ECONOMIC DEVELOPMENT AND CHANGING AGRICULTURAL PRODUCTION PATTERN WITH SPECIAL REFERENCE TO SATARA, SANGLI AND KOLHAPUR DISTRICTS (S. S. K. REGION) FROM 1950-51 TO 1976-77

A THESIS SUBMITTED TO THE UNIVERSITY OF POONA FOR THE DEGREE OF DOCTOR OF PHILOSOPHY IN ECONOMICS

BY
T. G. NAIK

GOKHALE INSTITUTE OF POLITICS & ECONOMICS PUNE 411004

JUNE 1982
The less developed countries (LDCS) are prominently agricultural in character. The economic development of these countries is identified with their industrialization. Since the beginning of the planned economic development in India, emphasis has been laid on the rapid industrialisation of the country. The agricultural sector has also been receiving greater emphasis during the successive Five Year Plans. We have tried to highlight the significant role that agriculture plays in accelerating and promoting the process of economic development of our country. Along with the industrial development there must be concurrent development of agriculture. Hence we have propounded for concurrent growth thesis as in the case of Japan. In the process of agricultural development some changes in the production structure are bound to occur in response to economic development. The agricultural sector has to provide adequate amount of foodgrains for the growing population in the urban areas and the agricultural sector must also ensure adequate supplies of raw materials for agro-based industries.

The present study refers to the regional development and changing agricultural production pattern of Satara, Sindhli and Kolhapur districts as these three districts contribute the most fertile belt area of the State of Maharashtra. The scheme of the study has been divided into seven chapters.

The first chapter deals with the role of agriculture in the process of economic development in general. It also presents methodology and some of data used for the study. We have assumed 1950-51 as the base year and have worked out the index numbers for the area, output and yield for food and nonfood crops of every individual district and of the region as a whole. We have also worked out the annual compound growth rates for such periods and for the whole period under reference. To obtain the annual compound growth rates, the exponential curve was fitted to the data by the least square method.

The area, output and yield data of different crops have been collected from the Season and Crop Reports and Performance Budgets of the Government of Maharashtra.

Chapter II deals with the land utilisation pattern of the three districts and the region. We have analysed the behaviour of the various land use categories. The area not available for cultivation has increased. Other uncultivated land category has also increased. Despite this, the
gross cropped area increased only by one per cent and that
too on account of the increase in the area sown more
than once.

Chapter III deals with the growth rates of the major
cereals grown in the region. For the study of the be-

haviour of the major cereals in respect of area, output
and yield, we have divided the period into two sub-periods
pre- and post-H.Y.V. period. For both the periods we have
worked out the annual compound growth rates separately and
for the whole period. The important cereals grown in the
region are rice, kharif jowar, rabi jowar and bajra and
Nachani.

Chapter IV deals with pulses. Pulse crops are grown
along with major cereals in the region. The major pulse
crops grown in the region are, gram, tur, black gram (Udid)
and horse gram (Kulthi). We have analysed their behaviour
in respect of their area, output and yield.

Chapter V deals with the sugarcane crop in the region.
Along with the development of perennial irrigation sources,
the area under sugarcane has been expanding very rapidly.
Satara and Sangli districts have also emerged as sugarcane
growing area.

Chapter VI deals with the nonirrigated commercial
crops. Among the nonirrigated commercial crops, ground-

nut occupied the foremost position. Notwithstanding
the process of the crop in respect of area, output and
yield is far from satisfactory. The cotton crop partly
irrigated and partly nonirrigated registered significant
growth. The area under the crop however remained stationary.
On account of the market imperfections and the absence of
marketing infrastructure acreage under production and
productivity of tobacco registered negative growth rates.

Chapter VII deals with the conclusions arrived at.
Despite the positive growth rate of irrigated area,
the gross cropped area did not increase pari passu. Since
the beginning of the H.Y.V. period, the performance of the
rice crop seems to be somewhat satisfactory as its area
registered positive growth rate. Kharif jowar which is the
major crop grown in the region did not show any significant
progress in respect of output and yield. Over the period,
the performance of the crop has not been encouraging. The
area under kharif jowar remained stationary. The area
output and yield of rabi jowar increased to some extent.
By clubbing these two crops together the area under total
jowar declined by a small margin, whereas the output and
yield showed some signs of improvement. Bajra is grown
mainly in Satara and Sangli districts. The performance of
bajra over the period seems to be unsatisfactory. Wheat
crop seems to have been gaining importance in the crop pattern of the region.

The pulse crops did not register any positive growth rate over the entire period. On the contrary, they have shown over all declining trends. Some of them are on the verge of being dropped out. The expansion of the area under sugar cane could be attributed principally to growth rates of irrigation and establishment of cooperative sugar factories in the region.

The nonirrigated commercial crops have exhibited a very dismal picture owing to inadequate marketing infrastructure and the market imperfections.

All the relevant tables of index numbers and annual compound growth rates of different crops have been given at the end of each chapter.
ACKNOWLEDGEMENTS

The present work was carried out at the Gokhale Institute of Politics and Economics, Poona 4 under the guidance of Dr. G.R. Mulla.

When I was living merely in the ivory tower of research, Dr. G.R. Mulla, my research guide, by his incisive comments and suggestions made me realise the rigour and exacting standards of research. If I have succeeded at least partly to live up to his expectations it is due to his constant encouragement and patient bearing with me at all stages.

I am thankful to the authorities of the Gokhale Institute of Politics and Economics, Poona-4 and to Prof. V.M. Dandekar, in particular, for allowing me to undertake this study and register my name as a Ph.D. student of the University of Poona. I am also thankful to the present Director of the Institute, Prof. N. Rath for allowing me to get clarified my doubts from time to time from him.

I wish to express my gratitude to Shri M.F. Khare, not only for the statistical advice, but also for the help rendered by him through discussion throughout my work. This work could not have been completed but for the timely help of my friend Prof. S.B. Gadhari, Lecturer in Statistics, Pajaram College, Kolhapur.

I express my sincere thanks to Dr. S.F. Patil (a cardiologist), Dr. S.K. Desai, Head of the Department of English, Shivaji University, Kolhapur, Prin. P.B. Koshti, the College of Commerce, Kolhapur, Shri A.K. Jakati, the Librarian, Shivaji University, Kolhapur and D.S. Patil
a secondary teacher in Vikram High School, Kolhapur for their constant encouragement and instilling confidence in me until the work is completed.

Lastly, I thank Shri N.G. Phadke for typing the thesis and Shri B.S. Adurkar for drawing the maps and graphs neatly.

Poona,

June, 1982.  

T. G. Naik
