REPORT

OF THE

FUEL POLICY COMMITTEE

INDIA

1974
CONTENTS

(i) Chairman's letter forwarding the Report
(ii) Names of Chairman and Members of Fuel Policy Committee
(iii) Names of the Secretariat of Fuel Policy Committee
(iv) Abbreviations.

CHAPTERS

I Introduction
II Trends in Energy Consumption
III Forecast of Energy Demand
IV Fuel Resources of India
V Regional Distribution of Demand for Energy
VI Perspective of Long Term Energy Problems
VII Coal Policy
VIII Oil Policy
IX Policy for Power Sector
X Policy for Energy Supply to Domestic Sector
XI Costs and Prices in Energy Sector
XII Technology Plan for Energy Sector
XIII Summary of Recommendations

ANNEX TABLES AND TECHNICAL NOTES

ANNEX Table

II-1 Sector-wise consumption of Commercial Energy for the Period 1963-64 to 1970-71
II-2 Total Consumption of Commercial Energy Fuel-wise in Original Units
II-3 Total Consumption of Commercial Energy Fuel-wise in Million Tonnes of Coal Replacement
II-4 Coal Consumption Direct and Indirect
II-5 Electricity Generation and Consumption
III-2 Estimated Demand for Coking Coal and Blendable Coal in India in 1978-79, 1983-84 and 1990-91
XII-1 Extracts from Chapter VI of the Power Economy Committee Study Group Report IV on Rural Electrification

TECHNICAL Notes

II-1 Conversion Factors used for Aggregation of Energy Measures
II-2 Regression Models Relating Energy Requirements to Various Explanatory Variables
VIII-1 Refining Capacity, Hydro-Cracking Capacity and Fertilizer Feedstock Choices—A Mathematical Programming Approach

(1-11)
Dear Shri Malaviya,

The Fuel Policy Committee has authorised me to submit to you this Report dealing with the policy issues in regard to fuels, covering the period upto 1990-91. You may recall that Part I of the Report (Fuel Policy for the Seventies), submitted to the Government on May 16, 1972, dealt with the Fifth Five Year Plan period only. Subsequent to the submission of Part I of the Report, there have been several changes in the economic situation within the country and in the international situation in regard to the supply and price of oil. The perspective of growth of the economy outlined in the earlier Government documents has been changed to some extent in the Draft Fifth Five Year Plan. The Committee had, therefore, to re-examine several of its previous conclusions and revise its recommendations appropriately. The present Report is based on a comprehensive re-examination of all issues and should be taken as the final Report of the Committee and not as a sequel to Part I.

2. In order to properly plan for meeting the energy demand, it is essential that we assess and forecast the future demand as accurately as possible. The fact that sectors producing energy in primary or secondary forms involve very long gestation periods extending over 5 to 10 years or even longer makes it imperative that we project demand over a 15 to 20 year period for evolving an appropriate energy production plan. In the nature of the case, such a forecast involves that a number of assumptions be made about the rate and pattern of growth of the economy, the technology of energy production and energy utilization and about possible directional changes in consumer preferences. While in regard to the rate and pattern of economic growth the Committee was guided by the perspective growth of the economy given in the Draft Fifth Five Year Plan, in regard to other factors, the Committee had to make its own judgement based on the study of the past trends in our country, information relating to similarly placed countries and from various published materials regarding possible technological shifts in future.

3. The Committee has given several demand forecasts for different forms of fuels, which take into account feasible inter-fuel substitution possibilities even when the aggregate energy requirement may remain constant. The projection of aggregate energy requirements as well as those pertaining to specific fuel forms must be judged as dimensional hypotheses rather than as rigid numbers. The main thrust of the Report and of the deliberations of the Committee has been to evolve an appropriate policy mix for the energy sectors for the period upto 1990-91. We are of the opinion that our policy conclusions are likely to remain invariant with respect to a fairly wide range of alternative growth rates, even though specific numerical projections may need to be kept under constant review.

4. In forecasting energy consumption in terms of different fuel forms, it is necessary to take into account possible shifts in technology in different sectors of the economy as well as in the relative costs of different fuels over time. While submitting Part I of the Fuel Policy Committee Report in May 1972, we drew the attention of the Government to the fact that crude oil prices which were once predicted to come down significantly had in fact hardened a great deal during the early seventies. In view of the desire of the oil exporting countries to make the most out of their exhausting assets, it was anticipated that the prices would
The present energy crisis arises out of a very sudden increase in the price of oil. The dramatic increase in the price of oil in October 1973 made it imperative that we re-examine our earlier studies. Studies done by the Fuel Policy Committee in the middle of 1973 on the substitution of coal for oil in different sectors of the economy were made on the assumption that the price of oil would be around $5 per barrel by the end of the seventies. This was in keeping with the projections made by noted international authorities with the exception of Professor Adelman, who went to the extent of predicting a fall in prices. It is clear from Adelman’s recent study that if the rules of the game in the world oil industry conformed to standard economic criteria as discussed in standard textbooks, his conclusions could be defended without violence to data. But it is a major act of abstraction and a somewhat unwarranted one to assume that the oil industry could be treated in isolation from a whole set of socio-political factors. The present energy crisis arises out of a very sudden increase in the price of oil products to levels which were not predicted in any study by any country. The movement of oil prices in the international market itself is an interesting study. Given the dizzy heights to which oil prices have soared today, there is a common tendency to lose sight of a certain perspective. Oil represents one commodity whose price went down steadily over a period of 15 years. For example the market price of light Arabian crude was $1.93 per barrel in 1955 and it was $1.30 per barrel in 1970. Even in January 1972, it was still lower than the 1955 price. But from then on, it has increased today to over $11 per barrel within a period of 24 months. The price upto October 15, 1973, was around $3 per barrel only. Can this movement in prices be explained by a sudden spurt of demand or a sudden fall in production? At this stage, it is extremely hazardous to make any guesses in this respect since the problem, as mentioned previously, possesses important characteristics which are not purely economic in nature.

While the direction of the change in the energy substitution policies suggested in Part I of the Report is invariant to the likely changes in the price of oil products, the pace of inter-fuel substitution has to be determined with reference to the relative price of fuels. At prices of $12 per barrel of oil delivered at Indian ports we find that all the uses of oil except those in the transport sector can be substituted for by indigenous fuel, namely, coal or coal-based energy forms. For example, in the household sector the use of kerosene for lighting can be replaced by electricity. The use of kerosene for cooking can be replaced by coal gas in the case of densely populated urban areas and soft coke in small towns and some rural areas. In industry for all heating requirements coal becomes the preferred fuel. For lifting water, electricity becomes more advantageous relative to diesel oil. In the case of transport, the movement of bulk commodities over long distances by rail becomes preferable to road movement even if the expected volume of traffic is low. But it will not be realistic to assume that oil prices will continue at the present level upto 1990-91 as possibilities of producing oil at a very low cost ranging from 15 Cents a barrel to $4 a barrel are available in a large number of countries in the world, given the time to explore for oil and develop the oil fields. It would, therefore, appear that while directionally oil will have to be replaced by other fuel forms, which are more abundant in this country, we have to be extremely careful regarding the type and
extent of substitution that we adopt, especially those involving very major investment outlays.

8. Given the uncertainty regarding the level of oil prices in the future, the areas and extent of substitution of oil by coal will have to be limited to those options whose worthwhileness remains largely unaltered for any probable variation in prices. We believe that the recommendations of the Committee contained in this Report satisfy this criterion. The pace of inter-fuel substitution recommended by the Committee is based on our judgement regarding the gestation periods involved in converting oil using facilities to those using alternate fuels to satisfy the substitution requirements and the organisational constraints in effecting the inter-fuel shifts. The recommendations made are mostly invariant to possible changes in the oil price and are feasible of implementation if they are implemented as a whole, taking note of their inter dependence. The directions in which a coherent fuel policy should move are clearer now than ever before and it will not be prudent to delay the implementation of any of these recommendations, if they are otherwise acceptable, in the hope of possible changes in the supply and price of oil.

9. Our analysis contained in the Report establishes beyond any reasonable doubt that coal should be considered the primary source of energy to the country. The coal resources of India, in spite of the quality being poor and their unevenness to the issues connected with the supply and price of oil, are being exploited severally and their inter dependence. The directions in which a coherent fuel policy should move are clearer now than ever before and it will not be prudent to delay the implementation of any of these recommendations, if they are otherwise acceptable, in the hope of possible changes in the supply and price of oil.

10. Our oil resources as known today are very insufficient to meet our needs. But there are some indications that we may find more of oil and natural gas particularly the latter. Every effort should be made to step up such production, on shore as well as off shore and appropriate surveys in advance using geophysical and other sensing devices should be undertaken—the policies outlined for reducing the rates of growth of oil consumption in future may not require any major revisions. Even countries which are endowed with abundant oil reserves like Iran are canvassing the view that oil should be used as raw material for high value chemicals instead of being burnt as mere fuel. The use of oil for any purpose in the country will have to be decided in future with reference to the price at which we can get alternative fuels to be used in place of oil. It is, therefore, important that the policy measures suggested in the Report for reduction of the use of oil in several sectors should be given urgent attention. The extent to which the use of oil could be reduced was examined by the Committee carefully. The suggestions made are based on the consensus regarding the extent to which such reductions are feasible. They are based to some extent on the subjective judgement of the members of the Committee, regarding the organisational and technical improvements that can be achieved within the appropriate time span to bring about reduction in the use of oil in
sectors which have become accustomed to the use of convenient fuel. If we are faced with more severe balance of payments difficulties in future, it may become necessary to force the pace of substitution of oil by other fuels to rates higher than those indicated in this Report. The specific estimates given in the Report should be treated as “normal” estimates based on the assumption that the overall rate of growth in the economy is going to be according to anticipation contained here. In the short-run, special measures may, therefore, need to be adopted to tide over exceptionally difficult situations.

11. The Committee has endeavoured to integrate the policies regarding fuel and supply of feedstock for fertilizers as fertilizer production will be a very important activity calling for the use of material which could be used as fuel. We are convinced that in future at the relative price of coal and oil assumed in our studies coal should be the primary feedstock for fertilizers in the country. Oil refineries will always have some residual heavy-end products which could be used as a feedstock. It is also felt that a greater use of secondary processing to convert the heavy-end fractions in a refinery to higher value light products will be more rational for us.

12. We have erred on the side of caution in assessing electricity demand as a shortage of electricity will be difficult to remedy by any short-term remedial measures. However, in translating the power requirements into capacity for power generation to be created, the Committee has tried to include in its calculations a factor reflecting increased efficiency in the operation of power generation and transmission systems. Electricity is a highly capital-intensive source of energy. A country like ours with a serious shortage of capital cannot afford to neglect the possibilities of capital saving that may be available in the power sector. Taking note of the relative merits of different methods of generation the Committee has suggested that more attention should be paid to hydel power generation in the Sixth Five Year Plan and that nuclear power generation based on thorium-plutonium cycle should be introduced at least in the Seventh Five Year Plan.

13. The supply of fuels to the domestic sector in our country presents a number of special problems. The percentage of non-commercial fuels used in the domestic sector though large is slowly getting reduced. (It will be about 80 per cent in 1978-79 and 60 per cent in 1980-81). Our calculations show that the quantity of non-commercial fuels used which have been increasing gradually over time, will reach a peak during the early years of the Sixth Five Year Plan and will decrease slowing from then on. But the magnitude of firewood used will continue to be so large compared to the availability of the resources that there is likely to be serious repercussions in regard to the conservation of forests and the consequential ecological problems. Informed judgement suggests that the extraction of about 120 million tonnes of fuels from forests as of today is much beyond the level of fuels that could be extracted without serious impairment to our forest wealth: This fact and the divergence between social and private costs of using forests fuels underline the need to take-up measures for supply of increased quantities of commercial fuels at appropriate prices to the poorer sections of the rural community and for increasing the availability of firewood by taking up well-conceived schemes of low cost afforestation. Though the benefits of using cowdung as a manure are well-recognised today, increasing quantities of dung are being used as a domestic-fuel. Gobar Gas Plants provide a means of exploiting the fuel as well as the plant nutrient potential of dung and, therefore, deserve greater attention. Though the total quantitative contribution of gobar gas plants to the fuel needs of the domestic sector, even on very optimistic expectations, is likely to be limited, the contribution of gobar gas plants to other social benefits, like nutrient production, and pollution abatement have prompted the Committee to strongly recommend an intensified campaign to popularise the use of gobar gas.

14. The problem of energy supply to rural as well as urban areas has implications for ecology and environmental pollution. Data relating to pollution costs and cost of pollution control are, as yet, meagre in India. The Committee recommends specific suggestions in this regard. But it is hoped that as and when the problems of pollution become significant in any area or industry, the specific issues will be examined and appropriate measures taken.
15. We have analysed the possibilities of deriving energy from non-conventional sources like geo-thermal energy, tidal power, solar power, etc. It is felt that the likely contribution of energy from these sources will be insignificant during the period covered by this Report.

16. It is well known that there is a growing imbalance between the resource base of our economy and the drift of modern technological developments in the energy sector as observed so far. The international research and development efforts until recently were directed towards improving the methods of utilisation of fuels and feedstock which were in short supply in the country. Inspite of the new thrust in research and development towards the use of coal and other fuels it is necessary that we should ourselves undertake research and development effort, which would enable a more rational use of our resources. A technology plan has, therefore, been suggested in this Report.

17. The Committee has been fully conscious of the fact that energy is one of the several inputs required to ensure the desired rate of economic growth. The availability of energy is a necessary but not a sufficient condition to sustained economic growth. Economic growth can be achieved only when the availability of energy is matched by adequate supply of other inputs. A meaningful energy plant in the economy should be an integral part of the national plan reflecting fully its objectives and strategies. The Committee has endeavoured to draw up the recommendations for a coherent energy policy which it considers to be in consonance with the objectives and policies of the government. We have suggested certain organisational arrangements like the setting up of Energy Board which will ensure the integration of energy plan with the national plan not only at the stage of drafting these plans but at every stage of their implementations.

18. The Committee is conscious of the fact that our recommendations are fairly numerous and amongst themselves cover a very wide range of issues. This is of course only natural since the problems pertaining to energy sector are inevitably complex and are often interdependent. We would, therefore, request that our recommendations should be viewed in a coordinated manner. If they are found acceptable, we hope that necessary actions in these areas will be initiated and pursued with utmost expedition.

19. I would like to take this opportunity of expressing my gratitude to members of the Committee who not merely tendered very valuable suggestions in their own areas of specialization but throughout the deliberations kept in view the overall implications of formulating an appropriate energy policy in consonance with our fundamental objectives and constraints. The Committee throughout received very valuable assistance from the Secretariat. I would, however, like to place on record my deep appreciation of the work done by Shri T. L. Sankar, Secretary of the Committee, who brought to bear on the problems his comprehensive grasp of the empirical and analytical aspects of the issues dealt with in the Report and thus contributed in a very substantial measure to the formulation and completion of this Report.

With kind regards.

Yours sincerely

(S. CHAKRAVARTY)

Shri K. D. Malaviya,
Minister of Steel & Mines,
NEW DELHI.
