SKETCH MAP

To accompany
REPORT ON INDIAN WHEAT.

NOTE. This Map must be regarded as only a first tentative sketch, as the exact statistics recently ordered have not yet been received.
The Geographical distribution of the principal varieties of Wheat shown in it is founded on a large collection of samples forwarded by the Gov^t of India. No samples, however, were received from the Native States, and even some of the British Provinces, such as the Punjab, were only imperfectly represented.
The data available for estimating the total production of Wheat in India are as yet very imperfect. The production of the North Western Provinces and of Bengal, shown in the Map, is only a rough estimate, while no data at all are available with regard to the Native States, some of which are however known to grow Wheat in considerable quantities.

N.B. The areas of the squares represent roughly the production of Wheat in India, and its principal Wheat growing districts; as follows:

PUNJAB	10½	MILLION	QUARTERS
N.W. PROVINCES	10½	"	"
OUDE	3½	"	"
BENGAL (say)	4	"	"
CENT ^r PROVINCES	3	"	"
BOMBAY	3	"	"
SIND	½	"	"
NATIVE STATES (say)	5	"	"
ALL INDIA (say)	40	"	"

Approximate Annual demand for Wheat in the Market of the World 20 to 25 Million quarters.

The Total Production of Wheat in India 40 Million quarters.

Export of Wheat from India in 1877, 1.3 Million quarters.

Average Production of Wheat in the United Kingdom 11 Million quarters.

Average Annual Import of Wheat into the United Kingdom 11 Million quarters.

REPORT ON INDIAN WHEAT

BY

DR. FORBES WATSON.

INTRODUCTION.

IN submitting the subjoined Report on the samples of Indian wheat forwarded to this Office in accordance with the Resolution of the Government of India of the 14th March 1877, I would take the opportunity of pointing out a few of the principal results of the examination, together with their bearing upon the question of the supply of Indian wheat for the European market. The Resolution referred to directs the collection of detailed statistics and other local information on the subject of the cultivation of wheat, but the results have not yet been received, and the Report has accordingly been restricted to the examination of the question, mainly, by the light of the evidence afforded by the samples themselves. The subject derives at the present time an unusual importance from the obvious consideration that the depreciation of silver, which affects so injuriously the finances of India, can be best counteracted by a development of the Indian export trade. Until, however, the information now in course of collection has been received, the question of the production and export of wheat from India cannot be treated with the amount of statistical detail which it deserves, as the materials available in the usual administration reports are of a fragmentary and incomplete description. At the same time it will be found that the examination of the large collection of samples under report has of itself led to some conclusions which may have an important bearing on the future of the Indian wheat trade.

Bearing of the wheat export on the silver question.

2. The number of samples amounted to more than 1,000, and together they form by far the most complete collection of Indian wheat ever brought to this country. The valuations of the individual samples are given in the tabular statements at pp. 26 *et seq.*, whilst the section commencing at p. 11 will be found to contain a number of special observations referring to them. For the present purpose it will be sufficient to refer to the summary Table at p. 9, which presents a synopsis of all the chief results, and indicates the number of samples of each variety of wheat received from the different provinces of India, as well as their quality, range of price, and average value. A map is also appended, showing the geographical distribution of the chief varieties, and the Report is accompanied by a collection of samples, illustrative of the more important kinds of wheat grown in India.

Report, map, synoptical table of results, and typical collection of specimens.

3. By arranging all the samples, according to price, in classes corresponding to the usual classification of soft white wheats, the following result is obtained:—

Principal results of the valuations.

	Number of Samples.				
	Soft white.	Hard white.	Soft red.	Hard red.	Total.
Superior samples, 44s. to 48s. per quarter of 496 lbs.	101	—	—	—	101
Grade No. 1, 41s. 6d. to 43s. 6d.	123	13	10	—	146
Grade No. 2, 39s. 6d. to 41s.	73	83	56	—	212
Ordinary, 37s. to 39s.	51	61	74	68	254
Inferior, below 37s.	9	10	20	75	114
Total No. of samples	357	167	160	143	827
Average price per quarter	s. d. 41 9	s. d. 39 5	s. d. 38 5	s. d. 36 1	s. d. 39 8

It will be seen that wheats equal or superior in value to grades numbers 1 and 2 of white wheat form the greater portion of the collection, numbering in fact 459

samples, against 368 ordinary and inferior samples; moreover, out of a total of 827 samples, 101 must be described as being of a very superior quality, whilst only 114 samples are decidedly inferior.

Comparison of the prices realised by the Indian samples with the current quotations of foreign wheats.

4. The surprisingly favourable character of these results will be clearly perceived on comparing the prices assigned to the Indian samples with the quotations current at the time of valuation for the different kinds of wheat in the London market, viz.:—

	per quarter of	
Danzig	496 lbs.	42s. to 46s.
Australian	„	47s. to 48s.
Californian and Oregon	„	44s. to 45s.
White American and Canadian	„	42s. to 46s.
No. 1 Milwaukee	„	42s. to 43s.
No. 2 „	„	40s. to 41s.
No. 2 Spring	„	38s. to 40s.
No. 3 „	„	36s. to 37s.

No higher quotations than those realized by numbers of Indian samples appear in this list, the highest being the quotation for Australian wheat at 47s. to 48s. per quarter, a price which has been realized by a certain number of the best Indian samples. It will be likewise seen that the most numerous classes in the Indian collection are those which correspond in value with the better kinds of American wheat quoted in the list.

Comparison with current quotations of English wheat.

5. The valuations of the Indian wheats compare even more favourably with the prices of English wheat. At the time of valuation the quotations for new English white were from 30s. to 45s. per quarter (of 480 lbs.), and for new English red from 30s. to 41s. per quarter, while the average weekly rate throughout the United Kingdom was only 38s. per quarter. It will be seen that the Indian collection contains numbers of samples exceeding in value the highest of these quotations, while the average for the whole collection amounts to 39s. 8d. per quarter, or to nearly 2s. above the average of the United Kingdom. It must, however, be explained that the last English crop was one of exceptionally poor quality, as shown by the fact that at the date of the valuations (beginning of February 1879), the bulk of the English wheats were almost unsaleable at Mark Lane in consequence of their poor condition.

India admirably suited for the growth of the finest qualities of both soft and hard wheat.

6. The above facts conclusively show that India is well adapted for the growth of wheat of the finest quality. It must be, however, kept in mind that a considerable number of the samples sent from India were far superior to any Indian wheat usually seen in the London market, and that without more local information than we now possess it is not possible to decide whether these fine varieties could at present be forthcoming in quantities sufficient for the development of an important trade. In fact, Messrs. Finlay, Scott, & Co. state, in a letter printed among the enclosures to the despatch from the Government of India on the subject, that on the Bombay side the supply of the best qualities is very limited, as compared with the common qualities, and that the prices of the fine wheats are so well kept up in India itself that more profit is to be obtained on the shipment of inferior than of fine wheat. Be this, however, as it may, one result is clearly apparent from the mere inspection of the samples, and that is that the cultivation of the finest wheat cannot be considered as anything exceptional, but that it is spread over a considerable portion of the country. If samples like those mentioned in the valuations as being equal to the finest Australian or Californian had only been sent from a few places their occurrence might have been explained as due to unusually favourable conditions which do not apply to the country at large. But samples of equal or only slightly inferior value were sent from district after district. It is not from one nor half-a-dozen places that the best samples were received, but probably from more than 100 different localities. More than 60 districts sent one or more samples of soft white wheat reported as superior to No. 1, and valued at from 44s. to 48s. These 60 districts include the greater portion of Behar, the North-West Provinces, Oude, and the Central Provinces; and it is probable that but for the weevilled condition in which most of their samples were received, the same might have been said of the Punjab and Sind. In addition, perhaps a dozen more districts in Bengal, Bombay, and Berar may be counted, which though not producing soft white of a similarly high character, yet grow a hard white wheat equal to the finest wheat of the same kind grown anywhere. The provinces above mentioned include the whole of the wheat-growing area proper in India; Madras, Mysore, and

Burma are evidently but little adapted for the cultivation of wheat, the few samples received from them being mostly very inferior in quality. We thus arrive at the important conclusion that throughout the wheat-growing part of India the cultivation of the finest varieties is well understood and extensively practised. This is a most important fact, bearing not only on the development of the wheat trade, but also on agricultural progress in India generally, for it indicates the existence of a much higher agricultural skill than India has usually been credited with. We often hear of the ignorance of the Indian ryots, and of their careless and shiftless modes of cultivation. But a glance at the collection of Indian wheats under report proves that there must exist all over India a numerous class of agriculturalists to whom such a reproach cannot apply. It is impossible to avoid the conclusion that the ryots who grew those samples of soft wheat equal to the finest Australian, or of hard wheat equal to the finest Kubanka, must be as keenly alive to the advantages of selection of seed and of careful cultivation as the most intelligent English farmer; and our samples prove that such ryots are to be found in almost every wheat-growing district.

7. With regard to the prices assigned to the Indian samples, it is necessary to remark that although they compare very favourably with the quotations of the various English and foreign wheats in the market, yet they afford a much smaller margin, as compared with the prices current in India, than has been the case in former years. It must be observed, however, that the exceedingly low range of prices for wheat and other grains now ruling in European markets seems quite exceptional, whilst the prices in India are unusually high. As pointed out in the "Economist" of the 1st of March of the current year, the price of wheat in England has only twice within the last 100 years fallen to the present level, viz., in 1835 and in 1851. Two causes have mainly contributed to bring about the present state of the market. The crops produced in America for two years in succession have been exceptionally heavy, while the existing financial depression and distrust combine to restrict the scale of commercial operations; so that, notwithstanding the cheapness of wheat, the stocks in England continue low, as the grain merchants cannot obtain from the banks the usual advances. (In India, on the contrary, the prices ruling in the chief producing districts are higher than in normal years, partly on account of the exhaustion of stocks by the recent famines, partly on account of the apprehensions excited by the unfavourable season in the North-West Provinces and in the Punjab. So far these causes have undoubtedly resulted in a very considerable diminution in the arrivals of Indian wheat in this market.)

Observation on the present low level of prices.

8. But whatever may be the case, under such exceptional conditions as those now prevailing, all the facts point to the conclusion that, as regards wheat, India may shortly become one of the chief sources of supply for the United Kingdom. It must be borne in mind that India is one of the largest wheat-producing countries in the world. The production of the United Kingdom amounts to only about 10,000,000 to 13,000,000 quarters per annum. Austro-Hungary, Italy, and Spain each produce about the same quantity. Germany produces from 15,000,000 to 18,000,000 quarters, and the two countries which produce the largest amounts are France and Russia, each producing from 30,000,000, to 35,000,000 quarters per annum. Both are surpassed by the United States, which produced during each of the past two years upwards of 45,000,000 quarters. (No complete statistics exist for India, but we know that the Punjab alone produces about as much as the United Kingdom, Oude about 3,500,000 quarters, the Central Provinces about 3,000,000, and Bombay not much less. The production in the North-West Provinces proper has never been estimated, but must be fully equal to that of the Punjab, and that of Behar is also known to be considerable. Thus the yearly production of the provinces under direct British rule will amount to from 30,000,000 to 35,000,000 quarters, or to the same quantity as that produced by Russia or France. But if the native States in the Punjab, Rajpootana, Malwa, Bundelkund, and Guzerat be added, in all of which wheat is largely cultivated, it will be found that India must be considered as being, next to the United States, the largest wheat-producing country in the world.)

Comparison of India with other wheat-producing countries.

9. The prospect appears even more encouraging when viewed in connexion with the results already mentioned of the examination of the samples under report. Whilst as regards cotton and some other produce the soil and climate of India are rather at a disadvantage with those of other competing countries, as regards wheat India is proved to be admirably adapted for the production of the finest qualities of both soft and hard wheat. This is a circumstance of great importance, because the supply of

The true policy for India in the matter of wheat is to encourage the cultivation.

tion of the finest varieties.

the fine varieties is much more restricted than that of the commoner kinds. In considering the competition in the market of the world, France, although producing as much as Russia, may be left out of account, as its production, large though it be, barely suffices for its own consumption. Thus, practically, Russia and the United States are the chief competing countries to be considered. But in both countries the area for the production of fine full grown winter wheat is comparatively restricted. Spring wheat forms a very large proportion of the Russian supply, as the greater part of the country is too cold for the growth of winter wheat; in the United States likewise, the climate of Minnesota, Iowa, and the other States on the Canadian border, in which the cultivation of wheat has been recently so rapidly extending, is only adapted for the growth of spring wheat. This wheat, which is mostly red, is not only inferior in quality to a good winter wheat, but it produces also a much lighter crop, not more than 12 to 15 bushels per acre. Thus, however much the cultivation may extend in these parts, it is not likely to affect the supply of the finest varieties, such as are grown in some of the older States or in California.

The true policy for India, therefore, appears to consist in taking advantage of her climatic position, and cultivating for export only the finest varieties, in which the competition of Russia and the Far West in America is not likely to be as severe as in the case of the common varieties. Such a policy receives additional recommendation from the fact that the price of the finer varieties is always better kept up, and suffers less in a falling market than that of the common wheat. The higher priced wheat will likewise support better the necessarily high charges of transport and freight.

Causes of the inferior quality of the bulk of Indian shipments of wheat.

10. The bulk of the Indian wheat as actually shipped to this country is, however, by no means of a high quality, as the good average Indian wheat chiefly known in this market only classes with grade No. 2. There is room for considerable improvement both in the quality of the grain itself, and as regards the condition in which it is sent to this market. The three principal causes which at present tend to depreciate Indian wheat are,—(a) the mixture of different varieties of wheat, white and red, hard and soft in the same sample; (b) the admixture of other grain, such as barley, gram, rape, or linseed; and (c) the presence of foreign matters, such as chaff, earth, lumps of clay, and dirt of every description.

(a.) With regard to the mixture of different varieties of wheat, that of hard with soft wheat is the most objectionable, as also the most frequent. The mixture of soft red with soft white wheat depreciates the price to a certain extent, though many samples of such mixed wheat were highly reported on, but the presence of a considerable proportion of hard grain reduces the value materially.

(b.) The admixture of foreign grains reduces even more the value of the wheat. Many samples from the Punjab, Sind, and also occasionally from Bengal and the North-west Provinces, are so mixed with barley as to be quite unfit for milling, and the presence of smaller quantities of gram or oilseeds is frequently met with in samples coming from every province.

(c.) The third cause of depreciation—the presence of chaff, earth, and other extraneous matters—is likewise more noticeable than would be the case if the wheat trade were properly organised.

The existing causes of depreciation of Indian wheat easily removable.

Excellent seed may be found in almost every wheat-growing district.

Cheap winnowing and screening appliances.

Advantages which would result from the introduction of

11. Fortunately no serious difficulties seem to stand in the way of effecting a great and rapid change in the character of the wheat exported from India. The quality of the grain itself depends mainly upon the care exercised in the selection of seed. The collection of samples here reported on proves, however, that in almost every district excellent qualities of wheat may be already found. There is therefore no question of acclimatising seed imported from England or other countries, but simply of extending the area of the fine varieties already cultivated, and if a regular demand for the better qualities should spring up, there is every probability that the mere extension of the cultivation already existing would be able to meet it. As regards the condition of the wheat, the considerable quantities of chaff and dirt of all kinds, the presence of which depreciates the Indian wheat on the average by at least 2s. 6d. per quarter, could be easily removed by the introduction of comparatively simple screening and winnowing machinery.

12. The measures so far suggested are all capable of easy execution, and attention to the points mentioned would contribute to improve materially the position of Indian wheat in the English market. But, in addition, the introduction of steam threshing machinery has recently been strongly recommended. No doubt, if such machinery

came to be extensively adopted in India, the benefit derived from its use would be considerable. In view, however, of the great cost and general unsuitability of such machines to the Indian system of farming, it is impossible to entertain the hope that they could ever be adopted for general use in India. But it cannot be doubted that in some of the principal exporting districts such machines might be used with the greatest advantage. In addition to the clean condition of the grain, a great saving would be effected in the time required for the preparation of the crop for the market and its shipment to this country. In this manner the ravages of the weevil, one of the greatest obstacles to the development of the Indian wheat trade, would be reduced to a minimum, and Indian wheat could be delivered in this country just at that period before the gathering of the English harvest when stocks are lowest, and prices at their highest. It may be mentioned that the introduction of steam threshing machinery into Russia, and quite recently into Egypt has resulted in a considerable improvement in the quality in the wheat sent from these two countries.

threshing
machines.

13. The suggestions contained in the preceding paragraphs bear upon the measures required for developing in India the production of a better quality of wheat than that now principally exported. But of equal importance to the increase of the supply of good wheat in India are any measures which might lead to an increased demand for the Indian wheats by the opening up of new markets. I may remark on this point, that in the opinion of the valuer to whom the samples were submitted, the Mediterranean would afford for some of the varieties a much better market than England. This applies particularly to a fine, hard, white wheat grown in many parts of India. Many of the samples of this kind sent from Bengal, the North-west Provinces, but especially from Bombay, were equal to if not better than the finest Kubanka wheat, which is usually accepted as the type of the best wheat of this class. This kind of wheat is specially suited to the manufacture of macaroni, which is so important an industry in Genoa, Naples, and other places in Italy. Hard white wheat is on this account in great request there, and may be frequently disposed of at prices much in advance of the London quotations. The difference in favour of Italy may sometimes amount to as much as 5s. per quarter. As, moreover, the shipping charges from India to Italy will be lower than those to England, that country seems to be the natural outlet for this description of Indian wheat, which up to the present has not been sufficiently appreciated in England.

Opening up
of new mar-
kets for In-
dian wheat.
The hard
white wheat
most suitable
for Italy.

14. There is another point which has an important bearing on the demand for Indian wheat. Its consumption in this country depends mainly upon its adaptability for the purposes of the miller. It must be kept in mind that the recent remarkable development of the export trade in Indian wheat was to a considerable extent influenced by the improvements effected in this country in the mode of grinding it. This development was of course favoured by the opening of the Suez Canal, and by other circumstances; but the principal cause was the discovery that by previous wetting Indian wheat is rendered perfectly suitable for grinding in the usual way, and also that an admixture of the dry Indian wheat with the English grain is very advantageous, especially after a wet harvest.

Increased
adaptability
of the Indian
wheat for
the purposes
of the Eng-
lish miller.

15. There is every reason to suppose that just as in the past changes or improvements in the milling process have affected the demand for Indian wheat, so in the future further improvements may result in increasing the demand. The improvements which have been effected during the last few years in milling machinery are very considerable. In addition to the usual system of grinding the grain by means of millstones, two new methods have been prominently brought into notice. The one consists in crushing the wheat by passing it repeatedly between chilled iron rollers. This is the method now universally used in Hungary, and it produces the finest flour in the market. The superiority of the flour prepared in this way to that produced by the ordinary method is shown by the quotations, which, for instance, on the 10th of February last ranged between 41s. and 55s. per sack of 280 lbs. of Hungarian flour, whilst the highest price for town-made flour was only 40s. The third and most recent system consists in a combination of the grindstones with crushing cylinders. The grain is first broken up between grindstones so as to convert it into a kind of semolina or soojee, which is subsequently crushed between smooth porcelain cylinders.

Recent im-
provements
in milling
machinery.

16. I had occasion to inspect the two new systems here referred to at the recent Paris Exhibition, and I concur with the opinion which has been expressed in the

Suggested
experiments
in order to

ascertain capabilities of Indian wheat for the manufacture of the finest flour.

accompanying letter by Mr. Alexander Smith, of Cornhill, to whom I am indebted for the laborious series of valuations on which this Report is founded, as to the expediency of ascertaining by direct experiment the suitability of the Indian wheat for the production of the finest flour, with the aid of the new milling apparatus here referred to. Mr. Smith expresses his surprise at seeing so many specimens of really very fine wheats among the samples submitted to him. He says these extra fine wheats are unknown here, and that it would be of the utmost importance to get some of them converted into flour, and even into bread. He was particularly struck with the fine hard wheat, which he thinks is not sufficiently appreciated in this market, and he refers to some experiments undertaken some time ago, at his instance, with flour produced from the hard St. Petersburg wheat, which yielded per sack of 280 lbs. 110 four-pound loaves of fine bread, whereas the best English wheat yields only 90 to 92 loaves. Some of the Indian samples of hard wheat are even finer than the best hard St. Petersburg or Kubanka wheat; and Mr. Smith is of opinion that the methods of milling recently introduced, in which the grindstones are replaced by crushing cylinders, will do away with the objection formerly entertained to the hard wheat on account of its being injurious to the grindstone.

For each milling experiment a quantity of about 20 quarters would be required; so that to test the three systems of milling now in use, 60 quarters, or about 350 maunds, of each variety of wheat would have to be procured. Mr. Smith suggests that the following sorts should be tried:—

- 1st. Fine hard white.
- 2nd. Fine soft red.
- 3rd. Fine soft white.
- 4th. Good average soft white, No. 2.

Of these, the three sorts first mentioned are not obtainable in the London market. The quality last mentioned as "good average white, about No. 2," may, indeed, be purchased here, but it is often so much mixed and dirty that it would be preferable to have it likewise imported directly from India.

It may be pointed out that the greater portion of the expenditure on account of such experiments would be recovered from the sale of the resulting flour.

Districts from which samples suitable for the experiments could be most readily obtained.

17. It should not be difficult to procure the quantities required of the wheats named for the proposed experiments. The lists of the best samples of each of the different varieties, and their place of production, at pp. 19 to 23 of the Report, supply an indication of the places in which these varieties are obtainable. Although generally the best specimens of soft wheat are all produced north, and the best specimens of hard wheat south, of the Nerbudda, there are many districts in the North-West Provinces or in the Central Provinces in which all the four varieties required may be found together. The finest specimens of hard white wheat comes from the Khandesh district in the Bombay Presidency, but wheat almost equal to it is found in many parts of the North-West Provinces, and even as close to Calcutta as the Maldah district. The simplest way would be to entrust Mr. Buck, the Director of Agriculture of the North-West Provinces, with the duty of purchasing the necessary quantities, approaching as nearly as possible the quality of the samples Nos. 1 or 2, Nos. 4, 6, and 7, of the set of samples which accompany this Report, and the description of which is given in Appendix B., p. 10. The districts of Cawnpore, Bulundshahr, or Meerut appear the most suitable for such a purpose, as from each of them excellent samples of all four varieties have been received.

Request for a collection of fresh samples from the Punjab.

18. I would take the same opportunity for suggesting that a fresh collection of samples should be forwarded from the Punjab. As pointed out on page 13 of the Report, the collection sent from that province would, in all probability, have scarcely done justice to it, even had it arrived uninjured. But by far the greater proportion of samples were either totally destroyed, or at least partially damaged by weevil. A number of most important wheat-growing districts are, in consequence, left unrepresented even by a single sample, and the whole province, containing 30 districts, and producing annually more than 10,000,000 quarters of wheat, or about as much as the whole United Kingdom, is only represented by 19 sound samples. From such scanty materials it is of course impossible to draw any reliable conclusions with regard to the character of the cultivation of wheat in the Punjab. Examples of the two extremes of Indian agriculture may be found there side by side. On the one hand, the specimen of soft white wheat sent from Delhi is the best sample in the whole collection, and several other samples are of equal excellence; on the other hand, there are a number

of samples, among the red wheats especially, which could only have been grown from seed apparently degenerated through a long course of neglect. As observed in the Report, the samples in question, in addition to foreign substances, contain a large proportion of grains of wheat of so stunted a growth and shrivelled appearance as to resemble rather grass-seed than a cultivated grain. The cultivation of such a degenerate wheat is the more astonishing, as, to judge by our samples, seed of first-rate quality seems to be produced in the same or adjoining districts, so that the remedy for the evil is close at hand. One remark may be made on this subject. If the collection presents a fair picture of the varieties cultivated in the Punjab, then it must be inferred that the cultivation of wheat in the Punjab proper, that is, the districts between the Indus and the Sutlej, is conducted with considerably less skill and care than in the neighbouring North-West Provinces. By far the greater number of the samples sent from the Punjab districts consist of red wheat, frequently of a very inferior quality; in fact, the proportion of inferior samples is greater in the Punjab collection than in that from any other province, Madras, Mysore, and Burma alone excepted, which can hardly be classed among the wheat-producing provinces. But on account of the incompleteness of the collection, it would be hazardous to draw any definite conclusions.

19. The uncertainty in which the question of the quality of the Punjab wheats is left is the more a matter of regret as that province seems capable of becoming the chief wheat exporting district of India. As I had occasion recently to point out, there is no part of India in which, in proportion to the population, wheat is grown to the same extent as in the Punjab, the acreage now under wheat amounting to more than 6,000,000 acres, and being capable of rapid extension.

Punjab probably destined to become the chief wheat exporting province of India.

Hitherto the only railway available for the wheat coming from the Punjab has been the Punjab and Delhi and the East Indian line, so that the producing districts were at a distance of from 1,100 to 1,500 miles from the port (Calcutta).

By the Indus Valley Railway the distance to the port (Kurrachee) will only amount to from 600 to 1,000 miles. The reduction in the railway carriage will thus be considerable, amounting on the average to about 6s. per quarter. There will be a further saving of 2s. per quarter on the freight from Kurrachee to London as compared with the freight from Calcutta to London. The total saving effected by the Kurrachee route will thus amount to about 8s. per quarter, and the total expense of carriage and freight to London will be from 15s. to 20s. per quarter.* Considering that the price of wheat in London may be taken at the present time at from 40s. to 45s. per quarter, and that in the Punjab in normal years the prices range from 9 to 14 rupees for the same quantity, a saving of 8s. will often make the whole difference between a profitable

* The saving on the inland carriage has been made on the basis of the special reduced rate for long distances now charged on the East Indian Railway, viz., 18'7 pies per 100 maunds. The rates on the Sind, Punjab, and Delhi line, parts of which would have to be used both in exporting via Calcutta, as well as via Kurrachee, are a little higher, viz., 25 pies per 100 maunds. For the purpose of a rough calculation, however, it will be sufficient to adopt the East Indian Railway rate of 18'7 pies for the whole distance, especially as it may be presumed that with an increased wheat traffic the Sind, Punjab, and Delhi Railway would bring down its rates to the lower level.

	Punjab to London, via Kurrachee.		Punjab to London, via Calcutta.	
	Minimum Distance, 600 miles (Multan).	Maximum Distance, 1,000 miles (Umballa or Rawalpindi).	Minimum Distance, 1,100 miles (Umballa).	Maximum Distance, 1,500 miles (Multan or Rawalpindi).
Carriage by rail to the port, per quarter.	s. d. 6 10	s. d. 11 5	s. d. 12 6	s. d. 17 2
Freight by sea to London, per quarter.	8 0	8 0	10 0	10 0

This shows an advantage of 5s. 8d. on the railway carriage and 2s. on the sea freight, or nearly 8s. per quarter in favour of the Kurrachee route.

As the Indus Valley Railway is almost finished, with the exception of the bridge at Sukkur, experience will shortly show whether the line will be able to convey as large quantities of merchandise at rates as low as those now charged on the East Indian line, and it is only the inability of the Indus Valley Railway to accomplish this which would affect the above forecast.

and a losing trade, that is between a trade of the largest dimensions and no trade at all.

The completion of the Indus Valley Railway is thus calculated to bring about a complete revolution in the wheat trade of India, which is likely to assume in the Punjab a magnitude considerably greater than that which it is likely to attain in the districts from which the wheat is at present exported.

These few observations on the special interest attaching to the exact knowledge of the varieties of wheat cultivated in the Punjab will, I trust, be considered to justify the adoption of the suggestion made above for the collection of a new set of samples in that province.

Suggested
chemical
analysis of
the principal
varieties of
Indian
wheat.

20. I beg likewise to suggest that it is very desirable to obtain a detailed chemical analysis of the chief varieties of wheat referred to in the accompanying Report. An opinion has been recently expressed that a proof is afforded of the exhaustion of Indian soils by the very low per-centages of phosphoric acid contained in the ash of the Indian wheats. It would be desirable to test the correctness of this opinion. A detailed analysis would further show whether the difference in quality between hard and soft wheat is due to a difference in chemical composition, the hard wheat appearing to be much richer in nitrogenous matter than the soft wheat. All these various points could be satisfactorily settled by analysing samples of the four different varieties, soft white, soft red, hard white, and hard red. For the sake of comparison samples of English wheats and of Australian and Californian should be analysed at the same time.

Request for
the statistical
information
collected in
India with
regard to
wheat.

21. In conclusion, I beg to refer again to the great importance of obtaining from India the detailed statistical information which has been collected under the orders of the Government of India mentioned at the beginning of this Memorandum. This information is urgently required to complete that which is afforded by the direct examination of the samples, and only after its receipt will it be possible to compile a complete and reliable account of the cultivation of wheat in India, an account which under the present circumstances would be exceedingly useful both to the Government and to the mercantile community.

J. F. W.

APPENDIX A.

TABLE showing for each Province, as also for all India, the number of samples forwarded by the Government of India of wheat of each of the several varieties, together with their range in price, taken at the beginning of February 1879.

Note.—The classification, according to price, adopted in this Table applies, strictly speaking, only to the soft white wheats. It has been extended to the three other varieties in order to give a general idea of the number of samples of all varieties comprised within the same range of prices.

APPENDIX B.

*Typical Collection of Samples illustrating the principal varieties of Wheat grown in India.**

Nos. 1 and 2.—Samples of the finest kind of soft white wheat, equal to the best Australian. No. 1 is a sample of wheat grown near Delhi ("Safed," No. 273), and is the best of all as regards colour and shape of grain, but as regards softness it is excelled by the second sample, grown in the Meerut district ("Safed," No. 397). Both were valued at the highest figure of any wheat at the time (February 1879) in the London market, viz., 48s. per quarter, and the weight per bushel is high, 65 lbs. in the case of the first, and 62 lbs. in that of the second sample. Samples approaching these two in quality were received from about 60 districts, comprising the greater part of Behar, the North-West Provinces, and Oude, the Central Provinces, the Punjab, and Sind.

No. 3.—Sample of good wheat, grade No. I., grown in the Sultanpur district of Oude ("Samdhara," No. 711), and valued at 43s. 6d. per quarter.

No. 4.—Sample of good average wheat, grade No. II. or rather better, grown in the Chumparun district of Behar ("Hada," No. 154), valued at 40s. 6d. per quarter, and weighing 61 lbs. per bushel. This sample, like the previous one, differs from the two samples placed first by being mixed with a certain proportion of red and hard wheat, and is less uniform in appearance and colour than the best soft wheats placed first. These two specimens represent the two most numerous classes of the samples of soft white wheats in the present collection.

No. 5.—Sample of a peculiar wheat, resembling pearl barley in appearance, grown in the Meerut district ("Chunia," No. 401), valued at 43s. 6d. per quarter; weight 63½ lbs. per bushel. This specimen is included rather as a curiosity, the variety it represents being cultivated only locally in some parts of the North-West Provinces, Oude, the Punjab, and Sind.

No. 6.—Sample of fine hard white wheat, equal to the best St. Petersburg or Kubanka, grown in the Khandesh district ("Bansi," No. 605), valued at 42s. 6d. per quarter, and weighing 62½ lbs. per bushel. Wheat of similar quality is cultivated throughout the Deccan and Berar. Excellent samples were also sent from the North-West Provinces, Oude, and Bengal. This kind is most in request in Italy for the manufacture of macaroni, where it would fetch a considerably higher price than in this market.

No. 7.—Sample of fine soft red, grown in Ajmere ("Baja maigee," No. 588), valued at 41s. 6d. per quarter, and weighing 61 lbs. per bushel. Wheat of similar quality may be found almost throughout the whole of Northern India, and as far south as Berar.

No. 8.—Sample of hard red wheat, grown in Guzerat (No. 1a), valued at 37s. 6d. per quarter. This variety is very unsuitable for the European market, and its growth should not be encouraged. It is found mainly in the Peninsula, or south of the Nerbudda, as far as Mysore and Tinnevely, and its prevalence usually indicates the unsuitability of that part of the country for the production of the better kinds of wheat.

No. 9.—A specimen of degenerate red wheat, from the Kurnool district in the Punjab ("Gehun lal," No. 260), valued at 31s. 6d., is included in this collection as an example, and by no means the worst example, in the present collection, of a grain the cultivation of which should be discouraged. It weighs only 53½ lbs. per bushel.

* A certain number of duplicates of the Collection here referred to have been forwarded to India with the copies of this Report.

REPORT ON THE SAMPLES.

1. The samples of wheat which the Government of India, in their Resolution of 14th March 1877, directed to be forwarded to the Secretary of State for India for valuation and report, were received at various dates during the years 1877 and 1878 as enclosures to the Despatches noted in the margin,* the final consignment of samples having been received only in December last. The total number of samples forwarded amounted to 1,152, and these were contributed by the different provinces in the following proportion:—

In addition to the collection of samples, the Government of India in the Resolution above referred to directed the collection of statistical details on the subject of wheat. Until that information arrives, it would be useless to undertake the elaboration of the very imperfect materials at present available. No attempt therefore has been made to give a statistical account of the cultivation of wheat in India, and the present Report will contain solely the results of the examination of the samples sent to this country.

Condition of the Samples.

2. The condition in which the samples arrived here illustrates one of the principal difficulties of the Indian wheat trade. As will be seen from the figures noted below,

Name of Province.	Total No. of Samples.	No. of Samples destroyed by weevil, lost, or otherwise unfit for valuation.	No. of Samples valued.	
			In a more or less weeviled condition.	In a sound or nearly sound condition.
Bengal - - - - -	117	49	21	47

Burma - - - - -	2	—	—	2
Total - - - - -	1,152	325	330	497

* Three of the Madras and fifteen of the Mysore samples were evidently of the nature of spelt, with the husk adhering to the grain. They were all reported on as unmarketable in this country, and would require to be husked in the same way as paddy.

more than one half of all the samples were found on arrival to be more or less damaged by weevil. Of the 325 samples entered as lost or otherwise unfit for valua-

tion, a few were sent in quantities insufficient for examination, others (from Madras and Mysore) were forwarded unhusked, some were lost owing to injury in transit to the bag or case containing the samples, but the great majority were found to be unfit for valuation on account of excessive weevilling. Thus, only 827 samples were left for valuation, and even of these, 330 samples were more or less damaged by weevil, though not to such an extent as to render a valuation entirely misleading. Only 497 samples out of a total of 1,152 were in a perfectly sound, or at any rate nearly sound, condition.

Some provinces are much worse off in this respect than others. Thus in the case of Sind, out of 122 samples, there was not one perfectly sound, although 58 were still in a tolerably fit condition for valuation. Out of the 101 samples sent from the Punjab, almost one half, viz., 47, were unfit for valuation, and of the remainder only 19 were perfectly sound, whilst 35 were more or less weevilled. It is clear that from this reason the valuation of the Sind and Punjab series of samples will show a rather lower range of prices than would have been obtained if all the samples had been sound. The samples from Bombay and the Central Provinces are those which on the whole were received in the best condition, considerably more than one half of all the samples having remained perfectly sound.

The causes of this excessive damage by weevil are not far to seek. The best way of preventing this damage would have been to have collected the samples as soon as possible after harvest, and to have forwarded them to London by the quickest route. It appears, however, from an examination of the dates, that most of the samples were collected a considerable time after harvest, and that their arrival in London was still further delayed by their being forwarded in the first instance to Calcutta. It is probable indeed that many of the samples were already weevilled before they left India. The Bengal samples, for instance, were packed each in a hermetically sealed tin case, so that no weevil could have found access to them during the voyage, and yet out of 117 samples 70 arrived more or less weevilled. It should be suggested that in future any samples of wheat or other grain to be forwarded to this country for valuation should be collected immediately after the harvest, and despatched direct to London. The parcel post will be found on the whole to supply the quickest, most convenient, and most economical mode of forwarding them.

It may be further remarked that, in order to obtain a fair valuation, it is necessary to have a sufficient quantity of the material for ascertaining the weight per bushel, a very important determination. Many of the samples forwarded, especially in the second consignment from the North-West Provinces, were quite insufficient for this purpose, in some cases not exceeding two ounces, whereas at least one pound is required.

Extent of wheat cultivation in India.

3. Taken as they stand, the collection of samples here reported on still affords the most complete representation of the cultivation of wheat in India which has been brought together up to the present time. As will be seen from the numbers already given in the previous paragraphs, every province of India is represented in the collection. Samples appear from every district which is known to produce wheat in any considerable quantity. If any wheat is cultivated at all in the districts which are not represented, all the information at our disposal leads to the inference that such cultivation is quite exceptional and insignificant in amount. The districts therefore from which samples have been sent may be assumed, without any important error, to represent the area within which wheat is cultivated in India. This area comprises by far the greater part of the country. It extends throughout every district of the North-West Provinces, Oude, the Punjab, Sind, the Central Provinces, and Berar. In the Bombay Presidency samples were received from every part, with the exception of some of the coast districts. Similarly, the few examples received from the Madras Presidency were sent mainly from some of the interior districts, scarcely any coming from the districts near the coast. In the Lower Provinces of Bengal, all the districts comprised within the limits of Behar are represented by samples, but in Bengal proper hardly any are sent from the districts within the Gangetic delta, or those adjoining the Brahmaputra, and the cultivation of wheat seems to be restricted to the more or less hilly parts south and west of the Ganges, the Maldah district being the only one on the other side of the river from which any fair samples of wheat were forwarded. The area of wheat cultivation in India may be thus defined as the whole of Northern India up to the Gangetic delta, and in Southern India the whole of the

table-land above the Ghâts. From British Burma only two samples were sent, and its cultivation there is evidently quite exceptional.

The collection of samples is less complete in the case of some of the provinces than of others, and is still further diminished by the loss or damage from weevil, which has already been referred to. The most complete collection of samples were sent from the North-West Provinces and Oude, from which 448 samples were received, so that, notwithstanding the usual loss of some of the samples from weevil, there is from almost every district an ample supply of sound samples representing the varieties of wheat usually cultivated in it. But in the case of almost every other province repeated instances occur in which all the samples from a particular district have been destroyed. Such is the case, for instance, with the Purneah district and the Sonthal pergunnahs in Bengal, the Umritsur, Rawul Pindee, Montgomery, and other districts of the Punjab, the Surat and Ahmednagar districts of the Bombay Presidency, the Jubbulpore district of the Central Provinces, and some others. Again, many districts are represented only by samples more or less weevilled, others by only inferior specimens of wheat, all the softer and therefore more valuable samples having been rendered unfit for valuation by excessive weevilling. But in most cases enough samples remain from the surrounding districts to enable one to infer with tolerable certainty the nature of the wheat cultivated in the districts from which a deficient supply was obtained. The most notable exception occurs in the Punjab. Even if the whole collection had arrived uninjured, it would have hardly done justice to that province, which, in proportion to its area and population, possesses the largest cultivation of wheat in India, and which, as shown at page 7 of this paper, there are grounds for thinking may before long become one of the most important centres of the export of wheat from that country. From the districts of the Punjab proper, beyond the Sutlej, in one half of the instances only one sample was sent per district, although there is no reason to suppose that the wheats grown in the Punjab present a smaller range of varieties than those cultivated in other parts of India. The Punjab collection must therefore have been far from complete, even as sent from India, but as in addition it has suffered more from weevil than that of any other province, Sind alone excepted, it affords only a very imperfect idea of the cultivation of wheat in the Punjab. A collection of 19 sound samples can hardly be considered to adequately represent a province containing 30 districts, and producing annually more than 10 million quarters of wheat, or about as much as the United Kingdom.

Native names of the different varieties.

4. Considerable confusion exists with regard to the native names of the different varieties of wheat. Many samples from Bombay and the Punjab had no names at all attached to them. Others are only distinguished as red or white wheat, or by similar generic designations in native languages, such as "safed" (white), "lal" (red), "surkh" (brick colour), "safed gehoon" (white wheat), "lal gehoon" (red wheat). The other Hindi, Persian, or Sanskrit synonyms for wheat, "kunun," "gundum," or "saman," are also frequently employed, either alone or in connexion with the adjectives designating white or red. Whether by mistake or otherwise, the names appear sometimes to be misapplied. Thus, for instance, two samples called "lalia" (valuation Nos. 349 and 696), from Sitapur, consist of fine, soft, white wheat. In the same manner "lal disi" (No. 146), from Muzaffarpur, "kathia lalia" (No. 329), from Fyzabad, "lalia" (No. 478) from Lucknow, "lal pissia" (No. 504), from Etawah, and some other samples similarly described, are all white, notwithstanding the use of the adjective "lal" or red. On the other hand, a "white pissi" (No. 565), from Bilaspur, is described by the valuer as a good, soft, dingy red.

In addition to these generic designations, many specific names occur, which at first one would be inclined to consider as applying each to some well known variety of wheat with well defined characteristics. To a certain extent this seems to be the case. For instance, spread over all India from the Punjab to Bengal, and south as far as the Deccan, appear names like the following,—Daudi, Doodhia, Dawoodi, Daudkhani, Dudhia, which all seem to be derived from the same original name, "Dawood Khani" (Prince David's wheat). Throughout the Gangetic valley the samples sent under these names are of a nearly uniform character, almost invariably white and soft, and frequently of a very superior quality; but occasionally, and especially in the Deccan, a very inferior hard white wheat will go under this name. Another widespread series of names which appear to apply to the same description of wheat are the names Mundi, Mundia, Mundwa, Mandwa, Mondha, Mendha, which appear to be

equivalent with Muria, Marua, Marwa, Muria ratua, and Ratta, Ratwa, Ratua, as also with Ujra. These names occur throughout the North-West Provinces and Oude, as also in the adjoining portion of the Central Provinces, such as "Pissi mundi." They apply almost invariably to a beautiful, soft, white wheat, as a rule of a very high quality. The same holds good of Seta, Sitia, Setwa, and Satwa, as also of Saman bargehuma, Sambhari, Sambharia, or Samaria, names which are frequently met with in the same districts as the above. The name "pissi," frequently used in the Central Provinces, and occasionally in the North-West Provinces, seems invariably to imply a softness of grain, whether in white or red wheat.

But in the case of almost every other name samples of the most different character may be found. Thus, for instance, the names Gajar, Gajra, Gaja, designate, as a rule, in the Agra and Rohilkund divisions and adjoining parts of Oude, rather an inferior sort of white wheat. Very frequently the wheat is mixed, white and red, sometimes altogether red; but occasionally samples are to be found under the same name, consisting of the finest soft white wheat, equal in value to the best specimens produced in India. The same applies to the names Kathua, Katteh, Kuttya, and other variations, which in most parts of India designate rather a poor sort of wheat, white or red, but mostly hard, and yet occasionally have been applied to the most beautiful samples of soft white. The names Jamali and Gangajali so frequently met are indiscriminately applied to wheat of the most different characteristics.

It may indeed frequently happen that, even in cases in which the grain is of a different hardness or colour, the plant known under the same name may be distinguished by a certain similarity in outward appearance, and that only the character of the seed has become changed or degenerated. It is impossible to decide this point without possessing specimens of the whole plant. But sufficient evidence has been shown of the uncertain meaning of the Native names as applied to the grain itself to make it unsafe to adopt them as a basis of a commercial grouping of the samples sent from India. This has been therefore effected entirely on the basis of the appearance of the samples themselves, without regard to the names under which they were sent.

Description of the principal varieties of wheat grown in India.

5. The whole of the 827 samples submitted for valuation may be arranged in four principal groups, embracing the white soft, the white hard, the red soft, and the red hard wheat. The differences between these varieties when pure are very striking.

The pure soft white wheat has a grain usually of a bright straw colour, is opaque in appearance, and the fracture is white and floury, the inner portion of the grain being friable. This is the most valuable variety for the London market, as it yields the finest flour. The Indian wheat of this description is in special request on account of its dryness, which renders it useful for admixture with home-grown wheat containing too much moisture when harvested in wet seasons. It is also liked by millers, on account of the considerable increase in weight which it experiences in grinding in consequence of its power of absorbing moisture.

The pure hard white wheat has a grain of a translucent, flinty, or "ricey" appearance, varying in colour from a greyish or yellowish white to the lighter shades of brown, the fracture smooth and glass-like, and the grain hard and brittle. This kind of wheat is not much in favour in the London market, as the usual appliances of English millers do not seem to be so well adapted for dealing with it as with the soft white. It is, however, in considerable request in the Mediterranean, and especially in Italy, where it is used in the manufacture of macaroni. This is the reason why the quotation in Italy for wheat of this description is frequently as much as 5s. per quarter higher than that of the London market.

The pure soft red wheat is only distinguished from the soft white by the different colour of the skin, which varies in different varieties from an amber colour to a reddish brown. The fracture is as white and mealy as in the soft white wheat, and the grain as friable. It is eminently suitable for the English market. The Indian red varieties are, however, frequently rather smaller berried than the white varieties, and are usually much deteriorated by being mixed with barley, gram, and different oilseeds.

The hard red wheat is the darkest of any, being frequently of a dark brown colour. It is translucent in appearance, and the fracture is smooth and glass-like. It occupies the lowest position in the London market, as it is generally disliked by the millers.

Only a certain number of the samples, however, present these characteristics with distinctness. A considerable number consist of mixtures of the primary varieties in all possible proportions, white and red, soft and hard, from which the grains of each kind may be picked out. A considerable number too, though consisting of grain of uniform quality, exhibit in the character of the individual grain a transition between some of the four varieties above mentioned. For instance, in certain samples of the Bansi wheat, from the Central Provinces, some portions of the same individual grain may be opaque and soft, others translucent and hard. In the same way, many of the samples of wheat from the Punjab and from Bengal, although in general approaching in appearance the soft white wheat, are yet considerably harder than the pure soft wheat, and yet not hard enough to be classed with the hard wheat. These were usually described as semi-hard, and are in general classed with the soft white wheats. The same may be remarked even more frequently of red wheat, in which, perhaps, the greater number of samples is neither completely soft nor yet decidedly hard. In colour, again, the hard white passes by imperceptible transitions into the hard red, as there are many specimens of a light brown translucent grain which might be arbitrarily classed with either the hard red or with the hard white variety.

For the purpose of a simple classification, however, all the samples have been arranged in four groups, corresponding to the four distinctive varieties, the mixed or transitional samples being added to the group with the character of which they most nearly corresponded. Thus, all the semi-hard white wheats, or mixed wheats in which the soft white variety predominated, have been included in the same group with soft white. A peculiar description of short round berried wheat, in appearance like pearl barley, with a hardness considerably in excess of the usual soft wheat, has been likewise included with it. In the same manner, most of the semi-hard red and brown wheats are included in the same group with soft red. The number of samples contained in each group appears from the following enumeration; the average price assigned to each group has been added in order to show in this way the relative estimation in which the different descriptions stand in the London market:—

	Number of Samples.	Average price per Quarter of 496 lbs.
		<i>s. d.</i>
1. White, soft and semi-hard, and pure or mixed, with a predominance of soft white	357	41 9
2. Hard white - - - - -	167	39 5
3. Red, soft and semi-hard; pure or mixed, with a predominance of soft red	161	38 5
4. Hard red - - - - -	142	36 1
Total - - - - -	827	39 8

The number of samples classed with soft white and soft red amounts to 518, against 309 of hard white and hard red samples, showing a considerable predominance of soft samples, even when taking into account that, among the inferior varieties of the samples grouped with the soft wheat, there are many semi-hard samples or samples of soft wheat largely mixed with hard grain. The great number of soft samples is an important fact, as it is the soft wheat which is most suitable for export to this country, as appears from the higher price realized by it.

Geographical distribution of the different varieties of Indian wheat.

6. To a certain extent, the four distinctive varieties, the soft and hard white, and the soft and hard red, are cultivated side by side in the same districts, but, on the whole, a distinct geographical distribution of the several varieties may be perceived. In the accompanying map * the leading varieties of wheat produced by each district have been separately marked, and it clearly appears that, while Northern India produces mainly soft wheats, the samples produced in Southern India and part of Bengal are chiefly hard. The cultivation of the soft white wheat appears to be comprised within the basins of the three great rivers, the Ganges, the Indus, the Nerbudda, and their tributaries. In fact, from the whole territory south of the Nerbudda basin only two samples of soft white wheat were sent, one from Khandesh on the

* This map does not pretend to do more than give a general idea of the production of wheat in India, and of the manner in which information on this subject can be represented after the receipt of the complete statistics now in process of being collected.

Tapti, only a little south of the Nerbudda, and a sample of mixed soft red and white from the Belgaum district. Whilst the North-West Provinces and Oude sent mainly soft white samples, the majority of the samples from the Punjab are soft red. The soft red wheat also extends farther south than the soft white. Several fine samples were sent from Berar, from which not a single sample of soft white wheat arrived, and a sample (all but destroyed by weevil) came from as far south as Bellary. The hard white wheat occurs occasionally wherever the soft white is cultivated, but it is predominant in the Deccan, Berar, and parts of Bengal. The least valuable variety, the hard red wheat, extends the farthest to the south of all, and is, moreover, the only kind cultivated in the moist climate of the Gangetic delta, Orissa, and Burma. In the extreme south of the Madras Presidency, and in Mysore, the wheat appears to belong to a variety similar to the spelt, in which the husk adheres so strongly to the grain that mere threshing is insufficient to separate them, so that it requires to be husked in the same way as paddy. The grain appears to be of an inferior hard red description.

In the following table, the predominant character of the wheat culture in each province is shown by the number of samples of each of the four kinds of wheat sent from them, whilst the average price for each province illustrates the influence which the cultivation of the more valuable soft and white varieties exercises on the value of the whole provincial produce.

Name of Province.	Number of Samples of				Total Number of Samples.	Average price per Quarter of 496 lbs.
	Soft White.	Soft Red.	Hard White.	Hard Red.		
Bengal	27	21	12	8	68	s. 39 d. 10
North-West Provinces and Oude	251	71	37	15	374	40 9
Ajmere and Mhairwarra	—	3	1	1	5	40 6
Punjab	17	30	3	4	54	38 5
Sind	41	2	15	—	58	39 0
Bombay	5	13	60	61	139	38 3
Central Provinces	16	13	8	12	49	40 1
Berar	—	7	31	16	54	38 10
Madras	—	—	—	18	18	36 1
Mysore	—	—	—	6	6	32 4
Burma	—	—	—	2	2	34 3
All India	357	160	167	143	827	39 8

It appears from this table that the greatest preponderance of soft white samples occurs in the North-West Provinces and Oude, 251 samples out of 374 belonging to this class. The average value of the samples from this province is therefore the highest of any in India, amounting to 40s. 9d. per quarter of 496 lbs. The two provinces in which the soft white likewise constitutes an important fraction of the samples, viz., the Central Provinces and Bengal, realize also the next highest average values, viz., about 40s. per quarter. The Punjab would almost certainly have shown an equal, if not a higher value, if the collection from it had been more complete, and the same would probably have applied to Sind, if the samples from there had not been weevilled throughout, in addition to being mixed frequently with barley and other grains. All the other provinces have a lower average, the lowest occurring in the case of Madras, Mysore, and Burma, all the samples coming from which belong to the hard red description.

The detailed description and valuation of the samples is contained in the accompanying valuation list, pp. 26 *et seq.*, in which the samples are arranged according to the districts from which they were forwarded. The provinces are arranged in sequence, starting from Calcutta. First come the Lower Provinces of Bengal, followed by the North-West Provinces and Oude, by Ajmere and Mhairwara, and the Punjab. Then follows Sind, in the Bombay Presidency, and the Bombay districts proper. Next follow the Central Provinces, Berar, Madras, Mysore, and at last Burma. Within each province the divisions follow in their geographical, and the sub-divisions or districts in alphabetical order. The samples within each district are grouped according to the four varieties, soft white, hard white, soft red, and hard red, the best samples of each description coming first, and then the others in the order of their value. In order to facilitate reference, and to be able to estimate at a glance the comparative frequency of the samples of each description of wheat, each entry is prominently distinguished by a

mark consisting of one or more of the four letters A, B, C, D. The letter A stands for soft white, B for hard white, C for soft red, and D for hard red, whilst combinations of the letters indicate mixtures, in which the letter placed first points to the predominant variety. For instance, A D designates a mixture of soft white with hard red wheat, the soft white preponderating. The valuations of all the samples are strictly comparable with each other, although they were originally made at different periods, in the order of the arrival of the samples from India. At the time of the valuation of the last consignment, in February of this year, a certain number of samples of the first consignment were revalued, and rules were agreed upon for reducing the prices of the previous valuations to the level of the last quotations, and these reduced prices only were finally entered. It must be remarked that in the course of the arrangement of all the samples district by district, and in the order of their quality, the running numbers of the original valuation lists, which followed each other in the order of the arrival of the samples, were considerably disarranged, because samples from the same district may have arrived in several batches at very different times, and were placed at very different places in the original valuation list, whilst they are all placed together in the list now submitted. Whenever possible, the local number of the sample has been likewise entered. Most of the consignments, however, arrived without any list or local numbers whatever, and can only be identified by their name and the place they were sent from.

Soft white wheat.

7. The quality of the samples of white wheat forwarded to this country is on the whole surprisingly high, and Mr. Alexander Smith to whom they were submitted reports that a considerable number amongst them are far superior to any Indian wheat ever seen in the London market. The better qualities of wheat coming from Calcutta are usually comprised under the classes No. 1 and No. 2 Club, the quotations for which at the time of the last valuations, in the beginning of February of this year, were 42s. to 43s. for No. 1, and 40s. to 41s. for No. 2. By adding the samples which depart only a little from these values to the numbers contained within the above classes, and by distinguishing those either above or below them in value, the samples of soft white wheat may be arranged in the following five classes:—

Observations on the samples of soft white wheat.

	Price per Quarter of 496 lbs.
a. Samples of superior quality	- 44s. to 48s.
b. „ grade No. 1	- 43s. 6d. to 41s. 6d.
c. „ „ No. 2	- 39s. 6d. to 41s.
d. „ ordinary quality	- 37s. to 39s.
e. Inferior samples	- below 37s.

The number of samples belonging to each class will appear from the following statement:—

Name of Province.	Number of Samples of Soft White Wheat (including mixed and semi-hard with predominance of soft white) of each of the Classes under mentioned.					
	Superior quality, 44s. to 48s. per quarter of 496 lbs.	No. I. Club 43s. 6d. to 41s. 6d. per quarter of 496 lbs.	No. II. Club 39s. 6d. to 41s. per quarter of 496 lbs.	Ordinary quality, 37s. to 39s. per quarter of 496 lbs.	Inferior quality, below 37s. per quarter of 496 lbs.	Total.
Bengal	6	9	5	5	2	27
North-West Provinces and Oude	81	96	44	26	4	251
Ajmere and Mhairwarra	—	—	—	—	—	—
Punjab	7	4	4	1	1	17
Sind	—	8	14	17	2	41
Bombay	—	3	2	—	—	5
Central Provinces	7	3	4	2	—	16
Berar	—	—	—	—	—	—
Madras	—	—	—	—	—	—
Mysore	—	—	—	—	—	—
Burma	—	—	—	—	—	—
All India	101	123	73	51	9	357

Thus, out of a total of 357 samples, more than 100 samples are better than Grade No. 1, and more than 120 samples come up to that grade. The result would have been even more favourable if a certain proportion of the samples had not been to some extent damaged by weevil.

Four different types of grain may be distinguished among the samples of soft white wheat. These are:—

a. Wheat similar to Australian or Californian, stout regular grains of a brilliant colour, mostly very soft, and usually very uniform in quality and in clean condition.

b. Small berried wheat, more dull in colour than the foregoing, and less uniform in quality, hardly any sample being quite free from admixture with red or hard white wheat. Frequently the admixture of red grains is so considerable that the wheat must be called mixed rather than white, and there may be such a preponderance of hard or almost hard grains, as to give to the sample the character of a semi-hard rather than of a soft wheat.

c. A large berried wheat, thick in the middle, pointed at the ends, rarely uniform in colour, some grains as bright as the first variety just mentioned, others more dull and grey, occasionally passing into red, but more frequently mixed with hard grain, or passing into it by imperceptible degrees, the individual grains being often partly soft and partly hard. In fact, the greater portion of the samples of this description must be described as semi-hard.

d. Wheat with a peculiar, short, roundish grain, in appearance like pearl barley. It is the wheat known under the names of *paighumbree*, *gilghit*, *giljit*, or *nikka* in the Punjab, and of *chunia*, *munia*, or *rae muneer* in Oude and the North-West Provinces. It occurs locally in Oude, the North-West Provinces, the Punjab, and Sind, but it does not possess any great importance, as it does not appear to be very prolific. Although it is mostly semi-hard or even almost hard, the samples were very favourably reported on.

The sample sent from the Delhi district under the name "Gundun safed" (No. 273, page 46 in valuation list) may be accepted as the finest type of wheat grown in India. It is a soft white stout grain, remarkably uniform in quality, and in clean condition. The weight is very high, amounting to 65 lbs. per bushel. It is equal to the finest wheat grown in South Australia or California, the countries from which of all others the finest qualities of wheat are imported. It has been valued at 48s. per quarter of 496 lbs., this being the quotation for best Australian wheat at the time, and it has been declared equal in quality to the finest sample of wheat shown in the late Paris Exhibition. Nor is this an exceptional sample. Wheat of equal value and of equal excellence has been sent from Gya in Behar ("Dawoodie," Val. No. 150, page 29), from Unao in Oude ("Saman," No. 359, page 37), from Bulandshahr and Meerut in the North-West Provinces ("Safed," No. 397, page 45, "Safed," No. 629, page 45, and "Safed," No. 459, page 44), from Dera Ismail Khan, in the Punjab (No. 411, page 51), as also from Hoshungabad, in the Central Provinces ("White Pissi," No. 575, page 61). These places indicate the limits of the area within which the finest wheat is cultivated, and within which may be found a considerable number of samples ranging in value from 46s. to 48s. which are but little inferior to the eight samples selected as types of the best wheat, and which are mostly described by the valuer as being similar to Australian or Californian wheat. Not only most of the 45 samples ranging in value from 46s. to 48s., but also many of the 48 samples valued from 44s. to 46s., consist substantially of wheat of the same quality; all, more or less, like Australian or Californian, and only slightly depreciated in value by weevil, by slight admixture with red or hard grains, with barley, gram, or oilseeds, or impurities of other description. The local names vary from province to province, but no corresponding difference appears in the grain. The samples belonging to this class under the various names of Pissi in the Central Provinces; Shori in Sind; Zurd kanak in the Punjab; Daudia, Safeda, Setwa, Muria, Mundia, or Gajar in the North-West Provinces and Oude; Dawoodia in Behar, are almost indistinguishable in appearance, and all of equal excellence, though under the same names many other samples may be found which are perfectly different in appearance, and often really inferior in quality.

The varieties previously described as the small berried and the large berried respectively constitute the greater portion of the wheats of Grades Nos. 1 and 2, and of those of lower quality. But in the comparatively rare instances in which they are characterized by considerable uniformity and softness of grain they range as high in value as the samples resembling the Australian wheat, whilst the value of even this latter variety may be reduced by the admixture of impurities to the lowest level observed in any of the other varieties.

It has been already explained that both the small-berried and the large berried variety of soft white wheat are usually of less uniform appearance than the Australian-like wheat, and that they frequently contain a considerable admixture of red and of hard white wheat, so as to render it often difficult to decide whether a given sample should be classed as a red or a white, a hard or a soft wheat. This seems to afford an explanation why the same name so often serves to designate varieties of grain which appear to be very different from each other. Thus under the name of Jamali a number of small berried varieties were sent from Bengal, some of which were soft and white, others perfectly hard, white, or red, others again a beautiful soft red, while most were rather mixed in character. In the same way the large berried soft variety occurs frequently under names like Burghona, Anokha, Kathia, Jalalia, and Bansi, usually applied to hard white wheats, or even under the name of Desi, usually applied to red wheats, and, in fact, it is rarely free from a considerable admixture of hard grains, even if the individual grain does not, as is often the case with the Bansi variety in the Central Provinces, possess a mixed character, partly soft, partly hard.

Every defect in the way of colour, uniformity, and softness of the grain diminishes in a corresponding manner the value of the sample, but the quality is even more seriously deteriorated by the admixture of foreign substances, especially of barley, gram, linseed, and rapeseed or other grains. Other impurities, such as lumps of earth and clay, and chaff, likewise occur, and often reduce the value of the wheat considerably. In many of the samples mere screening would suffice to separate the fine grain from the impurities, and to improve the value by as much as 5s. per quarter. For instance, a sample from the Etawah district (Mundia, No. 498) has been valued at only 37s. on account of the considerable admixture of barley and gram, and impure condition generally, but the valuer reported that by cleaning the value could be raised to 42s. It may be noticed that the Sind samples especially suffer from the presence of barley, and that the wheat, which is often of the finest quality, is thereby rendered often quite unsaleable, as being in its actual condition quite unfit for milling.

The following list of some of the finest samples of soft white wheat will serve to give some idea of the names under which some of the finest samples were sent, as also of the places in which they were produced:—

District.	No.	Name.	Weight per Bushel.	Price per Quarter.	Remarks.
<i>Lower Provinces of Bengal.</i>					
Chumparun	157	Dawoodia	63	47 0	Small berried.
Gya	150	Dawoodia	62½	48 0	Like Californian.
Patna	141	Maghie	64½	45 6	
Shahabad	144	Doodhia	62	47 0	Like Californian.
<i>North-West Provinces and Oude.</i>					
Azingarh	713	Daudi	61	46 0	
Benares	703	Daudia	—	46 0	
Basti	715	Gangajali	—	45 0	
Banda	704	Pisi gangajali	—	47 0	
Cawnpore	642	Muria	—	48 0	
Ditto	621	Anokha	—	47 0	
Ditto	637	Desi	—	46 0	Large berry.
Ditto	514	Mudia	—	44 6	Fine drop wheat, probably 64 lbs.
Futtehpore	639	Pisi awwal	—	46 0	
Ditto	670	Muria	—	45 0	
Pertabghar	466	Mundwa	62½	47 0	Like Californian.
Ditto	630	Setwa	60	46 6	
Ditto	614	Mundia	—	46 0	
Elaraich	459	Daudi	61	46 6	Like Californian.
Ditto	488	Sambodhwa	—	46 0	
Ditto	702	Sandhua	—	46 0

It will be seen that the majority of the finest specimens, ranging from 45s. to 48s. per quarter, come from the North-West Provinces and Oude. The Central Provinces come next, and there are likewise some specimens from Behar, and from the Punjab. No samples equal to the foregoing appear from Bengal proper, although soft white wheat of a tolerably good quality, mostly of the small-berried kind, is grown as low down as the Hooghly district, and a sample from Beerbhoom was fully equal to Grade No. 1. As regards the Punjab again, the best samples all come either from the Delhi and Hissar divisions immediately adjoining the North-West Provinces, or else from the Trans-Indus districts, in which the wheat resembles the fine variety cultivated in Upper Sind. But from the Punjab proper, between the Indus and the Sutlej, no perfect samples of pure soft white were available for report, even the best being rather semi-hard than soft, and the grain less uniform than in the samples included in the foregoing list. Nevertheless it would not be fair to conclude on this account alone that the cultivation of wheat is conducted less carefully and skilfully in the Punjab than in the North-West Provinces, because the fragmentary nature of the Punjab collection already commented on, and especially the highly weevilled condition in which most of the samples arrived, make it impossible to accept the Punjab series of valuations as a fair representation of the cultivation of wheat in that province. It must be also remarked that the softest, that is, the finest specimens,

are those most exposed to destruction by weevil, and it is likely that but for their weevilled condition some of the samples from the parts of the Punjab referred to would have been as favourably reported on as the finest samples from the North-West Provinces. The same applies to Sind, from which a number of samples were sent equal to the finest grown in India, but their weevilled condition prevented their being valued at anything like the prices assigned to the best samples. The districts under Bombay sent no samples which could be compared with the finest wheat of the Central Provinces, but a few samples were sent from Broach and from Khandesh which come up to Grade No. 1.

The weights per bushel given in the above list of samples are very high, notwithstanding that some of the samples were touched by the weevil. None weigh less than 60 lbs. per bushel, whilst in some cases the weight goes up to as high as from 63 to 65 lbs.

Hard white wheat.

8. There is much less variety among the different samples of hard white wheat than among those of soft white wheat already noticed. A great number of samples resemble in appearance the large berried soft or semi-hard wheat already described, only that they are completely hard and translucent. Others, with the same difference, resemble the small berried soft or semi-hard variety. There is in addition a considerable number of samples with a long thin ricey grain, resembling some of the inferior varieties of hard red wheat. These latter samples, frequently known under the name of Khattya, Kathe, Kuthya, are really an inferior grain in every respect, and the samples are rarely in a good condition, most of them containing chaff, dirt, and foreign substances in considerable quantity. But among the large berried samples there are many of a very high quality, with clear uniform grains in good condition and free from impurities. In fact, many of these samples are equal, if not superior, to the best hard St. Petersburg or Kubanka, which is usually considered as the type of wheats of this kind. The highest prices realized by the hard white wheats are, however, much below those ranging in the London market for the soft wheats, and, as already remarked, the Mediterranean, and especially Italy, seems to afford the best market for wheat of this description, which is in demand there for the manufacture of macaroni, and frequently fetches prices as much as 5s. per quarter in excess of the quotations of the London market.

Observations
on the sam-
ples of hard
white wheat.

No classification in any way resembling that of the soft white exists for the hard white wheat; but in order to obtain a view similar to that given for the samples of the former variety, the hard white wheats have been arranged in groups corresponding to the same ranges of price as those of the different classes of the soft white. The following table shows the result of this classification :—

Name of Province.	Number of Samples of Hard White Wheat of a value per quarter equal to that of the under-mentioned Classes of Soft White Wheat.				
	Class I., 43s. 6d. to 47s. 6d.	Class II., 39s. 6d. to 41s.	Ordinary quality, 37s. to 39s.	Inferior quality, be- low 37s.	Total.
Bengal - - - - -	3	4	5	—	12
N.-W. Provinces and Oude - -	5	23	8	1	37
Ajmere and Mhairwarra - -	—	1	—	—	1
Punjab - - - - -	—	2	—	1	3
Sind - - - - -	—	—	8	7	15
Bombay - - - - -	3	29	27	1	60
Central Provinces - - - -	—	5	3	—	8
Berar - - - - -	2	19	10	—	31
Madras - - - - -	—	—	—	—	—
Mysore - - - - -	—	—	—	—	—
Burma - - - - -	—	—	—	—	—
Total - - - - -	13	83	61	10	167

It will be seen that a considerable proportion of the samples is supplied by Bombay and Berar, from which hardly any samples of the soft wheat were sent. These two provinces supply by themselves more than one half of the samples of hard white wheat. The number of samples (37) sent from the North-West Provinces and Oude

is large in itself, but it appears small when compared with the number of soft white samples from the same parts, which was almost seven times larger. The following list enumerates some of the best samples of the wheat now under consideration :—

District.	No.	Name.	Weight per Bushel.	Value per Quarter.	Remarks.
<i>Lower Provinces of Bengal.</i>					
Moorshedabad	109	Jamali	62½	41 6	Short berried.
Monghyr	57	Bogra	62	41 0	Long berried, flinty.
Maldah	77	Gangajali	63½	42 0	Very fine, long berried.
Tirhoot	145	Jamalkhani	64	41 6	Small berried.
<i>North-West Provinces and Oude.</i>					
Gonda	394	Daudi	63	41 0	Mostly hard.
Barabanki	367	Murua	62	41 0	Mixed, hard.
Lucknow	475	Tamla	64½	42 6	
Unao	650	Samanbargehuna	—	41 0	Long berried.
Etah	435	Bhidia	61	40 6	Long berried, like Kubauca.
Mainpuri	379	Anokha	60½	42 0	Long berried.
Ditto	656	Ditto	—	40 6	Ditto.
Aligarh	643	Kathia	58	41 0	Ditto.
Bulundshahr	651	Barha	—	42 0	Ditto.
Ditto	461	Ditto	—	40 6	Large berried.
Meerut	402	Ditto	61	41 0	Long berried.
Ditto	654	Ditto	—	40 6	Ditto.
Burdaon	655	Ratua	—	40 6	Ditto.
Shahjehanpur	481	Sambhari	60	40 6	
<i>The Punjab.</i>					
Sarsa	291	Brown wheat	60½	41 0	Small berried.
<i>Bombay.</i>					
Bhownuggur	25	Hasia	60½	40 6	Long berried.
Khandesh	580	Kalee kusal	61	42 6	Ditto.
Ditto	605	Bansi	62½	42 6	Very fine.
Nassick	999	Yellow Banshi	57	40 0	Finest of all, but weevilled.
Punch Mehals	1,011	Daudkhani	62	42 0	Large berried.
Ditto	1,013	Kathee malvi	61	40 6	
Dharwar	581	"	58	40 6	
Poona	965	Bukshi gabu	62	41 0	Large berried, finest kind grown.
Satara	994	Buxi	60	40 6	Very fine.
<i>Central Provinces.</i>					
Saugor	164	Hansia	62½	40 6	Long berried.
<i>Berar.</i>					
Nagpore	197	Botka	61	40 6	Long, thin.
Oomraotti	879	Bansi	61	41 6	Long berried.
Ellichpur	923	Ditto	60½	41 0	Ditto.
Ditto	918	Ditto	60	40 6	Ditto.
Akola	894	Bansi	61	41 6	Long berried.
Ditto	891	Ditto	60	41 0	Ditto.
Buldana	908	Ditto	61	41 0	
Ditto	914	Ditto	60	41 0	
Ditto	912	Ditto	61	40 6	

The finest of these samples is (No. 605) "Bansi," from Khandesh, valued at 42s. 6d., though even this sample would have been probably surpassed by a sample of "yellow Banshi" (No. 999) sent from Nassick, had not the latter arrived very much damaged by weevil. All parts of the Bombay Presidency south of the Nerbudda supply fine samples under the names of Banshi, Bansi, Bukshi, Buxi, Jalalia, and others. But some of the samples from the North-West Provinces and Oude, sent under the names of Barha, Tamla, Anokha, and others, are equally good. One of the best samples, "Gangajali" (No. 77), valued at 42s., comes from the Maldah district in Lower Bengal, and altogether the cultivation of hard white wheats, if restricted to a smaller area than that of the soft varieties, results in the production of many samples equal to the finest grown in any country, which sent to a suitable market would be

likely to realize prices almost as high as those obtainable for the best descriptions of soft white wheat. It may likewise be noted that the hard wheat appears to be on the whole less liable to suffer from weevil than the soft variety. The weights per bushel are almost as high as in the soft white; all but a few are above 60 lbs. per bushel, some as high as $64\frac{1}{2}$ lbs. Of the few samples below 60 lbs. most are so much weevilled that the loss of weight is accounted for.

Soft red wheat.

9. The condition of most of the samples of soft red wheat affords evidence that its cultivation is conducted with much less care than that of the fine white varieties. They are, as a rule, much mixed with barley, gram, or oilseeds, and foreign substances of all descriptions, and the grain is rarely so uniform in its quality as in the good white samples. The striking uniformity in the Native names for the red wheat is in itself a proof of the smaller estimation in which it is held by the Native agriculturist. In the greater number of districts, in which half a dozen or more different varieties of white wheat will be cultivated under as many different names, the red wheat will be known only under the generic denomination of "lal" or "surkh," indicating that the process of selection of seed and cultivation of special varieties has been applied to red wheat in a much smaller degree than to the white wheat. The red wheat is, however, deserving of more attention than it now receives, for the soft red varieties are exceedingly suitable for the English market, and very readily saleable. The following table shows the number of samples and their range of prices for each province of India, the classes being those adopted for the soft white wheat, as there is no corresponding classification for the red variety :—

Observations on the samples of soft red wheat.

Name of Province.	Number of Samples of Soft Red Wheat of a value per quarter equal to that of the under-mentioned Classes of Soft White Wheat.				
	Class I., 41s. 6d. to 43s. 6d. per quarter of 496 lbs.	Class II., 39s. 6d. to 41s.	Ordinary quality, 37s. to 39s.	Inferior quality, below 37s.	Total.
Bengal - - - -	3	11	6	1	21
N.-W. Provinces and Oude - -	2	23	38	8	71
Ajmere and Mhairwarra - -	2	1	—	—	3
Punjab - - - -	2	7	11	10	30
Sind - - - -	—	1	—	1	2
Bombay - - - -	—	8	5	—	13
Central Provinces - - - -	1	2	10	—	13
Berar - - - -	—	3	4	—	7
Madras - - - -	—	—	—	—	—
Mysore - - - -	—	—	—	—	—
Burma - - - -	—	—	—	—	—
Total - - - -	10	56	74	21	161

As may be seen from the foregoing table, the provinces in which the soft red wheat is chiefly grown are the same as those in which the soft white is cultivated, but the limit of cultivation of the former, as previously remarked, extends rather further to the south than that of the soft white variety. The following is the list of the finest samples of soft red wheat obtained :—

District.	No.	Name.	Weight per Bushel.	Price per Quarter.	Remarks.
-----------	-----	-------	--------------------	--------------------	----------

Lower Provinces of Bengal.

				s.	d.	
Beerbhoom -	89	Jamali - - - -	$61\frac{1}{2}$	41	0	
Burdwan -	99	Desi - - - -	61	41	0	Small berried.
Bhagulpore -	66	Jamali - - - -	$62\frac{1}{2}$	41	0	Ditto.
Hazareebagh -	162	Gour - - - -	63 $\frac{1}{2}$	41	6	Small berried, yellowish.
Lohardugga -	158	Jogra - - - -	$63\frac{1}{2}$	42	0	Stout.
Gya -	149	Lall - - - -	64	41	6	Stout, short berried.
Tirhoot -	127	Sarhal - - - -	62	40	6	Fine, clean, semi-hard.

District.	No.	Name.	Weight per Bushel.	Value per Quarter.	Remarks.
<i>North-West Provinces.</i>					
Azingarh	148	Hurrah	53½	41 0	Small berried, semi-hard.
Allabad	777	Raksa	—	41 0	
Cawnpore	789	Pisia	—	41 0	
Jalaun	473	Pisia, red	61½	41 6	Large berried.
Muttra	790	Lal	—	40 6	
Bulandshahr	464	Gahun lal	62½	42 0	
Meerut	398	Surkh	61½	41 0	Long berried.
<i>Ajmere and Mhairwarra.</i>					
	588	Baja maigee	61	41 6	
	592	Kharcha baja	64½	42 6	
	590	Ditto	62	41 0	
<i>Punjab.</i>					
Gurgaon	259	-	64	41 6	
Rohtak	427	Red wheat	62	41 0	
Jhelum	272	Lal	61½	41 0	
Shahpur	410	Rati	61	41 0	Large berried, mixed with barley.
Dera Ismail Khan	413	Rutti kanak	60½	41 6	Long berried.
<i>Bombay Presidency.</i>					
Bhownuggur	15	Vajia	58	40 6	Semi-hard.
	22	Patalia	58	40 6	Ditto.
	9	Ditto	59½	40 6	Ditto.
<i>Central Provinces.</i>					
Nimar	194	Dhunya	—	40 6	Fine specimen.
Bilaspur	567	Khathia	60	41 6	Small berried.
	566	Red pissi	63	41 0	
<i>Berar.</i>					
Bassim	906	Casdee	61	41 0	

All these samples represent wheat which is very suitable for the English market. The finest sample is one from Ajmere, "Kharcha baja" (No. 592); but, as will be seen from the list, there are numerous samples almost equal to it from Bengal, the North-West Provinces, the Punjab, and the Central Provinces. The samples from the provinces just named are, as a rule, comparatively light in colour, and quite as soft as the softest white wheat. But from Bombay a good many samples of a large berried wheat were sent which deserve rather the name of brown than of red wheat, on account of the darkness of their colour. They are also much harder than the usual soft wheat, in fact almost hard. Still some of the samples grown in the State of Bhownagar are favourably reported on, with values up to 40s. 6d. per quarter. It may be likewise remarked that in the Punjab, from which several of the best samples were obtained, there appears to be grown in many districts a very degenerate kind of red wheat, in which a large proportion of the grains are so thin and shrivelled that they resemble rather grass seeds than the berries of a cultivated grain.

The prevalence of inferior varieties in the Punjab may be gathered from the fact that out of 30 samples of soft red wheat 10 are classed as inferior, being in value below 37s. the quarter, whereas out of 131 samples sent from the other parts of India only 11 are inferior. The weights per bushel given in the list are as high as in the preceding group, rising to 64½ lbs., and only in three instances is the weight below 60 lbs.

Hard red wheat.

10. The following table shows the number of samples and their range of prices :—

Observations
on the sam-
ples of hard
red wheat.

Name of Province.	Number of Samples of Hard Red Wheat.		
	Ordinary quality, 37s. to 39s.	Inferior quality, below 37s.	Total.
Bengal - - -	2	6	8
North-West Provinces and Oude.	4	11	15
Punjab - - -	—	4	4
Sind - - -	—	—	—
Bombay - - -	31	29	60
Central Provinces - - -	11	1	12
Berar - - -	13	3	16
Madras - - -	5	13	18
Mysore - - -	1	5	6
Burma - - -	—	2	2
Total - - -	68	74	142

Most of these samples come from the Deccan and Southern India, and a very large proportion are inferior in quality, very thin, hard, and very dark. Wheat of this description is not in good demand in the London market.

India Office,
29th March 1879.

J. FORBES WATSON.

VALUATION of the Samples of Wheat forwarded in accordance with the Orders of the Government of India of 14th March 1877.

The values given are based upon the quotations ruling in the London Market in the beginning of February 1879.

Key to letters showing colour and hardness,—A, soft white; B, hard white; C, soft red; D, hard red.

Valuation Number of Sample.	Number on Sample as received.	Locality.	Description of Sample.		Valuation and Report.
