged in cotton textiles, 30 per cent are in rural areas and the remaining 23 per cent in urban areas though the textile mills are, with very few exceptions, in urban areas. The large handloom industry scattered all over the State is responsible for the slightly larger rural figure. The predominance of cotton textiles in the rural areas is maintained in all the divisions except in the South Madras division, where, out of 36 per cent, 17 per cent are in rural areas and 19 per cent are in urban areas, which is of course due to the concentration of a large number of mills in Coimbatore and large numbers of handlooms in a number of towns notably Salem, Madurai. Kancheepuram, Gudiyattam and Melapalayam.

S.T.—5·10

below :--

[Statement No. 93.]

Area.	Total.	Rural.	Urban
(1)	(2)	(3)	(4)
Madras State	100	58	42
Madras Deccan Division.	7	4	3
West Madras Division.	12	9	3
North Madras Division.	20	14	6
South Madras Division.	61	30	31

It will be seen that the rural figure is higher than the urban figure except in the South Madras division where the urban percentage is higher for the reason already mentioned.

13. Division 3—Processing and manufacture of metals, chemicals and products thereof.—This division accounts for only 163,156 self-supporting persons or 3 per cent of the self-supporting persons in all Industries and Services. This is not surprising, having regard to the fact that, as in India as a whole, heavy chemicals, iron and steel industries have yet to be developed in this State on any appreciable scale. The percentage distribution under this division among the more important subdivisions is given below :-

Manufacture of metal products other-	
wise unclassified	54
Iron and steel (basic manufacture)	3
Transport equipment	21
Electrical machinery, apparatus,	
appliances and supplies	2
Machinery (other than electrical machi-	
nery) including engineering work-	
shops	9
Basic industrial chemicals, fertilizers	
and power alcohol	2
Manufacture of chemical products	
otherwise unclassified	R
	•

Of the self-supporting persons in this division, 5 per cent are in the Deccan division, 12 per cent in the West Madras division, 19 per cent in the North Madras division, and 64 per cent in the South Madras division. Even here the Agency is, of course, hardly in the picture. In the West Madras division, Malabar leads, while there is a more even distribution in the North Madras division. The dominance of Malabar in the West Madras division is due to the famous metal works (brass, copper and bell metal) in Palghat and cutlery at some centres. In the South Madras division, 13 per cent out of the 64 per cent referred to above is

The rural urban percentages for the State the contribution of Madras City, which has and for the natural divisions are compared a number of metal works, aluminium factories, match factories, engineering workshops, etc. Coimbatore comes next, and then Tiruchirapalli, Madurai and Salem.

> Subdivision 'O'.- 'Manufacture of' metal products otherwise unclassified' covers several categories including blacksmiths and other workers in iron and makers of implements, workers in copper, brass and bell metal, aluminium factories and workers in . other metals. The metal works are carried on, mostly as cottage and small-scale industries, but not in all places. The only common category in all the districts is the blacksmith. There is a steel rolling mill in Nagapattinam and foundries in many places.

Transport equipment.—In the North Madras division, the largest contribution is that of Visakhapatnam district, where, besides motor workshops there is a shipbuilding yard in Visakhapatnam town. Under this subdivision, Madras leads, Tiruchirapalli comes second, Coimbatore third and Chingleput and Visakhapatnam fourth. Madras City has not only numerous motor workshops, but also a railway workshop and workshops for other kinds of transport The Tiruchirapalli figure is, equipment. of course, due to the railway workshop in the Golden Rock colony. The Coimbatore figure is due to motor workshops. Chingleput has not only its normal quota of workshops in large towns like Chingleput and Kancheepuram, but also the Government Transport Coach Building Factory at Chromepet, the Union Company's Motor assembling factory at Vandalur and the railway work-shop at Tambaram. The largest contributors under Subdivision 5 ['Machinery (other than electrical machinery) including engineering workshops '] are Madras City, Tiruchirapalli and Coimbatore. The figures of some of the districts throw some doubts about the correctness of the classification under this subdivision.

Under Subdivision 6, 'Basic Industrial Chemicals,' the chief contribution is that of Salem due, of course, to the Mettur Chemicals located at Mettur. The other figures are very small and represent persons employed in the manufacture of explosives and fireworks. There is no production of power alcohol in this State.

The small figures found in a few districts under Subdivision 7, viz., medical and pharmaceutical preparations, evidently

:S.T,--5:11

relate mostly to small establishments manufacturing indigenous and patent medicines. The Nilgiris figure relates to the manufacture of eucalyptus oil. The blanks in the table indicate defective enumeration, for example, at Shoranur in Malabar district, Ayurvedic medicines are prepared on a large scale but the figure against that district is nil.

Subdivision 8 covers a large number of items including toilet preparations, soaps, paints, varnishes, polishes, ink and matches. The main contributors are the districts of Malabar, Krishna, Madras City, Chingleput, Salem, Madurai and Ramanathapuram. There are soap factories in Malabar and Madras City, match and ink factories in Madras City, match factories in Chingleput and Madurai, soap manufacture in Salem and match factories in Sivakasi and Sattur in Ramanathapuram district.

The distribution of these industries between the rural and urban areas is indicated below:—

[Statement No. 94.]

State and natural division.	Total.	Rural.	Urban.
(1)	(2)	(3)	(4)
Madras State	100	43	57
Madras Deccan Division	5	3	2
West Madras Division	12	8	4
North Madras Division	19	8	11
South Madres Divisio 1	64	24	40

It will be seen that, in the Deccan and West Madras divisions, the rural percentages are higher than the urban ones, but the reverse is the case in the other two divisions, where the industry is carried on in large establishments, as large industries are naturally found in the towns and the cottage and small-scale establishments are mostly in the rural areas.

14. Division 4—Processing and manufacture not elsewhere specified.—There are in this State 397,158 self-supporting persons under this category, i.e., 8 per cent of the self-supporting persons in all industries and services. Forty-nine per cent of these are in South Madras division; 24 per cent in the North Madras division; 20 per cent in the West Madras division; and 7 per cent in the Deccan division. The chief subdivisions in this division are wood and wood products other than furniture and fixtures (49 per cent), manufacturing industries otherwise unclassified (22 per cent), non-metallic mineral products (15 per cent), printing

and allied industries (5 per cent) and bricks, tiles and other structural clay products (5 per cent).

It is not surprising to find that the largest number of self-supporting persons in this division are engaged in wood and wood products other than furniture and fixtures. This subdivision covers all industries in which wooden materials are used excluding furniture or fixtures but including sawyers, carpenters, turners, joiners, veneer and plywood makers, match veneer, splint makers and basket makers. Malabar district leads naturally under this subdivision, as it is the main indigenous source of good timber in this State.

The items included in subdivision ' Manufacturing industries otherwise unclassified' have been specified in Annexure III. The important items under this subdivision are repair and manufacture of watches and clocks, workers in precious stones, precious metals and makers of jewellery and ornaments, manufacture of musical instruments and appliances, stationery articles other than paper and paper products, makers of plastic and celluloid articles other than rayon, sports goods makers, toy makers and other miscellaneous manufacturing industries including bone, ivory, horn, shell, etc. Under this subdivision also, Malabar leads, and the other important districts are Tirunelveli, Madras City, Tiruchirappalli, Tanjore and East Godavari. Makers of gold and silver jewellery and ornaments are mostly goldsmiths and they are generally found in all districts.

The next important subdivision is 4.4 'Non-metallic mineral products' in which the important items are potters and makers of earthenware found in all districts, makers of porcelain and crockery, glass bangles, glass beads, glass necklaces, etc. Makers of porcelain and crockery are confined to a few centres the most important of which are Mangalore, where the manufacture of crockery has been developed to a considerable extent, thanks to the pioneer work done by the Basel Mission, and Ranipet where Messrs. Parry & Co., have a large factory for manufacturing crockery. The crockery made in this State are of a simple type and cannot compare with the luxurious kind of crockery made in Europe and the United Kingdom.

The next important subdivision is 4.9 Printing and allied industries' which

covers not only printers, lithographers, engravers, but also book binders and stitchers. The largest contributions are those made by Madras City, Malabar, Tiruchirapalli, Coimbatore, Krishna. Madurai, Ramanathapuram, Tirunelveli and Salem. Madras City of course leads. These contributions are mainly of large towns where there are a number of printing presses. Sivakasi in Ramanathapuram district is famous for lithographic printing in multiple colours and these printing factories get orders even from firms outside the State for advertisement, etc. I understand that these printing presses of Sivakasi have no rivals in India except in one or two centres in Northern India.

Next in importance comes subdivision 2, namely, 'Bricks, tiles and other structural clay products' in which, naturally, for reasons already given, Malabar and South Kanara districts on the West Coast lead. There are numerous tile factories in these two districts and there are large demands for their goods in this State as well as outside.

The cement industry has only a few units of production in this State and therefore accounts only for 1.24 per cent of the self-supporting persons in this division. The important contributions in this subdivision are naturally from those districts where there are cement factories, namely, Krishna (cement factory at Vijayavada), Guntur (cement factory at Mangalagiri), Coimbatore (cement factory at Madukkarai), Tiruchirapalli (cement factory at Dalmiapuram) and Tirunelveli (cement factory at Tazhaiyuthu). The small figures in the other districts are evidently those relating to makers of cement products.

There is only a negligible production of paper and paper products in the State, and the largest contributions are those of East Godavari where the Government are running a paper mill at Rajahmundry and Kurnool where hand-made paper is being manufactured.

There are no petroleum or coal industries in the State now, and the negligible figures under this subdivision 41 evidently relate to persons employed in these industries outside the State who happened to be in this State at the time of the Census enumeration.

Rural-urban distribution under this division is given in the statement below:—

[Statement No. 95.]

State and natural division.	Total.	Rural.	Urban.
(1)	(2)	(3)	(4)
Madrae State	100	64	36
Madras Deccan Division	6	4	2
West Madras Division	20	16	4 1
North Madras Division	24	16	8
South Madras Division	50	28	22

It will be seen that 64 per cent of the self-supporting persons engaged in these industries are in rural areas and 36 per cent in urban areas, and that the rural figure exceeds the urban figure in all the natural divisions.

15. Division 5—Construction and utilities.—This division includes construction and maintenance of buildings, roads, bridges and other transport works, telegraph and telephone lines, irrigation and other agricultural works, electric power and gas supply, domestic and industrial water-supply, sanitary works and services including scavengers. The number of self-supporting persons engaged in these occupations in the entire State is 307,223, i.e., 6 per cent of the total number of self-supporting persons in all industries and services. Of these, 52 per cent are in the South Madras 25 per cent in the Deccan division, 12 per cent in the North Madras division, and 11 per cent in the West Madras division. We should expect large contributions under this head from districts, where there were hydroelectric and irrigation project works under execution at the time of the Census. This explains the large contributions made under subdivision 4— Construction of irrigation works, in Bellary (Tungabhadra Project works), Coimbatore (Lower Bhavani Project) and Tirunelveli (Manimuthar Project).

The most important subdivisions under this division are 5·1—Construction and maintenance of buildings (45 per cent); 5·2—Construction and maintenance of roads, bridges and other transport works (13 per cent); 5·4—Construction and maintenance operations of irrigation and other agricultural works (12 per cent); 5·6—Domestic and Industrial water-supply (11 per cent); and 5·7—Sanitary works and services including scavengers (10 per cent). There has been considerable activity in recent years in the matter of house building to provide

S.T.--5·13

more houses, though progress has been handicapped by the difficulties in securing building materials. Under subdivision 5·1, the most important districts are Coimbatore, Salem, Madras and Tiruchirapalli, followed by Malabar, Tanjore, South Kanara, Madurai, Bellary, and Tirunelveli.

Under subdivision 5.2—'roads, bridges and other transport works', the Deccan division leads by a very large margin, more than 50 per cent of the self-supporting persons being in this division. This is due to the special programme of road works undertaken in these districts.

Subdivision 5.4—'Irrigation and other agricultural works' has already been referred to.

Subdivision 5.6—Domestic and Industrial water-supply—The only large figures under this subdivision are those of Cuddapah and Kurnool which is quite inexplicable. I have consulted the Sanitary Engineer to the State Government and he agrees that the disparities in the district figures clearly indicate mistakes in enumeration.

Subdivision 5.7—Sanitary works and services including scavengers—Scavengers, of course, are found in all the towns in the State, though sanitary works are found only in some large towns. Madras City naturally leads under this subdivision.

under subdivision 5.5—Electric power and gas supply—Madras City naturally leads and Coimbatore comes second, as that district has benefited most from the Pykara project. Tirunelveli comes third on account of the Papanasam electric project.

Under subdivision 5.3—Construction and maintenance of Telegraph and Telephone lines, it is not surprising that the figures are negligible and that the bulk of the contribution is from Madras City.

The rural urban distribution for this division is given in the statement below:—

[Statement No. 96.]

State and natural	Percentage in			
division.	Rural.	Urban areas.	Total.	
m (r)	(2)	(3)	(4)	
Madras State	58	42	100	
Madras Deccan Division	18	7	25	
West Madras Division	9	2	11	
North Madras Division	- 6	6	. 12	
South Madras Division	26	26	52	

The rural figures are appreciably in excess of the urban figures in the Deccan and West Madras divisions, and they are almost equal in the other two divisions. The figures in this division will of course vary from year to year with reference to the projects under execution.

16. Division 6—Commerce.—The number of self-supporting persons engaged in Commerce in the entire State is 948,791, i.e., 18 per cent of the self-supporting persons in all industries and services in the State. Of the self-supporting persons in this division, 58 per cent are found in the South division, 21 per cent in the Madras North Madras division, 14 per cent in the West Madras division and 7 per cent in the Deccan division. These figures give a correct picture of the relative position in the various divisions. It is well-known that hawkers, street vendors and retail dealers dealing in miscellaneous articles are found all over the State, and even in small villages. It is not therefore surprising to find that, of the self-supporting persons in this division 40 per cent are under sub-'O'-Retail division trade otherwise unclassified; 36 per cent are engaged in retailtrade in food stuffs (including beverages and narcotics); 8 per cent in retail trade in textile and leather goods; 5 per cent under money-lending, banking and other financial business, and 4 per cent under wholesale trade in commodities other than foodstuffs.

Under subdivision 60—Miscellaneous retail trade, Malabar leads, Madras coming second, and Coimbatore third. The Malabar figure will not come as a surprise to any one, who has toured in that district.

The figure of 36 per cent under subdivision 6.1-Retail trade in foodstuffs (including beverages and narcotics) will not come as a surprise, if it is remembered that this subdivision covers retail shops not only in foodstuffs including grains and pulses, sweet meat, etc., but also dealers in pan, bidi and cigarettes. There are naturally people engaged in the latter in all the districts. Here also Malabar leads. That, owing to the thinness of the population and its being scattered, even these facilities are lacking in the Agency areas is borne out by the negligible figures in the Agency tracts under this subdivision.

S.T.-51.4

· Under subdivision 6'3—Retail trade in textile and leather goods, the trade in textile goods, of course, is the more important and there are naturally persons engaged in this occupation in all the districts.

Under subdivision 6.8—Money-lending, banking and other financial business, Madras City naturally leads, followed by Ramanathapuram, Tirunelveli, Tiruchirapalli, Coimbatore and Malabar. Ramanathapuram naturally comes second on account of the Nagarathars (Nattukottai Chettiars) whose favourite profession is money-lending and banking.

Wholesale trade in commodities other than foodstuffs (6.5)—Madras City naturally leads, Madurai, Coimbatore and Tiruchirapalli coming second, third and fourth, respectively. In Madurai and Tiruchirapalli districts, the main contributors are Madurai town and Tiruchirapalli town, and in Coimbatore, there are three other very large trade centres besides Coimbatore, viz., Tiruppur, Pollachi and Erode. The enumeration in regard to wholesale trade cannot be said to be accurate, e.g., Krishna district is credited with lower figures than Nellore district under subdivisions 4 and 5.

The figures under subdivision 6.4—Wholesale trade in foodstuffs, confirm the small number of persons engaged in this trade. Madurai district leads, while Madras City and Coimbatore occupy the second and third places; respectively. The Madurai figure is not surprising, seeing that Madurai town is the most important market, not only for Madurai district, but also for Ramanathapuram and Tirunelveli districts, while Coimbatore has four of the most important commercial centres in the State, viz., Coimbatore, Pollachi, Tiruppur and Erode.

The figures under subdivision 6.6—Real Estate (House and Estate Agents, and non-agricultural rent collectors) are negligible throughout the State. The figure for Visakhapatnam seems to indicate inaccurate classification, as may be seen from comparing its figure of 13 with the figure of 1 for Madras City.

The small figures under subdivision 6.7—Insurance, do not cause any surprise, as insurance business and agents are to be found only in a few large towns, though, from there, they carry on business throughout the State or over a number of districts.

The rural urban distribution of selfsupporting persons engaged in Commerce is given in the statement below:—

[Statement No. 97.]

State and natural	Per	centage	in .
division.	Rural areas.	Urban areas,	Total.
(1)	(2)	(3)	(4)
Madras State	45	55	100
Madras Deccan Division	3	4	7
West Madras Division	10	4	14
North Madras Division	11	10	21
South Madras Division	21 -	87	59

Persons engaged in Commerce are naturally found in larger numbers in urban areas than in rural areas, as business on a large scale can be conducted only in and from towns. In the West Madras division, the rural percentage is appreciably higher than the urban percentage for reasons which have already been indicated; the urban areas in this division being relatively very small, traders are found in larger numbers in villages, as they must be, to serve such a hilly area.

17. Division 7—Transport, storage and communications.—The number of selfsupporting persons engaged in the occupa-tions included in this division is 271,007, i.e., 5 per cent of the total number of selfsupporting persons in all industries and services. 57 per cent of these are found in the South Madras division, 21 per cent in the North Madras division, 16 per cent in the West Madras division and 6 per cent in the Deccan division. Analysing by subdivisions, 49 per cent are engaged in road transport services, 25 per cent are employees under railways, while 12 per cent are engaged in transport by water. The small numbers of persons engaged in transport by air are naturally found in the districts where there are aerodromes, viz., Chingleput (the aerodrome at Meenambakkam which serves Madras City is located in Chingleput district) and Visakhapatnam. Of the persons employed in the Meenambakkam aerodrome, some live near the aerodrome itself, and others in Madras City.

Postal services account for 7 per cent of the self-supporting persons in this division, while the telegraph and telephone services account for about 1 per cent each. Persons engaged in postal services are naturally found in all the districts, Madras City leading by a large margin, Tanjore

S.T,-5.15

occupying the second place, Malabar the third place, Madurai the fourth place, and Coimbatore the fifth place. Persons engaged in telephone services are naturally found only in the small number of towns where telephone facilities are available, Madras City of course leading by a large margin. The figures under telegraph services are not large, as telegraph and postal services are operated together by common staff in most places. Wireless service has not developed much in this State, and this is clearly reflected by the small figures under subdivision 7.9—Wireless services, the only two important figures being those of Madras City and Visakhapatnam. Subdivision 7.1 —Transport by road—Persons engaged in transport by road are naturally found in all the districts: there is no district in the State, where large numbers of buses are not plying. Madras City leads, while Malabar, Coimbatore and Madurai come second, third and fourth, respectively. This subdivision covers all means of transport by road.

Under subdivision 7.2—Transport by water also, Madras leads with Malabar as a close second and South Kanara third. In Madras City, there is not only the traffic in the Harbour, but also the heavy boat traffic in the Buckingham canal, which is mainly used for transporting firewood to the City. Malabar and South Kanara come second and third respectively, on account of their large boat traffic in the rivers and backwaters and the ports in those districts. East Godavari comes next on account of its navigable canals where boats ply, and the Kakinada Port. Tirunelveli comes next, though far behind, on account of the Tuticorin Port. In West Godavari, which comes next, there is some boat traffic, the volume or this traffic having declined considerably after the advent of buses and the branch Railway lines from Nidadavole Narasapur and from Gudivada to Bhimavaram. Though there has been a similar decline in East Godavari, there is still a large volume of canal traffic in that district on account of the Central delta, and the appreciable traffic on the river between Rajahmundry and Polavaram and Bhadrachalam in the Agency tracts. Visakhapatnam comes next, mainly on account of the Visakhapatnam port.

The figures under railway transport are naturally found in all the districts. Madras City naturally leads here also, Tiruchirapalli coming second. Next to Madras

City, Tiruchirapalli has of course the largest railway colony.

The rural-urban distribution for transport services is given in the statement below:—

[Statement No. 98.]

	Pe	rcentage	in
State and natural division.	Rural areas.	Urban areas.	Total.
(1)	(2)	(3)	(4)
Madras State	32	68	100
Madras Deccan Division	2	5	7
West Madras Division	10	5	15
North Madras Division	7	14	21
South Madras Division	13	44	57

Except in West Madras division, the urban figures are much higher than those for the rural areas, as transport services are most conveniently operated from towns. The reason for the rural figure being nearly twice the urban figure in the West Madras division is what has already been indicated more than once in this report; the urban area in this division being relatively small and the rural area large and hilly, transport services by road and by water have to be operated at many places, which cannot be conveniently covered by services based on the towns.

18. Division 8—Health, Education and Public Administration.—The number of selfsupporting persons in this division is 508,708 in the entire State, that is, 10 per cent of the self-supporting persons in all industries and services. 56 per cent of these are in South Madras division, 23 per cent in the North Madras division, 12 per cent in the West Madras division and 9 per cent in the division. Analysing by Madras Deccan subdivisions, we find 13 per cent under Medical and health services, 30 per cent under Educational services and research, 9 per cent under Police, 11 per cent under village officers and servants including village watchmen, 7 per cent under employees of Municipalities and other local bodies, 21 per cent under employees of the State Governments and 10 per cent under employees of the Union Government including Defence Services and employees of non-Indian Governments.

Under subdivision 8.2 Educational services and research, we find 15 per cent of the self-supporting persons in the South Madras division, 8 per cent in the North

S.T--5.16.

Madras division, 5 per cent in the West Madras division and 2 per cent in the Madras Deccan division. The number of persons under this subdivision will naturally depend upon the educational institutions in the various divisions—vide the statement below:—

LSt.	atem	ent	No.	99.1

Area.			Number of educational institutions (of all cate- gories) in the area,
(1)			(2)
Madras State	••		40,937
Madras Deccan Division	••	••	4,097
West Madras Division	• •	• •	5,570
North Madras Division	• •		12,837
South Madras Division	• •	• •	18,433

Malabar district leads, Madras City occupying the second place, Tirunelveli the third place followed by Guntur, Tanjore, Coimbatore and Madurai.

The next largest item is subdivision 7 Employees of State Governments. (The Police have been shown in a separate subdivision though the Police staff are mostly employees of the State Government. The official village establishments are also shown separately though they are entirely employees of the State Government). This subdivision, however, excludes services covered by any other division or subdivision, for example, forest officers and guards, medical and health services. The large concentration of employees of the State Government in Madras City is noteworthy. Next comes Malabar, though far behind, followed by Chingleput, Bellary and North Arcot districts. The other districts are considerably behind. The large figure in Chingleput district is of course due to the suburbs of Madras City where large numbers of employees of the State Government have to reside for want of accommodation in the City proper. The abnormal Bellary figure is of course due to the Tungabhadra Project Works. The large figures of Malabar and North Arcot districts are due to the large size of these districts.

The medical and health services include not only the staff employed by the State Government and local bodies but also private doctors, midwives, compounders, and nurses. Generally speaking, except in out-of-the way places, the private person under this category will be a larger number than the employees of the State Government. The total number of hospitals and dispensaries run by the Government and local bodies is given below:—

[Statement No. 100.]

Natural divisi	on,		Number of medical institutions.
(1)	•		(2)
Madras Deccan Division	••	••	114
West Madras Division	••	••	128
North Madras Division	••	••	341
South Madras Division Madras City).	(exclu	ding	587

The figures under 'Police' depend largely on the distribution of police stations which are located according to the needs of each area.

The figures under subdivision 5—Village officers and servants including village watchmen are found in all the districts as there is a wide spread village establishment in the State, the strength of the village establishment varying with the size of, and revenue derived from, the village unit.

Under subdivision 6—Employees of municipalities and local bodies we find figures in all the districts except in the Agency tracts where there is only one local body, viz., the East Godavari Agency District Board, which is a very small body. The figures in this division relate to employees of Panchayat Boards, Townships. Cantonments, Municipalities and District Boards. There is only one township, viz., Mettur in this State, and only 4 cantonments. The figures therefore relate mostly to mployees of panchayats, municipalities and district boards which are found in all districts in varying numbers. Madras City leads on account of the Corporation of Madras, the largest local authority in the State.

The rural-urban distribution of these services under Division 8 is indicated below:—

[Satement No. 101.]

State and natural division.	Pe	roentage	in
Charle wild manager and mindred	Rural areas,	Urben areas,	Total,
(1)	(2)	(3)	(4)
Madras State	44	56	100
Madras Deccan Division	4	5	9
West Madras Division	8	4	13
North Madras Division	12	11	23
South Madras Division	20	36	56

19. Division 9—Services not elsewhere specified.—This division covers all services not included in any other division. All domestic services are covered by this division-motor car drivers, cleaners, cooks, gardeners and other domestic servants. The other subdivisions in this division are barbers and beauty shops, laundries and laundry services, hotels, restaurants and eating houses-recreation services (which include cinemas, theatres, music, concerts, circuses, etc.)-legal and business services, letters and journalism and religious, charitable and wenare services. Priests, monks, nuns, sadhus, religious mendicants and other religious workers are included in the last mentioned subdivision. There is also the residuary subdivision.—Services otherwise unclassified. As this is a residuary division, we must expect large numbers enumerated under it. The number of self-supporting persons covered by this division is 1,327,527, i.e., 25 per cent of the self-supporting persons in all industries and services. Of these, 51 per cent are in the South Madras division, 21 per cent in the North Madras division, 20 per cent in the West Madras division and 8 per cent in the Deccan division. Analysing by subdivisions, we find 48 per cent under 'Services otherwise unclassified', 11 per cent under domestic services, 7 per cent under barbers and beauty shops, 13 per cent under laundries, and laundry services, 11 per cent under hotels, restaurants and eating houses, 2 per cent under recreation services, 3 per cent under legal and business services, (less than) 1 per cent under arts, letters and journalism and 4 per cent under religious, charitable and welfare services.

Domestic services account for 11 per cent of the self-supporting persons in this division, i.e., about 146,000 self-supporting persons in the entire State. Of these, 7 per cent are in the South Madras division, 2 per cent each in the North Madras division, and West Madras division and less than one half per cent in the Deccan division. The largest contributing districts are Tiruchirapalli, Madras City and Malabar. The Madras City figure is, of course, quite understandable and so also the Malabar figure, having regard to the large number of domestic servants employed by well-to-do persons in that district, but the Tiruchirapalli figure, which is the largest in the State, seems to indicate some vagaries in enumeration. The West Godavari figure of 31 seems

correct, but not the low figure of 17 for the Krishna district.

Under subdivision 9.2—Barbers and beauty shops—the. South Madras division accounts for 4 per cent, the North Madras division for 2 per cent and the other two divisions for less than 1 per cent each.

Under subdivision 9.3—Laundries and laundry services—the South Madras division accounts for 6 per cent, the North Madras division for 5 per cent and the other two divisions for 1 per cent each. This subdivision includes of course all the dhobies.

Under subdivision 9.4—11 otels, restaurants and eating houses—the South Madras division accounts for 6 per cent, the North Madras division for 1 per cent, the West Madras division for 3 per cent and the Deccan division for less than half per cent.

Under subdivision 9.5—Recreation services—the South Madras division contributes 2 per cent and the other three divisions together 1 per cent. Madras City, of course, leads by a large margin, and accounts for nearly one-fourth of the South Madras division figure. Tanjore comes next. Curiously, Chittoor comes third. I do not think that the Chittoor figure can be correct. I am afraid this and some other figures in this subdivision disclose vagaries in enumeration or tabulation.

Under su') division 9.6—legal and business services—the South Madras division accounts for 1.62 per cent, the North Madras division for 0.78 per cent, the West Madras division for 0.39 per cent, and the Deccan division for 0.15 per cent. There are naturally enough figures under this subdivision in all the districts—the figures in the Agency tracts are, of course, negligib. Madras City naturally leads by a large margin. Malabar comes second, hird, Coimbatore fourth and Madurai fifth. Thereis not much reason for Guntur to show a larger figure than Madurai or Coimbatore. I am afraid that, here also, there are some vagaries in enumeration or tabulation.

Under subdivision 9.7—Arts, letters and journalism—Madras City leads and the other figures are quite small. There is, undoubtedly concentration of these services in Madras City, and there are only a very few journals in the mufassal.

Under—Religious, charitable and welfare Services—(9.8), the South Madras division leads with nearly 2.5 per cent while the North Madras division and the West Madras

8.T.-517

division have about 1 per cent each. The figure for the Madras Deccan division is negligible.

It may be noted that, in this division, 48 per cent of the self-supporting persons are in the residuary category—'Services otherwise unclassified'.

The rural-urban distribution for these services is indicated in the statement below:—

[Statement No. 102.]

State and natural division.		ercentage	in
place and natural division.	Rural areas.	Urban areas.	Total.
(1)	(2)	(3)	(4)
Madras State	57	· 43	100

West Madras Division	15	5	20
North Madras Division	11	10	21
South Madras Division	25	26	51

20. Appendix VII gives the number of self-supporting persons by sex in selected non-agricultural occupations in the State as a whole and in each district.

21. Conclusion.—As already indicated in the Introductory chapter, no confident comparison can be made between the classification of means of livelihood made in 1931 and that adopted at the 1951 Census. The difficulty of this comparison will be clear from Subsidiary Table 5.6. It will be seen from that table that earners and working dependants as classified at the 1931 Census together accounted for 55 per cent of the population, while self-supporting persons and earning dependants at the 1951 Census together account for only 31 per cent of the population. At the 1931 Census, the population was classified under three categories. viz., earners, working dependants and nonworking dependents. By 'earner' was meant, a person making a regular individual contribution for the upkeep of the household of which he was a member. He need not

be self-supporting or actually working with his body or mind, or have a money income. Persons who had some earnings, but had no regular source of income, were treated as working dependants. The non-working dependents of 1931 thus corresponded to our non-earning dependants, and we should expect the total of the earners and working dependants of 1931, to correspond to the total of our self-supporting persons and earning dependants, but, as has just been mentioned, the figures do not bear out this comparison. Apart from the changes in the groupings of means of livelihood, the strict definition of self-supporting persons adopted at the 1951 Census and the treatment of domestic servants at that Census has involved far-reaching changes which make useful comparison of the figures of the two censuses impossible.

In this chapter, I have specified some cases, which clearly indicate some vagaries enumeration or classification. enumeration of the means of livelihood and economic status was the most difficult part of the enumeration, at the 1951 Census. A similar observation was made by the late Mr. Yeatts, in his 1931 report for Madras State. We introduced further refinements at the 1951 Census. The questions relating to 'Means of livelihood' raise many conundrums and subtleties, and they cannot be correctly understood and accurately applied by the average enumerator: it is not an easy task, to explain these questions to illiterate persons and get correct answers from them.

On the whole, it cannot be said, however, that the vagaries referred to above have resulted in any serious errors. Even the results of the enumeration of the means of livelihood and economic status conducted at the 1951 Census, such as they are, have been valuable and worthwhile.

It is in every way desirable that we should adhere to the present divisions and subdivisions of means of livelihood until we have obtained truly comparable data at a number of periodical censuses.

CHAPTER VI-HOUSES AND HOUSEHOLDS.

M.T.—A-I. S.T.—6·1.

General remarks.—The number of houses in this State has increased from 9,739,016 in 1941 to 10,213,903 in 1951, i.e., by 4.9 per cent as against the increase of 14.4 per cent in the population.

The number of persons per house has increased from 5.1 in 1921, 1931 and 1941 to) 5.6 in 1951. There was a sharp increase from 5·1 in 1941 to 5·6 in 1951. The present definition of a house as meaning a dwelling with a separate entrance took precise shape in 1931, but it is rather doubtful whether that definition was in fact enforced so strictly at the censuses of 1931 and 1941 as at the 1951 Census where a strict enforcement became possible on account of the introduction of the permanent scheme of house numbering in 1948. This can account only for a part of the increase, and the major portion of the increase undoubtedly reflects the growing congestion regarding housing accommodation.

The statement below shows the number of persons per house as ascertained at each of the Censuses 1921 to 1951 in each division and in the State as a whole:—

General population.

[Statement No. 103.]

	* .		<u>~</u>	
State and natural division.	1921.	1931.	1941.	1951.
(1)	(2)	(3)	(4)	(5)
Madras State	5.1	5·1	5.1	5 ·6
Madras Deccan Division	4.8	4.9	4.9	5.5
West Madras Division	5·4	5.6	5.6	6.3
North Madras Division	4.8	4.7	4.8	5·2
South Madras Division	5.2	5.2	5⋅2	5·6
In all the divisions, roughly the same wibetween 1941 and 19 persons per house is lexpect to find, in the V (6·3), South Madras divith 5·6, Madras Decthird with 5·5 while the has 5·2 persons per house dard size for a house.	th a 51. ' argest Vest I ivision can North se. As the va	sharj The r Jadra Madra divisi Madr we ha	o incommon i	er of vould vision econd oming vision stan-these

figures indicate largely the variations in the

size of the family. There is no doubt, however,

about the growing congestion in housing accommodation as already mentioned. It can be stated confidently that provision of housing accommodation has not kept pace with the growth in population. The large figure (6.3) in the West Madras division is mainly due to the comparatively large size of the family in the Malabar and South Kanara districts, the figures for these districts being 6.3 and 6.4, respectively. It will be seen that the Nilgiris figure is only 5.4. In the Plains portion of the North Madras division, the figures range from 4.9 in Srikakulam district to 5.6 in East Godavari. Madras City is of course exceptional, and the number of persons in a house in the City has increased from 8.2 per house in 1921 to 12.9 in 1951 and between 1941 and 1951, there has been a sharp increase from 8.8 to 12.9 confirming the well-known fact of congestion in the City and the inadequacy of the housing accommodation with reference to the large increase in the City's population. In the rest of the South Madras division, the number of persons per house ranges from 4.7 in Tirunelveli district to 6.4 in North Arcot district.

2. Houses in rural areas.—The figures for the rural areas corresponding to those given above for the general population, are given in the statement below:—

Madras Deccan Division	4.8	4:8	4.9	5·3					
West Madras Division	5·4	5·5	5.5	6-1					
North Madras Division	4.8	4.7	4.8	5.1					
South Madras Division	5.1	5-1	5.1	5.3					

In the rural areas, we naturally find less congestion than in the State as a whole, but only slightly less, thus confirming the view that the standard of housing is poorer in rural areas and that there is congestion in those areas also. It will be seen that these

7.2

figures have the same trend as those mentioned above in respect of the general population. The only districts where there has been actual decrease in the number of persons per house between 1941 and 1951 are Chingleput, North Arcot and Ramanathapuram. The decrease in Chingleput is very slight, but those in North Arcot and Ramanathapuram are appreciable. The explanation for this is to be found in the appreciable emigration from the rural areas that has taken place in these districts and to which reference has been made already.

3. Houses in urban areas.—The corresponding urban figures are given in the statement below:—

[Statement No. 105.]

South Madras Division ...

	U	rban po	pulatio	on.
State and natural division.	Pe	rsons I	er hou	se.
•	1921.	1931.	1941.	1951.
(1)	(2)	(3)	(4)	(5)
Madras State	5.5	5.6	5·4	7-0
Madras Deccan Division	5∙0	5-1	4.9	6.5
West Madras Division	6-0	6.4	6-1	7.7
North Madras Division	5.2	5-1	4.9	6-4

There is an unmistakable sharp increase in the number of persons per house in the urban areas between 1941 and 1951, a wellknown phenomenon. This increase is of course due to the large exodus to the towns which has been already referred to in this Report. Though new houses have sprung up in many of the towns, the increase has not by any means kept pace with the increase in the population. The problem of housing in the urban areas has been aggravated by the large exodus just referred to, and has yet to be solved satisfactorily. Here also, the largest number of persons per house is in the West Madras division (7.7), South Madras division comes next (7.2), while the other two divisions are below the State average of 7 per house. The largest amount of crowding is of course in Madras City as already mentioned, and the average is about 13 persons per house. The sharp increase between 1941 and 1951, a universal feature, is found in all the districts and the Ceded districts (Deccan division) are no exception. I do not think there is any rational explanation available for the apparent decrease in Kurnool district from 7.2 in 1941 to 6.8 in 1951. The sharp increase from 5.3 in 1931 to 7.2 in 1941 indicates that some error was committed in 1941. Next to Madras City, Madurai district has got the largest number of persons per house in urban areas (8.5). Then comes the Nilgiris with 8.1, next Malabar with 8, followed by Coimbatore with 7.8 and North Arcot close behind. The Madurai figure is, of course, largely due to the congestion in Madurai town. None of the other figures really call for any special comments. Tirunelveli district has the lowest number of persons per house in the urban areas (4.7) also. There is more congestion in the urban areas in the Madras Deccan Division than in Tirunelveli and Ramanathapuram districts.

In the above figures, the houseless persons have been treated as part of the population. Such persons are found in some numbers in all the large towns, Madras City being the worst in this respect. The numbers of the houseless persons in the State as a whole and in each of the important towns are given below:—

[Statement No. 106.]

4. Houses per 100 square miles.—Columns (15) to (18) of subsidiary table 6.1 give the number of houses per 100 square miles as ascertained at the various censuses from 1921 to 1951. The figure for each district depends of course upon its area and the number of houses. The small decrease between 1941 and 1951 shown by the figures of Cuddapah and Chingleput districts cannot be taken at its face value: it is probably due to the difference in the enforcement of the definition of a house at the two censuses. The general picture presented by the State figures, viz., the steady increase from 1921 to 1951 is undoubtedly a correct one. The increase in the number of houses per 100 square miles compares as follows with the increase in population:—

[Statement No. 107.]

State and nat division.	192	1-31.	193	1-41.	1941	-51.
division.	(4)	(b)	(a)	(b)	(a)	(b)
. (1)	(2)	(3)	(4)	(5)	(6)	(7)
Madras State	9.7	11.0	11.7	17.4	14.4	4.9
Madras Deccan Division.	10-1	9-7	111	8-5	12.4	0-8
West Madras Divi- sion.	13.6	10-2	11.6	11.2	20-3	6-4
North Madrae Divi- sion.	12-1	14.8	11.7	31.2	13.2	4.6
South Madras Divi-	8-2	8.9	11.7	11.0	14.0	5-4

Note.—(a) Percentage increase in population per 100 square miles.

(b) Percentage increase in houses per 100 square miles.

The figures bring out forcibly how far housebuilding has lagged behind the growth of population during 1941–1951. This position is due to the suspension of building activities during World War II and the shortage of building materials, particularly iron and cement, and the high cost of even timber and bricks and also labour during the post-war period.

The decrease in house density from 292,960 in 1941 to 224,476 in 1951 in Madras City is due to the inclusion during the decade, within the City limits, of comparatively thinly populated and not heavily built up areas covering an extent of about 20 square miles.

5. Households.—At a census, households have to be clearly distinguished from houses. A house is a dwelling with a separate main entrance, and there may be more than one household residing in the same house. At the census, a person is treated as resident at the place which he uses as his normal sleeping place. He may be having his food in the same premises or may be eating in a hotel outside. Persons who are living together in this sense and normally eating together at a place in the same or another building are treated as constituting a household if they are living under the general care and supervision, formal or informal, of one of themselves, who may be the seniormost member of the family living there or the person earning the highest income in the household. Among members of the same family, some may be living in one town and the others in another town; they will constitute two separate households. Relatives and servants and even friends living together as mentioned above in the same house have to be treated as constituting one household.

The total number of households in this State is 11,936,123 and these live in M.T.—C·I 10,213,903 houses, which works out to S.T.—6·2 1,169 households per 1,000 houses or 1·2 households for each house on the average.

The number of households per house in the rural areas compares as follows with that in the urban areas:—

[Statement No. 108.]

State and natural division			r house in
	•	Rural areas.	Urban areas.
(1)		(2)	(3)
Madras State		1.1	1.4
Madras Deccan Division	••	1.1	1.2
West Madras Division	••	1.1	1.3
North Madras Division	••	1.1	1.4
South Madras Division	_	1.1	1.5

There is a striking uniformity in the conditions in rural areas, which does not come as a surprise. The number of households per 1,000 houses is smallest in the West Madras division (1,090) and largest in the South Madras division (1,145), the Madras Deccan division and the North Madras division coming in between these two. These figures should be in a sort of inverse ratio to the average size of the family in the various divisions, and that this is so can be seen from the figure in column (4) of the Subsidiary Table 6.2, which shows that the number of persons per household is 4.7 for the State as a whole and varies from 4.5 in the North Madras division and South Madras division to 4.8 in the Deccan division and 5.8 in the West Madras division.

In the West Madras division as one would expect, the number of households per 1,000 houses in rural areas is smallest in Malabar (1,076) and largest in the Nilgiris (1,172).

In the Plains portion of the North Madras division, the figures vary from 1,025 per 1,000 houses in Srikakulam district to 1,201 in East Godavari district. In the South Madras division, the figures vary from 1,092 in Salem to 1,239 in North Arcot district.

Taking the urban areas of the State, there are 1,416 households per 1,000 houses in the State as a whole, the Deccan division having the smallest number of households, viz., 1,236, the West Madras division coming next with 1,264, the North Madras division with 1,355 and the South Madras division heading the list with 1,478. This general

picture reflects correctly the relative congestion from the point of view of housing accommodation in the various divisions. In the Madras Deccan division, all the districts are below the State average of 1,416. Malabar and South Kanara districts are below the State average, while the Nilgiris is above that average with 1,531. In the Plains portion of the North Madras division, the figures range from 1,092 in Srikakulam plains to 1,471 in East Godavari. In the South Madras division, Madras City has a figure of 2,453, i.e., nearly 2.5 households per house. It is, of course, the most congested town in the entire State. In the other districts in the South division, the figures range from 1,069 in Tirunelveli to 1,742 in Madurai district, the Madurai figure being of course largely due to the congestion in Madurai

The number of persons, males and females, per household vary, as shown below, in the rural areas:—

[Statement No. 109	1				
State and natural division.	Persons per house- hold.	Males.	Females.		
(1)	(2)	(3)	(4)		
Madras State	4.7	$2\cdot 3$	2.4		
Madras Deccan Divi-	4.8	2.4	$2 \cdot 4$		
West Madras Divi-	5.8	2.8	3.0		
North Madras Divi-	4.5	2.3	2.2		
South Madras Divi- sion.	4 ·5	2.2	2.3		

As already mentioned, the figures in column (2) above reflect the average size of the family in the various divisions and the other figures call for no special comment.

The number of persons with the component figures for males and females per household in the urban areas is given in the statement below:—

[Statement No. 110.]

	-	Per house.	
State and natural division.	Number of persons.	Number of males.	Number of females.
(1)	(2)	(3)	(4)
Madras State	4.7	2-4	2.3
Madras Decean Divi- sion.	5.0	2-4	2.6
West Madras Divi- sion.	5.4	2.6	2.8
North Madras Divi-	4.6	2.4	2.2
South Madras Divi-	4-6	2.3	2.3

As between the divisions, these figures present the same picture as the rural figures, and for the same reasons. The rural urban figures compare as shown below:—

[Statement No. 111.]

State and natural division	Rural. areas.	Urban areas.	
(1)		(2)	(3)
Madres State	• •	4.7	4.7
Madras Deccan Division		4.8	5.0
West Madras Division	••	5⋅8	5· 4
North Madras Division		4.5	4.6
South Madras Division	••	4.5	4.6

On the whole, one should, I think, expect the urban figures to be smaller than the rural figures. Generally speaking, urban families are smaller than the rural families, and many urban households consist of portions of families, the remaining portions of which are in their homes in the rural areas. As against these conditions of urban life, high rents coupled with higher cost of living compel people to stay together to a larger extent in urban areas than they would in the rural areas. Whether the urban figures are smaller than the rural figures or larger, will depend upon the balance between those opposing factors. It cannot, therefore, be said that the figures in the statement above are not correct. Actually, in fourteen districts, the urban figures are smaller than the rural figures.

In Madras City, the number of persons per household is 5.3 while in North Arcot it is 5.7. It is 5.7 in South Kanara, 5.9 in Malabar and Anantapur. Conditions vary from town to town and no special comments are called for in respect of these figures. The more important figure from the point of view of congestion in housing is the number of households in a house, which has already been dealt with.

Size of households.—Households have been classified as small, i.e., those with 3 members or less, medium (4-6 members), large (7-9 members) and very large (over 9 members).

8.T.-6.2

Rural areas.—The percentage of households under various categories in respect of the rural areas is as shown below:-

[Statement No. 112.]

	Average number		ution of 1	00 house	holds.
State and natural division.	of persons per house- hold.	Small.	Medium.	Large.	V 1y large.
(1)	(2)	(3)	(4)	(5)	(6)
Madras State	4.7	35	44	16	5
Madras Deccan Division.	4.8	35	41	20	4
West Madras Divi- sion.	5-8	21	45	24	10
North Madras Division.	4.5	39	43 .	15	3 .
South Madras Division.	4.5	38	45	14	8

It is well-known that the size of the average family is larger in West Madras division, then comes the Madras Deccan division, and then the other two divisions. The West Madras division has the smallest percentage of small families; then comes Madras Deccan division and then the other two divisions. Throughout the State, the largest percentage of families is of the medium size, i.e., families with 4-6 members. In the State as a whole, 35 per cent of the families are small, 44 per cent medium, 16 per cent large and 5 per cent very large. The figures under 'large' and 'very large' confirm what has already been stated about the families in the West Madras division and the Madras Deccan division. In the West Madras division, there are large numbers of large joint families resulting from the Marumakkathayam law and the Aliyasanthana law. These laws do not operate in the rest of the State, and the families are smaller; but in the Madras Deccan division, which is backward, the families are not broken up to the same extent as in the more advanced North Madras and South Madras divisions.

In the West Madras division, the Nilgiris district presents a marked contrast to Malabar and South Kanara districts: 49 per cent are small families, 40 per cent medium size families, and 11 per cent large families. This is because large members of the population in this district consist of immigrant labourers who either come alone for work in the plantations or with only portions of their families, leaving the rest in their home districts.

In the Plains portion of the Visakhapatnam district, 49 per cent are small families, 36 per cent medium size families, 13 per cent

large families and 2 per cent very large families. It is difficult to see why this district should have in its rural area the largest percentage of small families in the State excluding the West Madras division. I think the explanation is to be found in the appreciable number of emigrants from this district, the emigrants comprising largely portions of families.

Urban areas.—The corresponding percentages for the urban areas are given in the statement below:

[Statement No. 113.]

	Average 1 um ber		ibution of	100 hou	seholds.
State and natural division.	of persons per house- hold.		Medium.	Very large.	
(1)	(2)	(3)	(4)	(5)	(6)
Madras State	4.7	38	42	16	4
Madras Deccan Division.	5 -0	31	44	21	4
West Madras Divi- sion.	5-4	34	36	19	11
North Madras Division.	4.6	40	40	15	5
South Madras Division.	4.6	38	43	15	4

In respect of urban areas also, West Madras division leads, as far as large and very large families are concerned. The statement also shows a tendency for urban areas to have a smaller percentage of medium size families and a larger percentage of small size families, compared with the rural areas.

In the North Madras division, in Srikakulam district (Plains), 59 per cent are small families, 22 per cent medium size families, 15 per cent large size families and 4 per cent very large families. It is not easy to explain why this district should have the largest percentage of small families. I think the explanation in this case also is the same as what I have stated in respect of the rural area in the Plains portion of Visakhapatnam district. Among the households in Madras City, 25 per cent are small, 47 per cent of medium size, 23 per cent large and 5 per cent very large. The large percentage of large and very large families in Madras City and the small percentage of the small size families are due to pressure of the conditions of living in a large and expensive city like Madras compelling people to live together areas.

to an extent they would not do in the rural S.T.-6.3

3.T -6 8 from main table C-I which is based on ment below:-1/1000 sample households. The composition

Composition of Households.—The figures of an average household as seen from in subsidiary table 6.3 have been extracted subsidiary table 6.3 is indicated in the state-

[Statement No. 114.]

Carren 3 - annual diminion	Average number of persons per		of household heir wives.	Sons.	Daughters.	Other relations		
State and natural division.	household.	Males.	Females.	Done.	Daugntors.	Males,	Females.	
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	
Madras State	4.7	0-9	0.8	1.1	0.8	0.4	0.6	
Madras Deccan Division	4.8	0.8	0.8	1.1	0.9	0.4	0.7	
West Madras Division	5.7	0.8	0.8	1.3	1-1	0•7 ·	1.0	
North Madras Division	4.2	0.9	0.8	1.0	0.8	0.4	0.6	
South Madres Division	4.5	0.8	0.9	1.1	0.8	0.3	0.8	

Sons are, of course, more numerous than daughters, because the latter get married in their turn and leave their parents. The largest figure under daughters is in West Madras division indicating the later marriage of daughters and their consequent later departure from their parents' homes. In regard to the other male and female relations also, the largest figures are found in West Madras division and this is, of course, due to the large family circle making up the joint families under the Marumakkathayam and Aliyasanthana laws in Malabar and South Kanara districts. In this division the figures for the Nilgiris district are smaller under sons, daughters and other relations, confirming what has already been said, namely, that this district has large numbers of immigrant labourers, who do not bring their families, or bring only some of them with them to work on the plantations, leaving the rest of their families in their home districts. The reasons for the large figures of Malabar and South Kanara have already been referred to. In Madras City, the figures for sons, daughters, other male relations, and other female relations are respectively, 0.9, 0.7,0.9 and 0.8. The smaller figures under sons and daughters confirm the fact that many households in the city consist of portions of families, the remaining portions of which are in their family homes in the mufassal districts, and the large figures under 'Other relations' compared with the other districts are due to the compulsion even for persons who are not closely related, to stay together, owing to the hard conditions of living in the City, already referred to. It will also be noticed that, out of the 5,264 persons in 1,000 sample households in Madras City. the heads of households, their wives, sons, daughters and other, relations account in all only for 5,021; the remaining 243 persons, who are staying in these households. are persons (including servants) unrelated to the heads of those households, which again confirms what has already been said regarding the compulsion for people to stay together in the City.

CHAPTER VII—SEX.

Sex Ratio—General Population.—The statement below gives the number of females per thousand males as ascertained in the various Censuses from 1921 to 1951:—

[Statement No. 115.]

State and natural division.		Females per 1,000 males.						
		1921.	1931.	1941.	1951.			
(1)	(2)	(3)	(4)	(5)			
Madras S	tate	1,028	1,025	1,010	1,006			
Madres Divisio	Deccan on.	960	961	959	959			
West Division	Madras on.	1,048	1,053	1,059	1,054			
North Divisio	Madras	1,016	1,011	1,006	1,001			
South Division	Madras n.	1,027	1,025	1,010	1,006			

It will be seen that the number of females per thousand males has steadily decreased from 1,028 in 1921 to 1,006 in 1951. The position is more or less stationary in the Madras Deccan division, where there has always been a noticeable deficiency of females. In the West Madras division, the number of females per thousand males has been showing an increase on account of the substantial and maintained emigration from Malabar, the emigrants being mostly males, leaving their women-folk behind. In the South Madras division on the other hand, there has been a decrease in the number of females on account of the stoppage of emigration to countries like Burma and Malaya and the discouragement of emigration to Ceylon. The stoppage of emigration to these countries has not affected Malabar, where people spread out in appreciable numbers to many areas including other States in India. In the Agency tracts, the number of females per thousand males has been showing a tendency to decrease. It has decreased from 987 in 1941 to 979 in 1951, which is due to the preponderance of males over females among immigrants from the Plains, who have settled down in these areas. In the Plains districts of the North Madras division, the districts of Krishna and Guntur have shown a slight increase in the number of females per thousand males, while in the other districts there has been a decrease, the net result in this area being a decrease from 1,007 to 1,002 between 1941 and 1951. This is due to the restriction on emigration to Burma from the northern districts of this division.

Of the twenty-six districts in the State, leaving out those where the deviation from parity is not appreciable, there are nine districts, where there is an excess of females and eleven where there is a deficiency of females, as specified below:—

[Statement No. 116.]

Districts where there is a deficiency of females.

Name of	Number of females per 1,000 males (1951 census).			
	(1)			(2)
The Nilgiris Madras Anantapur Cuddapah Chittoor Bellary Krishna Chingleput		••		902 921 942 952 958 967 969
Guntur Kurnool Nellore	••	••	••	974 975 989

The first group specified above are all those from which there is considerable emigration of males, leaving their females behind.

8.T.--7·1

Of the districts in the second group, both in the Nilgiris and Madras City, there is a large immigrant population, which is predominantly male, and hence the deficiency of females in these districts. The Ceded districts of Bellary, Anantapur, Cuddapah. Kurnool, Chittoor and Chingleput, are dry districts with no large extents under assured irrigation, and they have to depend mostly on uncertain rainfall. It is natural to find, under these difficult conditions of living, a deficiency in the physically weaker female sex. Except for the small portion of the district covered by the Pennar delta, Nellore is in the same position as these districts, and so also the upland portions of Guntur, which tovers the major portion of that district. This seems to be the explanation for the deficiency of females in these districts also. As for Krishna, it is found that there is a deficiency of females in all the taluks, the figures ranging from 936 in Thiruvur taluk to 982 in Gudivada and Masulipatnam taluks. The deficiency is less in the more prosperous taluks than in the less prosperous ones. It is difficult to see why the deficiency of females should be larger in Krishna district than in the adjoining Guntur district. portions of both of which are irrigated by the Krishna river. It is surprising to find the deficiency larger in Krishna district than even in Kurnool. The figure seems to indicate a freak of nature, as far as the sex proportion in Krishna district is concerned. The deficiency is large in Vijavavada taluk, the figure for this taluk and the Vijayavada Municipality being 957, and this is presumably because of the male preponderance in the large immigrant population in the Vijayavada town, but this cannot explain the appreciable deficiency in females in the other taluks of the district. It may be noted, that both in Krishna and Guntur, the proportion of females has increased slightly during 1941-1951. In Krishna district, the proportion of females has actually increased since 1941 in five taluks including Vijayavada, while, in the remaining four taluks, the proportion has decreased, the decrease being very slight except in Kaikalur taluk. All the taluks have been prosperous and have shown large increases in population during 1941-1951. The district has received a large number of immigrants with a male preponderance, but this cannot obviously, be the whole of the explanation in respect of all taluks, with the exception,

perhaps, of Kaikalur taluk, where the female ratio has decreased from 981 in 1941 to 971 in 1951.

In the Nilgiris district, the number of females per thousand males has increased during the decade 1941-51 from 858 to 902, presumably because the labourers who settle down in the plantations for work, bring their families also gradually. In the Malabar district, there has been a decrease from 1,067 in 1941 to 1,056 in 1951 due to the return to the district, on demobilization. of the persons recruited to the Defence Services during World War II, and the migration into the district from the Travancore-Cochin State of a large number of immigrants, who have settled down in some interior parts of this district as already mentioned. In the South Kanara district, the figure has increased from 1,070 in 1941 to 1,080 in 1951. Though the migration of labourers from this district to the estates in Coorg is an annual feature, there has been an increase in the numbers of these migrants during the decade on account of the prosperity of the coffee estates during the decade and the expansion of the area under plantation products in that State.

In Madras City, the figure has increased from 908 in 1941 to 921 in 1951. This is definitely attributable to family migration, i.e., males along with their women have moved into the City during the decade for more comfortable living conditions after the introduction of controls and to escape the difficulties in the mufassal under the control regime. In the North Arcot district, the figure has increased from 992 to 1,003. As already explained, there has been considerable migration from this district and there is a large excess of males over females in the migrant population. In Tanjore, Tiruchirapalli and Madurai, there has been a decrease during the decade, reflecting the effect of the restrictions on emigration to places outside India.

2. Sex Ratio—Rural and Urban.—In the State as a whole, as well as in the Madras Deccan division, the North Madras division and the South Madras division, there is a downward tendency in the number of females per 1,000 males, both in the rural areas as well as in the urban areas, while in the West Madras division, the urban ratio has increased and the rural ratio has decreased.

S.T.—71

The sex ratios of 1951 compare as follows in the rural and urban areas:—

[Statement No. 118.]

Sex ratio (Females per 1,000 Males) in

State and natural	1,	UUU Males)	in
division.	General popula- tion. (2)	Rural popula- tion. (3)	Urban popula- tion. (4)
Madras State Madras Deccan Division.	1,006 959	1,011 960	989 952
West Madras Divi-	1,054	1,061	1,006
North Madras Divi-	1,001	1,001	1,003
South Madras Divi-	1,006	1,012	986

As one would expect to find, the number of females per 1,000 males is larger in rural areas than in urban areas. The North Madras division is the only exception; the reason for this peculiar feature is that, with a few exceptions, the towns in this division are residential towns rather than industrial centres, and the number of such centres is much larger in the South Madras division. It will be seen that, in the State as a whole, there is an excess of females to the extent of 11 per 1,000 males in the rural areas, and a deficiency of the same order in the urban areas. The only districts in which the urban figure is larger than the rural figure are Cuddapah, Srikakulam, East Godavari, West Godavari, Guntur, Chingleput, Chittoor, North Arcot and South Arcot. In regard to all these districts, it may be said that their towns are mostly not of the industrial type. The general explanation given with reference to the North Madras division applies to these districts also.

3. Sex Ratio—(1) Agricultural and nonagricultural classes.—The sex ratios for the general population, agricultural and nons.Ts.—7.2 agricultural, compare as shown in the and 7.3 statement below:—

[Statement No. 119.]

Sex ratio (Females per 1.000 Males) in

State and natural	1,000 Males) in			
division.	General popula- tion.	Agri- cultural classes.	Non- agricul- tural classes.	
(1)	(2)	(3)	(4)	
Madras State	1,006	1.018	986	
Madras Deccan Division.	959	965	945	
West Madras Divi-	1,054	1,085	1,021	
North Madras Divi-	1,001	1,010	981	
South Madres Divi-	1,006	1,019	984	

The higher sex ratio among the agricultural classes indicates that the economic pressure to emigrate affects them more than the non-agricultural classes; and the emigrants are mostly males.

(2) Agricultural classes.—The sex ratios in the different agricultural sub-classes, viz., Livelihood Classes I to IV are compared in the statement below:—

[Statement No. 120.]

	Sex rat	Sex ratio (Females per 1,000 Males)					
State and natur division.	al Agricul- tural classes.	Class I.	Class II.	Class III.	Clara IV.		
(1)	(2)	(8)	(4)	(5)	(6)		
Madras State	1,018	986	994	1,068	1,262		
Madras Decca Division.	n 965	940	598	1,032	1,130		
West Made Division.	ras 1,085	1,041	1,044	1,187	1,209		
North Made Division.	ras 1,010	990	968	1,034	1,274		
South Madi	ras 1,019	990	982	1,077	1,306		

The low sex ratio under class I reflects the poor economic condition of the bulk of the land owners who cultivate their own lands, consequent on the small size of the average holding and we should expect that, under difficult conditions of living more males than females survive. Class II comprises persons who cultivate lands on lease, and generally speaking, their economic condition is even poorer than that of the bulk of the persons in Class I. It is not, therefore, surprising to find the sex ratio in the Madras Deccan division, North Madras division and South Madras division even smaller under Class II than under Class I. But West Madras division is an exception to this and shows a slightly higher sex ratio in Class II than under Class I, which I think, reflects the better position of lessees under the special land tenures in this division. Class III comprises cultivating labourers whose economic condition is the worst among all the agricultural classes, and the high sex ratios ranging from 1,032 to 1,137 is due to the emigration of the males among them. Class IV comprises non-cultivating landlords and agricultural rent receivers, and generally speaking, their economic condition may be said to be the best among the agricultural classes. We should, therefore, expect to find among these classes a lower death rate for women than among the other classes. The position should be roughly the same for the men in this class, but in many cases the men in the same family may have other means of livelihood and may have been returned accordingly, and

their figures will not therefore come in here. It is noteworthy that, among the self-supporting persons in class IV, there are as many as 669 females per 1,000 males.

It will be seen from the Subsidiary Tables 7.2 and 7.3 that, in the districts specified below there is a slight excess of females among agricultural classes and that the deficiency noticed in the general population is really due to the position in the non-agricultural classes:—

[Statement No. 121.]

Sex ratio (Females per 1.000 Males) in

			·			
Districts.			General popula- tion.	Agricul- tural classes.	Non- agricul- tural classes.	
: 1	(1)		. (2)	(3)	(4)	
Sale Coi	lore , em , mbatore ath Arcot	•••	989 994 992 997	1,001 1,001 1,014 1,003	958 977 967 972	

The general position regarding the nonagricultural classes will be discussed in the next paragraph.

Under Livelihood Class IV, it will be seen that, in the Nilgiris district, the sex ratio is 767, i.e., there is a very large deficiency of females. This is of course due to the fact that even among this class of non-cultivating owners of land and agricultural rent receivers whose economic condition is better than that of the other three agricultural classes, many men live here by themselves without their womenfolk; the cold climate keeps away the womenfolk, particularly among Indians.

(3) Non-agricultural classes.—The sex ratios in the different sub-classes under non-agricultural classes are compared in the statement below:—

[Statement No. 122.]

Sex ratio (Females per 1,000 Males) in

		non-agricultural classes.					
	State and natural division.		Class V.	Class VI.	Class VII.	Class VIII	
(1)	(2)	(3)	(4)	(5)	(6)	
Madras S	tate	986	957	1,013	939	1,004	
Madras Divisio	Deccan n.	945	902	971	934	962	
West Divisio	Madras n.	1,021	996	1,000	910	1,064	
North Divisio	Madras n.	981	959	1,025	961	983	
South Divisio	Madras n.	984	951	1,017	940	1,003	

It will be seen that the deficiency of females is the largest in Class VII (Transport services), and there is a marked deficiency

in Class V also which comes next in this respect. The figures under Class VII reflect the proportionately larger number of unmarried men in this class, particularly drivers and conductors of buses and lorries. Under Class V, the main items are plantations and handloom industry. In the plantation areas there is, as mentioned in several places in this report, a predominantly male population, while, in the case of handloom weavers, their economic condition has not been satisfactory and they have been affected frequently either by yarn shortage or by slump in the handloom cloth trade, and these circumstances have naturally an adverse effect on the survival rates for women. Class VI, "Commerce" is the most prosperous among the non-agricultural classes, and this is reflected in the figures. Class VIII comes next. largest female deficiency under all the Classes V to VIII is found in the Deccan division, while among agricultural classes, this division showed an excess of females over males under Class III and Class IV. The figures undoubtedly reflect the backward condition of this area and the hard conditions of living among the non-agricultural classes. The largest deficiency in Madras Deccan division is found in Class V which reflects the fact that the handloom weavers in this division mostly weave only yarn of the lower counts and their economic condition is even worse than that of the weavers in the other divisions.

In the West Madras division, Class VIII has the highest sex ratio (1,064) which is evidently due to the emigration, in large numbers, of men in search of miscellaneous occupations.

The low sex ratios in the non-agricultural classes is explained by the fact that the bulk of the non-agricultural occupations are carried on in urban areas and men from the surrounding rural areas move into the towns, attracted by them, leaving their womenfolk behind and that only later, after they have settled down, their womenfolk join them. It is also well known that, in the non-agricultural classes, marriage takes place generally later than among the agricultural classes.

Under Class VI, it will be noticed that the two leading districts in the matter of general trade, viz., Madras and Madurai show a low sex ratio, viz., 861 and 966 respectively, which is of course due to the fact that the traders include large numbers of males who live in these towns for their business, leaving their women behind in their home districts in or outside the State. Under Livelihood Class VIII, Bellary district has a low sex ratio, viz., 893, which is due to the predominance of males among the labour population attracted by the Tungabhadra Project Works.

(4) Self-supporting persons in agricultural classes.—Sex ratios among self-supporting persons in agricultural classes are given below:—

[Statement No. 123.]

		Sex ratio (Females per 1,000 Males) in				
State and natural division.		Agricul- tural classes.	Class I.	Class II.	Class III.	Class IV.
. ((1) ·	(2)	(3)	(4) .	(5)	(6)
Madras 8	tate	254	175	· 145	413	669
Madras Di visio	Deccan	282	204	185	548	482
West Division	Madras	373	272	207	531	764
North Divisio	Madras n.	210	140	101	312	646
South Division	Madras on,	254	182	130	439	709

It is not surprising to find that the sex ratio is small in Classes I and II; the selfsupporting persons in these classes are mostly males. The sex ratio is much higher in Class III 'Cultivating labourers' which is also nothing surprising: in this class, the women work as much as they can to supplement their family income, in fact the women would work even more and the sex ratio would be higher but for their having to attend to their domestic work and to look after children. Hard conditions in the Madras Deccan division are reflected in the sex ratio figure under Class III which is the highest in the State. Conditions are only slightly better in the West Madras division as far as women in Class III are concerned.

Class IV, generally speaking, has the highest sex ratio as much as 669 in the State. This is an economically inactive class and the figures confirm the very appreciable number of women who own lands. The sex ratio is highest in the West Madras division as one would expect to find having regard to the peculiar laws of inheritance in force in Malabar and South Kanara under which properties are inherited by females on a much larger scale than in the rest of the State. It will be seen from the figures under Class IV that the Malabar figure of 907 contributes mainly to the large sex ratio in the West Madras division: it is the highest in the State.

(5) Earning dependants in agricultural classes.—The sex ratio among earning dependants in agricultural classes is given in the statement below:—

[Statement No. 124.]

		Sex ratio (Females per 1,000 Males) in					
State and natural division.		Agricul- tural	Class I.	Class II.	Class III.	Class IV.	
(1)	(2)	(3)	(4)	(5)	(6)	
Madrae S	tate	1,247	1,037	1,212	1,654	828	
Madrae Divisio	Deccan	1,117	1,034	1,296	1,870	889	
West Divisio	Madras	1,067	621	854	1,635	426	
North Divisio	Madras m.	1,842	1,093	1,276	1,747	919	
South	Madras	1,215	1,005	1,378	1,589	833	

The comparatively much larger figures under this category of earning dependants reflect the fact that women are part-time workers owing to their pre-occupation with household work. As one would expect to find, the sex ratio is the highest under Class III, viz., cultivating labourers. The sex ratio is naturally enough the lowest in Class IV: the persons on whom women in this class depend are the economically inactive, but comparatively well off, class of non-cultivating land owners and rent receivers, and the percentage of women who work to supplement the family income is noticeably smaller than the number of men who work to supplement their income.

(6) Non-earning dependants in agricultural classes.—The sex ratios for these are given in the statement below:—

[Statement No. 125.]

C4-4- 4-341		Females per 1,000 Males among non- earning dependants in					
State and natural division.	Agricul- tural classes.	Class I.	Class II.	Clams III.	Class IV.		
(1)	(2)	(3)	(4) .	(5)	(6)		
Madras State	1,587	1,589	1,573	1,578	1,702		
Madras Deccar Division.	1,470	1,488	1,456	1,874	1,088		
West Madras Division.	1,534	1,479	1,527	1,579	1,472		
North Madra Division.	1,655	1,638	1,647	1,678	1,776		
South Madras Division.	1,586	1,593	1,585	1,550	1,738		

The sex ratio is very high. For all agricultural classes in the State as a whole, it is 1,587. Leaving out Madras City, where the agricultural population is a negligible fraction, the lowest sex ratio is 1,429. This of course confirms the well-known fact that there is a much larger percentage of non-earning dependants among women than among men.

(7) Non-agricultural classes—Self-supporting persons.—The sex-ratios among selfsupporting persons in non-agricultural classes are given in the statement below:—

[Statement No. 126.]

State and natural	Sex ratio (Females per 1,000 males) in.					
· division.	Non- agri- cultural classes.	Class V.	Class VI.	Class VII.	Class VIII.	
(1)	(2)	(3)	(4)	(5)	(6)	
Madras State	182	148	158	27	244	
Madras Deccan Division.	228	145	, 171	30	309	
West Madras Division.	236	241	96	32	320	
North Madras Division.	148	116	173	19	183	
South Madras Division.	174	135	167	28	235	

As one would expect to find, the sex-ratio is very low throughout the State, being only 182. Generally speaking, non-agricultural occupations require more training and sustained work than agricultural occupations. Men are, therefore, preferred for these occupations, and there are also certain restrictions imposed under the Factories Act to safeguard the health of women. Some non-agricultural occupations hardly suitable for women. We naturally find the smallest sex ratio under Class VII (27 for the State as a whole): transport services are manned mostly by men and the percentage of women employed is negligible. The low figures under Class V indicate the very small extent to which women have been absorbed in industrial occupations. Class VI relates to the small but growing number of women employed in commercial firms as typists and clerks.

The largest sex ratio is under Class VIII, viz., other services and miscellaneous sources of income. This is a miscellaneous category which accounts for more selfsupporting women than any of the other non-agricultural classes. But the proportion is small, less than 25 per cent of the males in the class. This is, however, the class in which the proportion of females is sure to increase considerably in course of .time: an increasing number of women are taking up employment as teachers, clerks, typists, nurses, midwives and doctors. These developments which are inevitable and should, on the whole, be welcomed, are likely, when they assume large proportions,

to have their repercussions in the future even on the growth of population.

(8) Earning dependants.—The statement below gives the sex ratio among the earning dependants in non-agricultural classes:—

[Statement No. 127.]

State and material	Sex ra	io (Fema	des per i	l,000 mal e	s) in
State and natural division.	Non- agri- cultural classes.	Class V.	Class VI.	Class VII.	Class VIII.
(1)	(2)	(3)	(4)	(5)	(6)
Madras State Madras Deccan Division.	944 1,080	1,03 2 1,149	550 534	605 640	1,078 1,249
West Madras Division.	1,192	1,339	670	1,206	1,264
North Madras Division.	1 ,039	1,132	628	660	1,144
South Madras	818	888	495	449	965

For the State as a whole, the sex ratio for earning dependants in the non-agricultural classes is 944. Class VI, Commerce has the smallest sex ratio, then comes Class VII (Transport), then Class V (Production other than cultivation) and lastly Class VIII (Other services and miscellaneous sources of income). These figures reflect the comparative economic condition of these classes and the consequent attempts by the women folk to work and supplement the family income by engaging themselves in occupations which they find suitable for them.

(9) Non-earning dependants.— The following statement gives the sex ratio among the non-earning dependants in non-agricultural classes:—

[Statement No. 128.]

54-4 3 mad1		atio (Fen	ıales per 1	,000 mal	les) in
State and natural division.	All non- agri- cultural classes.	Class V.	Clars VI.	Class VII.	Class VIII.
(1)	(2)	(3)	(4)	(5)	(6)
Madras State	1,710	1,724	1,748	1,882	1,661
Madras Deccan Division.	1,542	1,546	1,677	1,868	1,475
West Madras Division.	1,703	1,743	1,695	1,770	1,668
North Madras Division.	1,792	1,810	1,812	1,993	1,744
South Madras Division.	1,709	1,710	1,750	1,876	1,666

The sex ratio for non-earning dependants is higher among the non-agricultural classes than among the agricultural classes in all the divisions: 1,710 against 1,587 in the State as a whole. This also shows the small percentage of women engaged in non-agricultural occupations.

7.1 Females per 1,000 males (general, rural and urban population) and comparison with previous censuses.

CHAPTER VIII—CIVIL CONDITION.

Marital status.—The figures discussed in this Chapter have been extracted from Subsidiary Tables 8 1 and 8.2, which are based on the Main Table C-III. The latter table has been prepared, as explained in the Introductory Chapter, from the 10 per cent samples selected from the entire population. The 1941 figures, referred to below, are based on the 2 per cent samples taken

out at that Census, while the 1921 and 1931 figures are based on the entire population, as recorded at those Censuses.

The statement below gives the percentage M.T.—C.III of males and percentage of females, respect-S.T.—8.1 ively, among unmarried, married, widowed and divorced persons according to the 1951 Census:—

[Statement No. 129.]

Percentage	OI

· ·		 									
State and natural . division.		Ma	les.		Females.						
CITA IBIOIL.	Un- married.	Married.	Widowed.	Divorced.	Un- married.	Married.	Widowed	Divorced			
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)			
Madras State	53	43	4	••	41	44	14	1

South Madras Division.	. 54	41	5	-	42	44	14	-			

Divorces are rare and this is clearly reflected in these figures. Four hundred and twentyeight males out of 1,000 males and 445 females out of 1,000 females are married. The percentage of unmarried males is 53, while that of unmarried females is 41. The normal age of marriage is, as is well known, earlier for females than for males. The percentage of widowed persons among females is much larger than among males, which reflects the fact that widow remarriage is deprecated by social custom, especially among the higher classes among Hindus. The percentage of unmarried persons is higher, both among males and females in the West Madras division, which confirms the fact that people generally marry at a later age

in that area, particularly in Malabar, than in the other parts of the State. The North Madras division has the lowest percentage of unmarried persons, both among males and females, showing that early marriages take place on a larger scale in this division than elsewhere in the State. The percentage of widows among females is largest in the North Madras division. This is also attributable to early marriages.

It will be useful to examine whether the marital ratio has undergone any change from decade to decade since 1921. The percentage of unmarried persons in each of the decades is given in the statement below:—

[Statement No. 130.]

Unmarried persons' ratios.

			Sta	te	Madras Divi	Deccan sion.	West M Divi	fadras sion.	North M Divi	fadras sion.	South Management	
	Decade.		(M)	(F) ·	(M)	(F)	(M)	(F)	(M)	(F)	(M)	(F)
	(1)		(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)
1921	••	••	53	38	54	36	58	41	50	34	54	39
1931	••	••	53	38	55	38	58	43	48	32	54	40
1941		••	55	· 41	56	40	60	45	51	35	55	42
1951		••	53	· 41	52	41	60	45	48	36	54	42

There has been no marked variation in the percentage for males, but there is an unmistakable increase in the percentage of unmarried females, indicating that the females are getting married later than in the previous decades. This tendency will become more prominent in future with the spread of education among women and the growing attention paid to the ability of the

married couple to live on their own independent resources. There is a definite tendency for both males and females to marry later than before and the Child Marriage Restraint Act is no longer felt to be a handicap.

The statement below gives the percentage of married persons among males and females during each of the decades 1921-1951:—

[Statement No. 131.]

1921	••		4	19	7	23	4	19	4	19	4	18
1931	• •	• •	4	18	6	20	3	18	4	19	4	17
1941			4	16	6	19	3	17	4	18	4	16
1951	••	• •	4	15	6.	15	3	14	4	16	5	15

At the 1951 Census, for the first time, figures have been given separately for widowed. and divorced persons; at the previous Censuses, they used to be lumped together under 'widowed'. The declining percentage of widows from 1921-1951 is noteworthy and it is the result of marriages taking place later. The percentages of widows is highest in the Madras Deccan division, but in that division also, the percentage has declined to more or less the same level as in the other divisions. Taking only the 1951 figures of widows, we find that the West Madras division has the lowest percentage, 12.1, the South Madras division coming next with 14.2 per cent, the Madras Deccan division coming third with 14.5 per cent, and the North Madras division coming last with 14 9 per cent. Marriage is thus still taking place comparatively early in the North Madras division and the position is best in the West Madras division.

It is surprising to find that, in the South Madras division, Madras has the smallest percentage under unmarried males and females and the largest percentage under married males. One would have expected to find the reverse. The explanation for this surprising feature is, I think, to be found in the fact that, in the immigrant population which has gone to swell the City's population between 1941 and 1951, are large numbers of married men and women. It has already been mentioned that the sex ratio in Madras City has increased from 908 in 1941 to 921 in 1951.

The percentage of widowed persons, both among males and females, is larger in Kurnool district than in the other districts of the Madras Deccan division.

In the Nilgiris district, the percentage of widowers, according to the 1951 Census, is only 2.7 per cent and the percentage of widows only 7.2 per cent. These low percentages are due to the fact that widows are not likely to be among the immigrants in any large numbers and that widowers will also find it difficult to migrate to this district leaving their children behind in the Plains.

In 1941, in Madras City, the percentage of widows was only 14.1 per cent and there were much higher percentages in the other districts in the South Madras division, but in 1951, Madras had the largest percentage of widows, viz., 17.8 per cent. While all the other districts have shown a definite decline in the percentage of widows, Madras City is the sole exception, and has shown an increase in the percentage of widows. This is presumably due to the widows, who migrated to Madras City during the decade 1941-1951. Young widows be expected to move to Madras City education and employment.

As already mentioned in Chapter I, there is a definite decline in the percentage of widows since 1921, and this is bound to have the effect of increasing the rate of growth of the population, but this will be counteracted to some extent by the tendency among both males and females to marry late.

2. Age distribut on—(1) Married persons.
—The age tabulation at this Census is based on the 10 per cent samples taken from the entire population. For the 1941 Census, we have the figures tabulated recently under the orders of the Government of India from the 2 per cent samples set apart after the tabulation for the tables actually prepared at that Census. The age figures for the 1921 and 1931 Censuses were tabulated with reference to the entire population.

It is well known that nothing connected with the Census Questionnaire is more difficult for illiterate persons than giving precise information relating to their age. In the case of such persons the enumerator had to do his best by questioning the more intelligent and elderly, if not educated, persons in the same household or neighbouring households, and arrive at as good an approximation to the actual ages as was possible. Enumerators were also equipped with calendars of outstanding occurrences in each taluk to enable them to assist the persons enumerated to recollect important events in their own life, particularly important ceremonies like marriage, or birth of a child, with reference to those outstanding occurrences and thus help the enumerator to ascertain the age correctly. At the 1921 Census, the age ascertained was that attained at the last birthday of the person enumerated. At the 1931 Census, what was

ascertained was the age attained at the nearest birthday, which might be either prior to the Census date or subsequent to the Census date. At the 1941 Census, the more ambitious proposal to record not only the completed years but also the number of months which had elapsed since the last birthday and up to the Census date, was tried. At the 1951 Census, we realized that this was too ambitious to attempt and we contented ourselves with ascertaining the number of completed years of age, that is, the age completed at the last birthday. People in this State usually give their running age, i.e., the age that they would be completing at their next birthday. This was pointed out and the enumerators were requested to record carefully the age at the last birthday. As at the last Census, the 1951 Census also showed the partiality for people to give their age in multiples of 5, but the figures ascertained by the enumerators have been adopted without applying any smoothing formula. These differences in the ascertained age are not however of an order which is likely to affect the validity of comparisons based on the figures recorded at the various Censuses.

(2) Subsidiary Table 8.2 gives, for each sex, the age distribution in 1941 and 1951 of married persons. The age-groups taken for purposes of this comparison are: 0-14, 15-34, 35-54, 55 and over.

Taking the State as a whole, we find the age distribution for 1,000 married persons among males in 1941 and 1951 to be as shown below:—

[Statement No. 133.]

	Yea	Br.
Age-groups.	1941.	1951.
(1)	(2)	(3)
014	 9	7
15—34	 413	386
3554	 445	455
55 and over	 133	152

These figures confirm the fact referred to in the previous paragraph that marriages are now taking place later and that there is a tendency for them to take place even later than the 15-34 group. The figures in the last group 55 and over are the result of improving death rates.

S.T.—8·2

The corresponding figures for females are given below:—

[Statement No. 134.]

		Ye	BF.
Age groups.		1941.	1951.
(1)		(2)	(3)
0—14 15—34 35—54 55 and over	••	56 639 272 33	28 597 318 57

These figures show the same tendency as the figures for males commented upon

above. The highest proportion of married persons is found among the males in the group between 35-54, while, for females, it is found in the group 15-34, which means that there is a larger proportion of males than females marrying after the age of 34. The figures in the first group, viz., Group 0-14, show also a much larger proportion of females than males who marry before the age of 15.

(3) The statement below gives, on the same lines, the comparative figures for each of the divisions in the State:—

[Statement No. 135.]

55 and over	• •	57	33	75	21	59	40	53	28	. 56	36

These figures show that early marriages in the first group have not yet disappeared, and the position is worst in this respect in the North Madras and Deccan divisions.

The Deccan division figures show otherwise roughly the same trend as in the State as a whole. There is a perceptible decrease in early marriages among females, but there is a slight increase in the number of married persons in the first group among males. I do not think this slight increase among males is likely to possess or has any significance affecting the general picture. It will be seen from the Subsidiary Table 8.2 that there is a definite decrease in the proportion of married persons among males in the age group 0-14 in the districts of Cuddapah, Kurnool and Bellary and that it is only in the Anantapur district there is an increase (7 to 27). I do not think any special significance need be attached to this position in Anantapur district, and there is no doubt that early marriages are definitely on the decline and that public opinion against them among all communities is growing and becoming more and more effective. This remark applies also to the similar anomaly noticed in some other districts, viz., Srikakulam, Guntur, Nellore, Madras City and Chittoor. The Madras City figure does not deserve any particular attention, because the City's population comprises several sections; with the most forward at the top and extremely backward people at the bottom.

The West Madras division figures present the same picture as the State as a whole and call for no special comments. In this division as well as in South Madras division, early marriages have practically disappeared.

Subject to the comments above, the North Madras and South Madras division figures present the same picture as the State as a whole.

In the 15-34 group for males, only Madras City, Chittoor and Cuddapah districts show an increase from 41-51. The explanation for the increase in Madras City is to be found in the large number of married persons who have moved into the City during the decade 1941-51. The unskilled labourers who have migrated to Madras City are likely to be in the groups 15-34 and 35-54, but the other classes are mostly likely to be in the group 15-34. As for the Cuddapah and Chittoor districts, they are among the backward districts of the State, where these marriage reforms take longer to make any headway, and there

is no doubt that they will also fall in line with the rest of the State.

In the 35-54 group for males, while there is a definite general tendency towards increase, there is a decrease in Madras City, Chittoor, Guntur, Malabar, Srikakulam. Anantapur and Cuddapah districts. The position in Madras City is more-or-less what we should expect as a corollary of the position in the 15-34 group discussed above. Srikakulam, Cuddapah, Anantapur, Chittoor and a large portion of Guntur district in the upland area are among the backward areas in the State, and it will take a longer time for them to fall in line with the more advanced areas. In the case of Srikakulam there is also the emigration factor. In Malabar, even formerly, marriages used to take place later than in the other districts. and there is also the emigration factor.

Females.—There is a marked decrease in the group 0-14 in all the districts. The custom of early marriage has not stopped in spite of the law restraining child marriages, but it is clear that it is only a question of time before that happens, not because of the law, but on account of public opinion and pressure of economic conditions. As already mentioned, the position is most satisfactory in the South Madras and West Madras divisions, and in the former area in the southern districts of Tanjore, Tiruchirappalli, Madurai, Ramanathapuram and Tirunelveli. The large percentages in this group, i.e., exceeding 30 and above per 1,000 are found in all the districts of the North division and in Bellary and Kurnool districts in the Deccan division.

In the 15-34 group, there is marked decrease practically in all the districts showing definitely that the women have been marrying later since 1941.

As a natural corollary of the position in the 15-34 group, we find a marked increase through out the State in the group 35-54.

In the 55 and over group there is marked increase in all the districts due, as already mentioned to the improvements in the death rates. The districts which show an abnormal increase are the Nilgiris, Anantapur and Kurnool. In the case of the Nilgiris district, it is explained by the increase in the number of old persons who have settled down here after World War II. As regards the remaining two districts, viz., Anantapur and Kurnool, it is difficult to explain why the position should be different in these two districts as compared with the other two districts in the same division, i.e., Bellary and Cuddepah where conditions are similar. I am not sure that the abnormal 1951 figures noticed are not the result of erroneous enumeration of such persons on the border line between the last two groups.

The figures in the State and the divisions discussed above are reproduced in the statement below with the age group 35-54 split up into the two group. 35-44 and 45-54. This has been done in order to examine the proportion of married females in the two age groups, 15 to 34 and 35 to 44, which are the vital productive groups for them, the latter group being less fertile than the former:—

[Statement No. 136.]

Ratio of married women under different age-groups and comparison with 1941.

				Numbe	er per 1,00	00 married	l females.			
State and natural division	on. 0-	14	15-	34	35-	-44	45-5	4	55 and	over.
	1951.	1941.	1951.	1941.	1951.	1941.	1951.	1941.	1951.	1941
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)
Madras State _	28	56	597	639	203	187	115	84	57	33
Madras Deccan Divi-	36	69	599	669	179	174	111	66	75	- 21
West Madras Divi- sion.	13	32	601	628	208	204	119	96	59	39
North Madras Divi-	63	110	591	623	191	166	102	73	53	28
South Madras Divi-	13	31	598	645	212	197	121	91	56	36

It will be seen that nearly 60 per cent of the married females are in the higher productive age group 15 to 34, and another 20 per cent in the next important productive group, viz., 35 to 44. It is a very sign ficant fact in connection with the population problem, that we have such a large percentage of married women in their productive periods. Ther is hardly any variation in the figures for the divisions in the age group 15 to 34, the variation being only from 59 per cent in the North Madras divi ion to 60 per cent in the other divisions. As for the age group 35 to 44, the percentage varies from 18 per cent in the Deccan division to 19 per cent in the North Madras division and 21 per cent in the other two divisions.

Comparing the figures of 1941 and 1951, we find decreases throughout the State, in age group 15-34, and increases in the age group 35-44, which again confirms the tendency for marriages to take place later. The next two groups, viz., 45-54 and 55 and over, also show increases throughout the State. The decrease in the most reproductive age group, viz., 15-34, is welcome, as it would help to lower our high birth rates.

Norg.—This statement has been compiled from Table C-III. Five hundred and fifty-three married persons who have not returned any age have been omitted in this statement.

^{*} Separate figures not available for 1941.

CHAPTER IX—AGE.

Infants.—For considering the age structure of the population, statistics have been compiled under six broad categories, viz., infants, i.e., children below one year of age; young children between the ages 1 to 4; boys and girls between the ages 5 to 14; young men and women in the age group 15 to 34, middle aged persons in the age group 35 to 54, and elderly persons in the age group 55 and over.

M.T.—C·II S.T.—9·1 The statement below gives the number of infants per 1,000 in the general population in the State and in each of the divisions:—

[Statement No. 137.]

Number of infants per 1,000.

			•	
State and natural divi-		1941.		
sion. (1)	Males.	Females.	Persons.	Persons (5)
Madras State Madras Deccan Division.	13 15	· 13 16	26 31	25 25
West Madras Division.	14	13	27	25
North Madras Division,	13	13	26	25
South Madras Division.	12	13	25	25

It will be seen that there has been a definite increase in the number of infants. This is due to the improvement in infantile mortality mentioned earlier in this report. The figures are practically stationary in the South Madras division and this area, it should be remembered, has got the lowest birth rate in the State. The Decean division shows the largest increase in the number of infant and the only explanation available—which stems to be adequate—is to be found in the fact that this division has the largest birth rate in the State.

The following statement compares the number of infants in the rural and urban population:—

[Statement No. 138.]

•	Number per 1,000.								
State and natural division,		General population.		Rural.		oan.			
ï	(M)	(F)	(A)	(F)	(M)	(F)			
(1)	(2)	(3)	(4)	(5)	(6)	(7)			
Madras State	. 13	13	13	13	13	13			
Madraa Decean Division.	15	16	15	17	15	13			
West Madras Division	. 14	13	14	14	13	13			
North Madras Division	. 13	13	13	13	13	12			
South Madras Division	. 12	13	12	12	12	13			

It will be seen that there is no significant difference, as far as infants are concerned, between the rural and urban areas.

The statement below gives the figures of infants per 1,000 of the population in agricultural and non-agricultural classes:—

[Statement No. 139.]

	Number per 1,000.									
State and natural division.	General population.		Agricul- tural classes.		Non-agri- cultural class co.					
	(M)	(F)	(M)	(F)	(M)	(F)				
(1)	(2)	(3)	(4)	(5)	(6)	(7)				
Madras State	13	· 18	13	13	13	13				
Madras Deccan Division.	15	16	15	16	15	16				
West Madras Division	14	13	13	14	14	13				
North Madras Division	13	18	18	12	14	14				
South Madras Division	12	18	12	12	12	13				

The pattern is more or less uniform throughout the State, and there is no marked difference between agricultural and nonagricultural classes.

2. Young children.—The numbers of young children, i.e., persons of both sexes of age 1 and above and below five years per 1,000 of the general population in the State and in the natural divisions are given in the statement below, with figures, for the number of such persons in 1941:—

8.T.--9·2

[Statement No. 140.]

South Madras

Division.

1951. 1941. State and natural division. Per-Males. Fe-Persons. males. sons. (1) (2) (3) (4)(5)Madras State 95 47 48 106 Madras Deccan 90 44 46 101 Division. West Madras 108 56 52 108 Division. North Madras 89 44 45 97 Division.

Number per 1,000.

47

111

In the State as a whole, there is a noticeable decrease in the number of young children by about 10 per cent and this may be correlated to the decline in the birth rates during the decade. In the divisions also there has been a decrease except in the West Madras division where the population of young children has been stationary.

The statement below compares the rural and urban population of young children:—

[Statement No. 141.]

	Number per 1,000 persons.								
State and natural division.	General population.		Rural population.		Urban. population.				
	(M)	(F)	(M)	(F)	(30)	(F)			
(1)	(2)	(3)	(4)	(5)	(6)	(7)			
Madras State	48	47	48	48	45	45			
Madrae Deccan Division	44	46	44	46	46	48			
West Madras Division	56	52	56	52	51	54			
North Madras Division	44	45	45	45	43	44			
South Madras Division	48	47	49	49	45	44			

In the State as a whole and in all the divisions except in the Deccan division, the rural figures are larger than the urban figures. The explanation for this is to be found in the higher fertility of women residing in the rural areas. In the Deccan division, the urban figures are higher than the rural figures, which is not surprising to find in these poor and backward districts where the rural areas lack medical facilities and conditions of living are more difficult than in the urban areas.

In the Srikakulam and Visakhapatnam districts as well as in Chingleput and Chittoor districts, the urban figures are higher than the rural figures and this is attributable to the fact that the health conditions and medical facilities available in rural areas are markedly inferior to those in the urban areas of these rather backward districts. In Coimbatore district also, the urban figures are higher than the rural figures, and the reason is to be found in the markedly superior conditions and medical facilities available in the urban areas.

As mentioned in Chapter I, mortality is highest in this age group barring the infants and the old people of the age of 60 and above. The survivals in this group will vary with the living conditions and the medical facilities available in the different areas.

The statement below compares the numbers of yourg children in agricultural and non-agricultural classes:—

[Statement No. 142.]

	Number per 1,000 persons								
State and natural division.	Gene popu	la-	Agricu		Non- agricultura classes.				
	(M)	(F)	(M)	(F)	(M)	(F)			
(1)	(2)	(3)	(4)	(5)	(6)	(7)			
Madras State	48	47	47	47	48	48			
Madras Deccan Division	44	46	43	46	46	46			
West Madras Division	56	52	56	52	55	53			
North Madras Division.	44	45	44	44	46	47			
South Madras Division.	48	47	48	48	48	4 :			

On the whole, the figures indicate a larger proportion of young children in the nonagricultural classes, and this may be explained as being due to the fact that there classes are largely town dwellers and living conditions there are markedly superior to those in the rural areas. In the Deccan division, the figure in the non-agricultural classes is lower than that in the agricultural classes in Bellary district; and this is due to the fact that large numbers of emigrant labourers working in the Tungabhadra Project Works have left their children behind in their home districts. A similar explanation applies to the Nilgiris district also. In the Ramanathapuram district in the South Madras division, the proportion of young children is larger among agricultural classes than among the non-agricultural classes, and the explanation for this is to be found in the fact that the large number of emigrants who are of course mostly from the agricultural classes, leave their womenfolk and children behind in their homes. In North Arcot district also, there is a similar position, but the difference is less marked, and in that district also the explanation is due to the emigrants leaving their children and womenfolk behind.

3. Boys and girls.—The statement below compares the numbers of boys and girls in the general population in the age group 5—14 with the 1941 figures:—

S.T.—9·3

[Statement No. 143.]

		N	umber p	er 1,000.	
			1951.		1941.
	e and division.	Per- sons.	Males.	Females.	Per-
(1	l)	(2)	(3)	(4)	(5)
Madras S	tate	241	121	120	259
Madras Divisio	Deccan n.	248	126	122	269
West Divisio	Madras n.	242	123	119	266
North Divisio	Madras n.	241	122	119	264
South Divisio	Madras n.	240	120	120	253

There is a noticeable fall in the State as a whole and in all the divisions, and I think, the explanation for this is to be found in the decline in the birth rates since 1938—vid. the statement in paragraph 12 of Chapter I.

The statement below compares the number of boys and girls in rural and urban areas:—

[Statement No. 144.]

	Number per 1,000.							
State and natural	General population.			Rural population.		an ation.		
division.	Males.	Females.	Males.	Females.	Males.	Fernales		
(1)	(2)	(3)	(4)	(5)	(6)	(7)		
Madras State	121	120	122	121	117	115		
Madras Deccan Division.	126	122	127	122	122	122		
West Madras Division	123	119	124	120	117	116		
North Madras Division.	122	119	123	119	120	117		
South Madras Division.	120	120	121	122	115	114		

It will be seen that the urban figures are definitely smaller than those for the rural population. This is what one would expect to find as it is only generally after the middle-school stage that boys and girls left behind in the rural areas by their fathers who have migrated to towns for their business or professional work join the latter.

The statement below compares the numbers of beys and girls per 1,000 of the general population among the agricultural classes and the non-agricultural classes:—

[Statement No. 145.]

	Number per 1,000.								
	Gene popula		Non-culti	ıral					
State and natural division.		_		<u> </u>	_				
division.	Males.	Females	Males.	Females	Maler.	F errale			
(1)	(2)	(3)	(4)	(5)	(6)	(7)			
Madras State	121	120	123	121	119	118			
Madras Deccan Division.	126	122	128	123	123	120			
West Madras Division	123	119	125	123	120	115			
North Madras Division.	122	119	123	118	121	120			
South Madras Division.	120	120	121	122	118	117			
In the State as a	whol	le, as	well	as i	n all	the			

In the State as a whole, as well as in all the divisions, the numbers of boys and girls among the agricultural classes are higher than among the non-agricultural classes. The explanation for this is the same as that for the rural-urban difference, as the agricultural classes reside mostly in rural areas.

4. Young men and women.—The statement below gives the numbers of young men

and women per 1,000 of the general population, compared with the figures of the 1941 census:—

[Statement No. 146.]

			Number	per 1,000.	
	Division. Test Madras Division. Orth Madras Division.		1951.		1941.
naturai	division.	Per-	Males.	Females.	Per-
(1	l)	(2)	(3)	(4)	(5)
Madras S	tate	335	164	. 171	339
Madras Divisio		328	168	160	337
West Divisio		342	159	183	338
North Divisio		332	162	170	341
South Division		336	166	170	338

Except in the West Madras division, there is a decrease in the proportion of the population in this age-group due to the increase in the proportions in the higher age-groups. As longevity increases, the proportions in the higher age groups increase, and there is a decrease in the age-group 15—34. The largest proportion of the population is in this group (33.5 per cent). The proportions in the lower age-groups are smaller so also the proportions in the higher age groups, as will be seen later in this Chapter.

In the Nilgiris, there is a large decrease in the proportion of young persons, from 400 to 323 per thousand, and there is a corresponding increase in the next higher age group, viz., 35—54 indicating, that the age-group of the immigrants is now predominantly in the higher group. In Malabar district, the proportion of young persons has increased slightly from 337 to 350. In South Kanara district, there is a slight decrease from 332 to 323. Owing to the heavy population in Malabar district, the division as a whole has shown a small increase from 338 to 342.

The statement below compares the rural and urban figures of young men and women:—

[Statement No. 147.]

-	Number per 1,000.								
State and natural	General population.			Rural population.		ben ation.			
division.	Males	Females.	Malos.	Females.	Malca.	Females			
(1)	(2)	(3)	(4)	(5)	(6)	(7)			
Madras State	164	171	160	170	182	176			
Madras Deccan Division	168	160	166	159	173	168			
West Madras Division	159	184	156	164	177	184			
North Madras Division	162	170	150	169	180	177			
South Madras Division.	166	176	100	168	165	176			

The urban figures are distinctly higher than the rural figures. This is the age group comprising persons who go in for higher education and who start earning after their education is over. One should therefore expect to find a larger proportion of the persons in this age group in the towns. For the same reasons, the proportion of males is larger in the urban areas than in the rural areas. In the urban areas, in the State as a whole, and in the divisions, except the West Madras division, the proportion of males is higher than the proportion of females. This is because the male population in urban areas consists of many unmarried persons including those who are still in the schools and colleges. Actually this is the position in 13 districts including Madras City, but in the remaining 13 districts including two of the three districts in the West Madras division (Malabar and South Kanara), the proportion of females is higher than the males. In the West Madras division as a whole, the proportion of females is higher than the males.

The following statement compares the population of young men and women in the agricultural classes and non-agricultural classes:—

[Statement No. 148.]

	_	N	amber į	er 1,00	1,000.					
•	Gen- popula		Agricu clas		l Non-agri- cultural classes.					
State and natural		<u> </u>				<u> </u>				
division.	Males.	Females	Мајев.	Femalos	Males.	Females				
(1)	(2)	(3)	(4)	(5)	(6)	(7)				
Madras State	164	171	159	169	174	175				
Madras Deccan Division	168	160	168	158	167	165				
West Madras Division	159	184	151	183	167	185				
North Madras Division.	162	170	159	169	170	173				
South Madras Division.	166	170	159	168	178	174				

In all the divisions, there is a higher proportion of young men and women among the non-agricultural classes than among the agricultural classes. This undoubtedly shows that an increasing proportion of the population is absorbed in non-agricultural occupations with the growth of industries and this is a vital group contributing to the number of active workers. In the districts of Cuddapah, Kurnool, Srikakulam and Chittoor, there is a slightly larger proportion of young men and women in the agricultural classes than among the non-agricultural classes. The reason is not far to seek. These are backward districts and not industrially advanced, where the scope for non-agricultural occupations is not much.

5. Middle aged persons.—The statement below gives the number of middle-aged persons, i.e., persons in the age group 35 to 54 per 1,000 persons of the general population, compared with the figures of the 1941 Census:—

S.T.—9.5

[Statement No. 149.]

	Number per 1,000.							
State and natural division.			1951	•	1941.			
		Per- sons.	Males.	Females.	Per- sons.			
(1)	(2)	(3)	(4)	(5)			
Madras S	State	216	110	106	199			
Madras Divisio	Deccan	213	115	98	198			
West Divisio	Madras	197	96	101	191			
North Divisio	Madras on.	221	113	108	199			
South Division	Madras	218	111	107	201			

There has been an increase in all the divisions in these figures between 1941 and 1951, showing that the average duration of life is increasing with the general improvement in public health. The increase is found in all the districts.

The proportion of middle-aged persons found in the rural areas and in the urban areas are given in the following statement:—

[Statement No. 150.]

		Number per 1,000.					
State and natural	Gene	ral.	Rur	al.	Urban.		
division.	M les.	Females.	Mules.	Females;	Males	Females.	
(1)	(2)	(3)	(4)	(5)	(6)	(7)	
Madras State	110	106	111	196	108	103	
Madras Deccan Division.	115	98	117	98	108	93	
West Madras Division	96	101	95	101	101	97	
North Madras Division.	113	108	115	108	107	106	
South Madras Division.	111	107	112	168	109	103	

Generally speaking, the rural figures are higher than the urban figures, but in the West Madras division, there is a slightly larger proportion in the urban population. The larger rural figures are due to the fact that the growth of industries during the decade 1941-51 has naturally drawn to the towns a larger proportion of the younger group 15—34. The position in the West Madras division is due to the slight excess of the urban figure over the rural figure in Malabar district. In that district, the urban figures are not so important as the rural figures.

The statement below gives the proportions of middle aged persons found among agricultural classes and non-agricultural classes:—

[Statement No. 151.]

[Diatomont = 1	Number per 1,000.						
	Gene		Agricul classe		Non-agri- cultural classes.		
State and natural		<u> </u>				<u>ٺ</u>	
divisio n.	Male.	I emale.	Male.	Female	Male.	Female	
(1)	(2)	(3)	(4)	(5)	. (6)	(7)	
Madras State	110	106	110	109	-110	99	
Madras Deccan Division.	115	98	114	100	118	91	
West Madras Division	96	101	91	104	101	98	
North Madras Division.	113	108	113	111	114	100	
South Madras Division.	111	107	111,	111	- 111	101	

The proportion of agricultural classes in the State as a whole and in all the divisions except the West Madras division is higher than the non-agricultural classes. In the West Madras division, the proportion of non-agricultural classes is slightly higher than that of the agricultural classes and this is due to the slightly higher figure under non-agricultural classes in Malabar district, the position in the other two districts, viz., Nilgiris and South Kanara, following the general pattern.

6. Elderly persons.—The statement below gives the number of elderly persons, that is, persons of the age of 55 and above per 1,000 of the general population, compared with the figures of the 1941 Census:—

[Statement No. 152.]

S.T.-9.6

	-	Number	per 1,000.	
State and natural division.	ست	195	l.	1941.
Month of any invarian	Per- sons.	Males.	Females.	Per- sons,
(1)	(2)	(3)	(4)	(5)
Madras State	87	44	43	73
Madras Deccan Division.	88	43	45	69
West Madras Division.	84	40	44	73
North Madras Division.	90	45	45	72
South Madras Division.	86	43	43	73

It will be seen that the number of elderly persons has noticeably increased in 1951 and this is of course due to the longer duration of life consequent on the improvement in public health and in the provision of medical facilities in all the divisions.

The statement below gives the number of elderly persons per 1,000 of the general population in rural and urban areas:—

[Statement No. 153.]

	Number per 1,000.							
State and natural	Gene	General. B		_	Urban.			
division.	Kale.	Female.	Mele	Female.	, Made	Frank.		
' (1)	(2)	(3)	(4)	(5)	(6)	(7)		
Madras State	44	43	43	44	41	43		
Madras Deccan Division.	43	45	42	46	50	40		
West Madras Division	40	44	40	44	89	40		
North Madras Division.	45	45	47	45	88	42		
South Madras Division.	43	43	45	42	40	44		

Except in the Deccan division, the rural figures are higher than those of the urban areas. The persons in this group were of the age of 45 or above in 1941 and naturally it was largely the younger persons who moved to the towns to take advantage of the growth of industries, thus, resulting in a larger proportion of the older group staying behind in the rural areas. In the Deccan division, the urban figure exceeds the rural figure by a slight margin. In this division. it is only in the Bellary and Anantapur districts that the urban figure exceeds the rural figure and this is due to the fact that the towns in these two districts, unlike those in the other two districts, viz., Cuddapah and Kurnool, are attractive, particularly Anantapur and Bellary towns, and many retired officers have settled down in these towns.

The following statement compares the proportionate numbers of elderly persons per 1,000 of agricultural and non-agricultural classes:—

[Statement No. 154.]

	Number per 1,000.						
	Gene Popula		Agricul		Non-agri-		
State and natural				_	Classon		
division.						•	
	Meles,	Fomales	Malos.	Females	Kaje.	Females.	
(1)	(2)	(3)	(4)	(5)	(6)	(T)	
Madras State	44	48	45	45	40	41	
Madras Decean Division.	48	45	41	45	48	44	
West Madras Division	40	44	43	46	37	42	
North Madras Division.	45	45	47	47	41	40	
South Madras Division.	43	43	46	41	40	45	

It will be seen that, except in the Deccan division, the proportion of elderly persons is larger in agricultural classes than in non-agricultural classes. The position in Deccan division is different due to the slightly larger proportion of elderly persons among the non-agricultural classes in the districts of Kurnool, Bellary and Anantapur. The deviation is trivial. In the Nilgiris, the proportion of elderly persons is appreciably larger among the non-agricultural classes (839) than among the agricultural classes (640). This is not surprising as the population of this district is predominantly non-agricultural.

7. Conclusion.—(1) The following statement shows the age structure of the general population during 1941 and 1951:—

[Statement No. 155.]

	•	Age.	group.	Number per 1,000.			
						1951.	1941.
		(1)	Ç		(2)	(3)
0	••		••	••	. • •	26	25
1-4	••	••	• •	•	••	95	106
5-14		••	••	••	••	241	258
15-34	•	••	• •		••	335	339
35-54		٠	• •	••	••	216	199
55 an	d over	••	•• .	. ••	••	87	73

It will be seen that the age group 15 to 34 contains the largest proportion of the population. The proportion decreases as we go down to lower age groups and as we go up to higher age groups.

The corresponding figures for the divisions are given below:—

[Statement No. 156.]

Age group,		Dec	dras can ision.	We Mad Divis	ras	Ma	rth dras sion.	South Madras Division.

55 and	over,	. 88	69	· 84	73	90	72	86	73	

These figures have already been discussed in this chapter. They show the same trend, as the previous table for the State as a whole. The statement below gives the number of persons per 10,000 in the State as a whole in each of the age groups specified in

column (1) of the statement as ascertained at each Census from 1921-51:—

Age distribution for 10,000 of the general population—1921-51.

[Statement No. 157.]

Age	group		1921.	1931.	1941.	1951.
	(1)	•	(2)	(3)	(4)	(5)
0–9	••		2,583	2,734	2,713	2,396
10-19	••	••	2,014	2,054	2,142	2,181
2029	••	••	1,713	1,788	1,719	1,659
30-39	••	••	1,413	1,411	1,360	1,358
40-49	••	••	1,000	960	999	1,072
50-59	••	••	673	592	613	729
60 and	over	••	603	462	455	605

No detailed comments can be usefully made on these figures, as the 1921 and 1931 figures are those based on the 'smoothed' figures as tabulated at those Censuses. The 1941 figures are based on 2 per cent samples, while the 1951 figures are based on the 10 per cent samples and take into account the ages as actually recorded by the enumerators (without applying any 'smoothing' formula).

It will be seen from the 1951 figures that children aged 0—9 constitute 24 per cent of the population, while the number of old persons aged 60 and above account for about 6 per cent of the population. The proportion of the population in the working ages 20—60 is about 48 per cent. The decline in the birth rate is reflected in the smaller proportion of persons in the lowest age group (24 per cent in 1951 against 27 per cent in 1941) while the improvement in the average duration of life is reflected in the increase in the figures in the last three groups.

According to Sundbarg, the famous Swedish statistician, a normal population has about one-half of its total between the ages of 15 and 50, and the proportion of those above that age to those below it indicates, whether the population is increasing, stationary or decreasing. The youngest of the three population groups must be double the eldest, if the population is to continue to grow; just short of that point, it may be stationary but if the elder continues to exceed the younger the population would be regressive. It has been considered, that, for Indian conditions, the middle age group should be more appropriately 15 to 40. The percentages of the population in Madras

below:—

	Age	group.			Percentage.		
0-14	••	••	••	••	36		
15-40	••	••	••	••	43		
Above 40	••	••	••	••	21		

If, as I think, we consider it sounder to adopt the groups 15-44 and 45 and over for the last two groups, we shall get the following percentages:---

[Statement No. 158.]

State and natural division.		tage of p	
CAT ENOM.	0—14.	15-44.	45 and over.
(1)	(2)	(3)	(4)
Madras State	36	46	18
Madras Deccan Division	37	45	18
West Madras Division	38	45	17
North Madras Division	36	46	18
South Madras Division	36	46	18

Our population is clearly of the progressive

(2) Mean age.—The mean age for the State, as a whole, has increased from 24.13 in 1941 to 25.03 in 1951. The mean age figures for 1951 for each division and for each sex are given below:-

[Statement No. 159.]

Mean age-Madras State.

				Per- sons.	Males.	Females
1941	••	••	••	24·13	24.06	24-12
1951	••	••	••	25.03	25.20	24.86

State under the relevant age groups are given . Mean age-Madras State and natural divisions (1951).

State and natural division.	Per- sons.	Males, Females,			
Madras State	25·0 3	25.20	24.86		
Madras Deccan Division	25.55	25.06	26.06		
West Madras Division	25.20	24.50	25.85		
North Madras Division	26-17	26·2 6	26-10		
South Madras Division	25·7 3	25.80	25.66		
Madras Deccan Division West Madras Division North Madras Division	25·55 25·20 26·17	25·06 24·50 26·26	26· 25· 26·		

It will be seen that, in the State as a whole, as well as in the North Madras division and the South Madras division, the . male mean age is higher than the female mean age, while, in the other two divisions, viz., the Madras-Deccan division and the West Madras division, the female mean age is higher than the male mean age. The disparities are very small, except in the West. Madras division and in the Deccan division, . where the female mean age exceeds the male mean age by 1.35 and 1.00, respectively.

(3) Under the Constitution of the Indian Republic, elections to the State Legislative Assemblies, and to the House of the People in Parliament, are on the basis of adult franchise, i.e., all persons, who have attained the age of 21 on the qualifying date and possess the other qualifications prescribed for voters, are entitled to vote at these elections. It will, therefore, be interesting to mention in this report, what portion of the general population is covered by adult franchise. With reference to the age figures recorded at the 1951 Census, it has been ascertained that the persons who have completed the age of 21 constitute 50.8 per cent of the population, and this is thus approximately the proportion of the population covered by adult franchise in Madras State.

NOTE.—This table has been prepared from Table C-II. Bural/urban break up for column 7-10 has been done with reference to the District returns. The figures in column 6 have been obtained from the age tables prepared on Y sample slips of 1941 Consus.

^{*} No separate figures available for 1941.

CHAPTER X-LITERACY AND EDUCATION.

General remarks.—As will be seen from the subsidiary table 10.1, only 19.3 per cent of the population in the State as a whole is literate, i.e., can read and write in some language or other. The remaining 80.7 per cent of the population is either illiterate or only partially literate, that is, can only read but cannot write in any language. The percentage of persons who are partially literate in the State population is 1.9 leaving 78.8 per cent of population as illiterate, that is, persons who can neither read nor write in any language. The percentage of literacy among the males in the State as a whole is 28.6 while that among females is 10.

The rural areas lag far behind urban areas as may be seen from the statement below:—

[Statement No. 160.]

S.Ts.-

and 10.8

-10.2

Percentage of literates in rural and urban areas—Madras State.

State and natural division.	· 1	Rural.		Urban.			
	(2) suosia	(3)	Females. (F)	Persons. (9)	Kales. (9)	Females. (2)	
Madras State Madras Deccan Division. West Madras Division. North Madras Division. South Madras Division.	15·4 11·8 26·7 12·6 14·6	23·9 19·4	6-9	35·4 27·7 43·0 30·7 36·9	47·1 40·8 53·1 40·4 49·3	23·4 13·7 33·0 20·9 24·2	

The figures of percentage of literacy for the total population for males and females compare as follows for the State as a whole and the divisions:—

[Statement No. 161.]

Percentage of literacy in total population.

	Total.	Males.	Females.
(1)	(2)	(3)	(4)
Madras State	19.3	28.6	10 0
Madras Deccan Division	14 3	22.7	5.2
West Madras Division	28 6	38.8	19.0
North Madras Division	15.7	22.4	8.9
South Madras Division	19.7	30.3	9·2

It is not surprising to find that, in the Agency tracts, which are largely inhabited

by hill tribes, the percentage of literacy is only 4.7, the percentage ranging from 2 per cent in the Visakhapatnam Agency, to 2.5 per cent in the Srikakulam Agency, 5.8 in the East Godavari Agency and 8.5 in the West Godavari Agency. In the rest of the State, the percentage of literacy ranges from 9.5 in the Srikakulam Plains to 50.2 in Madras City. Malabar comes second with 30.9 per cent. Tirunelveli comes next with 25.7, Nilgiris, South Kanara and Tanjore coming next with 23.5, 23.3 and 23.2, respectively. The Tanjore percentage would have been higher but for the large population of Scheduled Castes in that district.

Cent per cent correctness cannot be claimed in the classification of the uneducated population into illiterates and others. It is possible that, in spite of the instructions, some enumerators did not take the trouble to satisfy themselves that persons who claimed to be literates were really so, that is, could in fact read a simple message or letter to a friend or relative and write such a message or letter. But, on the whole, however, the figures reflect correctly the relative position in the various districts.

The Srikakulam and Visakhapatnam districts are the most backward from the point of view of literacy, the percentage of literacy being 9.5 and 10 per cent, respectively.

Salem and Chittoor come next with 11.4 and 11.6 per cent, respectively. Then comes Madras Deccan division with 14.3 per cent. The figures of the districts in the Deccan division range from 12.5 in Kurnool to 16.8 in Cuddapah. It is nothing surprising to find that, in the West Madras division, 28.6 per cent are literate. It is well known that Malabar leads with 30.9 per cent in the mufassal in the matter of literacy. In the Agency tracts, the educational institutions are practically all directly provided by the Government and the figures show how much more has still to be done in the matter of even elementary education in these tracts. The problem in these tracts is not only to provide more schools, but to make the hill tribes' children attend them.

S.T.—10·1

2. Progress of literacy.—The statement below shows the progress of literacy from 1921 onwards:-

[Statement No. 162.]

Progress of literacy.

	- 103	Pe	rcentage	of literat	es.
State.		1921.	1931.	1941.	1951.
(1)		(2)	(3) *	(4)	(5)
		Per	aons.		
Madras	••	9.8	9.3	14.4	19.3
		М	ales.		
Madras	••	17.3	16.1	22.4	28.6
		Fen	rales.		
Madras	••	2.4	2.6	6.6	10.0

There was not much progress in literacy between 1921 and 1931. But since then. there has been a steady progress both among males and among females. Though the increase in the percentage of literates in 1951 is only slightly higher among males than females (6 per cent as against 4 per cent per decade), female education is still lagging far behind, a fact which is glaringly brought out by the 1921 figures of 17.3 per cent for males and 2.4 per cent for females. There has been a marked increase in female literacy: it has increased nearly four times since 1921, while the percentage of literacy among males has not even doubled itself.

3. Literacy among males.—As stated already, 28.6 per cent of the males in the State are literate. In the Agency tracts the percentage varies. Literacy among males is 7·1 in the Agency, ranging from 3·4 in the Visakhapatnam Agency to 12.3 in the West Godavari Agency. Of the remaining areas in the State, Madras Deccan division is, as is well known, the most backward with 22.7 per cent, the district figures ranging from 19.9 in Kurnool and 27 per cent in Cuddapah. The percentage of literacy in the Plains area in the North Madras division is 23. This is only slightly better than the Madras Deccan division. This position is due to the Srikakulam Plains with 15.7 per cent and Visakhapatnam Plains with 16.4 per cent, the figures for the remaining districts ranging from 21.2 in Nellore to 29.1 in West Godavari Plains. West Madras division leads with 38.8 per cent and South Madras division stands second with 30-3 per cent. The figures in the West Madras division range from 32.6 in South

Kanara to 41.4 in Malabar. Madras City of course leads in the whole State with 61.4 per cent. The figures for the other districts in the South Madras division range from 17.8 per cent in Chittoor district to 38.3 per cent in Tirunelveli district.

4. Literacy among females.—As already mentioned, only 10 per cent of the females in the State are literate. The percentage, as one would be expected to find, is the lowest in the Madras Deccan division (5.5 8.7—10-8 per cent) and highest in the West Madras division (19 per cent), the North Madras division and South Madras division coming in between with 8.9 and 9.2 per cents, respectively.

The position of literacy is thus much worse among females than among males; though, as mentioned earlier, the position has been improving. It can hardly be surprising to find that the percentage of literacy in the Agency tracts among the females ranges from 0.5 per cent in the Visakhapatnam Agency and 1.1 per cent in the Srikakulam Agency to 2.9 per cent in the East Godavari Agency and 4.7 per cent in the West Godavari Agency.

Madras City naturally leads with 38 per cent literacy among females; Malabar is second with 21 per cent and South Kanara third with 14.8 per cent, just what one would expect to find. It is well known that these districts lead as regards literacy among women also. Among the other districts, the percentage ranges from 3.6 per cent and 3.8 per cent in the Srikakulam and Visakhapatnam Plains to 14.6 in West Godavari district. The percentage of literacy in the Godavari and Krishna deltas is higher than in the Cauvery delta. Srikakulam and Visakhapatnam districts are naturally the most backward from the point of female literacy also. In these two districts, as well as in two districts in the Deccan division. viz., Kurnool and Bellary, and in Salem, the percentage of literacy is below 5 per cent; Chittoor and South Arcot are only slightly better with 5.2 per cent and 5.9 per cent, respectively, and the position is far better in Tirunelveli district (13.8 per cent) than in the other mufassal districts in the South Madras division.

5. Livelihood classes.—The percentage of literacy for the population, males and

S.T.-10.2

emales combined, in each livelihood class is sollows in the State and in each division:—
[Statement No. 163.]

Percentage of literacy.

				_ ~		
Liveli hood class.		State.	Madras Deccan Divi- sion.	West Madras divi- sion.	North Madras divi- sion.	South Madras divi- sion.
(1)		(2)	(3)	(4)	(5)	(6)
I,		15.4	12.7	38.3	14.4	15.4
11		15.9	11.7	27.2	10.1	12-1
ш		7.0	6.8	13.4	5 ·5	6· 2
IV		39.1	23.6	57.4	39.9	37.0
7		22.8	16.6	28.8	17-1	24.0
VI ·		38-6	31.8	37.7	32·7	41.7
VII		33.8	28.6	29.8	26.2	38.5
VIII	••	29.9	16.5	34.2	28.1	31.8

It is not surprising to find that the largest percentage of literates is found in Class IV (Non-cultivating land-owners and agricultural rent-receivers and their dependants), Class VI (Commerce), Class VII (Transport) and Class VIII (Other Services and Miscellaneous sources of income), and that it is lowest among cultivating labourers (Class Class I and Class II, i.e., cultivators of land, owned and unowned and their dependants, and Class V (Production other than cultivation) occupy an intermediate The Madras Deccan division presents roughly the same picture as the State as a whole; in the West Madras division, particularly in Malabar and South Kanara, Class I occupies the second position from the point of view of literacy; in fact this class comes next to Class IV in this respect. These are districts of large landlords and this is therefore nothing surprising. In the Krishna and Godavari deltas also we find Class I occupying a respectable place from the point of view of literacy (23.6, 26.6 and 23.3 per cent). The position in Tanjore and Tirunelveli districts is similar. Madras City, where the agricultural classes are of course quite unimportant, Class VI (Commerce) has the highest percentage of literacy (63.7 per cent), Class VIII coming second with 49.5 per cent, Class VII (Transport) coming third with 44.1 per cent and Class V last, with 41.2 per cent. These are the figures one would expect to find in the City; the large percentage under Class VIII relates to the large population consisting of employees of Governments and persons belonging to the professional services, who will naturally be keen on the education of their children. The other districts follow the general pattern of the State as a whole.

Literacy among males by livelihood classes.—The figures are given in the statement below; no special comments are called for:—

[Statement No. 164.]

Males.

S.T.-10.2 Percentage of literacy. Madras West North South Class. State. Madras Deccan Madras Madras dividividividivision. sion. sion. sion. Literacy among females by livelihood sclasses.—The statement below gives the percentage of literacy by livelihood classes among females:—

[Statement No. 165.]

Females.

Percentage of literacy.

Cla	88	State.	Madras Deccan divi- sion.	West Madras divi- sion.	North Madras divi- sion.	South Madras divi- sion.
· (1)	(2)	(3)	(4)	(5)	(6)
I		6.2	4.0	25.9	8.3	4.5
п		8.2	$5 \cdot 2$	18-4	$5 \cdot 2$	3.3
ш		2.8	3.2	7-1	2.6	1.8
IV		27.2	$12 \cdot 4$	50.0	$28 \cdot 4$	23.5
V		10.4	4.9	16.8	7.6	10.3
VI		$22 \cdot 4$	$12 \cdot 2$	24· 4	18· 4	24-4
VII		$22 \cdot 2$	14.8	21.2	17.4	$25 \cdot 2$
VIII		19-4	8.4	24.6	17.7	20.5

The figures call for no special notice except the poor figure of Tanjore (8.3 per cent under Class I) when compared with the other districts which contain large deltaic areas, viz., East Godavari, West Godavari, Krishna and Guntur. There is no doubt that the Tanjore figures would show considerable improvement in this respect in future, with the spread of interest in education and the growing desire even among women to get educated.

S.T.—10·1

6. Analysis of literates by educational standards.—The statement below shows the distribution of 10,000 literates by educational standards in the State and in each M.T.—D-VII of the divisions:—

[Statement No. 166.]

Distribution of 10,000 literates in each natural division and State by educational standards.

Educational standard.	Madras State.	Madrae Decean Division,	West Madras Division.	North Madras Division	South Madras Division.

Medical	7	11	6	9	7
Others	5	• •	9	7	4

Column (1) of this statement is the same as in the Main Table D-VII.

[Statement No. 167.]

It will be seen that less than 12 per cent of the literates in the State have attained the Middle School or higher standard of education; only about 3.4 per cent of the literates have attained the Matriculation or S.S.L.C. standard. The percentage of literates, who have attained the Intermediate or higher standard, is only 1.8.

Though the West Madras division has the highest percentage of literacy in the State. the proportion, which has attained the Middle School or higher standard, is smaller in this division than in the other divisions. The South Madras division leads (5.8 per cent) in regard to the proportion of literates, who have attained the Matriculation or higher standard. The corresponding figures for the Deccan division and the North Madras division are 5.4 per cent and 5 per cent, respectively. At first sight, this takes one by surprise, but the position is explained by the fact that, of these two divisions, the Deccan division is undoubtedly more backward, and that those who take to education at all in that division are of the classes, which would be interested in going in, as far as possible, for higher education.

The statement below analyses the literates, in the general population and in each Livelihood class, by educational standards:—

10,000 literates in the General population and in each livelihood class arranged according to educational standards.

It will be seen, that Class VIII shows the largest figures under each educational standard of and above the S.S.L.C. This is not surprising, as this is the class to which the professional services and employees of Government and local authorities belong, and these are precisely the sections of the population, which are most keen on higher education for their children. It will also be seen that Agricultural Class IV (i.e., noncultivating owners of land and rent receivers and their dependants) and the non-agricultural classes are the ones, which take most to higher education; in other words, the first three agricultural classes are the most backward, from the point of view of higher education, Class III (cultivating labourers) being at the bottom of the list. It is again no surprise to find that Classes VIII and IV have made the largest contribution to the Legal and Medical professions.

7. Distribution of illiterates by age groups.—The statement below shows the distribution of illiterates by age groups:—

[Statement No. 168.]

Statement showing the distribution of 10,000 illiterates by age-groups.

Madras State.

	Number per 10,000 illiterates.			
	(2)			
5-9		••	 	1,568
10-14		••	 	1,313
15-24	• •	• •	 	1,878
25-34			 	1,698
35 -44		• •	 • •	1,393
45 54		• •	 • •	1,102
55-64			 	672
65_74			 	274
75 and over		••	 ••	102

These figures do not include persons, who are partially literate, i.e., persons who can only read but cannot write in any language. It will be seen that the first two age-groups together account for 29 per cent of the illiterates. These two groups are below the age of 15. Nineteen per cent is in the age group 15 to 24, 17 per cent in the age-group 25 to 34, 14 per cent in the group 35 to 44, and 11 per cent in the group 45 to 54. The first three age-groups account for nearly 50 per cent of the illiterates. These figures indicate that the most effective way of tackling illiteracy will be by attending to the children below 15, and that the next important section to be tackled are the young persons between 15 and 34.

The following statement shows the total number of educational institutions of all kinds in each district and the average population served by one institution:—

[Statement No. 169.]

State, natural division and district.	Total number of edu- cational insti- tutions,	Average popula- tion served by one insti- tution.	Percentage of literate population

It will be seen that it is not possible to trace any uniform correspondence between the percentage of literacy in a district and the average population served by one institution in that district, and that the figures disclose a number of disparities. This is because the percentage of literacy depends, not only upon the number of schools provided proportionately to the population, but also on the extent to which the schools have been actually availed of by the population in each area.

- 8. Distribution of literacy by sex and [Statement No. 170.] livelihood class.—Subsidiary Table 10-4 shows the distribution of 10,000 literates by sex and livelihood class by educational standards. The figures show that generally females lag behind the males in the matter of general education.
- 9. Conclusion.—The statement below compares the position as regards literacy in Madras State with that in some of the important States in India.

States.		Percentage of literates (all ages),						
States.		Persons.	Males.	Females.

CHAPTER XI-LANGUAGES.

Mother-tongue.—The distribution of 10,000 of the population speaking the more important languages in the State is given in the statement below:—

[Statement No. 171.]

Distribution of population by mothertongue spoken in the State and natural divisions.

(For 10,000 of the general population.)

Mother to spoker		State.	Madras Deccan Divi- sion.	West Madras Divi- sion.	North Madras Divi- sion.	South Madras Divi- sion.
(1)		(2)	(3)	(4)	(5)	(6)
Tamil	••	4,298	· 94	355	37	7,864
Telugu		3,815	7,033	73	9,390	1,500
Malayalam	••	917	10	7,409	5	54
Kannada	••	364	1,649	521	2	288

Lambadi		13	100		12	2
English	••	6	1	. 6	1	9
Other langua	ges	79	88	191	131	28

The important languages are Tamil, Telugu, Malayalam, Kannada, Hindustani-cum-Urdu and Tulu. Urdu and Hindustani are spoken as mother-tongue only by Muslims and such Muslims are to be found only among those who have come from Northern India and among Muslims in the Telugu districts and in Madras City. The Muslims in the mufassal districts in Tamil Nad speak only Tamil in their houses, but it will be seen from Table D-I that nearly five lakhs of persons in the mufassal Tamil districts have claimed Urdu or Hindustani as their mother-tongue. It is true that these Muslims study their Quoran in Arabic, but their mother-tongue is undoubtedly Tamil, and this claim of Urdu or Hindustani as their mother-tongue-under our instructions, the enumerator had no option but to accept the answer given by the person enumerated—is the result of the attitude of many Muslims in recent years. The Mopalas of Malabar speak only Malayalam as their mother-tongue. Tulu is a language spoken only in South Kanara and by the Tulu-speaking people, who have emigrated from there. The same remark applies to Konkani also, which is spoken only by about 43 persons out of every 10,000 persons in the State. In this State, Oriya is spoken only in the areas adjoining the Orissa border and by the emigrants from Orissa State, the total number of such persons being about 29 out of every 10,000 of the population of the State.

- (1) Sourashtras.—There are 64,170 males and 60,316 females whose mother-tongue is Sourashtra. It is the mother-tongue of the Sourashtra community who are mostly weavers by profession. The Sourashtras of Madurai have shown great enterprise in textiles. They do weaving of handloom cloth and dyeing of yarn and cloth. The community is practically confined to the South Madras division, more than half of it being in Madurai district. In fact, Madurai town may be called the headquarters of this community. The community has spread out to other districts where they have settled down mostly as handloom weavers and traders in textiles and dves. Sourashtra has no script of its own and it is only a spoken language.
- (2) Hindi.—Over one lakh people—60,825 males and 48,444 females—have returned Hindi as their mother tongue. It will be found that these returns occur in all the districts. Actually, Hindi is the mother-tongue in the case of only a section of the immigrants from States in Northern India. The number of persons who have claimed Hindi as their mother-tongue exceeds the number of immigrants from Northern India, showing that the figures are vitiated by the feeling on the part of a number of persons that they should return as their mother-tongue the official language of the Indian Union.
- (3) Marathi.—75,583 males and 69,457 females have returned Marathi as their mother-tongue. In a number of districts there are Mahratta families whose mother-tongue is Marathi, e.g., in Tanjore town, where we find a number of Mahratta families who have been there since the time of Mahratta Kings of Tanjore. The figures include also Mahrattas who have migrated to this State.
- (4) Lambadi.—Lambadi is the language spoken by the Lambadi community, which is

a backward one. A very large percentage of the Lambadis used to be registered under the Criminal Tribes Act, but in recent years they have settled down more and more to cultivation, thanks to the concessions shown to them by the Government as a backward class in the matter of land assignments. In the State, as a whole, there are 39,042 males and 35,701 females of this community. They speak Lambadi among themselves, but speak the regional language, while conversing with others. The women are easily identified by the gorgeous check patterns in their dress and the peculiar ornaments worn by them. As is well known, the bulk of them are found in the Deccan division. Bellary and Anantapur being ·heir strongholds, the other important districts for this community being Krishna, Guntur and Chittoor.

- (5) Badaga.—This is a corrupt form of Kanarese, the Badagas being persons who formerly migrated from Mysore State. This has no script of its own and it is only a spoken language. There are 33,463 males and 33,822 females, and, as is well known, they are practically all to be found in the Nilgiris district. They used to be backward, but latterly their condition has improved con iderably and they are now enterprising cultivators, particularly potato cultivation, and education is spreading among them.
- (6) Koya, Saora, Jatapu or Khend, Gadaba and Toda.—These are languages spoken only by certain hill tribes. The Toda language has no script, and is only a spoken language spoken only by the small Toda community, consisting of 426 males and 453 females. They are found only in the Nilgiris district. It is a well-known community which has attracted a great deal of attention, and there is a considerable literature about them.

The Koyas, Saoras, Jatapus and Gadabas are well-known hill tribes—all in the Agency tracts—but a small number of these are found in the Plains areas, particularly in those adjoining the Agency tracts. They are extremely backward and prefer to live in the hills. In this State, the Koyas are the most numerous among these tribes. Other hill tribes speak only the regional language.

(7) Yerukula, Irula or Korava.—This is a backward community which lives by begging and by making baskets, and large numbers of them still live a nomadic life.

Their's also is a spoken language without any script. They are found mostly in the Guntur and Nellore districts in the Circars and in the Deccan Division, but some, mostly nomadic, are found in the Tamil districts also.

(8) Gujarati, Bengali, Punjabi, Nepali and Marwari.—These languages are spoken only by immigrants with these languages as their mother-tongue. There are a number of Gujarati merchants in the State; the number of Marwaris is very small and they are mostly money-lenders (478 males and 257 females).

Though the number of displaced persons from Pakistan is small (9,113) in this State, it has swollen the figures of Sindhis and Punjabis in the State, particularly the Sindhis, to whom the bulk of the displaced persons in this State belong.

- (9) The other Asiatic and European languages returned as 'mother-tongues', are of course, those spoken by persons from those countries, who are in this State, in connexion with their business or professional activities. But all these are small numbers. Among the European languages, the only appreciable figure is that of English—17,420 males and 17,378 females, out of which 8,380 males and 10,468 females are in Madras City. These figures include of course Anglo-Indians whose mother-tongue is English.
- (10) Comparison with position in 1931.

 —Language figures were not tabulated at the 1941 Census, and the figures given below compare the figures of 1951 and 1931:—

[Statement No. 172.]

Distribution of 10,000 persons by mother-tongue spoken and comparison with 1931.

	1951.	1931.				
	(2)	(3)				
Tamil					4.298	4,004
Telugu				• •	3,815	3,768
Malayalam	• •				917	790
Kanarese				• •	364	357
Hindustani-	cum-T	rdu			272	261
Tulu	••			• •	123	120
Konkani				• •	43	43
Oriya					29	391
Hindi		••.			19	4
Lambadi		••	• •		13	11
English				••	6	8
Others			••	• •	101	243

It will be seen that the relative position of all the important languages continues unchanged. The decrease in the Oriya figure since 1931 is of course due to the transfer of a portion of the old Madras Province to Orissa Province in 1936.

2. Bi-lingualism.—The main table D-I (ii) indicates the extent to which bi-lingualism prevails in the State. Column (2) of the table gives the total number of persons using the specified language as their mother-tongue, while column (3) gives the number of persons speaking a language subsidiary to the mother-tongue. The subsidiary language in column (4) is the Indian language other than the mother-tongue, which the person enumerated commonly speaks. Column (4) gives the population by each

subsidiary language for the figure given in column (3). Under subsidiary languages, enumerators were instructed to record only the Indian language if any commonly spoken by the person enumerated besides his mother-tongue, i.e., the language used by him in his daily life. If he spoke more than one Indian language besides his mothertongue, only the one which he most commonly used was to be recorded. Not more than one subsidiary language was thus recorded in each case. Naturally, the most important subsidiary languages are also the most important regional languages of the State, viz., Tamil, Telugu, Malayalam and Kannada.

CHAPTER XII—RELIGION.

The detailed figures by religions are given gives the distribution, by religion, per in Main Table D-II. The statement below 10,000 persons of the general population:—
[Statement No. 173.]

Number per 10,000 of the population who are

•	Hindus.	Sikhs.	Jains.	Bud- dhists.	Zoroas- trians.	Muslims.	Chris- tians.	Jows.	Others.		
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)		
Madras State	8,769	1	6	••	••	796	426	• •	2		
Madras Deccan Division	8,407	••	5	• •	1	1,238	349	• •	••		
West Madras Division	6,728		16	• •		2,740	516	´ • •	••		
North Madras Division	9,058	••	1	• •	••	384	557	••	••		
South Madras Division	9,145	1	7	••	1	485	3 58	• •	3		

It will be seen that the only religions which have a large following in this State are Hinduism, Muhammadanism and Christianity, the percentage of the population following these three important religions being 87.7, 8 and 4.3, respectively. Of the other religions, the Jain religion forms the largest percentage, but even that religion accounts for only 0.06 per cent of the population. The Hindus (about 50 millions) are of course found in very large numbers in all the districts. The Muslims (about 4.5 millions) are also found in all the districts. They are found in appreciable numbers only in the districts of Krishna, Guntur and Nellore in the Circars, and in the Deccan division, South Madras and West Madras divisions. The largest Muslim population is of course in Malabar district (15.9 lakhs), on account of the large Moplah population there. The Christians (about 2.4 millions) are also found in all the districts, but they are found in appreciable numbers only in the districts of East Godavari, West Godavari, Krishna, Guntur and Nellore in the Circars: and in Cuddapah and Kurnool districts in the Deccan division, the South Madras division (except Chittoor and Salem), and in the West Madras division. Guntur has the largest Christian population (3.6 lakhs) in the State, while Tirunelveli comes second with 2.7 lakhs.

There are about 36,000 Jains in the State, the bulk of them being in the South Madras division. As is well known, South Kanara-district has the largest Jain population, about 9,100, North Arcot comes next, then Madras City and then South Arcot. The number of Jains in the other districts is quite negligible.

As will be seen from the fly leaf to Main Table D-II, about 8,700 persons returned themselves as Atheists, mostly from the Tamil districts, Salem being the leading district in this matter, presumably as a result of the atheistic propaganda in very recent years.

It is important to mention that there are no tribal religions in this State, and that even the hill tribes here follow the Hindu religion. It is of course well known that the Hindu religion is practised in various ways by the different classes, particularly among the Backward Classes.

The variation in the percentage of population following each main religion is compared in the statement below for 1941 and 1951:—

[Statement No. 174.]

Distribution of and variations in population by main religions, 1941-51.

Main religions.	Numb 13,000 latio		V	age aria- tion.	Actual popu- lation in		
rongions.	1941. 1951.			41-51.	1951.		
(1)	(2)	(3)		(4)	(5)		
All religions.	••	••	+	14-4	57,016,002		
Hindus	8,677	8,769	+	15-6	49,995,318		
Muslims	788	796	+	15.6	4,538,136		
Christians.	415	426	+	17-6	2,431,006		
Jains	6	6	+	18.6	35,778		
Sikhs		1	+	575-9	2,859		
Buddhists.		••	+	28-1	1,375		
Jews	• •		+	148-2	474		
Others	114	2	_	98-1	11,056		

It will be seen that the main religions have maintained their relative positions, as one would expect to find. The population of the State, as a whole, has increased by 14-4 per cent. The percentage increase in the number of Hindus, Muslims and Christians has been, respectively, 15-6, 15-6 and 17-6 during the decade 1941-51. No special remarks are called for.

CHAPTER XIII—BACKWARD COMMUNITIES.

Scheduled Castes -- Scheduled Castes are 341 of the Constitution. These castes are the communities recognized as such in the President's notification issued under Article

specified below :-

The population of the Scheduled Castes in this State is over 8.5 millions, i.e., 15 per M.T.-D.III cent of the total population. The statement below gives the percentage of the Scheduled Castes population in each division and district :--

[Statement No. 175.]

Statement showing the proportion of Scheduled Caste population to the total population in each district and territorial distribution of 10,000 Scheduled Caste persons in the State.

Nonce.					
Serial number, State, natural division and district.	Proportion of Scheduled Caste population to the total population (percentage). Malabar	8.3	460	Ramanathapuram.	14.3	349
South Kanara	6.5	. 133	Tirunelveli	15.2	435

It will be seen that the South Madras division leads in regard to the Scheduled Castes population, and the other divisions in the order of the Scheduled Castes population are North Madras division, Deccan division and the West Madras division. The Scheduled Castes are, of course, found in all the districts. The districts which have over 3 lakhs of Scheduled Castes population are East Godavari, Anantapur, Chingleput, Chittoor, North Arcot, Salem, Coimbatore, South Arcot, Tanjore, Tiru-Madurai. Tirunelveli chirapalli, Malabar.

2. Scheduled Tribes.—Scheduled tribes are the tribes notified as such by the President under Article 342 of the Constitution. These tribes are specified below:-

I Aranadan.

- Bagata. . 3 Bhottadas—Bodo Bhottada, Muria Bhottada and Sano Bhottada.
- 4 Bhumias—Bhuri Bhumia and Bodo Bhumia.
- 5 Chenchu.
- Gadaba-Boda Gadaba, Cerllam Gadaba, Franji Gadaba, Jodia Gadaba, Olara Gadaba, Pangi Gadaba and Pranga Gadaba.

Gondi-Modya Gond and Rajo Gond.

- Goudus-Bato, Bhirithya, Dudhokouria, Hato, Jatako and Joria.
- Kosalya Goudus, Bosothoriya Goudus, Chitti Goudus, Dangayath Goudus, Doddu Kamariya, Dudu Kamaro, Ladiya Goudus and Pullosoriya Goudus.
- 10 Magatha Goudus-Bernia Goudu, Boodo Magatha, Dongayath Goudu, Ladya Goudu, Ponna Magatha and Sana Magatha.
- 11 Holva.
- 12 Jadapus.
- 13 Jatapus.
- 14 Kammara 15 Kattunayakan.
- 16 Khattis-Khatti, Kommarso and Lohara.
- 17 Kodu.
- 18 Kommar.
- 19 Konda Dhoras.
- 20 Konda Kapus.
- 21 Kondareddis.
- 22 Kondhs—Desaya Kondhs, Dongria Kondhs, Kuttiya Kondhs, Tikiria Kondhs and Yenity Kondhs.
- 23 Kota.
- 24 Kotia-Batika, Benthe Oriya, Dhulia or Dulia, Holva, Paiko, Putiya, Sanrona and Sidho Paiko. 25 Koya or Goud, with its sub-sects—Rasha Koyas,
- Lingadhari Koyas (ordinary) and Kottu Koyas. 26 Kudiya.
- 27 Kurumans.
- 28 Manna Dhora.
- 29 Maune.
- 30 Mukha Dhora-Nooka Dhora.
- 31 Muria.
- 32 Paigarapu.
- 33 Palasi. 34 Panivan
- 35 Porjas-Bodo Bonda Daruva, Didua, Jodia, Mundili, Pengu, Pydi and Saliya.
- 36 Reddi Dhoras
- 37 Savaras—Kapu Savaras, Khutto Savaras and Maliya Savaras.
- 38 Sholaga.
- 39 Toda.
- 40 Inhabitants of the Laccadive, Minicoy and Amindivi Islands, who, and both of whose parents, were born in these islands.

The total population of the Scheduled Tribes in this State is 6.36 lakhs or 1.1 per cent of the total population. Of this, M.T.—D-III 4.82 lakhs or 76 per cent are in the North Madras division, 68,565 or 11 per cent in the West Madras division, 61,882 or 10 per cent in the South Madras division and 23,549 or 3 per cent in the Deccan division vide the statement below:-

[Statement No. 176.]

Statement showing the proportion of Scheduled Tribes to the total population in each district and territorial distribution of 10,000 members of Scheduled Tribes in the State.

	members of Screau	ilea I'ribes in	i the State.

	Madurai	••	•:
	Ramanathapuram. Tirunelveli	••	1
	Tirunelveli	••	••

As is well known, these tribes are found mostly in the Agency tracts in the North Madras division, the three districts in the West Madras division, Kurnool district

and certain hills in the North Arcot, Coimbatore and South Arcot districts. The Kurnool figure of 10,445 refers to the Chenchus, one of the well-known hill tribes, who live mostly in the Nallamalai forests in the Kurnool district.

3. Todas.—The Todas are a Scheduled Tribe in this State and they are found only in the Nilgiris. Special reference is made to this tribe here because the main point discussed in the literature on Todas referred to in sub-paragraph 6 of paragraph 1 of Chapter XI above is the apprehension that this tribe might die out, if proper remedial measures are not taken in time. I have personally never felt justified in taking such a pessimistic view, and my opinion is confirmed by the population figures relating to this tribe, as recorded at the various censuses:—

[Statement No. 177.]

Toda population—The Nilgiris.

	Yes	r.	·	ersons.	Males.	Females	
:	(1))		(2)	(3)	(4)	
1921				640	360	280	
1931	•••			597	340	257	
1941				630	342	288	
1951	••	••	••	879 ·	426	453	

It will be seen that there has been a large increase in the population between 1941 and 1951—a much larger increase than in the State population. (This abnormal increase indicates, I am afraid, underenumeration in 1941 and 1931.) While it is reasonable and necessary to do everything possible for the uplift of this very interesting and backward tribe, particularly in regard to the improvement of its health and social reform by way of stopping the objectionable practice of polyandry, there seems to be no ground for any panicky feeling about the survival of the tribe. It will be seen a state of the tribe of the first time of the seen and the survival of the tribe of the first time of the seen and the seem and the

a slight excess of females over males. This is a welcome sign, in view of the practice of polyandry referred to above.

4. Non-backward classes.—The population of non-backward classes, i.e., the communities listed as such by the State Government for the purpose of Question 2 (c) in the Census Questionnaire is 28,130,176, i.e., 49.3 per cent of the total population. A list of these communities is given below:—

		- C
2	Adi-Velama. Balija. Brahman.	14 Muslims other than Dudekula, Labbais and Mappillas.
4	Bunt.	15 Nadar.
5	Christians other than	16 Nattukottai Chettiyar.
	Harijans and tribes	
•	converted to Chris-	17 Navar.
	tianity.	18 Padma-Velama.
6	Gounder.	19 Raju (Raja).
7	Gramani.	20 Reddi.
8	Kamma.	21 Telaga.
9	Kapu.	22 Thiyya.
	Karkatars.	23 Udayar.
11	Kavara.	24 Vaisya (Chetti.
	Lingayat.	Komati).
13	Mudaliar.	25 Vellalas.

All communities other than those included in the above list will, according to the State Government, be treated as Backward Classes, which will accordingly comprise the Scheduled Castes, the Scheduled Tribes and other Backward Classes. The population of these 'Other Backward Classes' is 19,716,215, that is 34.6 per cent of the total population.

The statement below shows the percentage of literates in the (1) total population, (2) non-backward classes, (3) Scheduled Castes, (4) Scheduled Tribes and (5) other backward classes:—

[Statement No. 178.]

Other backward classes .	. 19	.716.215	14.85

CHAPTER XIV—NON-INDIAN NATIONALS.

The number of non-Indian nationals in this State on the Census date, viz., 1st March 1951 was only 15,696-7,549 males and 8,147 females. By non-Indian nationals is meant all persons who are citizens M.T.—D-VI of countries other than India. Citizens of Pakistan also are therefore non-Indian nationals. Of these nearly 12,491 (80 per cent) were in the South Madras division. The number in the Deccan division (150) is negligible, while that in the North Madras division is also small (1,188). The West Madras division comes next with 1,867.

> According to the district figures in column (2) of Main Table D-VI, South Arcot leads with 5,089 non-Indian nationals. This bloated figure is due to the 4,336 French Indians enumerated in this district. This large number of French Indians need not cause any surprise, as there are Pondicherry and other French possessions in this part of the State which are really enclaves in this district and it is quite likely that this number of French Indians, who have their relatives and in some cases who have their own houses in this district were there during the enumeration period. If we leave out French Indians, Madras City, as one would expect to find, leads with 2,884 non-Indian nationals. These persons are employed in large commercial, banking and engineering firms in the City, the Buckingham and Carnatic Mills (textiles) and match factories.

> According to columns (5) and (6) of Main Table D-VI, as many as 772 persons (482 males and 290 females) returned themselves as nationals of Pakistan. The official figures of the State Government show that there were in this State only 45 persons during February 1951 and 64 persons during March 1951 covered by temporary permits issued under the Permit Rules. It is, therefore, doubtful if the enumeration of these 772 persons as nationals of Pakistan was correct. There were only 63 such persons who were enumerated in Madras City and as many as 193 persons in Madurai district. Under the instructions, the enumerators could treat as displaced persons only those who had left their homes in West Pakistan or

East Pakistan, as the case may be, on or after 1st March 1947 and 15th October 1946, respectively, on account of civil disturbances or the fear of such disturbances, or on account of the setting up of the Dominions of India and Pakistan. It is possible that persons who had come over to India before these dates and who did not claim to be Indian citizens were correctly enumerated as nationals of Pakistan, but I am not sure that there has been no mistake in the enumeration. Fortunately, the number involved is only about 700 persons, and the error cannot be anything serious.

Among the non-Asiatic nationals, the British, of course, lead. Including the figures for Scots, as they should have been under British, the figures under British are 1,314 males and 1,385 females. Next come the Americans with 289 males and 299 females. Under the Americans, British and other European nationals, we have a number of missionaries, including those employed in mission hospitals and educational institutions.

The figures under Burmese, Ceylonese and Malayans cannot be taken at their face value. Except perhaps in respect of a very small number, these figures are, I am afraid, wrong, and really relate to Indian nationals, who were either born in those outside countries or have stayed there for long periods, and whom the enumerators have wrongly classified as non-Indian nationals, in spite of clear instructions that nationality should not be deduced either from the birth place or from race, that it means exactly citizenship status and that each person should be enumerated as the national of the country of which he is a citizen and claims to be a citizen. These incorrect figures account for about 2,600 persons. If allowance is made for this error, the number of non-Indian nationals will go down to 13.096.

Two thousand, three hundred and ninetynine French Indian males and 3,670 French Indian females have been enumerated, the districts in which they were mostly found

being Madras, Chingleput, South Arcot and Tanjore. The position regarding South Arcot has already been mentioned. In Tanjore, there is the Karaikal French Settlement and the position in this district is similar to South Arcot district, though the number of French Indians enumerated in this district is much smaller—as one would expect to find—as Karaikal is a much smaller settlement than the Pondicherry area.

Discrepancies between the figures in main Table D-IV, which relate to birth place and those in main Table D-VI, which relate to citizenship status, must be expected. People usually have the same citizenship status as their parents, but may have been born in countries to which the parents might have migrated temporarily. The discrepancies found between the figures in the two tables need not therefore cause any surprise.

CHAPTER XV-INCIDENCE OF LEPROSY.

Preliminary remarks.—The Government of India left one question in the Census questionnaire to be settled by the State Government, and the Government of Madras decided to have a Census of the incidence of leprosy in the State. The appended elaborate instructions-vide Appendix I, were given to enable the enumerators to distinguish between definite and doubtful cases of leprosy. Practically all the enumerators were laymen and we cannot claim any great accuracy for a census of this kind taken by laymen. However, there is no reason to think that the inquiries were not conducted fairly satisfactorily and that the figures are not useful as a basis for investigations, by experts.

The Census data tabulated in Main Table D-VIII has been analysed in Subsidiary Tables 15.1 to 15.4.

2. (1) Review of the Census data.—It will be seen from subsidiary tables 15.1 and 15.2 that, in the State as a whole, the census disclosed 53,688 definite leprosy cases and 18,434 doubtful cases, or 72,122 infected cases in all, i.e., roughly 0.13 per cent of the population. The infection is heaviest in South Madras division, 0.16 per cent, the North Madras division comes next with 0.1 per cent, then the West Madras division with 0.08 per cent, and lastly the Deccan division with 0.03 per cent. In the districts, the infection per 10,000 of the population varies from 2 to 47. The most heavily infected districts are South Arcot (47 per 10,000), North Arcot (25), Chingleput (23), East Godavari (20), Chittoor (18), Srikakulam Plains (15), West Godavari, Tiruchirapalli and Madurai (14) and Salem (13). This tallies with the general view held as to the heavily infected districts in the State. The infection is less in Malabar than in South Kanara, and is 6 per 10,000 in the Nilgiris. The districts which call for special attention in regard to eradication of

leprosy may accordingly said to be all the districts mentioned above and Visakapatnam, Tanjore and Tirunelveli districts, the first attention being given to the heavily infected districts.

The figures in Subsidiary Table 15-1 show that the number of infected cases is much larger among males than among females—more than twice and nearly thrice. We cannot take this disparity between males and females at its face value, as the enumerators must have found it far more difficult to register all the infected cases among the females: the infected cases which escaped their notice must be expected to have been larger in the case of females than in the case of males.

It will be seen from Subsidiary Table 15.3 that the number of infected cases in the rural areas is over six times that in the urban areas in the State as a whole; and this rural-urban proportion varies from division to division. A much larger number of cases must be expected from the rural areas, as they constitute a much larger proportion of the area of the State and the population there is nearly four times that of the urban population. The same Subsidiary Table shows that 14 out of 10,000 persons in the rural population are infected and 9 per 10,000 in the urban areas, and these proportions also vary from division to division. It will be seen from the same table that, taking the most heavily infected districts in the State, viz., South Arcot. North Arcot, Chingleput and East Godavari. the infection in the rural areas varies from 19 per 10,000 in East Godavari to 50 per 10,000 in South Arcot district, the corresponding figures for the urban areas varying from 15 in North Arcot to 25 in South Arcot

(2) The Subsidiary Table 15-4 shows the incidence of leprosy by livelihood classes and for each sex.

(3) The statement below shows the distribution of 1,000 infected persons by livelihood classes in the State as a whole

and in the Natural divisions and selected districts irrespective of sex:—

[Statement No. 179.]

Statement showing the distribution of 1,000 infected cases in the State, Natural division and some selected districts, according to livelihood classes.

State, natural division and district.	I.	п.	III.	IV.	Total agricul- tural classes.	v.	vī.	VII.	VIII.	Total non-agri- cultural classes.
(1)	(2)	(3)	- (4) -	(5)	(6)	(7)	(8)	(9)	(10)	(11)
Madra e State	394	89	200	35	₹718	87	45	9	141	282

West Madras Division.	98	224	168	34	524	131	61	14	270	476
North Madras Division.	319	89	279	36	723	73	42	10	152	277
South Madras Division.	445	75	181	36	737	87	45	8	123	263
Selected districts—					. '	. •	•	•		74
South Arcot	512	82	236	- 30	860	45	22	3	70	140
East Godavari	218	92	351	49	710	76	47	15	152	290
North Arcot	462	76	200	44	782	87	43	8	80	218
Chingleput	385	85	170	28	668	120	68	16	128	332

The number of infected cases is thus much larger among agricultural classes than among non-agricultural classes, and among the former, the cultivating owners of land, have more cases among them than cultivating labourers generally, the non-cultivating landowners and rent-receivers registering the smallest number of cases; the lessees (Class II) have more cases but far less than Classes I and III, generally speaking. The West Madras division shows a deviation from this general picture in respect of Classes I to III, and the East Godavari district in the North division in respect of Classes I and III.

3. Conclusion.—The State Government have been alive to the need for tackling the problems connected with the prevention and relief of leprosy in this State energetically and systematically, and much valuable work has already been done, as may be seen from the reviews contained in the State Government's Orders Ms. Nos. 1753 and 1754, Health Department, dated 16th May 1950. When suggesting this census of leprosy cases, the State Government were quite aware that it could not be expected

Strain to the state of

be an accurate one, and the intention was to get data which would enable the Government to locate the areas where the campaign against leprosy should be conducted first and settle the order in which the various areas should be taken up. It was also intended that the Census figures should be used as the basis for a more detailed and technical census by expert leprosy survey staff, or, in the alternative, to have random surveys conducted by such expert staff in the worst affected areas, so that the figures obtained at the 1951 decennial census could be corrected to the extent necessary. The 1951 census has achieved this objective of the State Government and on the basis of the census figures, expert investigation can now go forward and the problems connected with the prevention and cure of leprosy tackled energetically and systematically in the most effective manner possible. To facilitate these investigations, the figures of infected cases in each village or ward of a town will be made available in the District Census Handbook and the detailed analysis by livelihood classes in each local area will also be furnished to the State Government.

CHAPTER XVI—CONCLUSION.

Population growth and sustenance.— It is well known that Madras State has been deficit in food supply for many decades now, and that cereals and pulses have had to be imported regularly into the State to make good the deficit, as far as possible. Before World War II, the average, annual net imports amounted to 4,31,573 tons of paddy and rice, 9,372 tons of millets, 2,33,768 tons of other grains and pulses, and 62,446 tons of wheat and wheat products. Since 1941, the population of the State has increased by nearly 72 lakhs. In respect of cereals alone, the requirement for a population of one million, on the basis of 16 oz. per day per adult (persons of the age of 12 and above), and 8 oz. per child (persons below the age of 12), works out to 1.4 lakhs tons per annum. It has already been shown, that food production has not kept pace with the increase of population, though there have been some appreciable achievements under the Food Production schemes and extension of irrigation. The delicate nature of our food economy can be seen from another fact, already mentioned, namely, that a bad failure of the north east monsoon, such as has been occurring since 1947-48. might involve a loss of production of the order of nearly 14 lakhs tons of cereals in a year. It is therefore clear, that the maximisation of food production calls for energetic, vigilant and continuous attention. Except in some undeveloped areas like the tracts, the best Agency lands already under cultivation and only inferior lands are available for being brought under the plough in most areas, and a good portion of these lands will require, for their profitable cultivation, resources in money and equipment, which are beyond the capacity of individual ryots. Special schemes and arrangements will have to be formulated and encouraged and, when necessary, undertaken by the Government themselves, for the cultivation of such inferior cultivable lands. Intensive production on the lands, already under cultivation, has to be maximised, and kept up as the best method of securing immediate results. Extension of facilities for irrigation including expansion of the area protected by wells, has also to be pushed forward. Simultaneous action on many fronts is necessary to win the battle

for food. One of the measures which have to be undertaken, though it may not yield large scale results immediately, is propaganda among the people to readjust food habits to what India can produce, so as to dispense with imports of food. The objective must be to confine imports to what is required to build up a Central Reserve for meeting calamities like widespread failure or loss of crops.

Further, the production of adequate quantities of cereals for the population, is not the whole of the food problem, though it is an indispensable and vital part—the elementary part—of that problem. There is the larger problem of Nutrition. It is indisputable, that in this State also, there is under-nutrition and mal-nutrition, on a large scale. The physical deterioration of population, which is noticeable on a comparison of the present generation with the previous two or three generations, is largely attributable to these, and to the conditions of living of the bulk of the population, particularly in the towns. This raises the problem of protective foods among others. In Madras State, there is a large deficiency of all protective foods. with the exception of fruits. Though food production in the country can, and will, be improved, it is quite clear, that we shall not be able to feed, according to really satisfactory standards, a population like ours, if it continues to grow rapidly. There are no grounds for anticipating, that the rate of growth of the population, during the present decade, will be anything less than 10 per cent in ten years. In the normal course, a substantial check on the rate of growth of the population can be expected only if the standard of living of the masses improves substantially. All these circumstances point to the need for family planning, and to the Governments doing all that they can, to assist parents to plan their families on healthy lines. Such planning is desirable, not only in the national interest, but also from the point of view of the individual families, and the health of the mothers and that of their children. Family planning is called for, not only for restricting the numbers of children, but also for spacing their births suitably.

It is obviously necessary to tackle all these problems on an All-India basis. Considerable statistical information, relevant to the food problem, has been collected by the Central and State Governments since food controls were introduced. The 1951 Census has yielded an important part of the data, viz., the population which has to be fed now and the rate at which it has been growing. In the light of all this information, the problem of food production and the general food policy, will have to be reviewed by the Governments, with the assistance of the Planning Commission, and suitable measures implemented in the coming years. The Report of the Bengal Famine Commission has drawn attention to these subjects. in a comprehensive manner. Augmentation of our food resources, is one of the important items in the plan drawn up by the Planning Commission. Much more remains to be planned and done.

The statistics, referred to in this paragraph, have been taken by me from "Food and Agriculture in Madras State" by Dr. B. Natarajan, Economic Adviser to the Government of Madras, to whom I am indebted, not only for these figures, but also for the statistics of cultivation discussed in this report.

2. Future Censuses.—A decennial census involves, of course, a formidable administrative effort, but it is truly national service, and thanks to our tradition of having the enumeration work done by enumerators and supervisors on an honorary basis, except in very special areas, where paid wholetime staff is unavoidable owing to lack of adequate local staff, this colossal task is being accomplished, whenever the appeal is made. It is desirable to obtain, through decennial censuses, data which can be quite satisfactorily collected through a mass census of this kind. That it is neither possible, nor desirable, to dispense with decennial censuses, is an opinion supported by no less an authority than the Registrar General of the United Kingdom, as may be seen from the following extract from his Preliminary Report on the 1951 Census of England and Wales:

"In spite of the increasing body of statistical data available from other sources and of the increasing use nowadays of other methods of obtaining necessary basic material for purposes of Government and business, a periodical census of the whole population still remains a unique and indispensable instrument for gaining knowledge about the nation and its attributes. Far from becoming outmoded throughout the world, it is both spreading to countries that have hitherto not had one and also being more intensively used by those that have. It provides an essential base line for many statistical series and purposes and it alone takes account of every individual in the country at one point in time and can relate any selected attribute, or combination of attributes, to the totality of persons of any particular type."

The large, national, co-operative effort. which the decennial census means must. therefore, be maintained in the interests of the country. Conundrums are bound to arise even in regard to the simplest questions in a census questionnaire, and vital questions like those relating to means of livelihood should be included, though difficult, so long as we can, by taking sufficient pains through intensive instructions to enumerators, hope to deal with them satisfactorily even in a census covering the entire population. It would be valuable to have the data collected on difficult questions like 'Means of livelihood' and 'economic status' at the decennial census, checked up, in respect of the entire population in selected areas, by means of special censuses conducted through the agency of enumerators specially selected and trained for the purpose. Such special censuses may be arranged for during the inter-censal period, avoiding the years in which arrangements for a decennial census have to be made and executed. Comparison with the results of such special censuses would not only give us an idea as to how far the data yielded by the decennial census have been accurate, but would also enable us to devise ways and means of improving the enumeration at the next decennial census. Sorting by livelihood classes was a fundamental feature of the 1951 tabulation. The inquiry as to how people make their living is of the greatest importance and interest, and it must be made as comprehensive as possible by covering the entire population. Sorting by livelihood classes replaced the old method of sorting by religion, and I cannot think of any more valuable basis for sorting.

SECTION II.

INTRODUCTION.

Coorg is a Part C State picturesquely situated on the slopes of the Western Ghats, more on the eastern slopes than on the western side. The high range of Western Ghats forms a continuous western boundary, the highest peaks, viz., Thadiandamole and Pushpagiri, being 5,729 feet and 5,620 feet respectively, above the sea. The State is bounded on the west by the South Kanara district, on the south-west and south by the Malabar district and on the north and east by the Mysore State. The main drainage is towards the east, the largest river in this direction being the Cauvery with its principal tributaries Hemavati, Lakshmanthirtha, Kakkabe and Suvarnavati. The plateau of Mercara has an average altitude of 3,500 feet and slopes down to the Cauvery on the east and near Fraserpet on the Mysore border descends to 2,720 feet. The Barapolae is the only river which flows westward and passes into the Malabar district.

I know of no comparably hilly area which is more compact and better served by motorable roads, than Coorg. The State is far away from any Railway, but it is well served by roads connecting it with Mysore (723 miles) on the eastern side and with Mangalore (842 miles) and Cannanore (913 miles) in the West Coast.

This State has an abundant rainfall, like the West Coast districts of Madras, favouring extensive rain-fed wet cultivation, without the need for irrigation works. Artificial irrigation, however, exists for 6,735 acres—4,735 acres under channels and 2,000 under tanks. This irrigated area has increased by nearly 2,000 acres since 1941, thanks to the renovation of the channels and tanks, as well as the construction of new dams and channels under the Grow More Food and Minor Irrigation schemes.

The mean annual rainfall, based on the observations over a long period of years, is 127.43 inches, of which the south-west monsoon (June to September) contributes 106.49 inches, the north east monsoon (October to December) 12.01 inches, while 1.16 inches are received during the dry weather.

Coorg has also an altitude suitable for coffee, which is the most important and organized plantation industry in this State. Cardamom, tea and rubber are not so important, the area under tea being inappreciable.

Thanks to the systematic anti-malarial operations (mainly D.D.T. spraying of houses) and the compactness of the State, the incidence of malaria has been very considerably reduced: malaria can hardly be said to be a handicap now to development in this State. Coorg has thus stolen a march on other States where also the eradication of malaria is an important problem to be tackled by the Government, not only from the point of view of the health of the people, but also from the point of view of the development of the country.

2. Ever since 1891, the Census operations in this State have been entrusted to the general supervision of the Superintendent of Census Operations, Madras. The matter was considered again in 1950, and it was decided that the same arrangement should be adopted in connection with the 1951 Census.

The Census Reports relating to Coorg were written by the Superintendent of Census Operations for Madras, till 1921, when, for the first time, the work of writing this Report was entrusted to a local officer, although the statistics continued to be tabulated in one of the Tabulation Offices in Madras State. For the 1951 Census, I have reverted to the pre-1921 practice, and I have myself prepared the report on Coorg, as Section II of my Census Report for Madras and Coorg States. The enumeration slips relating to Coorg State were sorted and tabulated at the Regional Census Sorting and Tabulation Office at Mangalore.

3. For Census purposes, Coorg State was, as a matter of administrative convenience treated as a district of Madras State, and allotted Location Code No. 26. The two taluks in Coorg State, viz., North Coorg taluk and South Coorg taluk were assigned Location Code Nos. 1 and 2 respectively. All villages, Notified Areas, Panchayats and municipalities, in each taluk, were allotted

Location Code numbers in accordance with their geographical situation, the numbers beginning at the northern end and proceeding in rows from west to east in each row.

The State was split up into four charges. The two taluk charges excluded their respective municipal areas. The Charge Superintendents were the Subedar, North Coorg taluk, the Subedar, South Coorg taluk, the President of the Municipal Council, Mercara and the President of the Municipal Council, Virajpet. The following were the numbers of circles and blocks in each charge:—

[Statement No. 1.]

Name of the charge,	Number of Supervisors' Circles.	Number of Enumerators' blocks.
(1)	(2)	(3)
1 North Coorg taluk	70	244
2 South Coorg taluk	53	229 -
3 Mercara Municipality.	5	22
4 Virajpet Municipality.	2	8
	130	503
	.——	

A permanent house numbering scheme, on the lines adopted in Madras State, was also introduced in the Coorg State, on my suggestion. At my instance, the Coorg Village Panchayat Act, 1926 (Coorg Act No. I of 1927) and Coorg Municipal Regulation, 1907 (Central Regulation II of 1907) were amended. The object of the first amendment was to enforce the numbering of buildings in the panchayats and such other places, not being municipalities and Notified Areas, as may be notified by the Chief Commissioner, from time to time, in the Coorg Gazette, and to check the tampering with and obliteration of the house numbers, in rural areas. The Coorg Municipal Regulation, 1907, was amended to bring its corresponding provisions into line with the provisions made for panchayat and non-panchayat areas.

4. I received hearty co-operation from the Chief Commissioner of Coorg, the Assistant Commissioner of Coorg and the Subedars, throughout all stages of enumeration and my thanks are due to them all. Though, officially, a stranger to Coorg, when I first went there, I had no reason to feel like a stranger there, at any time and I had not the slightest difficulty in functioning effectively as the Superintendent of Census Operations for that State, which reflects great credit on the officers and the people of that State

CHAPTER I-GENERAL POPULATION.

The area of Coorg State is 1,586 square miles, which is 7 square miles less than the area mentioned in the 1941 Report. The slight difference is due to the adoption of the area furnished by the Surveyor-General of India.

2. General distribution.—The population of the State has increased from 163,726 in 1941 to 229,405 in 1951—an increase of 60,679 or 36 per cent. The density of the population has consequently increased to 145 per square mile in 1951, as against 106 in 1941 and 103 in 1931 and 1921. 62 per cent of the State has a density in the range 100 to 150, while the density of the rest of the State is in the range 150 to 200.

Of the total population of 229,405, 7 per cent (16,255) lives in the two towns in the State, viz., Mercara and Virajpet, and the rest in the rural areas.

3. Growth of population.—The growth of the recorded population in this State has not been steady. There were actual decreases recorded in 1911, 1921 and 1931. The M.T.—A-II 1941 Census showed an increase of 5,399 over the 1931 population, while the present Census has disclosed the much larger increase of 60,679. The net increase in population during the 50 years from 1901 to 1951 was 48,798 (27 per cent). It is well known that a vital factor affecting population in Coorg State is the immigration of the labourers, who work in the coffee estates and other areas under plantation products. Emigration takes place only on a small scale and is confined to those, who leave Coorg for employment, mainly professional, and for higher education. The significant part played by immigration in the variations of population specified in the Main Table A-II can be seen from the following figures:-

[Statement No. 2.] ·

Year.		Number of immig- rants.	Number of emig- rants.	Column (2) minus column (3).	Percentage of column (4) to the population in the year in column (1).
(1)		(2)	(3)	(4)	(5)
1911		44,535	3,858	40,677	23.2
1921		33,937	2,825	31,112	19-0
1931		38,718	4,000	34,718	21.3
1951	••	66,146	6,843	59,303	25-9

The fluctuation of population in Coorg is thus largely bound up with the annual migration of labourers to the estates. The distress caused by World War I, the difficulties experienced by the coffee estates particularly the small estates and the Influenza epidemic of 1918 also contributed to the decrease in the population recorded in 1921—Vide Chapter I of the Census Report for 1921. Between 1921 and 1931 the season was, on the whole, favourable for both rice and coffee, except during 1924 when, owing to an unusually heavy monsoon followed by unprecedented floods, the crops suffered badly. But full recovery was arrested by the general depression, which set in towards the end of 1930-Vide paragraph 5 of the Report on the 1931 Census. The depression affected the key industry of the State, viz., coffee, to a serious extent.

The period since 1931 has been, on the whole, one of general prosperity in the State. The World War II created conditions, which stimulated the demand for coffee and other plantation products, and Coorg being a surplus area for rice, stood to gain, by the food scarcity in the adjoining areas which became the major problem in those areas after the war and which still persists. There was, in consequence, an increase in the immigrant population, as well as the natural population.

4. Coffee industry.—The decade 1941-51 was a prosperous one for the coffee industry. The area under coffee increased steadily from 36,744 acres in 1941-42, to 44,408 acres in 1950-51, i.e., by about 21 per cent. The area under Arabica coffee has decreased by 8 per cent, while that under Robusta has steadily increased and has more than trebled itself-an increase of nearly 219 per cent. In the 1950-51 season, the planted area under coffee in Coorg was about 19.43 per cent of the total planted area under coffee in India, the share of Arabica and Robusta being, 17.54 per cent and 24.54 per cent, respectively. Of the total area planted in the 1950-51 season, 22,721 acres were in North Coorg and 21,687 acres in South Coorg. Of the total average production of coffee in India during the six years ending with the season 1950-51, Coorg accounted for 30.31 per cent of the

M.T.—A-I 8.Ts.—1·1

and 1.2

production, as against 36.05 per cent of Mysore State and 31.48 per cent of Madras State, the remaining States in India contributing only 2.16 per cent of the total production in India.

The number of coffee estates in Coorg has increased from 2,632 in 1945, to 4,371 in 1951. Though over 75 per cent of the estates consists of small holdings of less than 5 acres, they account for only about 10 per cent of the total area under coffee in the State. The large estates of and above 200 acres each, account for a third to one half of the total coffee area under each type of coffee in North Coorg as well as South Coorg.

The decade has been one of high prices for coffee, as may be seen from the index numbers of wholesale prices, which increased from 100 in August 1939, to 555 in August 1951, in respect of coffee, the corresponding figures for all commodities being, 100 and 437.6, respectively.

The condition and prospects of the coffee industry have improved very considerably, since the promulgation of the Coffee Market Expansion Ordinance in December 1940, and the subsequent legislation, which introduced, for the first time, statutory control over the marketing of coffee in India, and vested the control in a new incorporated body known as the Indian Coffee Board. All the coffee produced in India is pooled by the Board, which regulates the releases from the pool, both for internal markets and for exports. Thanks to the activities of the Board, the home market for Indian coffee has been considerably expanded; as a matter of fact, the internal market can consume almost the entire coffee now produced in India. The uncertainty of foreign markets, and the inadequacy of the home market, which used to cause considerable anxiety to the coffee industry in the precontrol days no longer exist. The growers are assured of a steady market and a fair price, which has been linked up, by the Board, with the estimated cost of cultivation. Marketing has been improved by the Board's standardization of the several grades in each type of coffee. The industry also stands to benefit, more and more, from the Research department organized by the Board.

It is no surprise therefore, that the number of immigrant labourers increased enormously during the decade 1941-51.

I am indebted to Sri M. A. Kuttalalingam Pillai, Chief Coffee Marketing Officer, for the

production, as against 36.05 per cent of information extracted above regarding the Mysore State and 31.48 per cent of Madras progress of the coffee industry in Coorg.

The areas under the important crops and plantation products, as recorded during the year 1950-51 are given below:—

Coffee . . . 44,408 acres. Orange . . . 18,742 ,, Cardamom . 6,368 ,, Rice . . . 89,640 ,,

population.—The

. 5. (1) Movement of

number of immigrants has increased by nearly 50 per cent since 1911. In 1951, the immigrants constituted 28.8 per cent of the population. This, as already indicated, is due to the prosperous condition of the coffee estates and other plantations. The immigrants are mostly from deficit food areas. and Coorg, which is a surplus area for rice, has had therefore more than the usual attraction for these labourers. They are mostly of the labouring class, who come to work in the estates, coffee and other plantations and there are also some of the petty trader class. The 66,146 immigrants recorded in 1951 comprise 62,445 persons from adjacent States, 3,606 persons from other parts of India, 11 from Pakistan and 84 from other territories beyond India. The bulk of this immigration is seasonal in nature, the labourers coming in to work in the estates soon after the commencement of the monsoon and going back to their homes about the middle of March, after the work in the estates is over for the year. Many of them naturally leave their wives and children behind. The consequent disparity

figures below:—
[Statement No. 3.]

Area.	Number of male immig- rants.	Number of femal ^e immig- rante.
(1)	(2)	(3)
(a) Adjacent States	38,389	24,056
(b) Other parts of India	2,62 1	985
(c) Pakistan	7	. 4
(d) Other territories beyond India.	55	29
Total	41,072	25,074

between the number of male and female

immigrants is clearly brought out by the

The figure 62,445 referred to against (a) above represents immigrants from Madras State and Mysore State.

The total number of immigrants is 66,146. of these 62,445 are from the States adjacent to Coorg, viz., Mysore and Madras—10,061 persons from Mysore and 52,384 persons from Madras (mostly from South Kanara

S.T.-16

S.T.—1·4

and Malabar). The plantation labourers are recruited mostly from these areas. There is only one other area which has contributed more than 3,000 immigrants and that is the Travancore-Cochin State which has supplied 3,234 persons. Of the immigrants from Mysore, the females exceed the males by about 1,000 persons, while in the Madras contingent, the males exceed the females by about 15,000. There is no doubt therefore that, taking the immigrants as a whole, there is a large preponderance of males over females.

During my visit in January 1951, I found in the coffee estates some Tamilspeaking labourers hailing from Coimbatore some Telugu-speaking district. and labourers from Anantapur district Madras State. The increase in the number of emigrants from about 4,000 in 1931 to 6,914 in 1951 takes one by surprise, having regard to the unwillingness of the indigenous population in this State to leave their homes and ancestral property, but evidently, the increase reflects the larger number seeking employment in the Defence Services, and in other walks of life and in those seeking higher education.

M.T.-D-V

- (2) Displaced persons.—Displaced persons from Pakistan 'present no problem in Coorg, as there are only seven of these—four males and three females: four of these came from West Pakistan in 1947 and 1949 and the remaining three from East Pakistan in 1948.
- 6. The natural population.—The natural population of Coorg, i.e., the population that would have been found there, if there had been no immigration or emigration, i.e., the recorded population minus immigrants, plus emigrants, is 170,173, an increase of 32·3 per cent over the 1931 figure.

S.T.—1·7

Health conditions have improved enormously in Coorg as a result of anti-malarial operations. The period 1941-1951 as already mentioned, was a prosperous one for both agriculturists and estate owners. During this decade, there was a striking increase in the area under coffee, oranges and cardamom and a small increase in rice, as may be seen from the figures given below:—

[Statement No. 4.]

Area under cultivation in acres.

	a .	_		in acres.				
,	Cro	•		1941.	1951. (3)			
Coffee		,		36,744	44,408			
Orange	••		• •	7,120	18,742			
Cardamom		• •		2,028	6,368			
Rice		•. •	• •	87,145	89,640			

The small increase in the area under paddy is due to the fact that most of the lands suitable for such cultivation are already being so cultivated, and extension of paddy cultivation would mean in many areas encroachment of the area suitable for coffee and involve heavy expenditure on reclamation, terracing and bunding.

7. Natural increase—Births and deaths.— The relevant figures have been furnished in Subsidiary Table 1.3. They have been worked out with reference to the mean population in each of the decades 1921-1930. 1931-40 and 1941-50, i.e., the arithmetical average of the population at the beginning and at the close of the decade. The mean decennial birth-rate calculated with reference to the registered births was 17.2 for the decade 1941-50 and 24.1 and 22.5 respectively for the two previous decades. The corresponding figures \mathbf{for} the mean decennial death-rate are 14.3, 23.4 and 31, respectively. The difference between these two rates ia the decennial rate of natural increase in the population as seen from the vital statistics, and these figures are 2.9 for the decade 1941-50 and 0.7 and—8.5 for the two previous decades. The decennial rate of growth of the population as calculated from the figures of the 1931, 1941 and 1951 Censuses is 30.5 per cent for the decade 1941-50 and 3.3 and -0.3 per cent for the two previous decades. migration-cum-registration error, i.e., the combined allowance to be made for migrations and for the errors in the registration of births and deaths accordingly works out to 27.6 per cent for the decade 1941—1950 and 2.6 per cent and 8.2 per cent for the two previous decades.

The registered birth and death rates per mille in Coorg State, for the period 1921–1950, are given in the statement below. These rates have been calculated on the population, as estimated for each year, with reference to the growth rate for the decade concerned.

Birth and death rates per mille in Coorg State for the period 1921—1950.

[Statement No. 5.]

_	Year.	1		Birth rate. (2)	Death rate.
1921	••			27.4	28.6
1922			••	26.1	34·6 29·1
1923	• •	• •	• ••	$\begin{array}{c} 25.6 \\ 21.2 \end{array}$	41·1
1924	••	• •	• •	18.9	30.8
1925	• •	• •	• • •		

S.T.—1.3

	Year.			Birth rate.	Death rate.
• ,	(1)			(2)	(3)
1926				22.8	34.2
1927				19-2	31-4

1929				22.1	23.7
1930	••	::	••	23.5	25·3
1931				24.5	23.8
1932				26· 4	23.3
1933				24.7	23.9
1934			• •	25.0	23.0
1935		••	• •	25·3	22.8
1936				23.6	23.5
1937				24.2	26.9
1938				22.7	23.9
1939				22.6	22.4
1940				22.3	20.5
1941				22.9	2 2·8
1942				18.9	22.0
1943				19.0	17.7
1944			• •	17.2	18.6
1945	••		• •	16-2	16.4
1946				16.3	13-4
1947		• •	• •	15.0	· 10·5
1948		• •	• •	15.5	10.1
1949				18.0	9.8
1950	••	• •	••	17-4	9·1

It will be seen that no clear trend can be deduced from these figures; the fluctuations have been largely, if not wholly, due to the disturbing factor of immigration, which varies from year to year. It may be noted that, in a number of years, the death rates exceeded the birth rates. I do not think, therefore, that any safe conclusion can be drawn from the figures relating to births and deaths in Coorg.

8. Density.—As already mentioned, the density of population in Coorg has increased

to 145 per square mile. This is the density calculated with reference to the entire area of the State. Excluding the reserved forests the density in the State is 215 per square mile.

9. Livelihood pattern.—Agricultural classes account for 58 per cent of the population, while non-agricultural classes account for the remaining 42 per cent. In the latter, production other than cultivation is the main component. Over 50 per cent of the latter category (24 per cent of the total population), comprises mostly persons employed in the plantations and their dependants. About 34 per cent of the total population consists of agriculturists who cultivate their own lands while 10 per cent cultivate lands not owned by them. Cultivating labourers account for about 11 per cent of the population. A little over 3 per cent of the population consists of non-cultivating owners of land, agricultural rent receivers and their dependants. A little over 3 per cent of the population depend on commerce. A little less than 1 per cent depend on transport services. The small number supported by transport services is not surprising as this State is far away from any railway and as, owing to the hilly nature of the country, the scope for motor traffic is restricted. All other services and miscellaneous sources of income not covered by the classifications referred to above account for a little over 14 per cent of the population.

CHAPTER II-RURAL POPULATION.

In Coorg also, a village is not a residential but an administrative unit, and as in the Malabar and South Kanara districts of Madras State, the people in the rural areas in Coorg live in isolated houses built in their own farms and street houses are a rarity except in the bigger roadside villages, where small bazaars exist. The number of villages in the State is 297 as against 301 mentioned in the Census Report for 1941. The difference of four villages is due to regrouping of villages when assigning the location code numbers. It is seen from the Assistant Commissioner's report that all the local areas have been fully covered.

2. The rural population is 213,150 as against 157,508 at the last Census—an increase of 35.3 per cent as against the 36 per cent increase in the total population. Nearly 93 per cent of the total population lives in villages and the average population per village is 718. Of the rural population, 73 per cent lives in medium size villages with a population ranging from 500 to 2,000, 11 per cent in large villages with a population ranging from 2,000 to 5,000, while the rest of the rural population (16 per cent)

lives in small villages with a population of less than 500 each. The density of population in the rural areas is 135 per square mile. The increase in the rural population cannot be a matter for surprise: all the estates and nearly all the cultivated lands are in the rural areas and all the population with the exception of the people living in the two towns of Mercara and Virajpet are in the rural areas.

3. Out of the rural population, the agricultural classes account for 61 per cent. Thirty-six per cent are cultivating owners. a little less than 11 per cent cultivate lands not owned by them, while a little over 11 percent are cultivating labourers. The number of non-cultivating owners, agricultural rent receivers and their dependants is less than 3 per cent of the rural population. A little over 24 per cent consists mostly of persons who depend on the plantations. Commerce accounts for 2.4 per cent of the rural population, transport for 0.51 per cent while 'Other services and miscellaneous sources of income? account for 11.43 per cent. These are the sort of figures one would expect in a rural area.

CHAPTER III—URBAN POPULATION.

There has been no change in the urban area in the State. No new places have become eligible for treatment as towns and Mercara and Virajpet continued to be the only two towns in the State. This is not surprising, in view of the facts that the State is far away from any railway and that there has been no development of industries to attract any large-scale settlements in residential units. There is little doubt that Coorg would not have been modernised and developed even to the extent it has been, but for its plantation products, notably coffee.

2. The urban population of the State is 7 per cent of the total population. The M.T.-A.IV population of Mercara town is 10,117 and that of Virappet 6,138. Both have definite characteristics. Mercara urban recorded an increase of 3,005, while Virajpet has had an increase of 2,032 during the decade. These are the two important trade centres in the State, and the larger increase in Mercara is evidently due to its higher elevation and better climate and to its being the headquarters of the State and its consequent greater attraction from the point of view of modern amenities. The only college in the State was started by the Government at Mercara towards the end of the decade under review.

> The urban population has risen from 11,218 to 16,255, recording a sharp increase of 44.9 per cent as against 14.2 per cent during the last decade. This reflects the steady and growing prosperity of the State during the decade. Virajpet has now crossed the normal minimum urban population limit of 5,000 with a comfortable margin of 1,138.

> The rural population has increased by 35.3 per cent, whereas the urban population has increased by 44.9 per cent. There is thus a tendency in this State, as elsewhere. for the movement of the population from rural to urban areas due to the growing desire for modern amenities and attraction of medical and educational facilities.

- 3. The main source of livelihood of the urban population is, as one would expect to find, non-agricultural. Production other than cultivation (mainly plantations), commerce and 'Other services and miscellaneous sources of income' are the chief means of livelihood. 'Other services and miscellaneous sources' support more than 50 per cent of the population. Production other than cultivation is the next important 8.T .- 37 means of livelihood and supports 18 per cent of the population. Commercial occupations account for 17 per cent of the population and transport for 6 per cent. The agricultural classes account for less than 9 per cent of the population in the two towns. which confirms the correctness of the classification of these two towns as urban areas. Among these agricultural classes, noncultivating owners of land, agricultural rent receivers and their dependants account for 5 per cent of the total population in the The corresponding towns. percentage figures for cultivators of owned land. cultivators of unowned land and agricultural labourers and their dependants are 1.77, 1.25 and 0.77 respectively.
- 4. Subsidiary Table 3.6 analyses livelihood characteristics of the town dwellers in Coorg, in relation to the general population of the State. Nearly half the number of persons engaged in transport services and more than one-third of those engaged in commerce are found in these towns. Out of 1,000 agriculturists cultivating their own lands, only four live in these towns, and similar figures for (1) cultivators of unowned lands, (2) agricultural labourers and (3) non-cultivating owners of land, agricultural rent receivers and their dependants are 9. 5 and 113 respectively. Out of 1,000 persons engaged in production other than cultivation, 52 are found in these towns. The picture presented by these figures is also in keeping with the position occupied by these towns in this State.

There is every reason to think that these towns will grow further in future.

CHAPTER IV-AGRICULTURAL CLASSES.

The population dependant on agriculture has been classified at this Census as follows:--

Class I Cultivators of land wholly or mainly owned and their depen-Class II .. Cultivators of land wholly or mainly unowned and dependants. Class III Agricultural labourers. Class IV .. Non-cultivating owners of land, receivers of rent in cash or in kind, and their dependants,

The agricultural classes account for 577 out of 1,000 of the total population. Fifty-nine per cent of the agricultural population are cultivating owners; 17 per cent are nonowning cultivators; 19 per cent are cultivating labourers, while 5 per cent are non-cultivating owners or rent receivers. Among the agricultural classes, 27 per cent are self-supporting persons, 69 per cent are non-earning dependants, while 4 per cent earning dependants. Non-earning dependants are thus over two-and-a-half times the number of self-supporting persons.

- 2. The secondary means of livelihood of agricultural classes are mainly production other than cultivation (plantations) and also other services and miscellaneous sources of income. This similarity is noticed in all the four agricultural classes. Commerce is the secondary means of livelihood in a small percentage of cases.
- 3. The extent of dependency among the agricultural classes is shown below:-

[Statement No. 6.]

B.T.-4:1

Per 1,000 persons of agricultural classes in column (1).

		lasses in ce	rumn (1
Class.	Self- support- ing persons.	Non- earning depen- dants.	Earnin depen dants
(1)	(2)	(3)	(4)
1 Agricultural class in general.	es 269	686	45
2 Cultivators of owner land and the dependants.		749	31
3 Cultivators of lan wholly or mainl unowned and the dependants.	y .	681	51
4 Agricultural labou ers and the dependants.	r- 423 ir	4 8 6	91
5 Non-cultivating owners, agricu tural rent rece vers and the dependents.	i-	69 4	20

Dependency is largest among the cultivators of owned land and least among the labouring classes. The abnormally large figure of self-supporting persons among agricultural labourers is evidently due to the fact that the immigrants among them are unaccompanied by their families in many cases.

4. The total active and semi-active workers in cultivation, that is, the number of persons actively engaged in cultivation, is given in the statement below. Self-supporting non-cultivating owners and rent receivers have been excluded as they are not active workers:-

- (1) Total number of self-supporting persons 33,615 who actually work on the land.
- (2) Number of persons in non-agricultural 736 classes who have cultivation as their secondary means of livelihood.
- (3) Earning dependants in agricultural and 1.764 non-agricultural classes who work on the land.

Total ... 36,115

or 15.7 per cent of the total population.

5. Progress of cultivation.—The average net area sown in 1951 was 161,990 acres as against 144,801 acres in 1941, 137,531 acres in 1931 and 141,824 acres in 1921. There has been an appreciable increase in the net area sown in the decade 1941-51, due, no doubt; to the good prices for food crops and the keen demand for them from deficit areas. In Coorg, the paddy crop is a longterm one which matures slowly; there is, . therefore, no second paddy crop in the year.

The area of cultivation per capita was 86 cents in 1921 and 84 cents in 1931. It rose to 87 cents in 1941 and fell to 71 cents in 1951.

The total land area per capita is 441 cents, but the area cultivated and cultivable per capita is only 189 cents. This is of course due to the very hilly nature of the country.

S.T.-4.7

6. Size of holdings.—The proportionate numbers of holdings of various sizes in the State are as shown below:—

[Statement	No.	7.]				•
•		of the	holdin	g in ac	res.	Number.
0-2						298
2-5						467
5-10						122
10-15						48
15-25						31
2550						18
50-100			• •			9
100-200	• •	• •	• •	••	•••	4
200-300	••				•••	2
300-500		• • • • • • • • • • • • • • • • • • • •		• • • • • • • • • • • • • • • • • • • •		ī
500-1,000	••	••	•••	••	•••	
			Tota	al.	••	1,000

It will thus be seen that the lower quartile size of holding is 1.7 acres, the medium size 3.3 acres and the upper quartile size 4.9 acres.

Nearly 30 per cent of the holdings are below 2 acres and over 75 per cent are below 5 acres. The average size of a holding is 7.7 acres. (The holdings number 55,105 in all and cover a total area of 424,403 acres, comprising 'Proprietary and occupancy holdings' relating to assessed as well as unassessed lands.)

CHAPTER V-NON-AGRICULTURAL CLASSES.

3

1

14

Forty-two per cent of the total population of Coorg belong to the non-agricultural classes and are distributed among the four non-agricultural classes as shown

below:-PER CENT Class V-Production (other than cultiva-24 tion).

neous sources of income. Taking the non-agricultural classes alone, the proportion of these four livelihood classes is as follows:---

Class VIII-Other services and miscella-

PER CENT. Class V-Production (other than cultiva-56 tion). Class VI-Commerce 8 Class VII—Transport 2 Class VIII-Other services and miscella-34 neous sources of income.

2. The economic status among the nonagricultural classes is as follows:-

			PER
			CENT
Self-supporting persons	 		47
Non-earning dependants	 	••	48
Earning dependants	 ••	• •	5

It is interesting to compare the degree of dependency among the agricultural and nonagricultural classes :-

[Statement No. 8.]

Class VI-Commerce

Class VII-Transport

S.T.-1.8

.T.---5·1

	Percentage of				
	Self- supporting persons.	Non- earning depen- dants.	Earning depen- dants,		
(1)	(2)	(3)	(4)		
Agricultural classes.	27	69	4		
Non-agricultural classes.	47	48	. 5		

The bulk of the dependants are non-earning and the proportion of dependants is much larger among the agricultural classes. This disparity would not be so large, but for the fact that the non-agricultural classes include the large number of immigrant labourers many of whom leave their wives and children at home, when they come to Coorg for work.

The following table indicates the degree of dependency in each of the four non-agricul- s.Ts.-5.2 tural classes :-

to 5.5

[Statement No. 9.]

Livelihood class.	Pe	f	
Divernioud class.	Self supporting persons.	Non- earning depen- dants.	Earning dependents.
(1)	(2)	(3)	(4)
Non-agricultural class.	47	48	5
V. Production other than cultivation.	51	43	6
VI. Commerce	34	63	3
VII. Transport	42	56	2
VIII. Other services and miscellaneous	43	54	3

The dependency is greatest in Class VI (Commerce) and least in Class V (Production other than cultivation). The low percentage of dependency under Production (other than cultivation) is attributable mainly to the influx of labour population into the estates who are not accompanied by their families. This immigration factor is responsible, though not to the same extent, for the larger percentage of self-supporting persons in the other classes also, compared with Madras State.

3. A study of the figures of the secondary S.Ts. 5.2 to means of livelihood among the four nonagricultural classes reveals that persons deriving their principal means of livelihood from Production (other than cultivation) derive also their secondary means of livelihood mainly from other productive activities, but to some extent also from 'Other services and miscellaneous sources.' In the case of persons whose principal means of livelihood is commerce or transport, the main secondary means of livelihood is rent derived from agricultural land, secondly, 'Other services and miscellaneous sources and next in importance is Production (other than cultivation). In the case of persons deriving their principal means of livelihood from 'Other services and miscellaneous sources, ' rent from agricultural land stands second among the secondary means of livelihood, while other activities

in the same Class VIII stand first in importance. This shows that rent from agricultural land provides secondary means of livelihood to people engaged principally in commerce, transport and other services. Evidently, these people possess small holdings, the income of which is not adequate to maintain them at their standard of living and so they have sought their principal means of livelihood in other ways.

4. The percentage of employers, employees and independent workers among the four non-agricultural classes is given in the statement below:—

[Statement No. 10:]

C 1	Percentage of						
Class.	Em- ployers.	Em- ployees.	Inde- pendent workers.	Other			
(1)	(2)	(3)	(4)	(5)			
Class V—Produc- tion (other than cultivation).		86	12	••			
Class VI—Com- merce.	11	. 29	60	••			
Class VII—Transport.	. 3	84	13	••,			
Class VIII—Othe services and miscellaneous sources.	_	88	8	2			

The fact that 60 per cent under 'Commerce' are independent workers confirms my impression that trade in this State is largely in the hands of petty dealers working by themselves. The other figures call for no comments.

5. The distribution of the self-supporting persons in the various industries and services in the State is given below in the order of their importance:—

[Statement No. 11.]

8.T.

	Division number.	CENT.
-5·7	0. Primary industries not elsewhere specified.	54
	9. Services not elsewhere specified	21
•	6. Commerce	6

	5. Construction and utilities	5
	8. Health, Education and Public Administration.	4 ,

Division number.	PER CENT
Processing and manufacture: foodstuffs, textiles, leather and products theroof.	2
7. Transport, storage and communications.	2
3. Precessing and manufacture: metals, chemicals and products thereof.	1
1. Mining and quarrying	••

The figures in column (2) of the Subsidiary Tables 5.7 to 5.17 represent the actual number of self-supporting persons dealt with in the particular table; the figures in the other columns give the proportionate figure (for 10,000 self-supporting persons) for the division or subdivision, as the case may be.

Under Primary industries, Division 0, 'Plantation industries' account for over 92 per cent, and forestry and wood cutting for 7 per cent—just what one would expect to find in Coorg.

Under 'Services not elsewhere specified,' division 9, 'Domestic services' account for 14 per cent; 'Hotels, restaurants and eating houses' for 11 per cent; 'Laundry services' for 3 per cent; 'Religious, charitable and welfare services' for 3 per cent; 'Barbers and beauty shops' for 2 per cent and 'recreation services' for 2 per cent, while miscellaneous unclassified services account for 6 per cent. The numbers under sub-Division 6 (Legal and business services) and subdivision 7 (Arts, letters and journalism) are negligible.

Under 'Commerce'—Division 6—'Retail trade otherwise unclassified' accounts for 47 per cent, 'Retail trade in foodstuffs including beverages and narcotics' for 35 per cent; 'Retail trade in textiles and leather goods' for 8 per cent; 'Wholesale trade in commodities other than foodstuffs' for 5 per cent; and 'Money-lending, banking and other financial business' for 1.52 per cent.

The other industries and services in this State do not call for any special notice.

The plantation industry is clearly the chief industry in the State, and it is the mainstay of the non-agricultural classes.

6. Appendix VIII gives the number of self-supporting persons by sex in selected non-agricultural occupations in Coorg State.

5.1 Non-agricultural classes per 1,000 persons of general population; number in each class and sub-class per 10,000 persons of all non-agricultural classes; and number of employers, employees and independent workers per 10,000 self-supporting persons of all non-agricultural classes.

CHAPTER VI-HOUSES AND HOUSEHOLDS.

There were 23 houses per square mile in 1951, as against 21 in 1941 and 1931, and 20 in 1921. The average number of persons living in a house, taking the whole State into consideration, works out to 6.3 in 1951, as against 5.1 in 1941, 48 in 1931, and 5.2 in 1921. The corresponding figures for rural and urban areas in the State are: Rural-6.3 in 1951, 5.1 in 1941, 4.8 in 1931 and 5.2 in 1921; Urban-6.6 in 1951, 4.8 in 1941, 5·1 in 1931 and 5·0 in 1921. The rural area being the predominant portion of the State, there is no appreciable difference between the State figure, and the rural figure. The density in the urban area is only slightly higher than in the rural area. This negligible difference in the density of the urban and rural areas can be traced to the fact that the urban areas have not developed industrially nor even commercially on a large scale.

The total number of households in the State is 50,348, residing in 36,514 houses.

2. Examining the number of households per thousand houses, and the size of the families in the State from the 1/1000 sample households selected, we find that the number of sample households is only 26 for the whole State, including rural and urban. It is not therefore possible to generalise

with confidence on the basis of the samples. As far as the samples go, the medium sized households (4-6 membe s per. household) account for 48 per cent in the rural areas and small-sized households (3 members or less) for 22 per cent, large-sized households (7-9 members) for 13 per cent, and very large sized households (10 members or more) for 17 per cent. Large and very large sized families account only for 30 per cent, whereas small and medium sized families account for 70 per cent. In Coorg, the joint family system is prevalent. It was observed at the 1931 Census that there was a tendency for the newly married youths to detach themselves from their main families and to set up separate houses. The above figures seem to confirm the observation made in 1931.

The composition of the sample households indicates that there are, in a household, appreciably more sons than daughters, and also that there are other relations of the family living in the household and that these relations account for about one-ninth of the family, in the sample households examined. Generally, the males are predominant in the households. This is due partly to the predominance of males in the large immigrant population.

CHAPTER VII-SEX.

The number of females per thousand males in the General population, was 830 in 1951, 827 in 1941, 803 in 1931 and 831 in 1921. Almost the same ratio is found in the rural areas; but in the urban area, the ratio is different: it was 750 in 1951, 772 in 1941, 680 in 1931 and 674 in 1921. But, in this connection also, we must take into account the large immigrant population in Coorg, especially in the rural areas. As mentioned already in more than one place in this report, the immigrants are mostly labourers, who have left their wives and children in their own homes, and have come to Coorg for earning their livelihood in the plantations. If we leave out this immigrant population, and take into account only the persons born and enumerated in Coorg State, we find a different proportion of females to males. Subsidiary Table 1.5 gives the

figures for the natural population of Coorg State, by sexes. The ratio of females to males, in the natural population, works out to 932 females per 1,000 males.

2. In the agricultural classes, the ratio is 922, while in the non-agricultural classes, the ratio is 719. The immigrant labour in 5.T.2.—7.2 Coorg is mainly absorbed in the plantations, which comes under non-agricultural classes and this fact explains this striking disparity.

It will be seen from Subsidiary Table 7.2, that, among the agricultural classes, the proportion of females to males is smallest in Class III (Cultivating labourers and their dependants)—722 females to 1,000 males. This figure indicates clearly that an appreciable number of immigrants are employed as cultivating labourers.

CHAPTER VIII—CIVIL CONDITION.

For every 1,000 males, 576 are unmarried. We have no recorded figures for 1941, but the figures for 1931 and 1921 show that the corresponding figure was 554 and 562, respectively. The number of unmarried females for every 1,000 females in 1951 was 474, against 444 and 453 in 1931 and 1921, respectively.

The number of married persons among males in 1951 was 383 for every 1,000 persons, as against 393 in 1931 and 386 in 1921. Among females, the number was 412 for every 1,000 persons in 1951 as against 396 in 1931 and 379 in 1921. Fewer seem to be marrying, indicating increasing awareness of the responsibilities of marriage, and the proportion of unmarried persons is larger among males. The proportionate number of widowed persons among males was 41 (including 6 divorced) in 1951, against 53 in 1931 and 52 in 1921. Among females, the number was 114 (including 6 divorced) in 1951 as against 160 in 1931 and 168 in 1921. These figures reflect the fact that in Coorg marriages take place even later than in Malabar district of Madras State and that the remarriage of widows is still not a common occurrence.

2. We have not got recorded figures for 1941 showing the marital status by age groups. At the previous censuses, the age groups adopted were different from the age groups adopted at this census. It is, therefore, not possible to have comparative figures for studying the variations in marital status according to age groups. But the figures for 1951 show that there was no married person among males below 15 years, but there were 9 cases per 1,000 married persons among females. In the age group 15-34, the number of married persons among

males and females per 1,000 were 351 and . 670, respectively. In the age group 35-54, the numbers were 522 and 280, respectively. In the old age group, i.e., 55 and over, the numbers were 127 and 41, respectively. The above figures show first of all that child marriage is not unknown, but that it is not practised in Coorg State on any appreciable scale as only 9 per thousand have been recorded among females. Post-puberty marriage is the rule and pre-puberty marriage exceptional. Considerations of prudence have impelled the people of Coorg to marry late. The proportion of married women is highest in the age group 15-34, the percentage being 67, whereas the corresponding percentage for males is only 35. The number of married women in the age group 35-54 is 280 per thousand, while the corresponding number for males is 522. Clearly, males marry later than females in Coorg, as elsewhere generally. This has been brought out clearly in spite of the fact that most of the married immigrant labourers do not bring their wives to Coorg.

It will be seen from Main Table C-III that men begin to marry in appreciable numbers only after the 24th year, and that, from the 35th year onwards, the number of married men exceeds very appreciably the number of married women.

3. According to the fly leaf to Main Table C-III, in the samples on which the C-Tables have been constructed, the total number of divorced persons in 1951 was 129 of whom 71 were males and 58 females and there were three divorces in age group 5-14. One is curious to know what rational grounds for divorces could exist in the age-group 5-14!

CHAPTER IX-AGE.

The following table shows at a glance the variations among the principal age groups in 1931 and 1951; recorded figures for 1941 are not available:—

[Statement No. 12.]

[Statement No. 13.]

35-54

55 and over ...

General population per 10,000 persons

Age-groups.	1931.	1951.
Infants (0)	264	.306
Young children (1-4)	931	1,089
Boys and girls (5-14)	2,300	2,263
Youngmen and women (15-34).	4,085	3,656
Middle aged persons (35-54)	1,931	2,017
Elderly persons (55 and over)	489	666

S.T.s.—9·1 to 9·6

The figures show that there has been a general increase in all age groups during the period 1931-51 excepting in the age groups 5-14 and 15-34. The decrease in the age groups 5-14 is too slight for any comments; that in the age group 15-34 reflects the fall in the birth-rate during the influenza period 1918-20. The other figures indicate the improvement in public health in the State.

2. Examining the various age groups for males and females together under rural and urban, we find that the percentage is larger in the rural areas than in the urban areas in all age groups excepting 15-34—(ignoring the trivial difference in the group 55 and over)—vide the figures below:—

	Per 10,00	0 persons.
Age-groups.	Rural population.	Urban population.
(1)	(2)	(3)
0 .!	310	259
1-4	1,107	858
5-14	2,269	2,173
15-34	3,621	4,123

This higher figure in the urban population in the age-group 15-34 must be expected

2,026

666

1,908

673

as the persons in this group migrate to the urban areas for purposes of securing employment and for education.

3. Analysing the population in the agricultural and non-agricultural classes by agegroups, we find that the proportion is larger in the agricultural classes in all age groups except in the groups 15-34 and 35-54—vide the figures below:—

[Statement No. 14.]

A			Per 10,000	persons,
Age-gro	ups.		Agricultural classes.	Non-Agri- cultural classes.
(1)			(2)	(3)
0	••		335	267
1-4		••	1,168	982
5-14	••	••	2,451	2, 008
15-34	••	••	3,315	4,124
35-54	••	••	1,955 ·	2,102
55 and over	• •	••	7 76 🐇	516

Here again, the presence of immigrants in the plantations who are mostly in the age groups 15-34 and 35-54 is reflected clearly.

4. The percentage of population in Coorg State under the age-groups 0-14, 15-40/44 and above 40/44 is given below:

i	Age-g	roup.	F	ercenta	ge.
į	0-14	••	!	37	
٠, ١	15-40			47	
I	15-44	••	••	49	<u>ا</u> ` ا
i	Above 40	••	••	16	
1	Above 44	••	8.5	14	

According to Sundbarg's theory, the population of the State is progressive.

The wealth of this State is derived from agriculture and plantations. So long as the plantations thrive, the population will show an upward trend. Population growth in Coorg State is very much bound up with the prosperity of the plantation industries.

CHAPTER X-LITERACY AND EDUCATION.

27.2 per cent of the population in Coorg is literate, i.e., can read and write in some language or other. The remaining 72.8 per cent is either illiterate or partially literate, i.e., can only read but cannot write in any language. The percentage of persons who are partially literate is 1.7, leaving 71.1 per cent as illiterates, i.e., persons who can neither read nor write in any language. Among the males, 34 per cent are literate, while among the females, 19 per cent are literate.

The rural areas lag far behind the urban areas as may be seen from the figures given below:—

[Statement No. 16.]

			R	ural.
Persons.	-		Máles.	Females.
25-9	••	•	32.7	17.7
	. i		<u></u>	rban.
Persons.) :	Males.	Females.
(1)	1 .	; :	(2)	(3)
50∙6	•	• •	59.2	39.5

2. The statement below shows the progress of literacy from 1921 onwards:—

[Statement No. 17.]

Perc	entage of liter	ates.
1921.	1931.	1951.
(1)	(2)	(3)
	Persons.	
12.6	15.5	27 ·2
	Males.	
19-0	22.0	34.0
	Females.	
5 ·0 '	7.5	19.0

The figures for 1941 were not tabulated. There was only a small improvement in literacy between 1921 and 1931, but there has been a considerable improvement since 1931.

3. The position in Coorg compares as shown in the statement below with that in the adjoining States:—

[Statement No. 18.]

State.	Perc	Percentage of literates.							
Diale.	Persons.	Males.	Females.						
(1)	(2)	(3)	(4)						
Travancore- Cochin.	45.8	54.8	37.0						
Mysore	20.6	30.4	10.3						
Madras	19-3	28-6	10.0						
Coorg	27.2	34.0	19.0						

4. The following statement gives the percentage of literates in each livelihood class and sex:—

[Statement No. 19.]

Classes.		Persons.	Males	Females.
(1)		(2)	(3)	(4)
Class I	• •	37-4	47.5	27.0
Class II	••	17.4	23.5	10-8
Class III	•••	8-3	12-2	2.8
Class IV	••	49.5	61-2	39-4
Class V	••	16-6	22.4	9.0
Class VI	••	45.7	56-1	29.3
Class VII	••	42.0	49.5	29.5
Class VIII		31.5	36-8	23.9
All classes	••	27.2	34 0	19.0

It will be seen that in Coorg also Class IV (Non-cultivating owners of land, agricultural rent-receivers and their dependants) stands first in the matter of literacy and that Class III (Cultivating labourers and their dependants) is the most backward.

5. The statement below gives the distribution of 10,000 literates of each sex and livelihood class by educational standards:—

[Statement No. 20.]

•	C	lass I.	Clas	ss ∏.	Clas	ıIII.	Clas	s IV.

As one would expect to find, the figures show that men have taken to higher education far more than women and that Classes IV and VIII have produced most of the persons who have attained a high standard of education. It is no surprise to find that, of these two classes, viz., Class IV and Class VIII, the latter leads noticeably in the matter of higher education. Class VIII represents the professional services and employees under governments and local bodies. It is well known the seare the classes which are most keen on educating their children up to the

highest standard possible. It is noteworthy that there is no one educated above the S.S.L.C. standard among the cultivating labourers and their dependants (Class III) and that Class II (Cultivators of land wholly or mainly unowned) has only made a start in regard to higher education.

The percentages of literates who have attained the Middle School standard, the Matriculation or S.S.L.C. standard, the standard of Intermediate in Arts or Science or have secured degrees or diplomas are 14.6, 4.6, 1.1 and 0.7 respectively.

tribution of illiterates by age-groups:-

[Statement No. 21.]

Age-groups.	Number per 10,000 illiterates.		
(1)		(2)	
5-9		1,645	
10-14		1,059	
15-24		2,008	
25-34		1,980	
35 -44	••	1,516	
45-54	• •	936	
55-64	••	553	
65-74	••	214	
75 and above	••	89	

These figures do not include persons below the age of 5, and those above that age who

6. The statement below shows the dis- are only partially literate, that is, those who can only read but cannot write in any language. It will be seen that the first two age-groups together account for 27 per cent of the illiterates. These two groups are below the age of 15. Twenty per cent is in the age-group 15-24, another . 20 per cent in the age-group 25-34, 15 per cent in the age-group 35-44, and 9 per cent in the age-group 45-54. The first three age-groups account for over 47 per cent of the illiterates. As in Madras State, these figures indicate that the most effective way of tackling illiteracy will be by attending to children below 15 and that the next important section of the population to be tackled are the young persons between the ages of 15 and 34.

CHAPTER XI-LANGUAGES.

The largest number of persons 80,410, that is, 35 per cent of the population have Kannada as their mother-tongue. Next comes Coorgi or Kodagu with 66,642 persons (29 per cent of the population) using it as their mother-tongue. The other languages are the mother-tongues of the immigrants. Even as subsidiary languages, Kannada and Kodagu are the most important. The other important subsidiary languages are Malayalam, Tulu, Tamil and Telugu.

2. The figures for 1941 and 1951, for the languages spoken as mother-tongue, are given below:—

[Statement No. 22.]

Distribution of population by mother-tongue spoken and comparison with 1941.

Mother-tongue.	Number p speaking th tongue in c	e mother-	
(1)		1941. (2)	1951. (3)
l Kannada		384	350
2 Kodagu or Coorgi	••	334	291 .
3 Malayalam	••	91	142
4 Tulu		88	92
5 Tamil		19	60
6 Telugu		16	17
7 English		2	1
8 Others	••	66	47

No remarks are called for except that the decrease under the first two languages is the result of the increase in the number of immigrants since 1941.

M.T.-D-J

CHAPTER XII—RELIGION.

M.T.--D-11

The important religions represented in this State are Hindus (87 per cent), Muslims (10 per cent) and Christians (3 per cent). Of the Christians, 41 persons are Anglo-Indians. There are no Tribal religions and only one person declared himself as an atheist.

2. The comparative figures for 1941 for the main religions are given in the statement below:—

[Statement No. 23.]

. .

Distribution of population by main religions and comparison with 1941.

Delinion	_	Number per 10,000.		
Religion.	19	41.	1951.	
(1)	(2)	. (3)	
Hindus	8,	918	8,695	
Muslims		873	1,005	
Christians	••	204	296	
Others	٠	5	4	

No special comments are called for. The Muslim figure has increased on account of the increase in the number of Moplah immigrants many of whom are petty shop-keepers in Coorg.

CHAPTER XIII—BACKWARD COMMUNITIES.

Scheduled Castes, Scheduled Tribes and other Backward Classes.—At the time of the Census enumeration in 1951, there was no list of Scheduled Castes, or Scheduled Tribes for this State. At the time of the tabulation of the data collected at the census, figures for Scheduled Castes and Scheduled Tribes were tabulated, with reference to the lists of these castes and tribes, which had been recommended by the M.T.-D-III State Government to the Government of India, and which were subsequently notified by the President in September 1951 in the Constitution (Scheduled Castes) (Part C States) Order, 1951, and the Constitution (Scheduled Tribes) (Part C States) Order, 1951. The total number of Scheduled Castes and Scheduled Tribes in Coorg State, as recorded in the 1951 Census, is 25,690 and 21,084, respectively. The number of persons belonging to the Non-Backward Classes, specified in the list furnished by the State Government, is 113,209. The rest of the population belongs to Backward Classes other than Scheduled Castes and Scheduled Tribes and numbers 69,422. The lists referred to above are reproduced in Appendix IX for ready reference.

2. The statement below shows the percentage of literacy among the Scheduled Castes, Scheduled Tribes and Non-Backward Classes as listed by the State Government:—

[Statement No. 24.]

	Classes.	Percentage of literacy.
	(1)	(2)
1	Non-Backward Classes as listed by the State Government.	o 40·3
2	Scheduled Castes	. 4.4
3	Scheduled tribes	. 1.7
4	Other Backward Classes	22.0

CHAPTER XIV-NON-INDIAN NATIONALS.

There are only 55 Non-Indian Nationals in the State—40 males and 15 females. Of these, 30 men and 10 women are British nationals. They are mostly planters. The main Table D-VI from which these figures have been taken gives an analysis according to citizenship status in respect of immigrants who are not Indian nationals. The discrepancies between this Table and Main Table D-IV which gives an analysis by country of actual birth of the persons enumerated should not, therefore, cause any surprise. There are 95 such immigrants: 40 were

born in Europe, including the United Kindgom and Ireland, 7 in South Africa and 48 in countries in Asia including Pakistan, Nepal, China, Burma, Ceylon and Malaya. The apparent discrepancies are due (1) to Indian nationals who were born outside India and who have returned to India and have been enumerated in Coorg and (2) to nationals of other countries born in Coorg. The number of immigrants from each of these outside countries is very small and calls for no special notice.

K.T-D-VI

CHAPTER XV-INCIDENCE OF LEPROSY.

Leprosy does not present any serious problem in Coorg. At the time of the Census enumeration in 1951, only 48 cases (36 males and 12 females) were found to be definite E.T.—D.VIII cases of leprosy, while 22 cases (15 males and 7 females) were returned as doubtful. Of the 48 definite cases, only four (all males) were found in the urban areas. All the doubtful cases were found in the rural areas.

Leprosy cases in Coorg are thus found mostly in the rural areas, the largest number occurring in livelihood class I, viz., cultivators of land, wholly or mainly owned and their dependants; livelihood classes V and VIII come next with a few cases, the number infected in the other classes being negligible.

APPENDIX I.

Instructions issued to the Enumerators in respect of question 13 in the schedule (Incidence of Leprost).

Infirmity (Incidence of Leprory) :— Look at the individual carefully but as unobtrusively as possible. If you find both the following signs, namely,

- (a) ear lobes, eyebrows and cheeks thickened, reddish and shining; and
- (b) deformities of the hands or feet including fingers and toes.

mark '1'. In such a case, you need not put any questions, and you should avoid as far as possible even giving the impression that you are looking at him closely. It should be treated as a case of leprosy.

If you do not see the above two signs (a) and (b) put the following question :--

Have you a patch or patches (discoloured area of the skin on your body)?

If the answer is in the affirmative, or if it is in the negative but you notice any patch or patches on his body then put the following further questions:—

How long ago did you notice the patch?

Has any patch been increasing in size?

Do you feel any numbress over the patch?

Does the patch ever get reddish and irritated?

Is any one in your family having similar patches or other signs of leprosy ?

Has any one in your family suffered from leprosy within your lifetime?

If, according to the answers to these questions patches are :--

Present.

Increasing in size.

With numbress or irritation.

With or without the two signs (a) and (b) above, then, write T, as you must treat it as a case of leprosy.

If there are no patches

 \mathbf{OR}

If patches are present:

but not increasing in size;

no numbness or irritation

signs (a) and (b) above are absent; and there has been no case of leprosy in the family, then write "O", as it is not a case of leprosy.

If, on the other hand, the patches are-

present,

but not increasing in size,

no numbness or irritation, and

the two signs (a) and (b) above are absent

BUT

there has been a case of leprosy in the family

then, there is room for doubt, and you should mark *2 .

APPENDIX II.

Comparison of Livelihood classes of the 1951 Census with the occupational groups of the 1931 Census.

APPENDIX III.

1951 CENSUS TABULATION PLAN.

Statement showing the Divisions and Subdivisions of Industries and Services (I.C.E.C. Scheme).

Subdivisions 6
Groups 22 Division 0

Primary Industries not elsewhere specified.

0.1 Stock Raising-

0.11 Herdsmen and shepherds.

0.12 Breeders and keepers of cattle and buffaloes.

0-10 Breeders and keepers of other large animals including transport animals (1931 Groups 21 to 23, I.S.I.C. Major Group 0-1 Part.)

0.2 Rearing of small animals and insects-

0.21 Poultry farmers.

0.22 Beekeepers.

0.23 Silkworm rearers.

0.24 Cultivators of Lac.

0.20 Rearers of other small animals and insects. (1931 Groups 24 to 26, I.S.I.C. Major Group 0.1 Part.)

0.3 Plantation Industries-

Owners, managers and workers in

0.31 Tea plantation.

0.32 Coffee plantation.

0.33 Rubber plantation.

0.30 All other plantations but not including the cultivation of special crops in conjunction with ordinary cultivation of field crops (1931 Groups 9 to 15, I.S.I.C. Major Group 0-1 Part).

0.4 Forestry and collection of products not elsewhere

0-40 Planting, replanting and conservation of forests (including forest officers, rangers and guards),

0.41 Charcoal burners.

0.42 Collectors of forest produce and lac.

0.43 Woodcutters.

collectors and cow-dung-cake 0.44 Cow-dung makers.

0.45 Grass cutters (1931 Groups 17 to 20, I.S.I.C. Major Group 0.2).

0.5 Hunting (including trapping and Game Propagation)—(1931 Group 28, I.S.I.C. Major Group 0.3).

0.6 Fishing-

0.60 Fishing in sea and inland waters including the operation of fish farms and fish hatcheries.

0.61 Gatherers of chanks and pearls.

0.62 Gatherers of sea weeds, sea shells, sponges and other water products. (1931 Group 27, I.S.I.C. Major Group 0.4.)

Subdivisions Groups Division 1

Mining and quarrying.

1.0 Non-Metallic mining and quarrying not otherwise classified—including mining and quarrying of such materials as precious and semi-precious stones, asbestos, gypsum, sulphur, asphalt, bitumen (1931 Groups 39 and 41, I.S.I.C. Major Group 19 Part).

1.1 Coal mining.—Mines primarily engaged in the extraction of anthracite and of soft coals such as bitumenous, sub-bitumenous and lignite. (1931 Group 35, I.S.I.C. Major Group 11.) Mining and quarrying-cont.

1.2 Iron ore mining-(1931 Group 30, I.S.I.C. Group 121).

1.3 Metal mining except iron ore mining-

1.31 Gold.

1.32 Lead, silver and zinc.

1.33 Manganese.

1.34 Tin and wolfram.

1.30 Other metallic minerals. (1 and 31 to 34, I.S.I.C. Group 122). (1931 Groups 29

1.4 Crude Petroleum and Natural Gas-

Oil Well and Natural Gas, well operations (including drilling) and oil or bitumenous sand operations. (1931 Group 36, I.S.I.C. Major Group 13.)

1.5 Stone-quarrying, clay and sand pits.

Extraction from the earth of stone, clay, sand and other materials used in building or manufacture of cement. (1931 Group 37, I.S.I.C. Major Group 14.)

1.6 Mica-(1931 Group 38, I.S.I.C. Group 19 Part).

1.7 Salt, saltpetre and saline substances—(1931 Group 40, I.S.I.C. Group 19 Part).

Subdivisions 10 Groups 40 Division 2

Processing and Manufacture-Foodstuffs, Textiles, Leather and Products thereof.

2.0 Food Industries otherwise unclassified-

2.01 Canning and preservation of fruits and vegetables.

2.02 Canning and preservation of fish.

2.03 Slaughter, preparation and preservation of meat.

2.00 Other food industries—(1931 Groups 73, 79 and 80, 81 Part. I.S.I.C. Groups 201, 203, 204 and 208).

2.1 Grains and pulses-

2-11 Hand pounders of rice and other persons engaged in manual dehusking and flour grinding.

2.12 Millers of cereals and pulses.

2-13 Grain parchers and makers of blended and prepared flour and other cereal and pulse preparations.

2·10 Other processes of grains and pulses. (1931 Groups 71, 72, I.S.I.C. Group 205.)

2.2 Vegetable oil and dairy products-

2.21 Vegetable oil pressers and refiners. 2.22 Manufacturers of hydrogenated oils.

2.23 Makers of butter, cheese, ghee and other dairy products. (1931 Groups 68 and 81 Part, I.S.I.C. Groups 202 and 312.)

2.3 Sugar Industries

2.31 Gur manufacture.

2.30 Other manufactures and refining of raw sugar, syrup and granulated or clarified sugar from sugarcane or from sugar beets. (1931 Group 74, I.S.I.C. Group 207.)

Processing and Manufacture-Foodstuffs, Textiles, Leather and Products thereof-cont.

2.4 Beverages-

2.41 Brewers and distillers.

2.42 Toddy drawers.

2.43 Ice-manufacturers.

2.40 Manufacture of aerated and mineral waters and other beverages. (1931 Groups 76, 77 and 67, I.S.I.C. Major Group 21.)

2.5 Tobacco-

2.51 Manufacture of bidis.

2.50 Manufacture of tobacco products (other than bidie) such as eigarettes, eigars, cheroots and snuff. Stemming, redrying and other operations connected with preparing raw leaf tobacco for manufacturing are also included. (1931 Group 78, I.S.I.C. Major Group 22.)

2.6 Cotton textiles-

2.61 Cotton ginning, cleaning and pressing.

- 2-62 Cotton spinning, sizing and weaving.
 2-63 Cotton dyeing, bleaching, printing, preparation and sponging. (1931 Groups 42, 43 and 49, I.S.I.C. Major Group 23 Part.)
- 2.7 Wearing apparel (except footwear) and made up textile goods-
 - 2.71 Tailors, milliners, dress makers and darners.
 - 2.72 Manufacturers of hosiery, embroiderers, makers of crepe, lace and fringes.

2.73 Fur dressers and dvers.

- 2.74 Hat-makers and makers of other articles of wear from textiles.
- 2.75 Manufacture of house furnishing of textiles.

2.76 Tent makers.

2.70 Makers of other made-up textile goods, including umbrellas. (1931 Groups 52, 83-84, Part of 89, I.S.I.C. Major Groups 243, 244.)

2.8 Textile Industries otherwise unclassified-

2.81 Jute pressing, baling, spinning and weaving. 2.82 Woollen spinning and weaving.

2.83 Silk reeling, spinning, twisting and weaving.

2.84 Hemp and flax spinning and weaving.
2.85 Manufacture of rayon, weaving of rayon fabrics and production of staple fabric yarn.

2.86 Manufacture of rope, twine, string and other related goods from cocoanut, aloes, straw, linseed and hair.

2.87 Mat weaving.

2.80 All other (including insufficiently described) textile industries, including artificial leather and cloth. (1931 Groups 44—48 and 50, I.S.I.C. Major Group 23 Part.)

2.9 Leather, leather products and footwear-

2.91 Tanners and all other workers in leather.

2.92 Cobblers and all other makers and repairers of boots, shoes, sandals and clogs.

2-90 Makers and repairers of all other leather products. (1931 Groups 51, 82, I.S.I.C. Major Group 29, Groups 241 and 242.)

Division 3 Subdivisions 9 Groups 32

Processing and Manufacture-Metals, Chemicals and Froducts thereof

- 3-0 Manufacture of metal products, otherwise unclassi-
 - 3.01 Blacksmiths and other workers in iron and makers of implements.
 - 3.02 Workers in copper, brass and bell metal.

3.03 Workers in other metals.

3.04 Cutlers and surgical and veterinary instrument makers.

3.05 Workers in mints, die sinkers, etc.

3-06 Makers of arms, guns, etc., including workers, in ordnance factories (1921 Groups 58, 63 part, LS.LC. Major Group 35.)

Processing and Manufacture-Metals, Chemicals and Products thereof—cont

3-1 Iran and steel (Basic Manufacture)

- Manufacture of iron and steel, including all process such as smelting and refining; rolling and drawing; and alloying and the manufacture of castings, forgings and other besic forms of ferrous metals. (1931 Group 57 Part, L.S.I.C. Group 341.)
- 3.2 Non-Ferrous Metals (Basic Manufacture)

Smelting and refining, rolling, drawing and alloying and the manufacture of castings, forgings and other basic forms of non-ferrous metals. (1931 Group 57 Part, I.S.I.C. Group 342.)

3.3 Transport Equipment—

3-31 Building and repairing of ships and boats.

3.32 Manufacture, assembly and repair of Railway equipment, motor vehicles and bicycles.

3.33 Manufacture of sircraft.

- 3.34 Coach builders and makers of carriages, palki, rickshaw, etc., and wheel wrights.
- 3.30 Manufacture of all other transport equipment. (1931 Groups 91, 92 and 93, I.S.I.C. Major Group 38.)
- 3.4 Electrical machinery, apparatus, appliances and supplies-

3.41 Manufacture of electric lamps.

3.42 Manufacture of electric fans and other accessories.

3.43 Manufacture of electric wire and cable.

- trans. 3.40 Manufacture of electrical generating, mission and distribution apparatus; electrical household appliances other than lights and fans; electrical equipment for motor vehicles, aircraft and railway locomotives and cars; communication equipment and related products, including radios, phonographs, electric batteries, X-Ray and therapeutic apparatus; electronic tubes, etc. (1931 Group 94 Part, I.S.I.C. Major Group 37.)
- 3.5 Machinery (other than electrical machinery) including Engineering Workshops—Engineering workshops engaged in producing machine and equipment parts (1931 Groups 58-62 Part, I.S.LC. Maj r Group 36.)
- 3-6 Basic Industrial Chemicals, Fertilizer and Power Alcohol-
 - 3.61 Manufacture of basic industrial chemicals such as acids, alkali salts.

3.62 Dyes, explosives and fireworks.

- 3.63 Synthetic resins and other plastic materials (including synthetic fibres and synthetic rubber). 3.64 Chemical fertilizers.
- 3.65 Power Alcohol (1931 Group [66 [Part and 70 Part, I.S.I.C. Group 311.)
- 3.7 Medical and Pharmaceutical Preparations-(1931 Group 70 Part, I.S.I.C. Group \$19 Part).
- 3.8 Manufacture of chemical products otherwise unclassified-

3.81 Manufacture of perfumes, commetic other toilet preparations.

3-82 Scaps and other washing and cleaning compounds.

3-83 Paints, varnishes and lacquers and polishes. 3.84 Ink.

- 3.85 Matches.
- 3.86 Candle,
- 3.87 Starch.

3-80 Other chemical products. (1931 Group 70 Pars LS.LC. Group 319 Part.)

and

Subdivisions 10 Groups 30 Division 4 Processing and Manufacture not elsewhere specified. 4.0 Manufacturing Industries otherwise unclassified 4.01 Manufacture of professional, scientific controlling instruments (but not including cutlery, surgical or veterinary instruments). 4.02 Photographic and optical goods. 4.03 Repair and manufacture of watches and clocks. 4.04 Workers in precious stones, precious metals and makers of jewellery and ornaments. 4.05 Manufacture of musical instruments appliances. 4.06 Stationery articles other than paper paper products. 4.07 Makers of plastic and celluloid articles other than rayon. 4.08 Sports goods makers. 4·09 Toy makers. 4-00 Other miscellaneous manufacturing industries, including bone, ivory, horn, shell, etc. (1931 Groups 53, 96—99, L.S.I.C. Major Group 39.) 4.1 Products of petroleum and coal-4.11 Kerosene and petroleum refineries. 4.12 Coke ovens. 4.10 Other manufactures of products petroleum and coal. (1931 Group 69, I.S.I.C. Major Group 32.) 4.2 Bricks, tiles and other structural clay products

Structural clay products such as bricks, tiles, etc. (1931 Group 64, I.S.I.C. Group 331.) 4.3 Cement-Cement pipes and other cement products-Manufacture of cement, cement pipes and cement concrete products. (1931 Group 65 Part, I.S.I.C. Group 334.) 4.4 Non-metallic mineral products-4.41 Potters and makers of earthenware. 4.42 Makers of porcelain and crockery

4.43 Glass bangles, glass beads, glass necklaces, 4.44 Makers of other glass and crystalware. *4.40 Makers of other miscellaneous non-metallic

mineral products, (1931 Groups 63 and
